**Clausel**, BERTRAND, a French marshal, was born at Mirepoix, Ariège, 12th December 1772, and obtained distinction in the Italian and Austrian campaigns of Napoleon; but more especially as commander in Spain, after the battle of Salamanca in 1812. Condemned to death as a traitor on the return of the Bourbons, he was in 1819 permitted to return from America to France; commanded the army and was governor in Algeria in 1830; and was made governor-general of Algeria in 1835. He returned to France in 1837, voted with the opposition in the Chamber, and died 21st April 1842. See ALGERIA.

**Clausewitz**, KARL VON, a very distinguished Prussian general, whose writings prepared the way for a complete revolution in the theory of war, was born 1st June 1780 at Burg. He served with distinction in several campaigns in the Prussian and in the Russian service, in 1815 became chief of a Prussian army corps, and was ultimately director of the army school, and Gneisenau's chief of staff. He died of cholera at Breslau, 16th November 1831. Of his works the best known are his great book on war, *Vom Krieg* (3 vols. 4th ed. 1880), and his life of Scharnhorst. See his *Life* by Schwartz (Berlin, 1877).

**Clausius**, RUDOLF, a great German physicist, born 2d January 1822 at Koslin in Pomerania. He studied at Berlin, and afterwards lectured on natural philosophy as *privat-docent* at Berlin, and as professor at the Zurich Polytechnic School. In 1869 he was appointed to the chair of Natural Philosophy at Bonn, and here he died, August 24, 1888. He was elected a foreign member of the Royal Society in 1868, and in 1879 was given its highest honour, the Copley Medal. His scientific labours cover parts of the field of optics and of electricity, but his especial work was his contribution to the science of thermo-dynamics, the honour of establishing which on a scientific basis he divides with Rankine and Thomson. His mathematical methods he also applied to the theory of the steam-engine, the dynamical or kinetic theory of gases, and to electricity and electro-dynamics. His great work is his *Abhandlungen über die mechanische Wärmetheorie* (1864, and 1867), which in its second edition took a more systematic form as vol. i., *Die mechanische Wärmetheorie* (1876), and vol. ii., *Die mechanische Behandlung der Electricität* (1879). Other books are *Ueber das Wesen der Wärme* (1857), and *Die Potentialfunction und das Potential* (3d ed. 1877). See *Life* by Riecke (1889).

**Clausthal**. See KLAUSTHAL.

**Clavagella**, or CLUB-SHELL, a genus of marine Lamellibranchiate Molluscs of the same family with *Aspergillum* (q.v.). They mostly live in excavated holes in rocks or in masses of coral. The ordinary form of the bivalve shell is curiously modified. One valve (the right) is fixed to the inner surface of the chamber in which the animal lives, and is continued without interruption into a secondary shell-tube, which extends from the chamber outwards, and varies considerably in length in different species. The left valve is free and movable on the right. The mode of excavation is not known. Six living species of wide

distribution are known. The fossil forms, which

*Clavagella lata*, showing the cavity and fixed valve: a, the fixed valve; b, the calcareous tube.

are more numerous, were first discovered. They do not occur below the Upper Chalk.

**Clavaria**, a genus of Fungi, of the order Hymenomycetes, family Clavariaceae, in which the spore-bearing tissue is produced over all parts of the surface. The species are numerous, some of them simple and club-shaped, some branched. *C. botrytis*, a species common in oak and beech woods, especially in Germany, growing on the ground, among moss, grass, heath, &c., is gathered when young and used as food, having a very agreeable sweetish taste. Other species of *Clavaria* are used in the same way. See FUNGI.

**Claverhouse**. See GRAHAM (JOHN).

**Clavichord**, or CLARICHORD, an obsolete keyboard musical instrument of the same type as the Harpsichord (q.v.) and spinet. The strings were set in vibration, not by plectra as in these instruments, but by metal tangents, so placed that they also determined the vibrating length, the unused portion of the string being damped by an interlaced band of cloth, which damped the whole string when the key was released. There might be a set of strings for each note, or the same set might serve for several notes. Bach's *Das Wohltemperirte Klavier* was written for the clavichord.

**Clavicle**, an important part of the pectoral girdle of Vertebrates, perhaps most familiarly known in the collar-bone of man and in the merry-thought of birds. It is well developed in those mammals in which the foreleg or arm is used very strongly and freely, but is poorly developed or absent in many cases, as in Carnivores and Ungulates. In most flying birds it is strong, and often fused to the breast-bone; in the ostrich tribe it is rudimentary or absent. It is not a prominent bone in reptiles, being absent in snakes and crocodiles, but it is well developed in the majority of lizards. There is a distinct 'clavicle' in most Amphibians, but the homology begins to be difficult; still more so when we pass to the bones in fishes to which the name clavicle has been given. See BIRD, BONE, SKELETON; also Huxley's *Anatomy of the Vertebrate Animals*, and other works on Comparative Anatomy, such as those of Gegenbaur and Wiedersheim (trans. Bell and Parker). There is a separate article on the human Collar-bone (q.v.).

**Clavicorn**, an old name for the bass tuba or bombardon. See SAXHORN.

**Clavicornia**, a name sometimes applied to several tribes of beetles with club-shaped (clavate) antennae. They are included within the great Pentamerous section of Coleoptera. Buizing beetles illustrate the type.

**Clavijero**, FRANCISCO XAVIER, Mexican historian, born at Vera Cruz in 1721, entered the order of the Jesuits in 1748, and became a teacher of philosophy. On the suppression of the Jesuits in 1767 he retired to Italy, where he died at Bologna in 1787. He wrote in Italian a *History of Mexico* (Eng. trans. 1787).

**Clavijo y Fajardo**, JOSE (1730-1806), a Spanish publicist, who had a duel with Beaumarchais, and was made, with a character much altered, the hero of Goethe's *Clavigo*.

**Claws**, a term often applied to the chela at the end of Arthropod limbs, but best restricted to the epidermic tips found at the ends of the digits in most reptiles, on the toes, and often on the thumb and first finger of birds, but seen in perfection in many mammals—e.g. Carnivores, Insectivores, Edentates. It is obviously impossible to draw any sharp line between claws and Nails (q.v.).

**Clay** (A.S. *clæg*; of the same root as 'clag,' 'claggy'), a term applied, in a vague way, to those kinds of earth or soil which, when moist, have a notable degree of tenacity and plasticity. The clays are not easily distinguished as rock species, but they all appear to owe their origin to the decomposition of various rocks, and to consist chiefly of aluminic silicate, along with other ingredients, which vary in character with the nature of the parent rock from the degradation of which they are derived. Thus common clay is a mixture of kaolin or China clay (which is a hydrated clay), and the fine powder of some felspathic mineral, which is anhydrous and not decomposed. Clays vary much in plasticity—all being more or less plastic when moistened with water, and capable of being moulded into any form. But while many retain their shape when dried by heat, others, which in the damp state would ordinarily be called clays, tend to fall to powder when all the water is driven off. Clay is eaten by the Botocudos and other savage tribes, as also in Georgia and the Carolinas by negroes and 'poor whites.' The plastic clays are used for many purposes, as for making pottery of all kinds, bricks and tiles, tobacco-pipes, firebricks, &c. The following are the commoner varieties of clay and clay-rocks: *China clay* or *Kaolin* (q.v.); *Pipeclay* (q.v.), very like kaolin, but containing a larger percentage of silica; *potter's clay*, not so pure as the preceding; *sculptor's clay* or *modelling clay*, a fine potter's clay, sometimes mixed with fine sand; *plastiline*, a potter's clay from Italy, supposed to be composed of oil, glycerine, rosin, and powdered clay, which, as it does not shrink, need not be kept wet; *brick-clay* (see BRICKS), an admixture of clay and sand with some ferruginous matter; *Fireclay* (q.v.), containing little or no lime, alkaline earth, or iron (which act as fluxes), and hence infusible or highly refractory; *Shale* (q.v.), a laminated clay-rock; *clay-slate*, an indurated cleaved clay-rock; *loam*, a non-plastic mixture of clay and sand; *Marl* (q.v.), a clay containing much calcareous matter. Clay at the deepest sea-bottom is largely of animal origin. See PETROGRAPHY and SOILS.

CLAY SOILS derive their character from the aluminic silicate which they contain in a state of mixture, as well as in chemical combination with other substances. Some soils contain so large a proportion of alumina as 35 per cent., but generally the proportion is much smaller. The felspars which chiefly yield the alumina of clay soils contain also soda, potash, and lime, substances which

tend to render clays fertile when under cultivation. The physical characters, however, of the different varieties of clay soils arising from the varying proportions of silica, and other substances mixed with the alumina, are chiefly concerned in their relative fertility. Calcareous matter exercises a considerable influence on their powers of producing crops. For an account of the distribution of soils in this country, see Johnston's and Cameron's *Elements of Agricultural Chemistry and Geology*.

**Clay**, CASSIUS MARCELLUS, a zealous abolitionist, born in Kentucky in 1810, graduated at Yale in 1832, and three years after was elected to the legislature of his native state. He opposed the annexation of Texas (1844); started at Lexington *The True American*, a vigorous anti-slavery paper, the following year; volunteered in the Mexican war (1846); supported Mr Lincoln in 1860; and from 1861 till 1869 was U.S. Minister to Russia. A true son of Kentucky, Clay delivered his political addresses armed to the teeth, was involved in a number of serious quarrels, and in 1877 was tried but acquitted on a charge of killing a discharged negro servant who had threatened his life. See his *Life, Writings, and Speeches* (2 vols. 1886). He died at ninety-three in July 1903.

**Clay**, HENRY, statesman, one of the 'great triumvirate' of American orators, was born in 'the Slashes,' a district of Hanover county, Virginia, April 12, 1777. He was the son of a Baptist preacher who died in 1781, and from the employment of some part of his early youth in connection with a grist-mill, he earned the cognomen of 'the mill-boy of the Slashes.' His early schooling was but scanty. When fifteen years old he became an assistant-clerk in the chancery court of his native state, and for four years was amanuensis to that excellent lawyer and true patriot, George Wythe, then chancellor. He also studied law for one year with Robert Brooke, attorney-general of Virginia. In 1797 he was licensed to practise law, and in the same year went to Lexington, Kentucky, where he soon acquired a high reputation as an orator and as a jury lawyer. He was sent in 1806, and again in 1809, to the United States senate for short terms. He first entered the lower house of congress in 1811, and was chosen its Speaker. This position he filled for many years with great ability. He was active in bringing on the war of 1812-15 with Great Britain, and was one of the commissioners who arranged the treaty of Ghent which ended the war. By his course in regard to the 'Missouri Compromise' of 1821, he won the title of 'the great pacificator.' In 1824 he was one of the strongest advocates of a high protective tariff, and in the same year was one of the four candidates for the presidency. No choice having been made by the electoral college, Mr J. Q. Adams was elected president by the House of Representatives; and Clay's acceptance of the position of secretary of state under Adams was by many held to constitute a proof of a corrupt bargain between two statesmen, neither of whom, in truth, would have been guilty of countenancing such a bargain. Clay re-entered the senate in 1831, and in the same year was renominated for the presidency; but in the following year General Jackson was re-elected to that office. His candidature for the office of president in 1844 was in like manner unsuccessful. The compromise of 1850 between the opposing free-soil and pro-slavery interests was largely Clay's work. He died July 29, 1852. Although he was the most attractive public speaker in his country during what is justly regarded as 'the golden age of American oratory,' his ability as a reasoner was excelled by that of Webster; while his other principal

rival, Calhoun, surpassed him in intensity and fiery earnestness. No man had a larger following of devoted personal friends than Clay, and for more than forty years he had a very conspicuous share in shaping the legislation of the republic. As a public man his career was without a blemish. Of the rather numerous biographies of Clay the best is that by Carl Schurz (Boston, 1887).

**Clay Cross**, a town in Derbyshire, 4½ miles S. of Chesterfield, the centre of a coal and iron district. The collieries here were begun by George Stephenson in 1838. Pop. 8700.

**Clay Ironstone**, a granular or compact admixture of the mineral *siderite* (ferrous carbonate) and clay. It occurs as nodules or in thin beds in various geological systems, but especially in the carboniferous strata. It frequently contains organic matter. When very highly carbonaceous, it passes into the variety called blackband ironstone. See IRON AND STEEL.

**Claymore** (a Gaelic term meaning 'the great sword') is properly used of the old Celtic one-handed, two-edged longsword, often engraved on ancient tombstones, with the guards pointing downwards. The name is now commonly given, inaccurately, to the basket-hilted sword of the officers of Highland regiments.

**Clayton**, JOHN MIDDLETON, statesman, was born in Sussex county, Delaware, 24th July 1796, studied at Yale, and practised as a lawyer. In 1829 he became a United States senator, and while secretary of state in 1849-50, he negotiated the Clayton-Bulwer Treaty with Britain, guaranteeing the neutrality of lines of interoceanic communication across Nicaragua or elsewhere. He died 9th November 1856. See BULWER.

**Clazomænæ**, one of the twelve cities of Ionia which stood on the gulf of Smyrna, westward from Smyrna. Under the Romans it was a free city, and had an extensive commerce. It was the birthplace of Anaxagoras. It is now called Vurla.

**Cleānthes**, a Stoic philosopher, born at Assos, in Troas, about 300 B.C. His poverty was such that he had to work all night at drawing water in order to obtain money for his support and to pay his class-fee while attending the lectures of Zeno—a fact discovered only when the Areopagus called upon the ardent young student to show how he obtained his living. For nineteen years he listened patiently to the great Stoic, and, on his death, succeeded him in his school. He died of voluntary starvation when about eighty years old. Cleanthes differed from the other Stoics in regarding the sun as the governing principle of the world; but none of his writings are extant except a *Hymn to Zeus*, one of the purest and noblest pieces of poetry in the Greek language, showing an admirable union of religious feeling and philosophic thought.

**Clear**, CAPE, a headland of Clear Island, the most southerly point of Ireland, with a lighthouse and telegraph station. Clear Island, 66 miles SW. of Cork, is 1504 acres in area.

**Clearing-house**. The business facilities afforded by bankers to their customers in collecting their bills, cheques on other firms, and similar obligations, early necessitated an organised system of interchanging such documents, whereby labour might be saved, and the cash-balances required in settlements reduced. It is claimed by a French writer that the *Chambre de Compensation de Lyon*, as reorganised in 1667, was practically similar to the modern clearing-house; and the Scottish bank-note exchanges (a species of clearing) were established as far back as 1752. The present system, however, originated in London at an unknown date. It is said that the clerks, when collecting

from the various banking-houses, began to interchange the documents of mutual indebtedness in the street, and subsequently at taverns or any banking-office where they were tolerated. Some time previous to 1773 a special apartment was devoted by the bankers to the purpose; and in 1810 the building in Lombard Street, since known as the 'Clearing-house,' was set apart for the clearing, under the direction of a committee of bankers, and the immediate management of two inspectors. The joint-stock banks were not admitted to the clearing-house until 1854. Four years later the country-cheque clearing was established as a department of the clearing-house. In 1864 the Bank of England entered, but it clears only *against* the other banks. Only eighteen banks, including the two chief offices of the London County and Westminster Bank, are members. Other London bankers arrange with clearing banks to represent them.

The system pursued is as follows: From time to time during the day, each firm transmits to the clearing-house cheques and bills payable by other bankers, classified according to the banks retiring them, account being also taken of obligations coming against their firm. At a certain hour the doors are closed, and the balances struck. Time is allowed for each bank to decide as to honouring the drafts upon it, after which the final adjustment of balances takes place. Subjoined is a specimen balance-sheet as at the close of a day's clearing.

691,570	1	5	Balance				
1,017,373	12	4					

The figures in either column are the sums due to or by the National Provincial Bank in account with each of the other members of the clearing-house, after allowing for their mutual indebtedness, as well as the total amount of vouchers returned unpaid. The result was that after placing all their claims on the other banks against the claims of the latter on them, there remained a sum of £691,570, 1s. 5d. due by the National Provincial Bank on the general balance. This was largely accounted for by the claims of the Bank of England, who only clear on one side. Each bank makes up a similar form. The inspectors having satisfied themselves that the general balance is correct (all the members having agreed between themselves, and the total *debtor* balances equalling the *creditor*), warrants for settling the balances by transfer at the Bank of England, certified by the inspectors, are passed between the members. Formerly these balances were settled in cash. Thus, transactions to the amount of many millions daily are settled without the use of

a bank-note or coin. The importance of the system is illustrated by the fact, stated in evidence before the House of Commons, that the London and Westminster Bank, by getting admission to the clearing-house, were enabled to reduce their cash-balance by £150,000.

A brief explanation of the terms 'Country Clearing,' 'Metropolitan Clearing,' and 'C.H.,' appearing in the specimen balance-sheet shown above, may be given. The Country Clearing deals with cheques drawn on the provincial branches of the various clearing banks, and also with cheques drawn on the country banks for which they act as London agents. The Metropolitan Clearing, which was instituted in February 1907, includes cheques drawn on the London branches of the various banks. Formerly presentation of such cheques was effected by post, or by 'walk' clerks sent out by each bank; since these cheques have been brought under the operation of the clearing system, a large economy of time and labour has resulted. The spaces opposite the term C.H. (i.e. Clearing-House) are used for the adjustment of errors which arise from time to time.

The record of the total amount of bills, cheques, and drafts passing through the clearing-house is regarded as an index of the state of trade; and as London is the chief centre of trade for the world, this record has a world-wide range. The sums passed through the clearing-house are greatest on certain 'special days.' These are, in normal times, (1) Stock Exchange settling days; (2) Consols settling days; and (3) 4ths of the month, trade bills being frequently dated on the 1st of the month, and, with three days' grace, falling due on the 4th of some succeeding month. In most of the large towns in England there is now a clearing-house, and in Scotland the system, including the separately conducted note-exchanges, has been thoroughly organised, so that clearings take place all over the country, which are settled by draft on Edinburgh, the balances of the Edinburgh clearing-house being finally settled in London twice weekly.

The first clearing-house in America was started in New York on 11th October 1853, and the system has since assumed enormous proportions throughout the United States.

The clearing system also developed to a considerable extent in various British colonies.

The system has also extended to the continent of Europe. *La Chambre de Compensation des Banquiers de Paris* was formed in March 1872, the clearing-house of Berlin in 1883, and that of Vienna in 1884; but their transactions are greatly less than those of London and New York. While it was in connection with banking that the clearing-house system originated, the principle (in modified forms) has been adopted by other departments of business. The Stock Exchange Clearing-house was founded in 1874.

See Howarth, *Our Banking Clearing System and Clearing House* (4th ed. 1907) and *The Banks in the Clearing House* (1906); François, *Clearing House* (Lille, 1887); Cannon, *Clearing Houses* (New York, 1900); White, *Money and Banking* (New York, 1902); Matthews, *The Bankers' Clearing House* (1921).

THE RAILWAY CLEARING-HOUSE is an association instituted in 1842 to enable railway companies in Great Britain to carry on, without interruption, the through traffic in passengers, animals, minerals, and goods passing over different companies' lines of railways, and to afford to the traffic the same facilities as if the different lines had belonged to one company. The arrangements are conducted in London by a committee, the members of which are appointed by the directors of the companies who are parties to it; and the association is regulated by the Railway Clearing Act, 1850. The

companies are each represented on the committee by a delegate. Subordinate committees of railway officers also meet from time to time. The accounts of the clearing-system, and the balances due to and from the several companies, are settled and adjusted by the secretary of the committee, with appeal to the committee, whose decision is final. The clerks at stations of the various companies send abstracts of all traffic monthly. The collected passenger-tickets are also sent monthly. Number-men are employed by the clearing-house at junctions where the lines of different companies meet, who note the number of every carriage, horse-box, wagon, van, and sheet or wagon-cover on the train going beyond the parent line, and make weekly returns. The returns from the companies' stations, together with those of the number-men, enable the accounts of mileage and demurrage incurred to be made up by the clearing-house, by whom the companies are debited and credited, as the case may be. A debtor and creditor account is sent from the clearing-house monthly to each company, showing on the one side in one sum what the company has to receive from all other companies as their proportion of through passenger fares, through goods and parcels rates, and mileage and demurrage of carriages, wagons, and sheets; and on the other side, also in one sum, what the company has to pay to others out of moneys drawn by them. The balance is struck as against, or in favour of, the clearing-house (as a common debtor or creditor). In addition to declaring the balances, the clearing-house supplies to each company monthly statements of the details of the traffic of each station.

The clearing-house system is made available also for the recovery of lost articles of luggage. Reports giving the description of each lost article are sent from all stations daily to the clearing-house, and by this means almost all lost luggage is restored to the owners. The government scheme of the parcel post involves payment by the Post-office to the railway companies, and the apportionment as between the companies is effected through the machinery of the clearing-house. There is a similar railway clearing system in Ireland, with its headquarters in Dublin.

**Clearing-nut** (*Strychnos potatorum*), a small tree of the same genus as *Nux Vomica* (q.v.), abundant in the forests of India. These seeds being rubbed on the inside of a vessel, muddy water put into it quickly becomes clear, all impurities settling to the bottom.

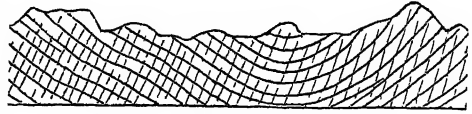

**Cleator Moor**, a town of Cumberland, 4 miles SE. of Whitehaven, with coal-mines and iron-furnaces; pop. 8300.

**Cleats**, in Shipbuilding, are pieces of wood or iron fastened to various parts of the vessel, and having holes or recesses for fastening ropes.

**Cleavage**, in crystals, is the property of splitting more readily along certain planes than others. These planes are the same for all crystals of the same substance, and may be, but need not be, parallel to the crystal-faces. Thus fluorspar crystallises ordinarily in cubes, seldom in octahedra, but the cube can be reduced to an octahedron by flaking off the corners. Cleavage sometimes helps the recognition of minerals. The nearly rectangular cleavage of augite distinguishes it from hornblende, whose angle is about 56°.

**Cleavage**, or **SLATY CLEAVAGE**, is a condition of rocks in which they split easily into thin plates. In true bedding the layers of rock correspond to planes of deposition or accretion, but in slaty cleavage the planes along which the rock splits may or may not coincide with bedding-planes. In point of fact they rarely do, but intersect the bedding-planes at all angles. Slaty cleavage is a

superinduced structure—the result of the extreme compression which the rocks have undergone while they were being squeezed into anticlinal and synclinal folds (see **ANTICLINE**). When thin

Section exhibiting Lines of Cleavage.

sections of clay-slate are examined microscopically, the grains of which the rock is composed are found to be flattened or compressed, and drawn out in the direction of the cleavage planes. Although slaty cleavage is best developed in homogeneous fine-grained clay-rocks, it yet occurs in many coarse-grained rocks as well, but in these the cleavage is never so perfect as in the finer-grained clay-rocks. As induration necessarily accompanies cleavage, the cleaved clay-rocks become of great economic importance, and are familiar to every one in the common blue and purple roofing-slates.

**Cleavers**, or **GOOSE-GRASS** (*Galium Aparine*), a species of Bedstraw (q.v.), a coarse Rubiaceae annual, with whorls of six to eight leaves, both stem and leaves rough with reflexed bristles, the fruit also hispid, and when ripe distributed by adhering like a bur to any animal which may brush against it. A very common weed in hedges and bushy places in Britain and most parts of Europe and North America, it was formerly of repute in domestic medicine as a diuretic. From the time of Dioscorides, and it is said still in Sweden, its prickly stems have been used as a strainer for milk.

**Cleckheaton** is now part of Spenborough.

**Cleethorpe with Thrumsoe**, a Lincolnshire watering-place and urban district in the parliamentary borough of Grimsby; pop. 28,000.

**Clef**, a musical character placed on the staff, by which the absolute pitch of the notes is fixed. There are three clefs—viz. the G, the C, and the F clef. The G clef is placed on the second line, and the stave with this clef is known as the treble stave; the C clef on the third line as the alto stave; and the F clef on the fourth line as the bass stave. The C clef is a fifth below the G clef, and a fifth above the F clef, thus:

The C clef is also placed on the fourth line for some instruments, and for the tenor part in vocal music,

thus: ; and in old vocal music, and

also in full scores, the C clef placed on the first line is used for the soprano.

**Cleg**, a name given to some insects of the dipterous family Tabanidæ, the females of which are in summer extremely troublesome to horses,

cattle, and human beings. Some of them are well known as 'breeze-flies.' The females pierce the skin of their victims by means of formidable lancet-like mouth organs, and greedily suck the blood from the wounds. The name cleg is sometimes given in England to *Chrysops cæcutiens*, a fly frequent in most parts of Europe, but rare in Scot-

land. It often attacks man, and not infrequently inserts its proboscis through the sleeve, or some other part of the dress. It is about one-third of an inch in length, mostly black, with yellow markings on the abdomen, and very large eyes of the most beautiful green and golden colours. The insect always called cleg in Scotland is *Hematopota pluvialis*—a rather smaller but equally troublesome fly, mostly of a gray colour, but also remarkable for its very large and beautiful eyes, which are greenish, with waved purplish-brown bands. In England it is sometimes called the *Stout*. It is particularly common in low damp places.

**Cleistogamy**, in botany, is the production of small, inconspicuous flowers which never open, but pollinate themselves. In such flowers the petals are apt to be rudimentary, stamens and pollen-grains few in number. They may be subterranean. Many plants, such as chickweed, wood-sorrel, *Lamium amplexicaule*, and violets, produce both cleistogamous and large opening (chasmogamous) flowers, the latter giving an opportunity of cross-pollination. In these species darkness, cold, and other such conditions favour cleistogamy. Some plants produce only cleistogamous flowers.

**Cleveland**, JOHN. See CLEVELAND.

**Cleland**, WILLIAM (1661-89), Covenanting poet. See CAMERONIAN REGIMENT.

**Clematis** (Gr. *klēma*, 'the shoot of a vine'), a genus of plants of the natural order Ranunculaceæ, having four coloured sepals, no corolla, and for fruit numerous one-seeded achænia with long—generally feathery—awns. The species are pretty numerous, herbs or shrubs, generally with climbing stems, natives of very different climates, and much scattered over the world. They possess more or less active caustic properties. The long awns give the plants a beautiful appearance even in winter. The flowers of many species are also beautiful. *C. vitalba*, the common Traveller's Joy, is the only native of Britain. It is common in the south, but becomes rarer towards the north, and is scarcely

*Clematis montana*.

found in Scotland. The twigs are capable of being made into baskets. The fruit and leaves are acrid and vesicant; the leaves are used as a rubefacient in rheumatism; and those of other species are also employed in the same way. A number of species and many garden varieties are of the greatest beauty and most profuse in flowering. The flowers of some in different varieties attain the diameter of from 4 to 8 inches, and range in colour from pure white to pale azure, deep purple, and claret or ruby.

In the United States there are many native species. A beautiful evergreen species from New Zealand, *C. indivisa*, with pure-white flowers, is one of the handsomest of greenhouse climbers; and *C. flammula*, a native of southern Europe and northern Africa, with white flowers, which have a very strong honey-like smell, is the species known as Sweet Virgin's Bower. The garden varieties are propagated by grafting the young shoots in spring on the roots of such common species as *C. vitalba* and *C. flammula*.

**Clemenceau**, GEORGES BENJAMIN EUGENE, born in La Vendée, 28th September 1841, practised medicine in Paris. From his student days he has always been influential in politics. He has been a member of the National Assembly (1871), of the Chamber of Deputies (1876-93), a senator (1902-20), and Prime Minister (1906-9, 1917-20). In January 1920 he withdrew his candidature for the presidency and retired into private life. Apart from the Great War, and the peace of 1919, he is notable as a journalist and for his defence of Dreyfus.

**Clemens**, SAMUEL LANGHORNE, 'Mark Twain' (1835-1910), American humorist, was born at Florida, Missouri. He learned the trade of a printer, and afterwards acted as pilot on the Mississippi River. From a well-known call of the man sounding the river in shallow places ('Mark twain,' meaning 'by the mark two fathoms') his pseudonym as a writer was subsequently taken. After the outbreak of the war of 1861-65 he went to Nevada, where he tried silver-mining; next he became a journalist and lecturer in various parts of the United States. In 1867 he visited France, Italy, and Palestine, gathering material for his *Innocents Abroad* (1869), which established his reputation as a humorist, 125,000 copies selling within three years. He was afterwards an editor at Buffalo, New York, with an interest in the *Express*, where he married Miss Langdon, a lady of wealth. He later removed to Hartford, Connecticut. His books, mostly sold by subscription, yielded him a large income; but he became a member of a publishing firm, and lost his money by its bankruptcy in 1895. His humour, however grotesque, is never mean or ungenerous; it is singularly direct and simple in form, and has appealed as successfully to British as to American readers. 'If the prevailing spirit of Mark Twain's humour,' writes Mr Howells, 'is not a sort of good-natured self-satire, in which the reader may see his own absurdities reflected, I scarcely should be able to determine it.' He varied his work by excellent character-sketches and graphic descriptions. Among his books are *The Innocents Abroad* (1869); *Roughing It* (1872); *The Gilded Age* (1873), the last written with the co-operation of Mr Charles Dudley Warner, and published both as a story and as a comedy, in which shape it had great success; *Tom Sawyer* (1876); *A Tramp Abroad* (1880); *The Prince and the Pauper* (1882); *Life on the Mississippi* (1874); *The Adventures of Huckleberry Finn* (1885); a compilation, *Library of Humour* (1888); *Pudd'n-head Wilson* (1894); *Recollections of Joan of Arc* (1896); *Huckleberry Finn as Detective* (1897); *More Tramps Abroad* (1897); *The Man that Corrupted Hadleyburg* (1900); *Christian Science* (1907); *Autobiography* (1908). His serious outlook on life appears in *What is Man?* (privately printed 1906, published 1910). See W. D. Howells's *My Mark Twain* (1908), the Life by A. B. Paine (1912), and the *Letters* (ed. Paine, 1920).

**Clement**, or CLEMENS, is the name of seventeen Popes (q.v.). The first, CLEMENS ROMANUS, is accounted one of the Apostolic Fathers (q.v.), and is reckoned variously as the second or third successor of St Peter. A 9th-century legend makes him a martyr in the Crimea in 102. His day

is November 23. Origen (185-254) was the first to distinctly identify Clement with St Paul's 'fellow-labourer' (Phil. iv. 3); but this assumption has nothing to support it, while the ancient tradition makes Clement the disciple of St Peter. Moreover, on a name so common endless theories may be built. Distinguished German scholars, such as Hilgenfeld, and Harnack (doubtfully), have identified the bishop with Flavius Clemens, cousin of the Emperor Domitian, whose sons had been named successors to the empire, and who was consul in 95 A.D., and in the same year put to death on a charge of 'atheism' and 'Jewish manners.' The most probable view is that advanced by Lightfoot—that Clement was a freedman of Jewish parentage belonging to 'Cæsar's household'—strong arguments in support of which are set forth in his edition of the two *Epistles*. Of these, the so-called second epistle is really a homily, and is certainly not Clement's; but the first, although its genuineness has been earnestly disputed by the author of *Peregrinus Proteus* (Lond. 1879), is generally accepted. Chiefly hortatory and didactic, it is addressed to the Corinthian Church, in which serious feuds had arisen, and treats of social dissensions and of the resurrection, which is illustrated by a curiously circumstantial account of the phoenix. It was probably written about 95 A.D., and it was widely known and highly esteemed at an early date. Clement would appear to have had some reputation among his contemporaries as a letter-writer; Hermas (q.v.) represents himself as directed by the angel to deliver a copy of his *Shepherd* to him, that he may transmit it to the cities abroad, 'for this function belongs to him.' To-day the epistle is chiefly of interest as the first though innocent step towards papal aggression, and for what Lightfoot calls its *liturgical* position. There is no respectable evidence that it was ever placed in the same catalogue with the canonical books, but in the church at Corinth it was publicly read from time to time, and by the 4th century this use had extended to other churches. For convenience of reading it would be attached to MSS. of the New Testament, as is the case in the famous Alexandrian MS. of the 5th century; but neither on this fact nor on its insertion in the forged Apostolic Canons can any argument be based; and it is only in the late Syriac MS. that it actually appears with the catholic epistles. The first edition was edited by Patrick Young in 1623, from the mutilated and incomplete Alexandrian MS., then in the king's library. This was the only copy known to the world until in 1875 Bryennios (q.v.) published a complete MS. (dated 1056) found at Constantinople, and in 1876 a complete Syriac MS. (1170) came into the possession of Cambridge University. See Lightfoot's scholarly and exhaustive edition (1869-77; 2d ed. 1890), where the second epistle will also be found. Quite a mass of literature has sprung up round the name of Clement, but the other works attributed to him—the Apostolic Constitutions and Canons (q.v.), two Syriac epistles on Virginity (MS. dated 1470; published 1752), the *Clementine* (the *Recognitions* and *Homilies*), and two epistles to James, which, with three forged Clementine letters, were in the 9th century incorporated in the notorious Isidorian Decretals—are all undoubtedly spurious. The *Clementine* is a fiction of which St Peter is the hero; it was regarded by Baur and the Tübingen school as the most notable outcome of the Ebionite party in the early Christian church, and on it much of their theory is based; the *Recognitions* (the Latin form, preserved by Rufinus) have been edited by Gersdorf (1838), the *Homilies* (the Greek form) by Schwegler (1847), Dressel (1858), and De Lagarde (1865).

For the *Epistles to Virgins*, see Beelen's edition (Louvain, 1856), and Funk (Tub. 1881); for their source, see Cotterill's *Modern Criticism* (Edin. 1884).

**Clement of Alexandria**, or TITUS FLAVIUS CLEMENS 'ALEXANDRINUS,' a celebrated father of the Christian church, was born probably at Athens, of heathen parents, about the middle of the 2d century, and resided during great part of his life in Alexandria, whence the epithet *Alexandrinus*. In his earlier years he devoted himself with great zeal to the study of philosophy, and wandered far and wide in quest of truth. The date of his conversion is unknown, but it is certain that after coming to Egypt, and listening to the prelections of Pantænus, he joined the Alexandrine Church, and was made a presbyter. Afterwards he became assistant to his master, whom he succeeded, about 190 A.D., as head of the celebrated Catechetical school. In 203 the persecution of the Christians under Severus compelled him to flee to Palestine. The only later notice we have of him is as the bearer of a letter from his pupil Alexander, afterwards Bishop of Jerusalem, to Antioch; and the date and place of his death are matters of pure conjecture, some writers putting it in 213, others as late as 220. His most distinguished pupil was Origen. Clement held a place in the Western martyrologies until the 17th century, when his name was omitted by Clement VIII. from the revised Roman martyrology; but in France, at least, he has never lost his title, his festival is still celebrated on the 4th December, and his name appears in the popular list of saints whose names may be given to children at baptism.

The chief writings of Clement that have survived, besides a practical treatise, *Who is the Rich Man that is Saved*, are the *Missionary*, the *Tutor*, and the *Miscellaneous*, which form a connected series, probably continued in his lost *Outlines*, which was an investigation of the canonical writings. The first is an exhortation to the Greeks to abandon idolatry; the second, an exposition of Christian ethics; and the third, a collection of treatises and brief observations on Greek and Christian literature, designed as an introduction to Christian philosophy. They show that Clement, when he became a Christian, did not cease to be a philosopher. His liberal mind saw in science not a gift of devils, but of God through the Logos; Greek philosophy was part of the divine education of man, and his teaching is the result of the lofty purity of character that led him to seek the truth alike from heathen writers and from Christian heretics, believing that all that comes from God is good. The period in which he lived must also be taken into account: in his day all believers were regarded as in process of salvation; the distinction between the visible and invisible church had not yet been suggested, while Gnosticism offered to many minds an attractive solution of some obvious difficulties. Clement therefore distinguished between the ordinary believer and the Christian gnostic; above faith he placed knowledge, above salvation the more august glory and full spiritual life of the 'perfect man.' Faith implies knowledge, but imperfect knowledge; many things must be accepted in simple trust, until by contemplation and the practice of what is right the believer shakes himself free from the power of evil, and rises to intelligent sympathy with the divine will. And this system of spiritual evolution Clement extends to the future life, where the process of development is continued before the gnostic becomes as far as possible like God. Here are easily visible the germs of the later mysticism, just as his view of the Father as a pure Monad, undemonstrable, who can only be manifested through the Son, marks an important step in the progress of Neoplatonism. God and the cause of

all things he sought to discover in the simplest thing conceivable; and he went equally astray in making Christianity only a philosophy, and, as a means to a perfect life, the fullness of what had been partial in the Greek systems. Yet two truths he nobly taught—the present recovery of the divine likeness, and that formulated doctrine is not an end but a means to final knowledge. Clement's extant works exhibit a man of pure and gentle spirit, of sincere piety, of wide reading and of wider sympathies, and with a noble conception of the purposes of God's providence; but his learning is undigested, his quotations are often careless, and his turgid, verbose style and desultory method appear to have repelled most scholars.

See editions by Potter (1715) and Stahlin (1905 *et seq.*), translations in Clark's *Ante-Nicene Library* (1877-79) and Butterworth (select works with text, 1919), and a bibliography with Dr Westcott's article in the *Dict. of Chr. Biog.* (1877); Merk, *Clemens von Alexandrien* (Leip. 1879); Winter, *Ethik des Clemens* (Leip. 1882); Bigg, *Christian Platonists of Alexandria* (1886); and works by Eugène de Faye (1899), F. R. Montgomery Hitchcock (1899), John Patrick (1914), and Tollinton (1914).

**Clement XIV.**, GIOVANNI VINCENZO ANTONIO GAGNANELLI, born in 1705 at Sant' Arcangelo, near Rimini, at the age of eighteen entered the order of Minorites, and studied philosophy and theology, which he afterwards successfully taught at Ascoli, Bologna, and Milan. He was the friend and confidant of Benedict XIV., who appointed him to the important post of counsellor to the Inquisition, and under Clement XIII. he was made a cardinal. He succeeded to the papal chair, May 19, 1769, after a conclave agitated by the intrigues of the Catholic sovereigns, who united in opposing every candidate favourable to the Jesuits. The new pope first set about reconciling these monarchs; he suspended the bull *In Cena Domini*, and entered into negotiations with Spain and France. After four years of deliberation, he issued in 1773 the famous brief *Dominus ac Redemptor noster*, suppressing 'for ever' the society of the Jesuits. The motive assigned in the brief is, 'regard to the peace of the church.' From this time his strength gradually gave way, and he died September 22, 1774, of poison, it was said, although no evidence has been produced to verify this suspicion. Clement was remarkable for liberality of mind, address as a statesman, sound learning, and integrity of character. He cherished the arts and sciences, and was the founder of the Clementine Museum, which, by the additions of Pius VI. and Pius VII., became the chief ornament of the Vatican. See Theiner, *Geschichte des Pontifikats Clements XIV.* (Paris, 1853; also in French).

**Clément, JACQUES** (1564-89), the Dominican who stabbed Henry III. (q.v.) of France.

**Clementi, MUZIO**, in his time an eminent pianist and composer for the pianoforte, was born in 1752 at Rome, where he competed successfully for a post as organist at the age of nine. Before he was fourteen, he had composed several contrapuntal works of considerable size, one of which, a mass, had produced some sensation in Rome; he then attracted the notice of an Englishman, Peter Beckford, M.P., who brought him to England in 1766, and at whose house in Dorset he studied till 1770. When he appeared in London, his extraordinary command of the pianoforte secured him an almost unprecedented success. From 1777 to 1780 he conducted the Italian Opera; in 1781 he visited Paris, Strasburg, Munich, and Vienna, where he engaged in a prolonged musical combat with Mozart before the emperor, the victory being left undecided. Mozart's letters express the verdict that Clementi

was 'a mere mechanician;' but the latter had not then exchanged his brilliant execution for the melodic style of his after performances. He made other visits to the Continent, and amassed an independence in England by teaching; and when much of this was lost in the failure of a musical firm with which he had become connected, he founded the business of manufacturer of pianofortes which is still carried on under the name of his associate, Collard. He died at Evesham, 9th March 1832. He has left over a hundred sonatas, of which sixty are for the pianoforte alone; his 'Op. 2' (composed in his eighteenth year) is considered the model of all modern pianoforte sonatas. Of his other works, the *Gradius ad Parnassum* (1817) is a splendid series of studies, 'on which to this day the art of solid piano-playing rests.' See Life by Unger (trans. 1913).

**Cleome'des**, author of a Greek treatise, in two books, *On the Circular Theory of the Heavenly Bodies*, which sets forth the Stoic theory of the universe, and which is remarkable as containing, amid much error and ignorance, several truths of modern science—such as the spherical shape of the earth. Nothing is known definitely regarding his life, but it seems most probable that he flourished in the 2d century A.D. Editions of his treatise are those of Bake (Leyden, 1820), Schmidt (Leip. 1831), and Ziegler (Leip. 1891).

**Cleon**, a famous Athenian demagogue in the time of the Peloponnesian war, for about six years the leader of the party opposed to peace. Originally a tanner, he gradually abandoned his business, and became the champion of popular rights, a position for which his fluent speech and loud voice fitted him admirably. He first became prominent about 427 B.C. by his advocating the putting to death of the Mytilenean prisoners, but his first great success was the reduction of the island of Sphacteria, in which a Lacedæmonian force had long held out. It is by no means clear how far this exploit was not really due to the skilful dispositions of his colleague Demosthenes, but Cleon himself was highly elated with his success, and many of his countrymen must have credited him with military genius, for in 422 he was sent to oppose Brasidas, the great Spartan general, in Macedonia and Thrace. But for this task the demagogue was insufficient, and he only saved his character by falling in the battle fought under the walls of Amphipolis.

Our picture of Cleon has had the misfortune to have been painted in unfavourable colours by such masters as Thucydides and Aristophanes; and, as Grote has pointed out, it should be remembered that the great historian was full of oligarchical prejudices, while we know that Aristophanes girded at other men about whose nobility of character there is no doubt at all. Besides, it appears not unlikely that both owed the demagogue a private grudge; the former for having been banished at Cleon's instance while holding a subordinate command, the latter because Cleon had complained to the senate that in his comedy, *The Babylonians*, Aristophanes had ridiculed his country's policy in the face of foreigners, and that, too, in time of war. Whether just or unjust the picture, Cleon will live in the *Knights* of Aristophanes as the shifty and unscrupulous demagogue, lying and pandering to the mob, which he befools for his own selfish ends. In this comedy he is one of the actual *dramatis personæ*, and this part the author played himself, not being able to find an actor bold enough to take it.

**Cleopat'ra**, daughter of the Macedonian King of Egypt, Ptolemy Auletes, was born in 69 B.C. By the will of her father, who died in 51, she should have inherited the throne along with her younger

brother, Ptolemy, who was also to be her husband, in accordance with Egyptian custom. But she was expelled from the throne by young Ptolemy's guardians, Pothinus and Achillas, whereupon she retreated into Syria to raise troops, and was just about to return to reassert her rights when the great Cæsar arrived in Egypt in pursuit of Pompey. Her charms quickly touched the susceptible heart of Cæsar, who warmly espoused her cause, and, after the successful issue of the Alexandrine war, in which Ptolemy fell, placed her again upon the throne, this time with, as nominal colleague and husband, a still younger brother, of whom she soon rid herself by poison. Cleopatra bore a son to Cæsar, who was called Cæsarion (afterwards cut off by Augustus), and soon followed her lover to Rome, where she received such honours as were but ill-pleasing to the Roman populace. In the civil war after Cæsar's murder, she hesitated at first which side to take. After the battle of Philippi, Antony summoned her to appear before him at Tarsus in Cilicia, to give account of her conduct. The 'serpent of old Nile' sailed up the river Cydnus to meet him, in a gorgeous galley, arrayed as Venus rising from the sea, and accompanied with all the gorgeous and romantic splendour of the East. She was then in her twenty-eighth year, in the perfection of matured beauty, and that, from her pure descent, almost certainly of the best Greek type, spite of Shakespeare's 'gypsy's lust,' Tennyson's 'swarthy' cheeks, and Gérôme's typical Egyptian features. The splendour of her beauty and her wit so fascinated the amorous heart of Antony that he at once flung away for her sake, duty, a Roman's pride, and at last all his ambition and his life. They spent the next winter at Alexandria, where they steeped their senses in the most delirious revelries of reckless love. Antony, although in the meantime he had returned to Rome to marry Octavia, the sister of Octavianus, soon returned to the arms of Cleopatra, who met him at Laodicea, in Syria (36 B.C.), and accompanied him on his march to the Euphrates. From this time his usual residence was with her at Alexandria, and here he heaped upon her and her children the most extravagant gifts and honours. His infatuated folly cost him all his popularity at Rome, and weakened his energies for the inevitable struggle. It was at Cleopatra's instigation that Antony risked the great naval battle of Actium, and when she fled with sixty ships, he forgot everything else and flung away half the world to follow her. When the conqueror appeared before Alexandria, Cleopatra entered into private negotiations with him for her own security; while Antony, who was at first indignant at her treachery, being told that she had already killed herself, fell upon his sword. Mortally wounded, and learning that the report which he had heard was false, he had himself carried into her presence, and died in her arms. Octavianus, by artifice, now succeeded in making the queen his prisoner. Finding that she could not touch his colder heart, and too proud to endure the thought that her life was spared only to grace her conqueror's triumph at Rome, she took poison, or as it is said, killed herself by causing an asp to bite her bosom (30 B.C.). Her body was buried beside that of Antony, and the good Octavia brought up the twin children she had borne to Antony as if they had been her own.

For Cleopatra, 'age cannot wither her'—the fascination of her beauty and the rare romantic interest of her story defy the touch of time. Helen of Troy and Mary Stuart alone divide with her that sovereignty over the imaginations of men that survives across the centuries. See ANTONIUS, CÆSAR, and books by P. W. Sergeant (1909) and Arthur Weigall (1914). For Cleopatra's Needles, see OBELISK.

**Clepsydra** (Gr., 'water-clock'), an instrument to measure time by the trickling or escape of water. In Babylonia, India, and Egypt, the clepsydra was used from before the dawn of history, especially in astronomical observations. A Hindu form of it was that of a copper basin put to float in a vessel, so that by the gradual influx of water through an aperture beneath, it should sink in a certain time. A more common type is that referred to by Greek and Latin writers, which resembled the modern sand-glass, and was used in courts of law to limit the length of the pleadings. Julius Cæsar (*Com. de Bell. Gall.*, lib. v. 13) speaks of measuring time in Britain 'by accurate water-measures,' and some commentators infer that the clepsydra was used by the Britons. More probably, however, it was brought by the Romans, being regularly used in their armies for allotting out the three hours' watches. Pliny ascribes the invention of the clepsydra to Scipio Nasica, but he, no doubt, merely introduced it from Alexandria or Greece, where it had already been greatly improved and perfected.

The general form of the clepsydra consisted essentially of a float which slowly rose by the trickling of water from above through a small hole in a plate of metal. As the float rose it pointed to a scale of hours at the side of the water-vessel, or, in the more elaborate forms, moved a wheel by means of a ratchet, and thus turned a hand on a dial. The first great difficulty was to secure a constant and uniform supply of water. This was well and simply done by using an intermediate cistern, so that, by means of a waste-pipe near the surface, the water always remained at the same level, even when the amount poured in exceeded the average.

There remained a much greater difficulty, arising from a fact often overlooked—viz. that by the Greek and Roman calendar the *hour* was not a fixed space of time, being very much longer in summer than in winter. A *day* meant the interval from sunrise to sunset, and an hour being the twelfth part of it was by no means so simple and measurable a magnitude as the unit of time shown on our modern dials. The problem of measuring the hour, thus varying through the year, was solved by Ctesibius of Alexandria, who invented an elaborate self-adjusting mechanism.—Clepsydra was also the name given to an ancient musical instrument, a hydraulic or water organ, described by Athenæus.

**Clerc, JEAN LE.** See LE CLERC.

**Clerestory**, an upper row of windows rising *clear* above the adjoining parts of the building, but more probably so named as admitting *clearness* or light. The term is particularly applied to the windows in the upper part of the central nave of churches (see GOTHIC ARCHITECTURE; and for an illustration, the article BRISTOL). This mode of lighting was also in use among the Romans. See BASILICA.

**Clergy** (Gr. *klēros*, 'a lot, an inheritance'). The word *klēros* occurs in the Septuagint as the equivalent of the Hebrew *nachalali*, 'an inheritance,' applied to the Jewish nation generally as peculiarly the divine heritage (Deut. iv. 20; ix. 29), and to the Levitical office specifically, as a 'spiritual' heritage, distinguished from the temporal possessions of the other tribes (Deut. x. 9; xviii. 1-2). In the New Testament it is found in cognate senses applied to the Christian body or its several congregations (1 Peter, v. 3, where the word is plural), and to the apostolic office (Acts, i. 17, 25). Hence the term was very generally applied to the ministers of the Christian religion, as holders of an allotted office, in contradistinction to the

*Laity* (q.v.). This use of the term is very ancient, being found in Clement of Alexandria (*De Divite. Servando*, 46) and Tertullian (*De Monog.* 12), and appears to have gradually become prevalent, as the ministers of religion more and more exclusively, instead of the members of the Christian church generally, began to be regarded as God's 'heritage' and 'priesthood' (1 Peter, ii. 9), consecrated to him, and peculiarly his. The distinction between the clergy and the laity became more marked through the multiplication of offices and titles among the clergy, the ascription to them of a place in the Christian church similar to that of the priests and Levites in the Jewish Church, with peculiar rights and privileges (which occurs as early as Clement of Rome, *Ep. ad. Corinth.* i. 40), their assumption of a peculiar dress and of official insignia, the growth of monastic institutions, and the introduction of celibacy. In harmony with the notions on which this distinction is founded, is that of an indelible or almost indelible character derived from ordination, so that a renunciation of the clerical office is either viewed as an impossibility, or a sort of apostasy. These notions in their highest degree belong to the Church of Rome. In the Protestant churches, the distinction between clergy and laity is much less wide; and although the same terms are often used, it is rather conventionally than in their full signification. The employment of official robes by the clergy preceded their assumption of a peculiar ordinary dress (indeed, for the most part, there was no direct adoption of a special garb for ordinary occasions, but the clergy did not change their fashions as the laity did, and continued to wear attire, such as the cassock, which was once commonly worn by all persons, but was discarded by the laity), and is not so intimately connected with any peculiar pretensions.

Among the privileges accorded to the clergy by the Roman emperors, and in the middle ages, was exemption from civil offices; among the rights asserted by them, and which caused much dispute, was exemption from lay-jurisdiction, even in cases of felony. With the revival of the Western Empire by Charlemagne, the clergy became one of the Estates of the empire, and the bishops were given baronial rank, and entitled to sit along with the temporal nobles in the imperial Diets. This institution survived the break-up of the Carolingian empire, and prevailed in several parts of Europe, very noticeably in France until the Revolution. In England the clergy are still technically and constitutionally one of the three Estates of the realm, and taxed themselves in their convocations as late as 1663. The bishops who sit in the House of Lords do so in virtue of baronies annexed to their sees, but not as prelates of the church, and it was held by parliament in Henry VIII.'s time, and later by Coke, that the right of session in convocation made the clergy of the second order ineligible to sit in the House of Commons. But the point remained doubtful till the Act 41 Geo. III. chap. 63, sec. 4 definitely excluded clerks in holy orders from sitting there, under a penalty of £500 per day if so sitting or voting. Those only who have formally relinquished the clerical office can sit, in virtue of the Clerical Disabilities Act of 1870. The clergy were distinguished into the *higher clergy* and the *lower clergy*, that is, those in the 'major orders' of bishop, priest, and deacon (and, since the 13th century, sub-deacon), or those in the 'minor orders' of acolytes, lectors, exorcists, &c. The term *Secular Clergy* is the designation of priests of the Latin and Greek churches who do not follow any religious rule (*regula*), but have the care of parishes. Monks who are in holy orders are designated *Regular*

*Clergy*. See BENEFIT OF CLERGY, ORDERS, BISHOP, PRIEST, RECTOR, &c.

**Clergyman's Sore Throat.** See THROAT.

**Clericus.** See LE CLERC.

**Clerk** (Lat. *clercus*), properly a clergyman; also, in old usage, a scholar; an officer attached to courts and corporations, who keeps the records; a lawyer's assistant; a booking or railway clerk; and in the United States, a shopman.

The PARISH CLERK is an official in the Church of England, who leads the responses in a congregation, and assists in the services of public worship, at funerals, &c. There is usually one in each parish. In cathedrals and collegiate churches there are several of these lay-clerks; and in some cases they form a corporate body, having a common estate, besides payments from the chapter. Before the Reformation, the duties of parish clerk were always discharged by clergymen in minor orders.

**Clerk, JOHN**, of Eldin, writer on naval tactics, was born in 1728, the seventh son of the antiquary, Sir John Clerk of Penicuik, Midlothian (1676-1755). He prospered as an Edinburgh merchant, and by 1773 purchased the small estate of Eldin at Lasswade, where he devoted himself to etching, to geology, and to studying deeply both the theory and practice of naval tactics. In 1779 he communicated to his friends a new manœuvre for 'breaking the enemy's line' in a naval battle—a method which is claimed to have gained, in 1782, a decisive victory over the French. In 1782 Clerk printed fifty copies of his *Essay on Naval Tactics*, published in extended form in 1804. He died 10th May 1812.—His son, JOHN CLERK (1757-1832), was raised to the Scottish bench as Lord Eldin.

**Clerke, AGNES MARY** (1842-1907), born at Skibbereen, County Cork, lived in Italy and London, made astronomical observations at the Cape of Good Hope and elsewhere, and wrote a series of works on astronomy and the history of the science, including *Astronomy in the 19th Century*, *The System of the Stars*, *Astrophysics*, *Modern Cosmogonies*, and the book on the Herschels—not to speak of *Studies in Homer*.

**Clerkenwell**, a London parish, lying within the parliamentary borough of Finsbury, and due north of St Paul's. It is largely inhabited by watch-makers, goldsmiths, and opticians. The Fenian attempt to blow up Clerkenwell prison took place 13th December 1867.

**Clerk-Maxwell.** See MAXWELL.

**Clermont** (in the middle ages, *Clarus Mons*, or *Clarimontium*) is the name of several towns in France. The most important are: (1) CLERMONT, in the department of Oise, 41 miles N. of Paris by rail, with a large hospital and a prison for women. Population, 4000.—(2) CLERMONT-FERRAND, the capital of the department of Puy-de-Dôme (the *Augustonemetum* of the Romans, in the country of the Arverni), which is finely situated on a gentle elevation between the rivers Bedat and Allier, 135 miles S. of Paris by rail. Among the principal buildings are the old Gothic cathedral, built of dark lava from a neighbouring range of extinct volcanoes; the fine church of Notre Dame, where Pope Urban II. preached the first Crusade; the handsome Palais des Facultés; and the government buildings, formerly a convent (1250). The town is the seat of the university of Clermont, colleges, technical schools, and several scientific bodies, and has a large public library. The streets, with the exception of a number of fine squares, are narrow, tortuous, and steep. The chief manufactures are rubber goods, candied fruits, wax matches, chemicals, linen, rope, lace, and machines, and there is

an extensive traffic in the produce of the district, and in the transit trade between Paris and the south of France. There are several mineral springs in the town, of which the iron spring of St Alyre (65° F.) has formed by deposits in the course of ages two natural bridges. The bishopric of Clermont was founded in 253; and seven ecclesiastical councils were held here during the middle ages, the most remarkable of which was that in 1095, at which the first Crusade was instituted by Urban II. A statue has been erected to Pascal, who, as well as Gregory of Tours, was a native of Clermont. Pop. (1872) 32,963; (1921) 82,577.—(3) CLERMONT L'HÉRAULT, 33 miles W. of Montpellier by rail, with manufactures of leather and of cloth for the army. Pop. 5000.

**Clevedon**, a pleasant Somersetshire watering-place, on the Bristol Channel, 12 miles by road but 16 by rail WSW. of Bristol. The historian Hallam, and Arthur, his son, lie in the old parish church; Coleridge lived a while here at Myrtle Cottage (1795); and Clevedon Court (much damaged by fire in 1882) is the 'Castlewood' of Thackeray's *Esmond*. Pop. 7000.

**Cleveite**. See ARGON.

**Cleveland**, a wild mountainous district, with some picturesque fertile valleys, forming the east part of the N. Riding of Yorkshire between Whitby and the Tees. In the south the hills rise 1300 to 1850 feet. An extraordinary change has been wrought in the aspect of the country by a rich discovery of ironstone in the Cleveland hills; since 1851, lonely hamlets have become populous towns. The ironstone is chiefly an argillaceous carbonate, inferior to that of the Coal Measures. See MIDDLESBROUGH, IRON. The title of Duchess of Cleveland was conferred in 1670 by Charles II. (q.v.) on his mistress, Barbara Villiers, and her eldest son (Fitzroy) was first duke. In 1827 the marquise of Cleveland was bestowed on William Harry Vane, Earl of Darlington (whose grandfather married a descendant of the first duke); in 1833 he became duke—a title extinct since 1891.

**Cleveland**, the county seat of Cuyahoga county, Ohio, is the largest city of the state in population and general importance, and the fifth, in 1920, in the United States; it is situated at the mouth of the Cuyahoga River, on the south shore of Lake Erie, 255 miles by rail NE. of Cincinnati, 133 SW. of Buffalo, and 350 E. of Chicago. The city is built mainly upon a plain from 60 to 150 feet above the lake, and is divided into two great divisions, the east and west sides, by the tortuous valley of the Cuyahoga. The 'flats,' about half a mile wide, along the river are occupied by vast lumber-yards, numerous factories, iron, flour, and other mills, coal-yards, ore docks, ship-yards, &c. A wide and massive viaduct, 3211 feet long, constructed mainly of stone (1878), crosses the valley at the height of 50 to 70 feet; and another viaduct of iron (1888), 100 feet above the river and 3931 feet long, makes a second broad level highway between the two divisions of the city. Several other viaducts have since been built. The river forms the inner harbour, and is spanned by numerous bridges. An outer harbour in the lake, safe and commodious, is enclosed by an immense United States breakwater, over 5 miles long and half a mile from the shore, with a large opening for vessels opposite the mouth of the river. A pier on the lake-front saves passenger steamers the necessity of passing under the bridges. Cleveland has a fine city-hall, a court-house, post-office, and other public buildings. The business centre extends east from the lower part of the river-valley, along Superior Street, which is 132 feet wide, and is the chief shopping thoroughfare. It embraces

several parallel and intersecting streets. The Public Square (10 acres in area) is adorned with monuments, fountains, and the fine old 'Stone' (first Presbyterial) Church, a theatre, an hotel, banks, and many business blocks. This attractive breathing-spot contains fountains, a stone speakers' stand for public meetings, and a statue of Commodore Perry, the hero of the battle of Lake Erie in 1813. From the south-east corner of the square, Euclid Avenue, the most famous street in the city, and, according to Bayard Taylor and other travellers, the most beautiful in the world, extends nearly east through the best residence quarter of Cleveland, though business is encroaching upon it. Four and a half miles from the square it passes Wade Park, a beautiful tract of about 65 acres, containing a lake for boating, a deer paddock, fountains, groves of noble forest-trees, and the Museum of Art (1913-16).

A mile farther east is Lake View Cemetery, one of the finest in the country. Here, on a commanding site, 250 feet above Lake Erie, stands the stone monument, 125 feet high, over President Garfield's grave. Euclid Avenue is lined with stately mansions upon a gentle eminence, 200 to 500 feet from the Avenue, in a park-like stretch of shade-trees, smooth lawns, flowers, shrubbery, and winding walks and drive-ways. The same wealth of gardens and shade-trees is noticeable in a less degree throughout the 'Forest City,' except in the poorest quarters. Few houses are built in blocks, and tenements are virtually unknown. A great proportion of the families own the houses in which they live. The area of the city is 57 sq. m. The greater part of this area lies east of the river. The soil is light and sandy, the drainage excellent, and the water supplied from Lake Erie by tunnels is pure and abundant. The climate is temperate, the average yearly rainfall being 37.6 inches, and the mean annual temperature 50° F. Naturally the death-rate is low. Cleveland has a music-hall capable of seating 5000 persons, several fine theatres and others of less importance, hundreds of churches, the Western Reserve University, colleges, hospitals, asylums, and other benevolent institutions. There are two large circulating libraries, one, containing over 200,000 volumes, being free. Schools are numerous, and many periodicals are published in the city. Cleveland's rapid growth is due mainly to the fact that nowhere else can the rich iron ores of Lake Superior, the coal of northern Ohio, and the limestone of the Lake Erie islands be brought together so cheaply. The chief industries of the city are the various manufactures of iron, including steel rails, forgings, wire, bridges, steel and iron ships, engines, boilers, nails, screws, sewing-machines, motor-cars, agricultural implements and machinery of all kinds, the refining of petroleum, pork-packing, wood-work, and other manufactures of endless variety. In ship-building it takes a leading place among American cities. There are many natural gas-wells in the western outskirts. The city has a commanding commercial situation, due, primarily, to its position at the north terminus of the Ohio Canal, connecting Lake Erie with the Ohio River, at the mouth of the Scioto. The start obtained when the canal was opened in 1834 has been maintained. Seven railroads terminate in the city, and two pass through it from east to west. Cleveland's lake commerce is very great, and the bulk of it is coal and iron. Lumber and grain are also important receipts, and it is the largest fresh-fish market in America. In 1796 a party under General Moses Cleveland laid out the site of a town where Cleveland now stands, and in 1830 the population of the town was 1076. In 1836 the city of Cleveland was incorporated. Since then its growth has been very

rapid. In 1840 the Federal census showed a population of 6071; (1850) 17,034; (1860) 43,417; (1870) 92,829; (1880) 160,146; (1900) 381,768; (1910) 560,663; and (1920) 796,841.

**Cleveland**, or CLEVELAND, JOHN, cavalier poet, born at Loughborough in June 1613, the son of a clergyman ousted by the parliament from the living of Hinckley in 1644. In 1627-31 he was at Christ's College, Cambridge, and then migrated to St John's College, where he was elected to a fellowship in 1634, and lived nine years 'the delight and ornament of St John's society.' Here he studied both law and physic. Cleveland vigorously opposed Cromwell's election to the Long Parliament for Cambridge, and was for his loyalty ejected from his fellowship by the parliament in 1644. He betook himself to the king's army, was popular among the cavaliers, and was appointed 'judge-advocate' at Newark, but was obliged to surrender with the garrison. His indignation at the Scottish army for handing over the king to the parliamentarians he expressed in some stinging verses, which, however, are too violent to be really strong. Henceforward Cleveland lived upon the hospitality of his partisans, and was forced to keep his wit in check. In 1655 he was arrested at Norwich, but was soon released by command of Cromwell, whose magnanimous spirit could admire the courageous manliness of the poor poet's letter addressed to him. In 1656 he published a small volume containing thirty-six loyal poems, consisting of elegies upon Charles I., Strafford, Laud, and Edward King, the subject of Milton's *Lycidas*, also some stinging satires. Cleveland now went to live at Gray's Inn, where he soon after died, 29th April 1658. In the year 1677 was published, with a short account of the author's life, *Clevelandi Vindiciæ, or Cleveland's Genuine Poems, Orations, Epistles, &c.*, and in 1910 an edition by Berdan. Cleveland undoubtedly exercised a strong influence upon the greater genius of Butler. Thomas Fuller commends him as 'a general artist, pure latinist, exquisite orator, and eminent poet. His epithets were pregnant with metaphysics, carrying in them a difficult plainness, difficult at the hearing, plain at the considering thereof.' See Saintsbury, *Caroline Poets*, vol. iii.

**Cleveland**, STEPHEN GROVER, the twenty-second and twenty-fourth president of the United States, was born at Caldwell, Essex County, New Jersey, 18th March 1837, the son of a Presbyterian minister. In 1859 he was admitted to the bar in New York State, whither he had removed, and began the practice of law at Buffalo. From 1863 to 1866 he was assistant district attorney for Erie county, and in 1870 was chosen sheriff. After filling the office of mayor of Buffalo, he was, in 1882, elected governor of New York by an unexampled majority of more than 190,000 votes. His course as governor was approved by the best people of all parties. In 1884 he was nominated by the Democrats for the chief-magistracy of the United States. The canvass which followed was one of extreme earnestness and excitement. Cleveland received 219 electoral votes (Blaine, the Republican candidate, securing 182); and the returns of the popular vote also gave him a plurality. He took his seat as president in 1885. In a unique and forcible message to congress in December 1887 regarding the reduction of the great surplus in the national treasury, he strongly advised a careful readjustment of the tariff charges on certain manufactured articles of import, and the admission duty-free of some of the raw materials of manufactures—a position which led to a well-defined issue between the two political parties. Protectionists classed the president's message as a free-trade document, but

this was denied by the Democrats, and its doctrines were adopted as the basis of the Democratic platform at the convention of that party in 1888, when Cleveland was unanimously nominated for re-election to the presidency. In the following August, on the rejection of the proposed Fisheries Treaty with Canada by the Republican majority in the senate, the president sent a message to congress, declaring a policy of 'retaliation' against Canada now necessary. In October he demanded the recall of Lord Sackville, the British minister, for writing a letter held to trench on American politics. At the election in November, Cleveland was defeated by the Republican candidate, General Harrison, over whom, however, he secured a large majority in November 1892. His next term of office was signalled by his zeal for currency reform, for the repeal of the Silver Act, and against the high republican tariff schemes, and by a sudden intervention in the dispute between Britain and Venezuela (q.v.) by a message to congress (December 1895), which for a time threatened to cause war between Britain and the United States. In March 1897 he made way for President McKinlay (q.v.). He died 24th June 1908. See Life by Dr Robert McElroy (1923).

**Cleves** (Ger. *Kleve*, Dutch *Kleeft*), a town of Rheinland, 48 miles NW. of Dusseldorf. It is situated on three gentle elevations, about 2½ miles from the Rhine, with which it communicates by canal, in the midst of a rich and beautiful country. It is well built, in the Dutch fashion, and surrounded by walls. The fine old castle, known as the Schwanenburg, partly built on a commanding rock, is the reputed scene of the legend of the Knight of the Swan, made familiar by Wagner's opera of *Lohengrin*. Anne of Cleves, fourth wife of Henry VIII., was born in this castle. In the collegiate church, which dates from the 14th century, are some good monuments to the counts and dukes of Cleves. Cleves has manufactures of cotton and leather goods, tobacco, &c. Population, 20,000. Cleves was the capital of a duchy (a countship until 1416) extending along both banks of the Rhine, which passed by inheritance in 1609 to Brandenburg.

**Cleves**, ANNE OF (1515-57), daughter of John, Duke of Cleves, became in 1540 fourth wife of Henry VIII. of England by the policy of Thomas Cromwell. The king, disappointed in her looks, had the marriage declared null and void six months afterwards. Anne tamely acquiesced, and continued to live in England. See Hume, *Wives of Henry VIII.* (1905).

**Clew Bay**, an inlet of the Atlantic, on the west coast of County Mayo, Ireland, about 15 miles long by 9 broad. The upper part of the bay contains an archipelago of fertile and cultivated islets; and at the entrance of the bay is Clare Island (3949 acres), which, as well as Inishgort (27 acres), has a lighthouse.

**Cliché** (Fr.), the impression made by a die in any soft metal. It is the proof of a medallist's or die-sinker's work, by which they judge of the effect, and ascertain the stage of progress which they have reached before the die is hardened. The same term is applied by the French and others to electrotypes casts from wood-engravings.

**Clichy**, a town of France, on the Seine, to the north-west of Paris, of which it forms a suburb. It has numerous manufactories, especially of chemicals and catgut, and is much affected by washerwomen. Pop. 50,000.

**Click-beetle**, or SKIP-JACK. See WIRE-WORMS.

**Client**. See AGENT AND CLIENT, PATRON.

**Cliff-dwellers**. See AMERICA (*Antiquities*).

**Clifford**, a family descended from Walter, Richard Fitzpounce's son, who by marriage, prior to 1138, acquired Clifford Castle on the Wye, 17 miles W. of Hereford, and who assumed the surname Clifford. He was the father of Fair Rosamond, Henry II.'s mistress, who seems to have died about 1176, and to have been buried at Godstow Nunnery, near Oxford. The legend of her murder by Queen Eleanor appears first in the 14th century; the Woodstock maze, the clue, the dagger, and the poisoned bowl belong to a yet later age. Among Walter's descendants were the soldier-judge Roger de Clifford, who by marriage with Isabella de Vipont got Brougham Castle in Westmorland (circa 1270); John (1435-61), the savage Lancastrian; Henry (1455-1523), the 'shepherd lord'; Henry (1493-1542), fifteenth Lord Clifford and first Earl of Cumberland; George, third earl (1558-1605), naval commander; and Henry, fifth and last earl (1591-1643). Of a cadet branch was Thomas Clifford (1630-73), a Catholic member of the Cabal, in 1672 created Lord Clifford of Chudleigh.

**Clifford, JOHN** (1836-1923), Baptist minister and Liberal politician, was born at Sawley, near Derby. In 1858-1915 he was pastor of a charge in Paddington; in 1905-11 president of the Baptist World Alliance. See his *Life, Letters, and Reminiscences* by Sir James Marchant (1924).

**Clifford, WILLIAM KINGDON, F.R.S.**, one of the foremost mathematicians of his time, was born at Exeter, 4th May 1845. He was educated at a school in his native town, at King's College, London, and at Trinity College, Cambridge. While at Trinity he read largely in the great mathematical writers, and came out second wrangler in 1867, next year being elected a fellow of his college. At this time, while excelling in gymnastics, he would also solve and propound problems in the pages of the *Educational Times*, and could discuss with ease complicated theorems of solid geometry without the aid of paper or diagram. A High-Churchman at first (though on unconventional speculative grounds), Clifford soon after taking his degree threw off all dogmatic restraints, and discussed the fundamental questions of the philosophy of religion with complete independence. In August 1871 he was elected to the chair of Mathematics and Mechanics at University College, London, which post he retained until his untimely death at Madeira, March 3, 1879. Clifford first established his reputation as an original thinker with the faculty of expressing scientific thought in plain and simple language by a Friday evening discourse at the Royal Institution, *On Some of the Conditions of Mental Development*. He was a valued member of the London Mathematical Society, contributing to the *Proceedings*; for a time he acted as secretary, and afterwards vice-president of the Mathematical and Physical section of the British Association; he also lectured to the Sunday Lecture Society on various physical and philosophical subjects. The versatility of his mind for philosophical and scientific discussion was further shown by his varied contributions to periodical literature. Clifford issued in his lifetime the first part of *Elements of Dynamics* (1878). A further portion, edited by Mr R. Tucker, was published in 1887. A work on the *Common Sense of the Exact Sciences*, which Clifford left unfinished, was completed and edited by Professor Karl Pearson in 1885. A selection from his *Mathematical Papers* appeared in 1881, and a series of lectures on *Seeing and Thinking* in 1879. Clifford's general scientific and philosophical writings are collected, with a prefatory memoir, in *Lectures and Essays*, edited by L. Stephen and F. Pollock (1879; 2d ed. 1886).—**MRS CLIFFORD (LUCY LANE)** published a really

striking novel, *Mrs Keith's Crime* (1885); *Aunt Anne* (1892); two books for young children of quite unusual interest, *Anyhow Stories* and *Very Short Stories and Verses for Children* (1886); and plays.

**Cliff-swallow** (Petrochelidon). See SWALLOW.

**Clifton**. See BRISTOL.

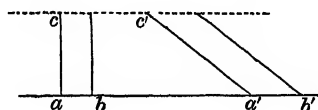

**Clifton**, Ontario. See NIAGARA FALLS.

**Clifton**, (1) a city of New Jersey, in Passaic county, 13 miles NW. of New York; pop. 26,000.

—(2) A copper-mining town of Arizona, 100 miles NW. of Deming, New Mexico; pop. 4000.

**Climacteric Years** (from Gr. *klimaktēr*, 'the step of a stair or ladder,' *klimax*). It was long believed that certain years in the life of man had a peculiar significance to him, and were the critical points, as it were, of his health and fortunes. The mystical number 7 and its multiples with odd numbers (e.g. 35, 49) constituted crises of this kind. The most important of all was the 63d year, called, by way of eminence, the 'climacteric year' or 'grand climacter,' which was supposed to be fatal to most men; its influence being attributed to the fact that it is the multiple of the two mystical numbers 7 and 9. An actual 'change of life' (Fr. *âge critique*) in woman is marked by the cessation of menstruation, usually between the 48th and 52d years. Astrologers called any period which an evil conjunction marked as threatening, a *climacteric time*.

**Climate** (from the Greek *klima*, 'a slope or inclination,' afterwards applied to a tract of country, with reference to its supposed inclination to the pole, and the effect of the obliquity of the sun's rays upon the temperature), a term now employed as including not merely the conditions of a place or country with regard to temperature, but also its meteorological conditions generally, in so far as these exercise an influence on the animal and vegetable kingdoms. The effect of the sun's rays is greatest where they fall perpendicularly on the surface of the earth, and diminishes as their obliquity increases; the surface which receives any given amount of the sun's rays increasing with their increased obliquity, as  $a'b'$  is greater than  $ab$  in the annexed figure; whilst

at the same time the oblique rays being subjected to the influence of a greater number of particles of the atmosphere, as  $c'a'$  is longer than  $ca$ , a greater amount of their heat is absorbed before they reach the surface of the earth at all. The greater or smaller extent of surface receiving a certain amount of heat, also makes important differences to arise from *exposure* by slope towards the equator or towards the nearest pole. *Elevation* is a most important cause of differences of climate. As we ascend from the level of the sea to the greatest mountain altitudes, the temperature gradually diminishes, and we ultimately reach a region of perpetual snow, as in approaching the poles. The progressive diminution of the temperature is, however, affected by many causes, so that the line of perpetual snow is far from being at the same elevation in all places of the same latitude. Thus the snow-line on the southern side of the Himalayas is depressed by the heavy rainfall brought by the winds from the Indian Ocean; and that on the northern side is elevated by the extreme drought and summer heat in the vast

tablelands of Central Asia, thus causing active evaporation from the snow-fields; so that the difference between the two is not less than 4000 feet in favour of the northern side of the mountain-ranges; and Humboldt says, 'millions of men of Tibetan origin occupy populous towns in a country where fields and towns would, during the whole year, have been buried in snow, if these tablelands had been less continuous and less extensive.'

As the actual temperature of the atmosphere depends not so much upon the direct rays of the sun as upon the radiation from the heated surface of the earth, the diversities in the character of that surface are productive of great effects in modifying climate. A sandy desert, a tract of country clothed with luxuriant vegetation, and an expanse of water, absorb and radiate heat in very different degrees. A newly ploughed field both absorbs and radiates heat much more rapidly than a field covered with grass. A sandy desert heats the atmosphere above it much more than either a fertile tract or a watery expanse, whilst a watery expanse only slightly raises the temperature; but, on the other hand, the desert cools sooner by terrestrial radiation; whilst the heat absorbed by the water being diffused through a larger mass, owing to the depth to which solar radiation penetrates and to vertical as well as horizontal currents generated by the winds to great depths, the influence of the ocean, of seas, and of great lakes, is very powerful in maintaining a greater equableness in the temperature of the air. Thus maritime places, and particularly islands and peninsulas, have a more equal temperature, with less diversity of the extremes of summer and winter, than more inland or continental places otherwise similarly situated. The effect of the sea is modified by many circumstances, and particularly by currents, of which the Gulf Stream (q.v.) affords a notable instance, the heated water conveyed by it and by the general surface-flow north-eastwards of the waters of the Atlantic, from the equatorial to the polar regions, having a great influence on the climate, particularly of the north-west of Europe. Over the world generally, atmospheric currents or prevailing winds must be regarded as exercising even a greater influence on climate than oceanic currents. The quantity of rain or snow that falls in the course of a year, and the times and manner of its falling, are circumstances which have the greatest possible effect on climate; these being in their turn much influenced by the distribution of land and water, and by the character and elevation of the surface of the land, according as the mountain-ranges lie across or in the line of the rain-bringing wind.

The relations of climate to vegetation are generally determined less by the mean annual temperature than by the relative duration of summer and of winter. Thus maize, which may be mentioned as an important example, succeeds well in climates of which the winter-cold is severe, the summer season alone being sufficient for its whole life; whilst, on the other hand, such plants as fuchsias, some kinds of laurel, and even the common hawthorn, which succeed well enough where maize would scarcely put forth an ear, would perish from the colder winters of countries where it is profitably cultivated. The polar limit of particular species of animals, except those which hibernate, is generally determined by the degree of winter-cold which they can bear without injury.

Bogs and marshes exercise an unfavourable influence on climate, cooling the air and generating fogs, as do clay-soils also to some extent, through their retentiveness of moisture; whilst marshes of some kinds, and in some situations, abound in malarious and other exhalations very unfavourable to health. Similar remarks apply to large tracts of forest.

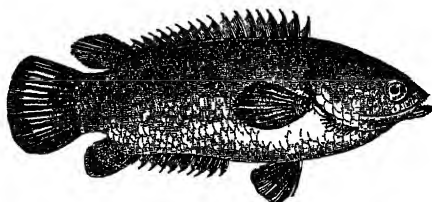

The clearing, drainage, and cultivation of land have generally favourable effects on climate; although plantations are often beneficial for shelter, and a too complete removal of natural forests may prevent the deposition of moisture from the atmosphere to such a degree as to cause droughts, a result stated to be exemplified in some of the smaller West India Islands, and the tendency to which is said to be manifested on a great scale in some sections of the continent of North America.

The important and difficult subject of climate will be found further elucidated in some of the principal geographical articles (ASIA, &c.), and in the articles ATMOSPHERE, GEOGRAPHICAL DISTRIBUTION, GLACIAL PERIOD, HAIL, HEALTH RESORTS, HYGROMETER, ICE, METEOROLOGY, MONSOONS, PLEISTOCENE, RAIN, SEASONS, SNOW-LINE, STORMS, TEMPERATURE, WEATHER, WIND. See also the great *Handbook of Climatology* by Julius Hann (3d ed. 1909-11; trans. 1903-4). Medical Climatology is an important subject of research, and of it the literature of health resorts represents a subsection, as illustrated by *The Climates and Baths of Great Britain* (2 vols. 1895-1902). Changes of climate seem to be responsible for grave national and political changes; the desiccation of Asia (q.v.) may have caused the great migrations of the early Christian centuries.

**Climax** (Gr., 'a stair'), in Rhetoric, that artifice which consists in placing before the mind of the reader or hearer a series of propositions or objects so arranged that the least forcible strikes it first, and the others rise by successive gradations in impressiveness. See the example in 1 Sam. iv. 17.

**Climbing.** See ALPINE CLIMBING.

**Climbing Perch** (*Anabas scandens*), a bony fish in the Acanthopteri division, famous for its peculiar clambering habits. It is a native of rivers and ponds in most parts of the East Indies. It is about six inches long, and in general form somewhat resembles a perch. That this fish climbs trees, has been asserted by observers whose veracity and accuracy cannot easily be questioned; yet others, who have enjoyed ample opportunity of observation, express great doubt concerning this habit. According to circumstantial accounts, the fish suspends itself by its spiny gill-covers, and by fixing its anal fin in cavities of the bark, urges its way upwards by distending and contracting its body. There is no doubt that it often leaves pools when they are in danger of being dried up, and travels in search of water. Though these fish are sometimes

Climbing Perch.

compelled in their distress to travel by day, and have been met in the glare of noon toiling along a dusty road, their migrations are generally performed at night or in early morning, whilst the grass is still wet with dew. This restless fish is aided in its peregrinations out of water by an accessory labyrinthine respiratory cavity, in which water may be retained for a considerable time. Climbing perches are plentiful in the Ganges, and the boatmen have been known to keep them for five or six days in an earthen pot without water, using

daily what they wanted, and finding them as lively as when just caught. Some related forms, such as the walking fish (*Ophiocephalus*), exhibit to a less marked degree the same power of living out of water. Closely related also is the Chinese Macropod, not unfrequently kept for its beauty in aquaria. Many of the genera make nests for the eggs, over which the males frequently keep guard.

**Climbing Plants**, or CLIMBERS, are, in the most extensive and popular sense of the term, those plants which, having weak stems, seek support from other objects, chiefly from other plants, in order to ascend from the ground. This, however, is accomplished in very different ways. Some climb by means of small root-like processes growing from the stem, as the ivy; others by means of hooks (e.g. Cleavers, q.v.); others again twining round their support—e.g. hop, convolvulus, &c.; and others, the most evolved, by help of sensitive organs, which are branches or leaves or leaf-stalks more or less modified. The subject of climbing plants has been worked out with peculiar fullness and interest in Darwin's classical monograph. See also in this work the section of the article PLANTS on the movements of plants; also the articles on CLEMATIS, CONVULVULUS, HONEYSUCKLE, HOPS, IVY, LIANAS, PASSIONFLOWER, VINE, &c.

**Clinical Medicine** (Gr *klinē*, 'a bed') is that department of the art which is occupied with the investigation of diseases at the bedside of the sick; and a clinical lecture is one delivered to students there. So with clinical surgery. Clinical baptism is baptism administered to sick or dying persons on their sick-bed; a clinical convert is one converted on his death-bed.

**Clinker**, the name given to the scales or globules of black oxide of iron, obtained from red-hot iron under the blows of a hammer. The same term is applied to the slags of iron-furnaces. By geologists the cindery-like masses which form the crust of some lava-flows are termed clinkers.

**Clinker-built**, or CLENCHE-BUILT. See BOAT.

**Clinkstone**, or PHONOLITE, is a greenish gray or brownish compact or very finely crystalline igneous rock, remarkable for its tendency to split into slabs, which are now and then thin enough to be used for roofing purposes. This structure is due to the parallel arrangement of plate-like or tabular crystals of sanidine felspar. The slabs give a metallic ring or 'clink' when struck with a hammer, whence its name. Its essential mineral components are sanidine and nepheline, but other minerals, such as angite or hornblende, leucite and magnetite, are usually present. The rock has often a porphyritic structure.

**Clinometer**, an instrument for the purpose of taking the amount of dip or angle of inclination of a stratum. There are various kinds in use, but the simplest consists of a strip of wood upon which is mounted a graduated arc with a pendulum. When this instrument is held horizontally, the pendulum points to zero; when it is held in a slanting position, the pendulum shows the number of degrees that the upper edge or the base of the strip deviates from horizontality. The most useful form of clinometer is that which is combined with a compass—both these instruments being required in geological observations.

**Clinton**, (1) capital of Clinton county, Iowa, on the Mississippi, which is here crossed by an iron railroad bridge, 4000 feet long, 60 miles SSE. of Dubuque by rail. It has numerous mills, foundries, and factories, and a trade in lumber and grain. Pop. 24,000.—(2) A city of Illinois, 22 miles S. of Bloomington, with iron industries; pop. 6000.—(3) A town of Massachusetts, on the Nashua River.

35 miles W. of Boston by rail. It has large manufactures of gingham and plaids, carpets, combs, and machinery. Pop. 13,000.—(4) The capital of Henry county, Missouri, about 90 miles W. from Jefferson City; pop. 5000.—(5) A village of Oneida county, New York, 9 miles WSW. of Utica, the seat of Hamilton College (1812; Presbyterian).

**Clinton**, a distinguished American family, descended from Charles Clinton, who was born in Ireland in 1690, settled in New York state in 1731, and died there in 1773.—His third son, JAMES, born in 1736, served with distinction against the French, and as brigadier-general took part in several operations during the War of Independence. He died in 1812.—The fourth son, GEORGE, born in 1739, studied law, and from 1768 sat in the New York assembly; in 1775 he was sent as a delegate to the second Continental Congress, and in 1776 he was appointed general of militia, serving against Sir Henry Clinton on the Hudson. In 1777 he was chosen first governor of New York, to which post he was re-elected from 1780 to 1795, and in 1801; and to him was due the first conception of the Erie Canal. In 1804 he was chosen vice-president of the United States, and in that office he died at Washington, 20th April 1812.—James's son, DE WITT, born in 1769, was admitted to the New York bar in 1788, and was private secretary to his uncle, then governor, from 1790 to 1795. He sat in the state legislature (1797) and in the state senate (1798–1802); and in 1802 he was elected to the United States senate, but resigned in the same year on being appointed mayor of New York by his uncle. In this office he continued, save for two short intervals, until 1815, holding other appointments at the same time; he was defeated by Madison in the presidential contest of 1812. It was he who pressed the adoption of the Erie Canal scheme; the bill was passed and Clinton elected governor of the state in 1817, and in 1825 he opened the canal. He was several times re-elected in spite of the untiring efforts of his political opponents, and died in office at Albany, 11th February 1828. He published a number of addresses, some literary and historical, which will be found in his Life by Campbell (1849).

**Clinton**, SIR HENRY, British general, born about 1738, was the son of the Hon. George Clinton, colonial governor of Newfoundland, and afterwards of New York. He first entered the New York militia, was gazetted to the Guards in 1751, served with conspicuous gallantry on the Continent, and was promoted colonel in 1762 and major-general in 1772. From 1772 to 1784 he sat in parliament in the interest of his cousin, the Duke of Newcastle. Sent to America in 1775, he fought at Bunker's Hill, and in 1776 was repulsed in an attack on Charleston, but was shortly afterwards knighted for his services under Howe. After Burgoyne's surrender in 1778, Clinton succeeded Howe as commander-in-chief of the forces in North America, which he at once concentrated in New York. In 1780 he captured Charleston and the entire southern army; but after Cornwallis' capitulation at Yorktown in 1781, Clinton resigned his command and returned to England, where in 1783 he published a *Narrative* of the campaign. In 1794 he was appointed governor of Gibraltar, and died there, 23d December 1795. His two sons both rose to be generals in the army and G.C.B.'s, the younger being one of Wellington's favourite officers.

**Clinton**, HENRY FYNES, a great classical scholar, was born January 14, 1781, at Gamston, in Nottinghamshire. He was educated at Southwell, Westminster, and Christ Church, Oxford, where he graduated B.A. in 1803. He represented Aldborough in parliament from 1806 till 1826. He

died at Welwyn, October 24, 1852. His great works on Greek and Roman chronology are unlikely ever to be superseded or forgotten. These are the *Fasti Hellenici* (1824-34), and *Fasti Romani* (1845-50).

**Clinton Group**, name given in North America to a subdivision of the Upper Silurian strata.

**Clio**, in Greek Mythology, the Muse of History and Epic Poetry. She was represented as sitting with a half-opened scroll in her hand, and a casket for holding manuscripts at her feet. See MUSES.

**Clio**, a genus of shell-less pelagic molluscs in the class of Pteropods. They occur in myriad swarms in northern (*C. borealis*) and southern (*C. australis*) seas, and along with such related forms as *Limacina* form the principal part of the food of some species of whales. The whalers rightly call it 'whales' food.' The whale has simply to swim through a shoal with its mouth open to engulf thousands. Clio is a small animal of a spindle-shape, towards an inch in length, with distinct head, bearing six tentacle-like processes, which are sensitive and glandular, and in part used for laying hold of the prey of small animals. It is active in habit, rising to the surface when calm, or as rapidly sinking again. It swims by means of two locomotor expansions of the 'foot.' See PTEROPODS.

**Clione**, a genus of boring sponges. See BORING ANIMALS.

**Clipper** is a sailing ship built expressly for speed, with very sharp lines and great spread of canvas. The Baltimore clippers in the California and the China trade were long famous, and, till superseded (after 1860) by steamers, the Aberdeen tea-clippers. In 1854 the *Lightning*, of Boston, did Boston to Liverpool, 2827 miles, in 13 days, and Melbourne to Liverpool, 12,190 miles, in 64 days. See Clark, *Clipper Ship Era* (1911).

**Clisthenes**, Athenian constitutional reformer, redistributed the people in ten tribes instead of four (510 B.C.), was ostracised by the aristocratic party of Isagoras, but recalled.

**Clitheroe**, a municipal borough in Lancashire, on the left bank of the Ribble, 35 miles N. of Manchester. It lies on a low eminence at the base of Pendle Hill, which is 1831 feet high. Clitheroe has cotton and paper mills, and extensive lime-quarries are wrought in the neighbourhood. Its ruined castle, founded by Robert de Lacy in the later part of the 12th century, was dismantled by the parliamentarians in 1649. The free grammar-school dates from 1554. About 4 miles south-west lies Stonyhurst College (q.v.). Clitheroe has been a borough since about 1280. Till 1832 it returned two members to parliament; till 1885, one. Pop. 12,000.

**Clive**, CAROLINE, novelist, was born in London, 24th June 1801, the daughter of Mr Meysey-Wigley, M.P. for Worcester. In 1840 she married the Rev. Archer Clive; and, for several years a great invalid, she died, through her dress catching fire, at Whitfield, Hereford, 13th July 1873. Between 1840 and 1872 she published eight volumes of poems by 'V.', but she is best known by *Paul Ferroll* (1855), a really strong sensation novel, much superior to *Why Paul Ferroll killed his Wife* (1860).

**Clive**, KITTY, comic actress, was born in London in 1711, the daughter of William Raftor, a Jacobite lawyer from Kilkenny. She came out at Drury Lane about 1728, and chiefly at Drury Lane she continued to play till 1769, when she quitted the stage, and retired to Twickenham. About 1731 she had married George Clive, a barrister, but they soon parted. She died at Little Strawberry Hill, 6th December 1785. Garrick, Handel, Horace Walpole, and Dr Johnson all liked her, the last

remarking to Boswell that 'in the sprightliness of humour he never had seen her equalled.' And of him she said: 'I love to sit by Dr Johnson; he always entertains me.' See her *Life* by Percy Fitzgerald (1888).

**Clive**, ROBERT, the creator of our Indian empire, was born at the manor-house of Styche, near Market-Drayton, 29th September 1725. He was the eldest of thirteen children; his father, a lawyer and small landowner, of a very old Shropshire family. The boy was brought up by an uncle near Eccles. There, and at all his four schools—Lostock, Market-Drayton, Merchant Taylors', and Hemel-Hempstead—he proved a much better fighter than scholar, a thorough young dare-devil; and in 1743 he was packed off to India as a writer in the service of 'John Company.' He reached Madras penniless, and the drudgery of his life there moved him to suicide. But the pistol snapped twice, and he flung it from him, exclaiming: 'It appears I am destined for something; I will live.'

The capture of Madras by the French (1746), Clive's escape thence to Fort St David (the scene of his gallant duel with the caid-sharper), his share in its defence, in the fruitless siege of Pondicherry (1748), and in the storming of Devikota (1749)—these events bring us up to the August of 1751, and Clive's daring dash upon Arcot. He seized it, and held its enormous citadel for eleven whole weeks against 7000 natives and 120 French soldiers. His own little force was reduced to 80 Englishmen and 120 sepoy (splendid fellows these); but, after a last desperate assault, the siege was raised (14th November), and Clive followed up his success by the victories of Ari and Kaveripak, and the capture of Kovilam and Chingalpat.

In February 1753 he married Margaret Maskelyne, sister to the astronomer, and immediately after sailed with her for England, where he was presented with a diamond-hilted sword, cleared his father's estate from encumbrances, stood for St Michaels, but was unseated, and otherwise got through a very fair fortune.

So in October 1755 he was back in India, and a twelvemonth later was summoned, with Admiral Watson, from Madras, to avenge the atrocity of the Black Hole. Calcutta was soon retaken; Chandernagore, the French settlement, captured; and at Plassey, on 23d June 1757, Clive's 3200 men (two-thirds of them sepoy) encountered Suraj ud Dowlah's 50,000 with 40 to 50 French gunneers. The battle took eight hours to win, that truly 'decisive battle of the world.' But its lustre was sullied by the only two blots on Clive's memory. In his dealings with Mir Jaffier, the would-be next nawab of Bengal, he had imposed on a go-between, the merchant Omichand, with a fictitious treaty, to which he had forged his colleague Watson's signature; and now from Mir Jaffier he accepted a present of upwards of £200,000. Both actions are defended by Malcolm, both sternly condemned by Macaulay and Malletson.

For three years sole ruler in all but name of Bengal, Clive, in 1760, with a fortune of more than £40,000 a year, returned to England, to be hailed by Pitt as 'a heaven-born general'; in India he was known as *Sabat Jung*, 'the daring in war.' In 1761 he entered parliament as member for Shrewsbury; in 1762 was raised to the Irish peerage as Baron Clive of Plassey; in 1764 was created a Knight of the Bath. But meanwhile in India the Company's affairs, through the dishonesty of its servants, high and low, had fallen into the utmost disorder; and Clive was the only man who could set them right. He arrived at Calcutta in May 1765, and at once applied himself wisely and firmly to reform the civil service and re-establish military discipline. This second governorship, lasting but

twenty-two months, marks the beginning of our Indian administration, as Plassey of our military supremacy.

Early in 1767 Clive quitted India, never to return; in all he had spent there less than a dozen years. This time he came back to England poorer than when he last left it; but this time he came back to encounter a storm of obloquy. The energy with which he had cleansed that Augean stable had raised up a host of influential enemies, who employed their influence to gratify their enmity, to stir up ill-feeling against him. His early proceedings in India were in 1772 made the subject of animadversion in parliament, and next year matter for the inquiry of a select committee. He was examined and cross-examined more like a sheep-stealer than the Baron of Plassey. Indignation at treatment so unmerited found vent at last in the exclamation: 'By heaven, Mr Chairman, at this moment I stand astonished at my own moderation.' The censure implied in the ultimate resolution was hardly wiped out by its rider, that he 'did at the same time render great and meritorious services to his country' (21st May 1773). Sickness, opium, mental depression—on 22d November 1774 Clive died by his own hand. He is buried in the church of Moreton Say, the parish that gave him birth.

Clive's eldest son, Edward (1754-1839), was governor of Madras 1798-1803, and in 1804 was made Earl of Powis, having in 1784 married the daughter of the last Herbert Earl of Powis.

See ABBOT, DUPLÉIX, INDIA; Sir John Malcolm's *Life of Clive* (3 vols. 1836), with Macaulay's essay thereon; two works by Malleon (1882 and 1893); *Lives* by Sir Charles Wilson (1890), Sir A. J. Arbutnot (1899), Sir George Forrest (1918); and Browning's *Dramatic Idylls* (2d series, 1880). For the conflicting accounts of the manner and place of Clive's death, whether by penknife, razor, pistol, or poison; whether at his mansion in Berkeley Square, or his Shropshire seat, Walcot Park, see Horace Walpole's *Letters to the Countess of Ossory* (i. 155); the *Gentleman's Magazine* for September 1848, p. 227; and several articles in *Notes and Queries* for 1888.

**Cloaca**, in Zoology, the technical name for the common terminal chamber into which the alimentary canal, the genital and the urinary ducts, all open. A cloacal chamber and aperture occurs in many fishes, in all amphibians, reptiles, and birds, and in the three lowest mammals. In all other mammals the urinogenital orifice is independent of the end of the alimentary canal or anus.

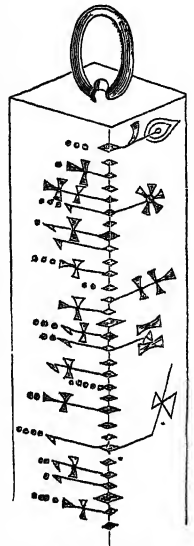

**Cloaca Maxima**, the most important of the sewers of ancient Rome, according to tradition, constructed by Tarquinius Priscus, or by Tarquinius Superbus, to drain off the stagnant waters of the Velabra, a swampy land between the Capitoline and Palatine hills on which the Forum and Circus Maximus also stood. Running from the valley of the Subura, under the Forum along the Velabrum, it opened into the Tiber in an archway still 11 feet wide by 12 feet high, consisting of three concentric arches, built of large blocks of peperino stone, fixed together without cement, of the uniform size of rather more than 5 feet 5 inches long and 3 feet high. The sewer was flushed by a continual stream of superfluous water from the aqueducts. Large portions of this and of the other cloacæ remain entire after two thousand years, but the greater part is buried, by the accumulation of soil, at a considerable depth below the present level of the streets. During the Republic, the surveillance of the Roman cloacæ was one of the duties performed by the censors. The *cloaca maxima* was repaired by Cato and his colleague in the censorship. Agrippa, when ædile, obtained praise for his exertions in cleansing and repairing the cloacæ, and is recorded to have passed through them in a boat. Under the empire, officers called *curatores cloa-*

*carum urbis* were appointed for their supervision. So thoroughly was the city undermined by these large sewers that Pliny calls it *urbs pensilis*, a city suspended in the air.—*Cloacina* ('The Purifier') was a surname of the goddess Venus at Rome.

**Clocks.** See HOROLOGY.

**Clodius.** See CICERO.

**Clog Almanac**, the name given in England to a primitive kind of calendar or almanac, called also a 'rim stock' and 'prime staff.' In Scandinavia it was called a 'Runic staff,' from the Runic characters used in its numerical notation. It was generally of wood (whence its name of 'clog'—i.e. log or block), of about 8 inches in length, but was sometimes of brass, of bone, or of horn. When of wood it was most commonly of box; but elm, fir, and oak were also employed. 'This almanac,' says Dr Plot, in his *Natural History of Staffordshire*, written in 1686, when it was still in use among the common people of that county, 'is usually a square piece of wood, containing three months on each of the four edges. The number of days in them are expressed by notches—the first day by a notch with a patulous stroke turned up from it, and every seventh by a large-sized notch. Some are perfect, containing the dominical letters as well as the prime and marks for the feasts, engraven upon them, and such are our prime staves in the Museum at Oxford: others imperfect, having only the prime and immovable feasts on them, and such are all those I met with in Staffordshire.' The marks on the left side, in the figure, indicate the golden numbers of a cycle showing the new moons throughout the year. On the right side against the 6th January is a star, the symbol of Epiphany; against the 13th St Hilary is shown by the bishop's double cross; 25th, conversion of St Paul, by an axe. The mark against the first notch (or New-year's Day) symbolises the Circumcision of our Lord. Christmas was marked by a horn, the sign of health-drinking—*notans cornua exharrienda*, as Dr Plot quotes. Examples of the clog almanac may be seen in the British Museum (one cut apparently towards the end of the 17th century); in the Ashmolean Museum and the Bodleian Library at Oxford; in St John's College, Cambridge; and in the Cheetham Library, at Manchester. It is described by the Swedish historian, Olaus Magnus, in the 16th century; and by the Danish antiquary, Olaus Wormius, in the 17th century. Some of the clog almanacs show a peculiar numerical notation. The first four digits are marked by dots; the fifth, by a sign like the Roman numeral V; the next four, by this sign and additional dots; and the tenth, by the sign +. See Chambers's *Book of Days*.

Clog Almanac for January.

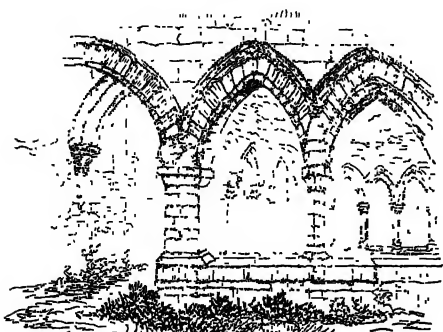

**Clogher**, a decayed episcopal city of County Tyrone, on the Blackwater, 15 miles SSE. of Omagh, with Protestant Episcopal and Roman Catholic bishops. The Protestant cathedral and Protestant Episcopal palace are handsome edifices; but, though formerly a parliamentary borough, the place is now a mere village. Pop. 200.

**Clogs** are a sort of shoes, the uppers of which are leather and the soles of wood (specially alder

wood); much used in the north of England and south-west of Scotland, especially in winter.

**Cloisonné.** See ENAMEL.

**Cloister** (Fr. *cloître*, *claustrum*, 'an enclosure'), a covered passage or ambulatory running round

Cloister, Kilconnell Abbey.

the walls of certain portions of monastic and collegiate buildings. The cloister usually surrounded or ran along three or four sides of a quadrangular area, which was called the *cloister garth*, generally situated on the south or sunny side of the church, as shown under CHURCH in the ground-plan of Durham cathedral. That of Salisbury, one of the finest in the kingdom, is 195 feet square. The roof of the cloister, which was often vaulted, was supported on the side next to the quadrangle by pillars and arches, which were frequently occupied by tracery. The upper portions of these arches above the mullions were often glazed; and sometimes latterly even the whole arches, so that they became a row of windows, as at Gloucester. Cloisters were used for exercise and recreation by the inmates of the religious houses. Occasionally, when wholly glazed, they had cells or stalls for study on the inner side; and very frequently a stone bench may still be seen, which runs along the same side. Many of the larger monasteries had more cloisters than one; and so characteristic were they of the religious houses, that the term cloister came to be used in a general sense for the whole establishment, which is still the sense of the word *kloster* in German. See MONASTERY.

**Clonakilty**, a seaport of County Cork, at the head of Clonakilty Bay, 33 miles SW. of Cork, with some trade in grain; pop. 3000.

**Clonard**, a village in Meath on the Boyne, in the 6th century the seat of a famous monastery where Finnian taught and Columba studied.

**Clones**, a town of County Monaghan, 94 miles NW. of Dublin by rail, with remains of an abbey and of a round tower; pop. 2400.

**Clonfert**, an ancient episcopal city of Ireland, is in the extreme east of County Galway. The bishopric was founded in the 6th century, and as an Anglican one was incorporated with Killaloe; but it is still the see of a Roman Catholic bishop.

**Clonmacnoise**, in King's County, on the Shannon and 10 miles south of Athlone, was the seat of a famous monastery founded by St Ciaran in 541, and still has impressive remains of its 'Seven Churches,' with a splendid Celtic cross and other memorials of the past.

**Clonmel**, a municipal borough in Tipperary and Waterford counties, on the Suir, 135 miles SW. of Dublin. It gave birth to Sterne and Lady Blessington, and was the chief scene of Smith O'Brien's attempted rising in 1848. Till 1885 it

sent a member to parliament. Here Bianconi (q.v.) first established his jaunting-cars; and Clonmel is still a great tourist centre. Pop. 10,000.

**Clontarf**, now part of Dublin city, is much frequented for sea-bathing. Here, in 1014, Brian Boru won a great victory over the Danes.

**Clootz**, JEAN BAPTISTE DU VAL DE GRÂCE, BARON, better known as Anacharsis Clootz, was perhaps the most singular of all the frothy enthusiasts brought to the surface of society by the French Revolution. He was born near Cleves in 1755, and from his eleventh year was educated in Paris. While still young he traversed Europe under the name of Anacharsis, lavishing his money to promote the union of all nations in one family. In the French Revolution he saw the fulfilment of his dreams. He constituted himself the 'orator of the human race,' and wearied out the National Assembly with his endless rant, at one time leading in a tatterdemalion regiment of strangers dressed in the costumes of different nations, at another raving at Christianity and preaching in screams the worship of Reason. He gave his vote for the king's death 'in the name of the human race.' With all its folly his enthusiasm was honest, and he was at once hated and feared by the jealous Robespierre, who had him excluded as a noble from the Jacobin Club, and at last involved him in St Just's impeachment of Hébert and his adherents. He was guillotined, March 23, 1794, preaching materialism to the last, and protesting against his sentence, as usual, 'in the name of the human race.' Of his books may be named: *Certitude des Preuves du Mohammédisme* (1780), *L'Orateur du Genre Humain* (1791), and *La République du Genre Humain* (1793). See Lives by Avenel (1865) and Stern (1915).

**Clopinel.** See MEUNG (JEAN DE).

**Close**, in England, specially the precincts of a cathedral. In Scotland the word means a narrow side-street, or a passage leading to a court, or to the stair of a block of tenements.

**Close Time**, the time during which game, certain wild birds, salmon, and some other fish may not be shot or caught, varies for the different animals and for different places. Lists of the dates may be found in such almanacs as Whitaker's; and see WILD-FOWL, SALMON, TROUT, &c.

**Closterseven.** See CUMBERLAND (DUKE OF).

**Closure** (formerly in the French form *clôture*), the name used for a power given in 1882 to the Speaker of the House of Commons, or chairman of committees, to close a debate when it seems to him that the subject has been discussed, and he is authorised to do so by a motion duly supported. For the rules of procedure, see PARLIAMENT.

**Clotaire I.** (*Hlothar*), son and successor of Clovis (q.v.), first king of the Franks in Gaul, reigned as sole king from 558 to 561.—CLOTAIRE II., a king of the same Merovingian dynasty, reigned over the Franks thirty years later. See FRANCE.

**Cloth.** See WOOLLEN MANUFACTURE.

**Clothes-moth.** See MOTH.

**Clotho**, one of the Fates (q.v.).

**Clotho**, a genus of spiders which spins a curious tent for itself and its young. See SPIDER.

**Clotilda**, St., born in 475, was the daughter of Chilperic, king of Burgundy, and in 493 became wife of Clovis, king of the Franks. She was the chief means of securing the conversion of her husband to Christianity, and largely influenced his life. After his death she lived a life of austerity at Tours, where she died in 545. She was canonised a few years after. Her remains were buried in the church of St Geneviève at Paris, and burnt

at the Revolution to prevent their desecration. See *Life* by Professor Kurth (Eng. trans. 1899).

**Cloudberry** (*Rubus Chamæmorus*), a plant related to the bramble, although of very different appearance, having a herbaceous single-flowered stem destitute of prickles. The plant is of humble growth, 8 to 10 inches in height; the leaves few, large, lobed, and kidney-shaped; the flower large and white; the fruit orange red, equal in size to a bramble-berry, and of an agreeable flavour. It is a native of the northern parts of Europe, Asia, and America. In Britain it is chiefly confined to elevated moors; in Norway and Sweden it is much more abundant, and the fruit is highly valued and made into excellent preserves.

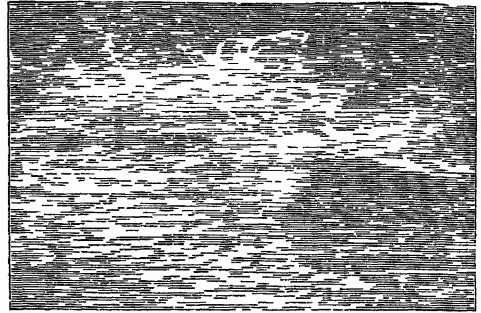

**Clouds** are masses of fog, consisting of minute particles of water, often in a frozen state, floating in the atmosphere. When air has its temperature lowered below the saturation point, either by ascending and becoming rarer, or by meeting a colder current, a portion of the vapour loses its gaseous form, and becomes condensed into minute specks of water. It was shown by Dr Aitken that this condensation always takes place round a small particle of dust. A cloud, therefore, does not consist of vapour, in the proper sense of the word, but of very small drops of water. How this water-dust is suspended in the atmosphere—why the particles do not descend as soon as formed, has never been thoroughly explained. Sir G. G. Stokes held that the rate of fall is rendered exceedingly slow by the friction and drag of the air-particles, just as fine powders remain suspended for a long time in liquids of much less specific gravity than themselves. Besides, as Sir J. Herschel says, ascending air-currents also oppose the fall of clouds, for the air may be ascending faster than the particles of the cloud are falling through it; while at night, in the absence of rising currents, clouds often descend to, and dissolve in lower and warmer levels. The conditions under which clouds are formed, and afterwards deposited in rain, are more fully considered under **EVAPORATION, DEW, RAIN, SNOW-LINE**. The present article is confined to a description of the various kinds of clouds and of the weather they indicate.

A general haze of precipitated vapour covering the sky, and coming down to the earth, is termed a *Fog* or *Mist*; and the term cloud is usually confined to masses of fog floating in the higher regions, and not descending to the ground. They are mostly within a mile of the earth's surface; and few are more than six miles above it. From observations made at Uppsala in Sweden, it has been found that there are three principal cloud layers: the low clouds at from 2000 to 6000 feet; middle clouds, 12,000 to 15,000 feet; and high clouds, 20,000 to 27,000 feet. These three layers are found at apparently much the same heights all over the earth. Clouds spread and move with the wind in varied, often grand forms; they are generally disposed in beds parallel to the earth's surface; vertical clouds occur rarely, if at all.

Luke Howard's classification of clouds, proposed in 1802, into three primary forms—*Cirrus* (Cir.), *Cumulus* (Cum.), and *Stratus* (Str.); three intermediate—*Cirro-cumulus* (Cir.-c.), *Cirro-stratus* (Cir.-s.), and *Cumulo-stratus* (Cum.-s.); and one compound form, *Nimbus* (Nim.)—has been universally adopted, and has been shown by the Hon. Ralph Abercromby and others to hold good in all climates and atmospheric conditions.

*Cirrus*, or curl cloud, consists of parallel, curling, flexuous, diverging, and partly straight fibres, increasing in any or in all directions by elongation, branching, or addition of new fibres. It is the

highest and least dense of clouds; varies most in extent, direction, and shape; retains longest its varied outlines; and is the longest illuminated after sunset and before sunrise. It has been compared to a mare's or cat's tail, a lock of hair, fine

Cirrus.

trellis-work, or thin silvery streaks, and it may cover all the sky. Threads and groups of Cir., during gentle wind after severe weather, presage serene settled weather. But after a long tract of fair days, whitish filaments or parallel bands of Cir. crossing the sky, with the ends converging by perspective in each horizon, foretell a change to wet; they move with the upper currents of the atmosphere, and generally indicate by this motion a change of wind long before it is felt on the earth's surface. Cir., being so high, consists of minute ice crystals, whose refractions and reflections produce the halos, coronæ, and mock suns and moons almost restricted to this cloud and its derivatives the Cir.-s. and Cir.-c. Cir., especially with fine tails, varying much in a few hours, presages rain or snow, and windy variable weather.

*Cumulus*, ball of cotton, day or summer cloud, consists of dense, convex, hemispherical, or conical heaps of small roundish clouds, piled or stacked on each other. The heaps enlarge upwards from a

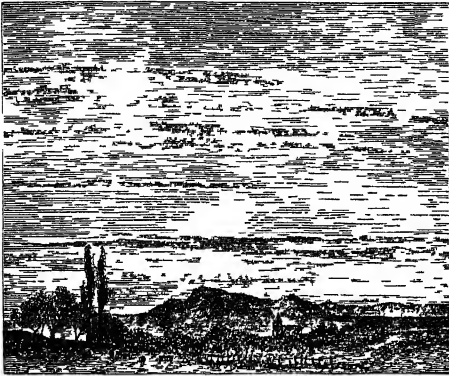

Cumulus.

horizontal base, and have rounded or rocky tops; they sometimes unite into stupendous white-topped mountains. It is formed by the condensation of vapour in local ascending columns of air, and is generally at from 4000 to 6000 feet elevation. Cumuli often begin after sunrise as a few scattered specks in the clear sky; these specks enlarge and unite to form clouds, which nearly cover the sky in the afternoon, and generally decrease and vanish about sunset; but rain follows if they increase in number and darkness in the evening. Cum., of

pleasing forms, dispositions, and colours, and of moderate size, presages fine dry warm and calm days; but cold, rain, and tempest follow dark, abrupt, dense, shaggy Cum., covering the sky, and rolling on each other. Hemispherical, silvery white Cum. presages thunder.

*Stratus*, fall or night-cloud, the lowest of clouds, is a widely extended, horizontal sheet, of varied thickness, seldom rising above 4000 feet, and often quite close to the earth's surface. It is common in

Stratus.

summer and autumn, often from sunset to sunrise, and is densest at or after midnight. It arises in calm clear evenings, after warm days, from the sinking and flattening out of Cum., from the cooling of moist air on damp ground, marshes, lakes, rivers, or from the cooling of moist air mixed with smoke enveloping great cities. From a height it is seen spreading around like a sea, and creeping up hillsides. After sunrise it rises higher, sometimes forming Cum., and sometimes entirely disappearing; but it may quietly accumulate in layers, and become Nim.

*Cirro-cumulus*, or sonder-cloud, consists of Cir. compressed into dense roundish-white cloudlets, or woolly irregular tufts, and is found either in the middle or high cloud layers. It forms the well-known mackerel sky, but is also often seen through breaks in lower clouds moving differently. It may vanish or pass into Cir. or Cir.-s. Solar and lunar coronæ appear in it. It occurs in warm dry weather and between summer showers, and presages increased heat. Cir.-c. very dense, round, and close, and with Cum.-s., presages a storm or thunder. In winter it precedes a thaw and warm wet weather.

*Cirro-stratus*, or vane-cloud, consists of long, thin, horizontal clouds, sometimes hairy, with bent or undulated edges. It is found on the advancing side of cyclonic storms, and hence is a sure prognostic of wind or rain. Being of great extent, but little depth, and at a great height, it is the most usual source of solar and lunar halos.

*Cumulo-stratus*, or twain-cloud, is a Cir.-s. mixed with Cum. heaps, or a wide flat base surmounted by a bulky Cum., with fleecy protuberances or rocky and mountain masses. It is much denser than Cum., though being formed by less rapidly ascending currents, the air is not dry enough to round off sharply its tops. It often forms vast banks of cloud, with overhanging masses. It is common towards night in dry windy weather, when it has a leaden hue. It generally arises from Cum. becoming denser, wider, and protruding in large irregular projections over the base. It tends to overspread the sky, and partly or wholly to become Nim., and fall in showers. Cum.-s. is intermediate

between clouds indicating fair and those indicating rough, rainy weather, and attends sudden atmospheric changes. Distinct Cum.-s. forms before thunder. Cum.-s. increases the grandeur of mountain scenery, and drops on and envelops mountain-tops like a curtain.

*Nimbus*, or Cumulo-cirro-stratus, the black rain-cloud, is a cloud, or mixed system of clouds, with rain or snow falling from it. It is a dense, continuous, horizontal black or gray sheet, with fringed edges, having rolling masses of Cum. above it and topped by Cir. Before rain, vast towering masses of Cum. often pass into Cum.-s., which, increasing in density, darkness, irregularity, and extent, become Nim. capped by Cir.-s. Thunderstorms are always accompanied by Nim. in its most perfect form.

The term *scud* has been applied to loose vapoury fragments of clouds driven by wind, and *cumulonous* to very shaggy cumuli.

The formation and height of clouds depend on the quantity of vapour in the air, the course and height of air-currents, the climate, season, temperature, disposition, and extent of sea and land, and the height of land. The highest clouds yet observed were Cir. at 46,000 feet elevation. Remarkable cloud-rings prevail over the calm zones of the equator, and over those of Cancer and Capricorn. The tops of mountains are often capped by clouds formed by the moisture in the air condensing as it is forced up and over the hill. Clouds, viewed from above in bright sunshine by the aeronaut or mountaineer, appear as dense volumes of steam or masses of white cotton.

Clouds moderate the sun's rays during day, and the earth's radiation during night. They always exhibit positive or negative electricity, but of greatest tension in thunderstorms. They are the carriers of the moisture required by plants; of the water of springs, lakes, and rivers; and of the polar, glacial, and winter snows, which cover temporarily or permanently parts of the earth.

In Britain, six or seven tenths of the sky is on an average daily obscured by clouds. There is most cloud in winter, and about mid-day, and least in May or June, and during night. Summer and autumn nights are freest of clouds. All the forms of clouds may be seen in one day, often very much commingled.

**Clough**, ARTHUR HUGH, poet, was born at Liverpool, January 1, 1819. His father, a cotton-merchant there, belonged to an old Denbighshire family. In the winter of 1822-23 he emigrated to Charleston, in South Carolina, and there the boy mostly lived in the midst of a home-life of singular happiness, until in November 1828 he was sent back to school at Chester, and to Rugby in the summer following. Dr Arnold had already been head-master for a year, and his high ideal of Christian duty early made a profound impression upon the boy. At Rugby he was foremost in athletic sports, edited for some time the school magazine, and not only worked his way to every honour open to him, but gained the warm affection of all his school-fellows. In November 1837 he entered Balliol College, Oxford, but astonished all who knew his powers by only obtaining a second-class in 1841. In the spring of the following year he was elected to a fellowship at Oriel. Clough's residence at Oxford had fallen at a time of fierce theological controversy, and his sensitive spiritual nature reflected all the unrest of the atmosphere around him. For a time he fell under the spell of Newman's influence, but this was soon followed by a period of severe inward struggle between his absolute honesty of mind and the religious prepossessions of his youth, the result of which was that he felt it his duty to withdraw in

1848 from Oriel. A little earlier he had published his first long poem, the *Bothie of Tober-na-Vuolich*, a 'Long Vacation pastoral' in hexameter verse. He spent some time in travelling in France and Italy, part of the time with Emerson, and was appointed on his return (October 1849) Warden of University Hall, London. His life here was far from congenial to him, but he found much help in the warm friendship of Carlyle. At Rome, in 1849, he had written his *Amours de Voyage*, and at Venice, during a holiday in 1850, he wrote *Dipsychus*. In 1852 he resigned his office, and sailed to America; but an examiner-ship in the Education Office soon recalled him to England. In June 1854 he married, and the remaining seven years of his life were spent in the calm peace of domestic happiness, free at once from the unrest of religious perplexity and the vexation of his earlier monetary liabilities undertaken for the sake of his father's business. In the spring of 1856 he was nominated secretary to the Commission for examining scientific military schools on the Continent, and the duties of this office carried him to France and to Vienna. But his health now began to give way, and he was advised by his physicians to travel. After visits to Greece, Constantinople, the Pyrenees, and Italy, he was carried off at Florence by paralysis succeeding a malarial fever, November 13, 1861.

Clough's poetry reflects with absolute sincerity all the spiritual unrest and conflict of his life, his passionate love of truth, and intense longing for reality. His few short lyrics are almost perfect in form and matter, but, as an artist in words, his best gift was perhaps his undeniable humour, which is of a rare and indeed exceptional quality. But his true significance is that pointed out with sure insight by Lowell: 'We have a foreboding that Clough, imperfect as he was in many respects, and dying before he had subdued his sensitive temperament to the sterner requirements of his art, will be thought a hundred years hence to have been the truest expression in verse of the moral and intellectual tendencies, the doubt and struggle towards settled convictions, of the period in which he lived.'

Clough is the subject of Matthew Arnold's elegy *Thyrsis*, one of the finest tributes of passionate admiration to the dead in the English language, almost worthy indeed to be compared with the *Lycidas* of Milton, the *Adonais* of Shelley, and the *In Memoriam* of Tennyson. No truer words have been spoken of Clough than these:

The music of his rustic flute  
Kept not for long its happy country tone;  
Lost it too soon, and learnt a stormy note  
Of men contention-tost, of men who groan,  
Which tasked his pipe too sore, and tired his throat.

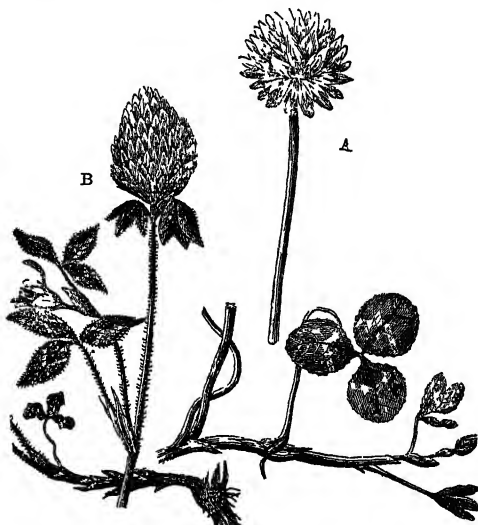

See Samuel Waddington's *Monograph* (1882), and a study by J. L. Osborne (1920). Clough's *Poems* were published in 1862, with a memoir by F. T. Palgrave; edited in 1910 by H. S. Milford, and in 1913 with an introduction by C. Whibley; his *Poems and Prose Remains*, edited by his wife, with an admirable short memoir, in 2 vols. in 1869.

**Clove Bark**, a name vaguely used for various aromatic drugs, some belonging to the clove, others to the cinnamon alliance. To the former class belongs the bark of *Eugenia caryophyllata* (see **CLOVES**); to the latter, the *Culilawan* (q.v.).

**Clovelly**, a coast village of north Devon, 11 miles WSW. of Bideford. From its rude little pier it climbs 400 feet upwards in a steep narrowcombe, white house rising over white house, and all nestling in flowers and greenery. Dickens describes it in *A Message from the Sea*.

**Clover**, or **TREFOIL** (*Trifolium*), a genus of Leguminosae containing a great number of species, natives chiefly of temperate climates, abounding

most of all in Europe, and some of them very important in agriculture as affording pasturage and fodder for live-stock. The name clover is popularly extended to a number of plants not included in the genus, but somewhat closely allied. See **MEDICK** and **MELLIOT**. The true clovers (*Trifolium*) have herbaceous, not twining, stems; roundish heads or oblong spikes of small flowers; the corolla remaining in a withered state till the ripening of the seed; the pod enclosed in the calyx and containing from one to four or occasionally up to six seeds. Twenty species are native to Britain, and several others are North American.—The most important to the farmer is Red Clover (*Trifolium pratense*), which is common in natural pastures and meadows throughout Europe. Red Clover is widely cultivated, as yielding a very large crop of palatable and nutritious forage, and as being adaptable to varying soil and climatic conditions. Two varieties are known in commerce, 'Ordinary' or 'Broad Red,' which is generally biennial in habit and early flowering; and 'Cowgrass' or 'Perennial Red Clover' (*Trifolium pratense perenne*), which is generally of longer duration, later flowering, hardier, and more drought-resisting. This plant was formerly reputed very noisome to witches, and knights and peasants wore a leaf of it as a potent charm against their arts. Zigzag Clover (*T. medium*) is sometimes mistaken for Red Clover, as the flowers are of similar colour. The stem, however, is bent in a zigzag manner at every node; the leaflets are narrower than in Red Clover, and the flowers are less densely crowded in the head. This plant is of little agricultural value,

A, White Clover (*Trifolium repens*).  
B, Red Clover (*Trifolium pratense*).

and its seed is not met with in commerce.—White or Dutch Clover is also a common native of Britain and of most parts of Europe and North America. The flowers are white or pinkish, borne on long flower-stalks which spring from the procumbent stem. White Clover is a valuable pasture plant, more particularly for the poorer classes of land. It is far less valuable for hay than either of the other species generally cultivated. Two varieties are recognised, viz. (1) Wild White, and (2) Cultivated White. The former is of smaller growth, but much harder and more lasting.—Alsike Clover (*T. hybridum*) is a perennial species introduced into England from Sweden in 1834, and has proved a valuable forage plant. While the yield is not equal

to that of the red species, it is hardier than the latter, and better suited to cold clay soils. Under suitable conditions it lasts up to four or five years. The flowers are white or pink.—Crimson or Italian Clover, frequently spoken of as 'Trifolium' (*T. incarnatum*), is an annual species with hairy, erect stems and rich crimson flowers. The species is tender, and cannot be grown successfully in the northern part of Britain. It is generally grown as a *catch-crop*, being sown on the stubbles in autumn, and fed off in time for another crop to be planted the following spring. A variety (*T. Molineri*) known as Moliner's Clover is native to Cornwall, and has shorter stems and pale, almost white, flowers.—Alexandrian or Egyptian Clover or Beers ( *T. Alexandrinum* ), a native of Egypt, is an annual, and is universally cultivated in its native country, where it is the principal fodder for cattle. It has oval heads of pale-yellow or whitish flowers.—Three small annual yellow species, which are generally confused with each other, and sometimes also with Black Medick (*Medicago lupulina*), occur in Britain, and are sometimes sown on poor and dry land, although their produce is very scanty. These are Yellow Suckling (*T. minus*), Slender Trefoil (*T. filiforme*), and Hop Clover or Hop Trefoil (*T. procumbens*).—None of the strictly native North American species have been much utilised as forage plants.

Clovers began to be widely introduced into field culture in Britain about two hundred years ago. They are now almost universally grown, either singly or in mixture with cultivated grasses in alternation with grain and root crops. Red Clover is frequently grown alone, while the other species more commonly form only part of the 'seeds' mixture. The varieties of Red Clover are the most valuable, but they require to be grown on fairly rich soils. Even on the latter frequent recurrence of the crop leads to 'clover-sickness' and the failure of the crop. Land should be thoroughly cleaned before the crop is sown; hence it usually follows the fallow or root-crop in rotation. It is almost invariably sown under a cereal 'nurse-crop,' although it may also be sown after harvest, at all events in the warmer districts. Clovers, like other leguminous plants, play a very important part in farm economy by restoring fertility. Their roots under normally suitable conditions develop nodules containing bacteria (*Bacterium radicicola*) which live in a condition of *symbiosis* with the plant, supplying it with nitrogenous substances derived from atmospheric nitrogen. Clovers, in the presence of these bacteria, which are present in most cultivated soils, are thus independent of nitrogenous manurial substances in the soil.

The caterpillars of a number of species of moth feed on the leaves of different kinds of clover; but the insects most injurious to the crop are weevils of the genera *Apion* and *Sitones*. See CLOVER-WEEVIL and WEEVIL.

**Clover-weevil**, a small black beetle of the genus *Apion*, which in larval and adult state infests clover and other leguminous plants. See WEEVIL.

**Cloves** (Lat. *clavus*, 'a nail') are the flower-buds of the Clove-tree (*Eugenia caryophyllata*). The genus to which this tree belongs is of the natural order Myrtaceæ; the tree is from 15 to 40 feet high, with a beautiful pyramidal head. The leaves are large, ovate-oblong, acuminate at each end, evergreen; the flowers are small, but produced in great profusion in cymes. Leaves, flowers, and bark have an aromatic odour. The ripe fruit resembles an olive in shape, but is not quite so large; it is of a dark-red colour; it sometimes appears in commerce in a dried state, under the curious name of *Mother Cloves*; it has an odour and flavour similar to cloves, but much weaker;

the broken fruit-stalks are sometimes also used for the same purposes as cloves; but the flower-buds themselves are the principal product of the tree. They are gathered, and are dried by exposure to the smoke of wood fires, and afterwards to the rays of the sun, or by the latter alone. When first gathered they are bright red, but become of a deep-brown colour. The unexpanded corolla forms a little round head at the end of the calyx tube,

Clove :

a, a branch with leaves, buds, and flowers; b, a bud.

which is about half an inch long, and thus the appearance is not unlike that of a little nail, whence the name. The clove-tree is a native of the Moluccas, and the Amboyna cloves were long esteemed the best; but the tree has been cultivated in Java, Sumatra, Réunion, Mauritius, Guiana, and the West Indies, and three-fourths of the entire crop of the world are now produced by Pemba alone, Zanzibar contributing most of the rest. The Dutch, in order to secure a monopoly and keep up the price, destroyed the trees in the other Molucca Islands in the 17th century, and confined the cultivation of them to Amboyna. In 1770 the French succeeded in introducing the plant into Réunion. Before the discovery of the Spice Islands Eastern merchants brought them from Arabia, Persia, and Egypt to the harbours of the Mediterranean, from which the Venetians and Genoese diffused them over Europe.

The Wild Clove-tree of the West Indies is *Pimenta acris*.

The properties of cloves depend chiefly on an essential oil, *Oil of Cloves*, which forms one-fifth or one-sixth of their whole weight. They are used for flavouring dessert dishes and articles of confectionery, also for driving moths from clothing, furs, &c., by placing them in the boxes or drawers with the clothing. They are also reputed to possess febrifuge properties. They have a hot taste and a characteristic odour. The oil of cloves is obtained by repeatedly distilling cloves with water, when two oils pass over, one of which is lighter and the other is heavier than water. The oil has a hot acrid taste, is of a light yellow when pure, and brown red when not so carefully prepared. It has a well-known odour, and is soluble in ether, alcohol, and the fixed oils. It is useful in medicine to check nausea and griping, caused by the administration of purgatives, and has consider-

able reputation as a cure for toothache. It is also employed in the scenting of soap, and by the distiller. *Tincture of Cloves* is obtained by treating cloves with alcohol for several days, and then straining, or by a solution of the oil of cloves in spirits of wine. It is added, in medicine, to stomachic, tonic, and purgative mixtures. Cloves are adulterated by adding to the fresh spice more or less of the buds from which the oil has been distilled, and which are thereby rendered practically worthless. The exhausted buds are made to appear fresh by rubbing them between the hands moistened with sweet oil, or otherwise varnishing them with a thin coating of oil.

**Clovis** (old Ger. *Chlodwig*, modern Ger. *Ludwig*, Fr. *Louis*), king of the Franks, was of the Merovingian race, and was born 465 A.D. By the death of his father, Childeric (481), he became king of the Salian Franks, whose capital was Tournai. His first achievement was the overthrow of the Gallo-Romans under Syagrius, near Soissons. He then took possession of the whole country between the Somme and the Loire, and established himself in Soissons. In 493 he married Clotilda, daughter of a Burgundian prince. His wife was a Christian, and earnestly desired the conversion of her husband. In a great battle with the Alemanni near Cologne, Clovis was hard pressed, and as a last resource invoked the god of Clotilda, offering to become a Christian on condition of obtaining the victory. The Alemanni were routed, and on Christmas Day of the same year Clovis and several thousands of his soldiers were baptised by Remigius, Bishop of Rheims. Most of the Western Christian princes were Arians, but Clovis was strictly orthodox, and, in consequence, was saluted by Pope Anastasius as the 'Most Christian King.' In 507, love of conquest concurring with zeal for the orthodox faith, Clovis marched to the south-west of Gaul against the heretic Visigoth, Alaric II., whom he defeated and slew at Vouglé, near Poitiers, taking possession of the whole country as far as Bordeaux and Toulouse; but he was checked at Arles in 507, by Theodoric, king of the Ostrogoths. Clovis now took up his residence in Paris, where he died in 511. His great aim was the subjugation of all the Frankish princes, and the union of the whole Frankish people into a single powerful kingdom.—Clovis II., son of Dagobert, reigned over the Franks from 638 to 656.

**Cloves**, WILLIAM, an Elizabethan surgeon of distinction, was born about 1540, became surgeon at St Bartholomew's Hospital, served with Leicester in the Low Countries, and also on board the fleet that defeated the Spanish Armada. He became surgeon to the queen, and after a prosperous practice in London retired to a country house in Essex, where he died in 1604. He wrote five books in clear and vigorous English, of which two long continued popular: *A Prooved Practise for all Young Chirurgeians* (1591), and *A Treatise on the Struma* (1602).

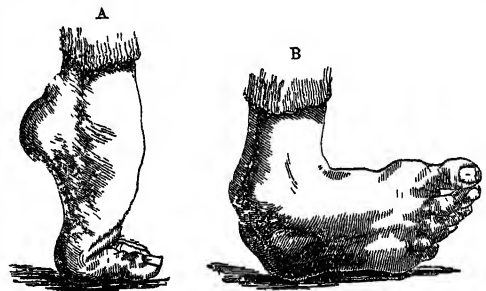

**Clown**. See FOOLS, PANTOMIME.

**Cloyne**, an ancient episcopal town of County Cork, 15 miles ESE. of Cork. The cathedral was founded in the 6th century by St Colman; opposite is a finely preserved round tower over 90 feet high. About 1430 the see was united to that of Cork, separated in 1678, and reunited in 1835; the town still gives its name to a Roman Catholic diocese. Berkeley was Bishop of Cloyne (1734-53). Pop. 750.

**Clubbing**, in cabbages, turnips, and other plants of the genus *Brassica*, a diseased growth of tubercular excrescences in the upper part of the root or lower part of the stem, caused by the larvæ of the Cabbage-fly (q.v.) and of other insects, by

which the vigorous growth of the plant is prevented, and crops are often much injured. It is common for gardeners to cut away these excrescences, with their contained larvæ, in planting out young cabbages, &c.; and where they are not so numerous that the injury done by the knife is necessarily great, this plan succeeds very well. Dressings of gas-lime applied to the soil some time before planting is the best preventive of this evil; but change of crop, when practicable, is of all things the most commendable. Clubbing is sometimes confounded with Anbury (q.v.), from which it is quite distinct.

**Club-foot** (Lat. *talipes*) is a distortion of the foot primarily due to shortening occurring in one or other of the groups of muscles which carry out its intricate movements; subsequently, this error in the muscular activity becomes aggravated by shortening of the ligaments which bind the bones together, and ultimately the shape of the bones themselves becomes altered so as to constitute a very serious deformity, difficult to correct. In the majority of cases the condition is congenital, and at the time of birth it is usually only the muscular structures that are affected. Thus it is of great importance to recognise its presence early in life; for until the ligaments and bones become altered in shape, it may be remedied by very simple means, such as manipulation and electric stimulation of the affected groups of muscles. If these simple measures appear ineffectual, recourse must be had to the division of the tendons (tenotomy), by which the shortened muscles are attached to the bones of the foot. The foot thus freed from the cause of the distortion, should be placed at rest in good position within an immovable apparatus, such as a plaster of Paris case, until healing of the tendons has occurred. The weakened parts should then be

Club-feet:  
A, *Talipes equinus*; B, *Talipes varus*.

exercised by suitable manipulations which restore their strength. In very bad cases it may be necessary to remove portions of the distorted bones and thus restore the natural shape of the foot.

These affections are very markedly hereditary, and they are in all probability due to disordered function in the nerves leading to the affected muscles, or in the brain or spinal cord, in which these nerves have their origin. Four chief varieties of club-foot are recognised by surgeons: (1) *Talipes equinus* (fig. A), in which the heel is drawn up, and the patient walks on the under surfaces of the toes; (2) *Talipes calcaneus*, in which the reverse condition is present, and the patient walks on the heel only; (3) *Talipes varus* (fig. B), in which the patient walks on the outer border of the foot; and (4) *Talipes valgus*, where the inner edge of the sole alone touches the ground. See DEFORMITIES.

**Club-moss**. See LYCOPODIACEÆ.

**Club-rush**. See SCIRPUS.

**Clubs.** The word *club* is from the same root as *clump*; and its secondary meaning of 'a collection of persons' is illustrated by 'a clump of trees.' As specially applied to a select association meeting for social intercourse, it dates from the 17th century, and the use has since been extended to other bodies having a common object, such as literature, science, amusements, politics, or the furtherance of material interests. The practice of some kind of club-life is almost universal, and can be traced in the earliest civilisations. Travellers in Africa, the Pacific, and elsewhere constantly speak of a kind of club-house where the men meet for gossip, recreation, or tribal business. Vacancies in the public tables among the Spartans were filled up by ballot, and Aristotle refers to members of the same locality in Greece as clubbing for merry-making. Many such associations both in Greece and Rome were, however, really secret societies for the cultivation of religious mysteries; others were more of the nature of Guilds (q.v.). But there are records of social clubs more closely allied to the modern form, and Cicero tells of his pleasure in frequenting such gatherings. We also hear of a club of old soldiers belonging to the armies of Augustus, and another among the officers of an African legion. Women had their sociable *collegia*.

In England the history of clubs dates from the Court de Bone Compaignie mentioned by Occleve in the early part of the 15th century. Nearly two hundred years later the symposia originated by Raleigh made the Mermaid Tavern in Bread Street famous, while Ben Jonson is said to have founded a similar gathering at the Devil Tavern. The Apollo is connected with Jonson's *Leges Convivales*. The Rota (1659) and the clubs of the Restoration were mainly political. The members of the Calves' Head Club (q.v.) were supposed to ridicule the memory of Charles I. The portraits of the members of the Kit Kat Club (1700) are still preserved. Addison, Steele, and the essayists of the *Spectator* and *Tatler* class have made us familiar with the coffee-house and tavern clubs of their time. The Royal Society Club (1743) is the earliest of the many dining-clubs associated with the learned societies. To Reynolds is due the institution of the still existing Literary Club (1762), which numbered so many distinguished members, among them Dr Johnson, who established the Ivy Lane and other clubs of a less formal character. Good fellowship and conversation were the leading features of these societies.

The present type of English club is quite different from the earlier bodies bearing the same name. It arose about the commencement of the 19th century, and is characterised by dining and other arrangements whereby members seek to preserve their independence while sharing in the benefits to which their united subscriptions contribute. The modern club-house is generally a spacious and handsome building, with dining, smoking, billiard, newspaper, writing, and drawing rooms, &c. Some possess libraries, the most extensive being that of the Athenæum, which owns one of the choicest collections of books of reference in London. The Garrick is famous for its theatrical, and the United Service for its naval and military, pictures. Portraits of eminent members are to be found on the walls of many club-houses. Clubs are usually managed by a changing committee, who submit their accounts and report to an annual meeting. Some are proprietary—i.e. owned by an individual, or by a small company. The number of members is generally limited. They are either elected by a ballot of the whole club, a certain proportion of black-balls or contrary votes excluding, or by the committee, who sometimes choose all or a select number. The revenue is derived from an entrance

fee and annual subscription paid by each member, and from the sale of provisions, &c., consumed in the house. Most clubs have a dining-room to which strangers may be invited; in others a select number of honorary members are admitted. Many clubs provide bedroom accommodation for members. Moderate card-playing is allowed, but games of chance are invariably forbidden in good English clubs. There are clubs for ladies alone, and some to which ladies are admitted on equal terms with gentlemen. In others ladies are allowed as guests. Speaking generally, the former exclusiveness of club-life is becoming relaxed, even in the older clubs; facilities for the entertainment of friends, sometimes ladies, are becoming more general.

It is difficult to say where the club proper ends and the mere drinking saloon commences; many of the inferior class of clubs which have grown so numerous of late years fall in the latter class. Partly in consequence of this difficulty, the Licensing Acts (1910 and 1921) provide strictly for the registration and licensing of all clubs, and for the withdrawal of such license on proof of any club being misconducted (see LICENSING LAWS). Within recent years many night clubs have been established, where dancing and other entertainments are carried on and ladies admitted. Some of these are reputable. The police supervision of clubs in Great Britain is nominal, but on the European continent all clubs are under a much more rigid legal control.

The best organised and finest clubs in the world are in London, where there are over a hundred of a high class. County clubs are to be found in all English provincial towns. At Edinburgh the New Club (1787), and in Dublin the Kildare Street (1790), are equal to the best metropolitan clubs. The English in India and the colonies possess luxurious club-houses in which bedrooms for temporary visitors are a convenience.

Well-appointed clubs in the English style have been established in all the leading cities of the United States. Among the best in New York are the Lotos (1870), Union League (1863), Century, Manhattan, Union, Knickerbocker, and University. Gambling, and the giving of dramatic and musical entertainments, and exhibitions of pictures are special features of club-life on the European continent. The Jockey Club (1833) and the Union Artistique 'Cercle des Mirlitons' (1863) at Paris are representative examples. The political associations formed in Paris at the time of the first revolution exercised considerable influence on public affairs. In 1848 similar bodies in Germany and Austria were suppressed by order of the police. 'Club' is frequently used as an equivalent to society, as in benefit societies, Alpine Club, Book-club (q.v.), and cricket, cycling, yachting, boating, and racing clubs.

**Clugny**, or CLUNI. See CLUNY.

**Cluj**, the Rumanian name of Klausenburg (q.v.) or Kolozsvár.

**Clumber**, a seat of the Duke of Newcastle 3 miles SE of Worksop. It has given name to a breed of Spaniels (q.v.).

**Clunes**, a gold-mining township of Victoria, 119 miles NW. of Melbourne; pop. 1800.

**Cluny**, or CLUGNY, an industrial town in the French department of Saône-et-Loire, on the Grosne, 15 miles NW. of Mâcon by rail; pop. 3000. The famous Benedictine abbey, founded here in 910 by the Duke of Aquitaine, had two centuries later attained a degree of splendour and influence unrivalled by any similar institution of the middle ages; at its height, Cluny stood second to Rome alone as a chief centre of the Christian world. It was the asylum of kings, the training-school of popes; its abbot took rank above all others, issued his own coinage, and was a power in the political world; it was enormously wealthy, and covered Europe with its affiliated foundations. Two hundred priors of subordinate houses assembled here in the 12th century, and in the 15th century there were said to be over 2000 religious houses that were offshoots of or connected with the abbey in France, Italy, Spain, England, Germany, and Poland; although the alphabetical list of Cluniac foundations in the 15th century, at the end of the *Bibliotheca Cluniacensis*, represents only 925. In England the extension of the order dates from the Conquest; William and his successors were devoted to Cluny, and numerous foundations were shortly established, of which the priory of Lewes (1077) became the chief. At their ultimate suppression in 1539 these numbered 35, exclusive of such Scottish foundations as Paisley and Crossraguel. In the 16th century the conventual buildings at Cluny covered upwards of 25 acres. The grand basilica or abbey church, commenced by St Hugh, the eighth abbot, in 1089, and dedicated by Pope Innocent II. in 1131, was, until the construction of St Peter's at Rome, the largest church in Christendom. Of this magnificent and imposing pile one tower and part of the transept alone remain; the site of the nave is traversed by a road. The abbey, over which cardinal-ministers and princes of the blood had once ruled as commendator-abbots (see COMMENDAM), had outlived both its utility and its importance; it was no longer a great seat of learning, and its 300 monks had dwindled to 40, when in 1790 the order to whom Pope Urban II. had said, 'Ye are the light of the world,' was finally suppressed. Its library was the richest and most important in France, and its archives are of the greatest value for monastic history and for the history of the early Norman kings of England. In 1562 the Huguenots sacked the abbey and scattered its records; but most of this literary treasure was afterwards wonderfully recovered. Many records were burned along with religious books by the mob in 1793, and the library was again scattered; it was generally supposed that nothing had survived, but in 1829 no fewer than 225 folio and quarto volumes of charters and MSS. were discovered in the town-hall, of which many are preserved in the Bibliothèque Nationale, Paris, and some have found their way to the British Museum.

For those relating to England, see Sir G. Duckett's *Record-Evidence of Chans* (1886), *Charters and Records* (1888), and *Visitations and Chapters-General* (1893).

See also works by Pignot, the historian of the order, Lorain, Penjon, Cuchérat, and Champly; and L. M. Smith, *Early History of the Monastery of Cluny* (1921). The ancient palace in Paris of the abbots became in 1833 a museum of antiquities.

**Clupeidæ**. See HERRING, SARDINE, SPRAT

**Clusia**, a genus of tropical trees and shrubs of the order Clusiaceæ or Guttiferæ (q.v.), some of which are commonly called Balsam trees, from their resinous or balsamic products. They are very often *epiphytes*, growing on larger trees, but also take root in the ground. *C. rosea*, a native of the West Indies and tropical America, yields a resin, which is used as an external application in veterinary medicine, and for covering boats instead of pitch. The abundant resin exuding from the disc of the flowers of *C. insignis*, the Wax-flower of Demerara, is used to make a gently stimulating and soothing plaster. The name was given in honour of the botanist Clusius.

**Clusium**. See CHIUSI.

**Clusius**, the name by which Charles de Lélusé (1526-1609), botanist, is generally known. Born at Arras, he travelled in Spain, England, Hungary, &c., and from 1593 was a professor at Leyden.

**Clwyd**, a river of North Wales, rises on Craig Bronbanog, in Denbighshire, and enters the Irish Sea after an irregular course of 30 miles. Below Ruthin it flows through the fertile Vale of Clwyd, 24 miles long, and 2 to 7 wide.

**Clyde**, a world-famous river and firth of south-west Scotland. The river rises as Dae Water at an altitude of 1600 feet, and runs 106 miles northward and north-westward, round Tinto Hill (2335 feet), and past Lanark, Bothwell, Glasgow, and Renfrew, till at Dumbarton it merges in the firth. Its drainage area is estimated by Sir John Hawkshaw at 1481 sq. m., of which 111 belong to the South, North, and Rotten Calder, 127 to the Kelvin, 200 to the Black and White Carts, and 305 to the Leven and Loch Lomond. Tributaries higher up are Powtrail Water, Little Clydes Burn, Douglas Water, Medwyn Water, Mouse Water with its deep gorge through the Cartland Crag, and, near Hamilton, the Avon. Of these, Little Clydes Burn, rising close to head-streams of the Tweed and the Annan, is often wrongly regarded as the Clyde's true source. In the four miles of its course near Lanark the river descends from 560 to 200 feet, and forms the four celebrated Falls of Clyde—Bonnington, Corra, Dundaff, and Stonebyres Linns, of which the finest, Corra, makes a triple leap of 84 feet. Above the falls the Clyde is a beautiful pure trout-stream, traversing pastoral uplands; below, it flows through a rich fertile valley, here broadening out into plain, there pent between bold wooded banks. But its waters become more and more sluggish, begrimed, and polluted the nearer they get to Glasgow, where experiments made with floats in 1857-58 showed that the sewage sometimes took a whole week to travel only 2½ miles. Since 1765 upwards of ten millions sterling has been expended on rectifying and deepening the channel from Glasgow to Dumbarton, about 90,000,000 cubic yards of materials having been lifted by steam-dredgers during 1844-1913. The result has been that whereas a hundred years ago there was a depth at low-water of 15 inches, now they have at Glasgow 27 feet at low-water (spring-tides); then even lighters could not pass to and from Glasgow except at time of floods or at high-water in spring-tides, and now the Clyde from Glasgow downwards is navigable by the largest steamers afloat. In 1812 Henry Bell (q.v.) launched on the Clyde the first practical steamboat that appeared on European waters; and since then the river's shipping and shipbuilding (the latter

dating from a little before 1720) have both grown enormously.—The FIRTH broadens from 1 mile at Dumbarton to 37 at Ailsa Craig. It sends off the Gareloch, Loch Long, Holy Loch, and the Kyles of Bute; contains the islands of Bute, Arran, and the two Cumbræes; is bordered along its ancient sea-margin with an almost continuous fringe of seaports and watering-places; and is one of the world's chief commercial waterways.

**Clyde, LORD.** See CAMPBELL, SIR COLIN.

**Clydebank,** an enterprising parliamentary (1918) and police burgh of Dumbartonshire, on the right bank of the Clyde, 11 miles by rail from Glasgow. Up to 1875 it was an entirely agricultural district, but since the establishment of extensive shipbuilding and sewing-machine works and docks it has grown enormously. The villages of Dalmuir, Kilbowie, and Yoker are incorporated with it. Pop. 37,500.

**Clydesdale.** See LANARKSHIRE; and for CLYDESDALE HORSES, see HORSE.

**Clyster** (*enema*), a liquid medicine administered by the rectum, or lower end of the intestine. It is used either for the purpose of procuring evacuation of the bowels, or of conveying stimulants (brandy, wine, &c.), other medicines, or nourishing substances into the system. A nourishing clyster, in order to be effective, must be specially prepared or digested by means of pepsin, pancreatin, or some such agent; for the rectum, though it has the power of absorbing food already digested, is not capable of performing the functions of digestion. A nourishing or medicinal clyster must be administered in as small bulk as possible; no more than a wine-glassful should be introduced at one time, or it will probably be rejected. For the purpose of procuring evacuation, on the other hand, as large a quantity should be introduced as possible; simple warm or cold water may be employed, or in special cases, various cathartics may be used in addition, such as colocynth, aloes, castor-oil, or turpentine made into an emulsion with yolk of egg; and sometimes carminatives, to expel air. The introduction of a teaspoonful of glycerine is often very effectual in procuring an action of the bowels when other methods fail. Medicinal clysters should only be used under medical superintendence. An injecting syringe, with a flexible tube and a double-action valve, is usually employed for the administration of remedies in this way.

**Clytemnes'tra,** in Homeric legend, the wife of Agamemnon. See AGAMEMNON, ÆSCHYLUS.

**Cnidus,** or GNIDOS, the chief of the cities of the Doric league in Asia Minor, stood on the promontory of Triopion (now Cape Krio), in Caria, and, with its two harbours, was long a wealthy and flourishing port. Here, in 394 B.C., a great sea-fight took place between the Athenians under Conon, and the Spartans under Pisander, in which the former were victorious. The city was a principal seat of the worship of Aphrodite, who was therefore sometimes called the Cnidian goddess. One of its many temples contained the famous statue in Parian marble of the naked Aphrodite by Praxiteles. Some of the marbles excavated in 1857-58 are in the British Museum.

**Cnossos.** See CRETE, MINOS, KNOSSOS.

**Cnut,** Latinised CANUTUS, hence CANUTE, called the Great, and by Scandinavian writers the Mighty and the Old, king of the English, Danes, and Norwegians, was born about 994, the son of Sweyn, king of Denmark, by his first wife Gunhild, a Polish princess. His father died in England in his career of conquest (1014), and Cnut was at once chosen by his fleet king of England, while his elder brother, Harold, succeeded as king of Denmark.

But the Witan sent for Ethelred to be king, and Cnut was soon obliged to flee and return to Denmark, but not before, with the characteristic cruelty of his early life, he had cut off the hands, ears, and noses of the English hostages of his father, and put them ashore at Sandwich. Next year (1015) he put to sea again with a splendid fleet, and landed on the coast of Dorsetshire. He ravaged the country far and wide, and by Christmas had made himself master of Wessex. Early next year he marched to York, and overawed all Northumbria into submission. Already he was master of almost all England, save the city of London alone, when the death of Ethelred and the election as their king by the Londoners of his vigorous son Edmund gave a new turn to the struggle, which went on fiercely, and with varying result. Twice Cnut failed in his attempts to capture London. The final struggle took place at Assandun (see ASHINGDON), when, after a desperate battle, the English fled. Edmund and Cnut met at the isle of Olney, in the Severn, and divided the country between them—Cnut taking the northern part; Edmund, Wessex and the south. The death of Edmund in 1016 gave the whole kingdom to the young Danish conqueror. His first act was to put to death some of the more powerful English chiefs, and to send the two little sons of Edmund out of the kingdom. In 1018 he levied a heavy Danegeld of over £80,000, with which he paid off his Danish warriors, keeping only the crews of forty ships, the nucleus of his 'hus-carls.' The kingdom he divided into the four earldoms of Mercia, Northumberland, Wessex, and East Anglia. From this time Cnut's character seems to have become completely changed. At once he laid aside his ruthless, revengeful temper to become a wise, temperate, devout, and law-abiding ruler. He strove also to govern England according to English ideas, restored the equal rights that had prevailed in Edgar's time, and gradually replaced the Danish earls with native Englishmen, to whom he opened up the highest offices. Æthelnoth became Archbishop of Canterbury; Godwine, Earl of Wessex. He himself married Emma, the widow of Ethelred. He was liberal to monasteries and churches, and reverent to the memory of the native saints and martyrs. He made a pilgrimage to Rome in 1026-27, and his letter sent from Rome to his subjects reveals alike the noble simplicity of his nature and the high conception he had formed of the duty of a king. The death of Harold in 1018 had given him the crown of Denmark; the death of Olaf in 1030 closed a long struggle, and gave him secure possession of Norway. Cnut gave eighteen years of peace and order to England. His power depended mainly on the greatness of his own personality, for at his death his empire at once fell to pieces. He died at Shaftesbury, 12th November 1035, and was buried in the Minster at Winchester. The famous story, telling how he rebuked the flattery of his courtiers by showing them that the advancing waves on the seashore had no regard for his kingship, is given by Henry of Huntingdon. By his first wife, Ælfgifu of Northampton, he left two sons, Sweyn and Harold, and by his second, Emma of Normandy, one son, Hardeknut, and a daughter, Gunhild. The crown of Norway went to Sweyn. In England Cnut was succeeded by Harold. See Oman's *History of England before the Norman Conquest* (1910) and a Life by Larson (1912).

**Coach Dog.** See DALMATIAN DOG.

**Coaching.** One of the most remarkable circumstances in connection with this subject is the comparatively short period in which its history is comprised. It might very reasonably have been

thought that the exigencies of commerce, no less than those of private requirements, would, even in the earliest times, have demanded a system of communication as speedy as possible, and that some steps would have been taken to secure the desired end. Such, however, scarcely appears to have been the case; and merchants and squires contented themselves with whatever facilities for travel were afforded by the stage-wagon, a cumbersome vehicle drawn at a walk by six, eight, or more horses. Passing over all earlier attempts to organise road traffic, we may come to the year 1659, when the first stage-coach—that from Coventry—was started. Its pace was probably not faster than that of the Oxford coach, which went from London to Oxford in two days, at about 3 miles an hour, or that of the vehicles which occupied two days and a half in compassing the distance between London and Dover. In 1700 a week was required to go from London to York; and two days from London to Salisbury. The first mail-coach was not put on the road until 1784, when Mr John Palmer, manager of the Bath theatre, and M.P. for Bath, overcame strenuous opposition, and induced Mr Pitt to supersede Allen's system of postboys, whose contract rate of speed was 5 miles an hour, by his (Palmer's) plan of carrying the mails by mail-coach. The first experiment was made on the 8th of August 1784, on which day Mr Palmer entered government service as comptroller-general of the Post-office. A coach left London at 8 A.M. and reached Bristol at eleven at night. The other coach left Bristol at four in the afternoon, arriving in London at eight the next morning, the up journey thus taking sixteen hours, or one hour longer than the down journey. The scheme appears to have worked so well from the beginning, that the municipal authorities of the more important towns soon petitioned for the adoption of Mr Palmer's plan in their districts, and in nearly every instance the request was complied with. It was part of the new scheme that the mails should be timed at each stage, so that they might all reach London at about the same hour; and that the outgoing mail-coaches should start at the same time from the General Post-office. At the outset the regulation pace was 6 miles an hour; but in course of time this was increased until the coaches were rated at 10 miles per hour.

This acceleration, however, was due to causes other than the judgment and enterprise of Mr Palmer, the skill of coachmen and coach-builders, and the employment of better horses. At the period above mentioned the bad state of the roads precluded quick travelling, and although we find that roads were the subjects of legislation as early as 1346, it was not till the days of Macadam and Telford that road-travelling was, so to speak, revolutionised. The former returned to Ayrshire from America in the year 1783, and after studying road-making as a science while one of the road commissioners in Scotland, came south to Bristol in 1816, became surveyor in that district, and was consulted as to the making of other roads in all parts of England. As soon as Macadam's plans were carried into effect, good roads took the place of bad ones; quick travelling commenced, and paved the way for the palmy days of coaching, until, in 1836, there were fifty-four mail-coaches in England, thirty in Ireland, and ten in Scotland. Meantime the stage-coaches had grown in number, travelled at a high rate of speed, and necessitated the employment of a vast amount of capital. Among the best-known London proprietors were Chaplin, Horne, Sherman, Nelson, and Mountain; the two first named, having the judgment to discern that the railways would eventually drive coaches off the road, threw in their lot with the London and

Birmingham Railway. It was not till after George IV. came to the throne that coaching reached the zenith of its fame in respect of organisation, pace, appointments, and one may, perhaps, say coachmanship as well. The 'palmy days,' concerning which so much has been written, began about 1820, and coaching was possibly at its most perfect pitch about 1836. For about four years it enjoyed this repute, and then the downward journey, far more rapid than the upward one, began; one by one coaches were taken off; coaching inns became roadside public-houses; coachmen and guards found other occupations, or migrated to the workhouse; stables were emptied, and admiration for coaching gave way to appreciation of railroad-travelling.

Of amateur coachmen and coachmanship in the 18th century comparatively little is known; but, when good roads were the rule instead of the exception, 'gentleman coaching' became a fashionable amusement. Mr John Warde, the famous master of foxhounds, was a renowned whip, to whom were due the thanks of the old coachmen for having originated the idea of placing springs under the coach-box. The name of Peyton has ever been connected with the annals of the road; the Messrs Walker, Sir St Vincent Cotton, the Marquis of Worcester, Mr Henry Villebois, Mr Maxse, Mr Jerningham, Mr Sackville Gwynne, Sir Bellingham Graham, Mr Stevenson, Hon. Fitzroy Stanhope, Hon. T. Kenyon, Colonel Sibthorpe, and Mr C. Buxton are among the number of those who patronised the road by every means in their power. Others, scarcely less enthusiastic, succeeded them, until there were no road-coaches to be driven. So far as London is concerned, the link between the past and present was broken in the year 1858, when the Brighton 'Age,' under the management of Clarke, assisted by the Duke of Beaufort and Sir George Wombwell, was given up. The coach, which was a sort of link between the real coaching period and the modern revival, was at work again, for a short time, in 1862. In 1866 Captain Haworth, Captain Lawrie, and a few others started the 'Old Times' to Brighton. At the end of the season the confederacy was broken up, and in 1867 the Duke of Beaufort, Mr Chandos Pole, and Mr B. J. Angel took the road, running a coach each way daily.

The year 1877 was a somewhat memorable one in the annals of modern coaching, as on 4th November the 'Old Times' was put on to St Albans, and thereafter ran for long every 'lawful day' without a break, though not always on the same route. In 1888 it was put upon the Brighton road, and on the 11th July, James Selby (*ob.* Dec. 1888), its coachman since 1877, drove from Piccadilly to Brighton and back in seven hours fifty minutes, the outward journey being accomplished in three hours fifty minutes and ten seconds. This performance, however, is not a 'record,' as in 1837 Israel Alexander, a professional on the Brighton road, drove down with Queen Victoria's first speech in three hours forty minutes.

The new movement was quickly followed up, and in 1867 Mr Charles Hoare had a coach on the road between Beckenham and Sevenoaks, which after a time made London its starting and returning point. Windsor, High Wycombe, Virginia Water, Dorking, Reigate, Guildford, Portsmouth, and Oxford, and Cambridge, all had their coaches during recent times, and the movement was at its height in the late 'nineties and the early years of the present century. With the advent of the motor-car there was a partial, but not a total, collapse; and just before the commencement of the Great War not only were there half-a-dozen public coaches running in and out of London, but there had recently been a marked increase in the number

of private coaches. Some eight or ten years previously—about the year 1906—it had looked as if four-in-hand driving was going out of fashion altogether. Only one or two coaches were struggling against the new order of things, and the number of coaches at the meets of the two driving clubs was being gradually diminished. But as the motor-car became more generally understood, the driving people took heart of grace, and began to return to their old love. The principal cause of the decline in four-in-hand driving had been the fact that the horses which were being actually driven when the first motor-cars appeared were frightened of the new traffic, and when one of a coach team tried to bolt the consequences were often unpleasant, even when accident was averted. But as a new generation of horses, accustomed to motor-cars from foalhood, began to be used, this difficulty disappeared, and four-in-hand driving became, to a great extent, once more popular.

The American whip, Mr A. G. Vanderbilt, put a pair of coaches, one running either way, on the Brighton road in 1908; and in the same year the first of the series of international horse shows was inaugurated at Olympia, and prizes were given for four-in-hand teams, while a year or two later the first Marathon drive from Hampton Court into the Olympia show ring took place. This Marathon drive for road coaches was from the very first a great success. It was followed shortly afterwards by the 'Field' Cup, or Coaching Corinthian, a drive for amateurs, which began at Olympia, and took the coaches through a part of Richmond Park, and thence to Ranelagh, where the teams were looked over by the judges, and rested for a time. Afterwards they were sent back to Olympia, and judged finally in the ring at the evening session. The full distance of this drive was at first seventeen miles, but it was afterwards curtailed by three or four miles. No change of horses was allowed. Another Marathon drive has taken place in connection with the Richmond show. In this case there is a class for road coaches, and another for private drags, and the two start together from the magazine in Hyde Park, and are driven to the show-ground at Richmond, where the road coaches are drawn up on one side, and the private drags on the other, for the judges to inspect. The popularity of these drives is quite phenomenal, and has been so since their commencement. All along the route the crowd turn out in thousands, and from Hammer-smith Bridge to Olympia the teams have to wend their way through a lane of people on either side, all other traffic being stopped for the moment by the metropolitan police.

The shows which have been mentioned have also held competitions for members of the Coaching Club, and these caused an extraordinary increase in the quality of the horses driven by members of this club.

The meets of the Four-in-Hand Driving Club and the Coaching Club are justly regarded as among the sights of the season. The former is the more exclusive as well as the elder, having been established in 1856, chiefly at the suggestion of Mr W. Morritt. The club could not entertain one quarter of the applications for membership, so in 1870 the Coaching Club was established, and has been gradually increasing in size. For the first driving club of which we have any account we must go back to the year 1807, the date of the establishment of the Bensington Driving Club—the B.D.C. it was generally known as, and commonly called the 'Benson'—which was limited to twenty-five members. For the first sixteen years of the club's existence its members used to drive down two days in the season to Bensington, near Wallingford, and twice to Bedford, near Staines; but

in 1823 the Bensington gatherings were given up. A second club was founded in 1808 by Mr Charles Buxton. The new association was called the Four-horse Club, and landaus were used instead of coaches; but it was sometimes, though wrongly, designated as the Whip Club, and the Four-in-hand Club. The Four-horse Club was broken up in 1820, was revived in 1822, but became extinct altogether about 1829. The B.D.C. was then the only body of the kind until 1838, when Lord Chesterfield established the Richmond Driving Club, the members of which, after meeting at Chesterfield House, drove to Richmond to dinner. This club, however, came to an end after nine or ten years; and in 1852 the B.D.C. was broken up. From that time there was no driving club until the present Four-in-hand Driving Club was founded as already mentioned. Coaches are sometimes put on in the provinces. The motor-car can hardly be accounted a rival of the four-in-hand.

See the Duke of Beaufort's *Driving* (Badminton series, 1888); W. Outram Tristram's *Coaching Days and Coaching Ways* (1888; new ed. 1903); Fairman Rogers's *Manual of Coaching* (N.Y. 1900); a series of works on the great coaching roads by C. G. Harper; the works of 'Nimrod' (C. J. Apperley, q.v.); the *New Book of the Horse*, by Charles Richardson; and the article in this work on Carriage.

**Coach-whip.** See WHIP-SNAKE.

**Coagulation**, the amorphous solidification of a liquid, or part of a liquid, as when the casein of milk is solidified by rennet in making Cheese (q.v.), or the white of an egg by boiling. The process varies in various substances. Albumen, or the white of an egg, coagulates at a temperature of 160° F. Milk is coagulated or curdled by the action of rennet or by acids. The fibrin in the blood, chyle, and lymph of animals is coagulated by the separation of these fluids from the living body. See BLOOD.

**Coahuila**, a state of Mexico, separated from Texas by the Rio Grande, has an area of 64,000 sq. m., partly mountainous, and forming in the west a part of the inland drainage basin of the Bolsón de Mapimí. The climate is healthy, although extremes of heat and cold are usual. The state is rich in minerals, especially silver. Coal, not of very good quality, is found. It is plentiful, however, as nowhere else in Mexico. Other minerals are lead, copper, iron, and petroleum. It has valuable pasturage, and in many parts a most fertile soil; but no district of Mexico was so slow in being developed. Railway construction, however, prepared the way for a change. Great areas of the Bolsón de Mapimí in Coahuila and the neighbouring state of Durango have been reclaimed by irrigation from the Nazas and other rivers, and the region has become the chief cotton-producing district of Mexico. A large number of cotton-factories and flour-mills are in operation. Pop. 400,000. Capital, Saltillo (q.v.).

**Coaita.** See SPIDER-MONKEY.

**Coal**, in the sense of a piece of glowing fuel (and hence a piece of fuel, whether dead or alive), is a word common to all the Germanic languages (Old English *col*, Icel. *kol*, Ger. *kohle*). The different sorts of fuel are distinguished by prefixes, as *charcoal*, *pit-coal*; but in England, owing to the absorbing importance of mineral or pit coal, the word coal alone has come to be used in this special signification (Ger. *steinkohlen*, Fr. *charbon de terre*).

Coal is one of the most important of all rocks; it consists chiefly of carbon, and is universally regarded as of vegetable origin. Its geological relations are noticed in the article CARBONIFEROUS SYSTEM. It occurs in layers or beds, and is always

of a black or blackish-brown colour. Some of the varieties have a very considerable degree of vitreous or resinous lustre, while others are destitute of lustre; some have a shell-like fracture, and others have a highly cross-jointed structure, and are readily broken into cubical or rhomboidal fragments. The precise characters of coal as a rock species are not easily defined, and both in Britain and other countries important cases have occupied courts of law, in which this difficulty was strongly felt, as in the great Scottish lawsuit concerning the Torbanehill Mineral or Boghead Coal (q.v.). Coal, indeed, is rather a commercial than a scientific term, but in a general way we may define it as a fossil fuel of black colour and stony consistency, which, when heated in close vessels, is converted into coke with the escape of volatile liquids and gases. The variety known as blind coal or anthracite no doubt gives off scarcely any volatile matter, but this is because it has undergone a natural distillation through the action of subterranean heat or of the proximity of intrusive igneous rock. We may therefore divide coal into two primary divisions—namely: (1) *Anthracite*, which does not, and (2) *Bituminous coal*, which does, flame when kindled. Anthracite (q.v.) sometimes contains as much as 94, and if we exclude the ash, 98 per cent. of carbon, and as this element decreases in amount it graduates into a bituminous coal. The term anthracite is, however, still applied to some coals which do not contain more than 80 per cent. of carbon. Various synonyms, such as stone coal, glance coal, culm, and Welsh coal, are also used to designate this substance, which is used chiefly for smelting purposes and for generating steam. In the United States it is also very largely used for domestic purposes—heating and cooking. It is difficult to kindle, but gives out a high heat in burning. Bituminous coal includes an almost endless number of varieties, one of the best marked being *cannel* or *parrot coal*. Cannel coal is probably so called from burning with a bright flame like a candle, and the name parrot coal is given to it in Scotland from the crackling or chattering noise it makes when burned. That of different localities varies much in appearance, but it is most commonly dull and earthy, or with only a slight lustre; some examples are, however, bright and shining. In texture it is nearly always compact, and certain beds of it admit of being polished in slabs of considerable size, which approach black marble in appearance. Of this material vases, inkstands, boxes, &c. are made. Cannel coal contains a large percentage of ash, but the best cannels are in some places much used for open-grate fires in houses. Cannel is for the most part consumed in making gas, of which it yields from 8000 to 15,000 cubic feet per ton. When distilled at a low red-heat it yields paraffin oil. The other varieties of bituminous coal are so numerous that, as an Admiralty report states, there are as many as seventy denominations of it imported into London alone. Still, among these there are three leading kinds—1. *Caking coal*, which cakes or fuses into one mass in the fire. It breaks into small uneven fragments, and is found largely at Newcastle and some other localities. 2. *Splint or hard coal*, occurring plentifully in Scotland, which is hard, and breaks into cuboidal blocks. This is often called block-coal; and locally it is very valuable, because it can be employed in smelting without being first coked. It is not very easily kindled, but when lighted makes a clear lasting fire. 3. *Cherry or soft coal*, which breaks easily into small irregular cubes, has a beautiful shining lustre, is readily kindled, and gives out a cheerful flame and heat. It is common in Staffordshire. Brown coal or Lignite (q.v.), though for the most part inferior to

true coal, is nevertheless an important fuel in some countries in default of a better kind. There are, however, large deposits of lignites in some regions, as in North America, which coke well, and which are excellent substitutes for true coal.

The use of coal does not seem to have been known to the ancients; nor is it well known at what time it began to be used for fuel. Some say that it was used by the ancient Britons; and at all events it was to some extent an article of household consumption during the Anglo-Saxon period as early as 852 A.D. There seems to be reason for thinking that Britain was the first European country in which coal was used to any considerable extent. A coal-pit at Preston, Haddington, was granted to the monks of Newbattle between 1210 and 1219. Henry III. is said to have granted a license to dig coal in 1234. About the end of the 13th century it began to be employed in London, but at first only in the arts and manufactures; and the innovation was complained of as injurious to human health. In 1306 the parliament petitioned the king to prohibit the use of coal, and a proclamation was accordingly issued against it; but owing to the high price of wood, its use soon became general in London. It was for a long time known there as *sea-coal*, because imported by sea.

Several theories as to the mode of the origin of coal have been put forth from time to time. The one now generally believed in is that the rank and luxuriant vegetation which prevailed during the carboniferous age grew and decayed upon land but slightly raised above the sea; that by slow subsidence this thick layer of vegetable matter sunk below the water, and became gradually covered with sand, mud, and other mineral sediment; that then, by some slight upheaval or gradual silting up of the sea bottom, a land surface was once more formed, and covered with a dense mass of plants, which in course of time decayed, sank, and became overlaid with silt and sand as before. At length, thick masses of stratified matter would accumulate, producing great pressure, and this, acting along with chemical changes, would gradually mineralise the vegetable layers into coal. Microscopical examination shows that coal consists principally of the cortical portions of plants—more especially of the bark of such trees as *Sigillaria*—commingled with the debris of various other plants, amongst which the spore cases and spores of certain lycopodiaceous trees not infrequently occur in great abundance. It seems probable indeed that many coal-seams simply represent great swamps and marshy jungles.

As will be seen from the following table, wood, peat, lignite or brown coal, and true coal indicate by their composition the changes which vegetable matter undergoes by decay and pressure; and a table in which a considerable number of examples of each substance could be given would show how gradually these substances pass into each other:

	Wood	Peat	Lignite.	Coal.
Carbon . . . . .	50.0	60.0	65.7	82.6
Hydrogen . . . . .	6.2	6.5	5.3	5.6
Oxygen . . . . .	43.5	33.5	29.0	11.8
	100.0	100.0	100.0	100.0

In each of these bodies there is usually a small percentage of nitrogen, which in the above table has not been separated. In passing from wood or peat to coal, the proportion of oxygen and hydrogen decreases, these substances being given off in the form of marsh-gas and carbonic acid in the process of decay.

On the continent of Europe, productive coal-fields occur in Belgium, France, Prussia, Spain, Silesia, and in Russia—the only important Russian coal-field being that of Donetz, on the north shore of the Sea of Azov. Coal is also found in India, China

(where several extensive coal-fields occur, in which coal has been worked from a very early period), Japan, the Malay Archipelago, Australia, New Zealand, Africa, and Antarctica. There is evidence of promising coal-deposits in several South American countries, but, owing to the great supply of wood in their forests, there is little temptation to work them. Considerable importance already attaches, however, to the mines of Chile (q.v.). In Canada there are small, though valuable, coal-fields; but in the United States enormous fields of fossil fuel are found. The entire area of these is about 200,000 sq. m., being 83 times greater than the area of the coal-fields of Great Britain. But although the coal-measures of the States are of vast extent, and contain many valuable coal-seams—a few of them 40 and even 50 feet thick at certain places—it has been doubted whether the amount of workable coal in them has not been exaggerated. In proportion to the extent of the seams, the quantity of coal annually raised in the States is small, some 500,000,000 or 600,000,000 tons. The distribution of the coalfields of Britain and North America is discussed at CARBONIFEROUS SYSTEM.

**Coal-supply of the World.**—A report on the world's coal-resources was drawn up for the twelfth International Geological Congress (Canada, 1912), and published at Toronto (3 vols. 1913). It was computed that there was probably available altogether in known coal-fields 7,397,533,000,000 tons (4 billion tons bituminous, 3 billion brown coal, the remainder anthracite). About half of the total is in the United States. Canada is second with one-sixth, mainly in the west. Approximately the reserves in various countries were these:

United States.....	3,214,174 million tons.
Canada .....	1,234,269 " "
Russia.....	233,997 " "
United Kingdom.....	189,535 " "
Germany.....	85,551 " "
France .....	17,585 " "

The world's consumption in 1916 was reckoned at 1600 million tons.

See Green and Miall, *Coal: History and Uses* (1878); Galloway, *History of Coal-mining in Great Britain* (1882); text-books of coal-mining by Pameley (1891), Hughes (1892), and Peel (1901); Hull, *The Coal-fields of Great Britain* (1880); Meldola, *Coal and what we get from it* (1891); D. M. D. Stuart, *Coal Dust and an Explosive Agent* (1894); Nicolls, *The Story of American Coals* (Phila. 1897); the Final Report of the 1901 Commission (13 parts, 1905); H. S. Jevons, *The British Coal Trade* (1915); *Historical Review of Coal-mining* (1924).—For mining methods, the inspection of mines, explosions, and cognate matters, see MINING. The condition of colliers and salters in Britain is discussed at SLAVERY. For coal-tar products, see COAL-TAR, DYEING. See also BRIQUETTE, COKE, FUEL, GAS, PETROLEUM.

**Coalbrookdale** is a district in Shropshire, extending 8 miles along the river Severn; its exhausted coal-field supplies iron, petroleum, and limestone, and manufactures iron. The village of Coalbrookdale is 11 miles SE. of Shrewsbury.

**Coal-fish** (*Gadus carbonarius*), a species of cod, with black upper parts, common in northern seas. It occurs from 80° N. lat. to the Mediterranean, and is common off North American and British coasts. In Scotland it is commonly called Saith. It often measures 2 to 3 feet in length, and may be considerably larger; occurs in great shoals; is exceedingly voracious. Though decidedly coarse, its flesh is much eaten in northern parts. The young ones are often caught by boys fishing off the rocks, and are variously known as podleys, sillocks, cuddies, and coalseys. See COD.

**Coaling Stations.** The necessity for maintaining a sufficient number of outposts on the great lines of British trade, both for mercantile and naval

purposes, has been recognised as a particular requirement of Great Britain on account of the extensive ramifications of her commerce and interests. In the old sailing days, when the largest man-of-war could only carry provisions and water for a few months, bases from which they could obtain supplies were an absolute necessity. In modern times, when supplies of coal are an even more urgent necessity, the question of coaling stations becomes a very acute one. It was not till 1878, however, that the question was taken up in earnest by the British government, when a strong Royal Commission was appointed to inquire into the whole subject. A great amount of evidence was taken, and a final report made in 1881. Their inquiry was directed to the needs of trade rather than that of the navy. The importance of the trade-route by the Cape to the East was the great point insisted on; harbours on this route were selected and recommended for defence. Since then the route *viâ* the Suez Canal has become even more important, and has been well provided for. While for mercantile purposes coaling and oiling or fuelling stations are absolutely necessary, for the naval purposes of Britain, with her fleets in every part of the world and her widespread interests, they are of supreme importance. The defence of coaling stations has always been a vexed question, and much money has been expended on many of them. It is now, however, being recognised that as any attack on them would probably be made by raiding parties of a few ships, their defence should not be so difficult a matter as was at first supposed. A few guns well disposed in suitable positions and manned by properly trained men will answer for general purposes, instead of what was at first contemplated—namely, that every coaling station should be another Malta or Gibraltar.

**Coalition**, in Politics, is applied to the union of two parties, or, as generally happens, portions of parties who agree to sink their differences, and act in common. Pitt the elder, when he took office in 1757, coalesced with the Whig aristocracy represented by the Duke of Newcastle. The Great Coalition was formed in 1782, when Fox, the leader of the reformers, took office along with Lord North, the leader of the opposite party. When Lord Derby's ministry resigned in 1853, there was a short coalition between the Whig party under Lord John Russell, and the more moderate of the Conservative party under Lord Aberdeen. The arrangement made between Conservatives and Liberal Unionists in 1886 can scarcely be called a coalition, inasmuch as the main responsibility of government rested on the former, while the latter gave them a general support. Part of the Liberal and Labour parties formed a coalition with the Conservatives under Mr Asquith (1915) and Mr Lloyd George (1916). Cohesion between its components had weakened before the Conservatives withdrew, and Mr Lloyd George resigned and was defeated in 1922.

**Coal-measures.** See CARBONIFEROUS.

**Coal-tar**, or GAS-TAR, is a thick, black, opaque liquid, which comes over and condenses in the pipes when coal or petroleum is distilled. Now usually obtained in the manufacture of gas, tar was about 1782 extracted from coal by the ninth Earl of Dundonald under a patent, expressly for the purpose of being used for protecting ships from rotting. Coal-tar is slightly heavier than water, and has a strong, disagreeable odour. The amount of tar so obtained of course varies with the nature of the coal employed, but it is also dependent on the average temperature of distillation. With a low temperature, a large quantity of tar is produced, along with

a small yield of a highly illuminating gas. At first this tar was regarded as a waste product, or, at most, as a source of pitch; but it soon became apparent that as a source of Benzene (q.v.), and through it of the Aniline (q.v.) dyes, it was a commodity of great commercial value.

When coal-tar is distilled, a large number of volatile substances pass over as the temperature rises higher and higher. At first various gases, ammonia and naphtha, are obtained to the extent of about  $\frac{1}{10}$ th part of the original tar, and then distillation ceases, although the temperature gradually rises. After a period of about an hour, more oils, like the former, lighter than water, are obtained, and so on the distillation proceeds, with successive intervals, yielding what are known as Creosote or Creasote (q.v.) oils, and finally Anthracene oils, the residue in the still being Pitch (q.v.).

At first, when anthracene was of little importance, distillation was not pushed so far, and the anthracene oils were allowed to remain in the pitch; but since the discovery of the process for making artificial Alizarin (q.v.), the heat is pushed as far as possible consistent with the production of a pitch that will sell. The first light oils yield chiefly benzol, carbolic acid, and naphtha. The creosote oils yield creosote and naphthalene, while the anthracene oils produce anthracene and lubricating oils.

After this enumeration of the chief coal-tar products, it will be possible to realise the great importance of this substance. The naphtha, besides being used as a solvent for india-rubber and gutta-percha, is burned to produce a fine variety of carbon for printing-ink. The benzol, including in this term many nearly allied substances, not only yields many brilliant dyes, but is used for cleaning gloves, silks, and other articles which would be injured by washing. The creosote in its crude form is largely used for preserving wood, enabling it to be exposed in damp situations without rotting, while, when burned, its smoke yields lampblack. The carbolic acid obtained is one of the most valuable constituents of coal-tar. Finally, the residual pitch is in constant requisition for making roofing felt and asphalt pavement. Besides these primary products of coal-tar, there are of course numerous compounds derived more or less remotely from it. Such are the aniline dyes, high explosives, the quinine substitutes, antipyrin, antifebrin, &c., and Saccharine (q.v.). Failing other outlet, the gas-works can use coal-tar in its crude state as fuel for heating the stills. See NAPHTHALENE, PICRIC ACID, &c.

**Coalville**, an urban district of Leicestershire, 16 miles NW. of Leicester; pop. 20,500.

**Coanza**, a river of West Africa, rising in the east of Benguela, and after a generally NW. course, entering the Atlantic about 30 miles S. of St Paul de Loando, by a mouth over a mile broad. It is navigable for light vessels as far as the Cambambe cataracts, over 120 miles.

**Coast Defence.** The character of the defence provided for the coasts of a state must depend on the nature of the coast and of the attack to be anticipated. Germany sought a solution of the problem mainly by means of submarine mines and aircraft, associated with a strong flotilla of torpedo-boats, and, in certain spots, with powerful batteries. Italy entrusts the defence of her coasts chiefly to her very powerful fleet of ironclads, which can move from place to place as required. In France and England all these methods are employed: mine-fields, aircraft, submarines, torpedo-boat flotillas, batteries, and a strong fleet of heavy ships, some of which have been specially designed for this purpose. In Italy the unusual feature of 120-ton guns

mounted in gun-barges, to take part in the defence of certain important harbours, is also to be noticed. As a general defence against an attack in force, aircraft, coastal motor-boats, submarines, and strong batteries in connection with mine-fields offer, perhaps, the best security. Against depredations by isolated ships or cruisers, well-placed guns on the disappearing system, with some fast aircraft and torpedo-craft, would probably be most efficacious. The question of the best system of defence, under the great changes which have taken place in the material of warfare, must probably remain undecided until the experience gained in the Great War has been thoroughly examined.

**Coastguard**, an organisation formerly intended to prevent smuggling merely, but later constituted so as to serve as a defensive force also. The old coastguardsmen were in the employment of the Customs department; they were posted along the shore at spots commanding extensive views of the beach, and were expected to be always on the look-out for smugglers. In 1856 the coastguard was transferred to the Admiralty. The Coastguard Service Act of 1856 was replaced in 1925 by the Coastguard Act. In 1922 a committee composed of civilians formed at the Admiralty to inquire into the duties, &c., of the coastguard force recommended that the coast watching in peace-time for excise and for general look-out duties should be undertaken by the Board of Trade, and that the naval votes be thus relieved of the cost of maintaining the coastguard personnel and matériel—buildings, &c. In war-time, however, the Admiralty would resume control of all coast-watching stations and duties of personnel. The transference to the Board of Trade took effect in 1923, but wireless and certain signal stations still remain under Admiralty control.

**Coast Survey** of United States. See CHART.

**Coatbridge**, a thriving manufacturing town in Lanarkshire, 9 miles E. of Glasgow by rail, and 32 W. by S. of Edinburgh. The centre of a great mineral district, it is surrounded by blast-furnaces, and produces locomotives, malleable iron, boilers, tubes, tin-plate, firebricks and tiles, and railway wagons. Its development to a municipal burgh (1885) was mainly due to the Gartsherrie Ironworks of Messrs Baird. Pop. (1831) 741; (1851) 8564; (1881) 18,425; (1921) 43,909.

**Coati**, or COATI-MUNDI (*Nasua*), a genus of the raccoon family (Procyonidae) in the bear-like section of Carnivora. There are two species found in Mexico, Central America, and South America. They live on trees, feeding somewhat omnivorously, and grubbing with an upturned flexible snout. They are social in their habits, and readily adapt themselves to domestication. See RACCOON.

**Coats Land.** See ANTARCTICA.

**Coatzacoalcas**, a river of the isthmus of Tehuantepec in Mexico, which falls into the Gulf of Mexico 130 miles SE. of Vera Cruz. At its mouth is Puerto Méjico (Coatzacoalcas), a terminus of the Tehuantepec Railway; pop. 10,000.

**Cob.** See COB-NUT.

**Cobalt** (sym. Co, eq. 59, from *Cobaltus*, 'a malicious sprite' or 'gnome') is a metal the ores of which are sparingly distributed. In the metallic state it is found in meteoric stones or aerolites to the extent of one per cent., but it generally occurs combined with arsenic as *Speiss* cobalt,  $\text{CoAs}_2$ , or as cobaltite, the arsenide and sulphide of the metal,  $\text{CoSAs}$ . To obtain the metal itself from its ores is a matter of some difficulty. It is more tenacious than iron, and is used in high-speed steel and electroplating. It is of a gray colour with a reddish tinge, brittle, hard, and very magnetic. Many of its compounds are valued on account of the brilliance and permanence of their colours.

The Protoxide of Cobalt,  $\text{CoO}$ , is employed as a blue pigment in porcelain-painting. *Zaffre* is the impure oxide obtained by partially roasting cobalt ore previously mixed with two or three times its weight of fine sand. *Smalt* is the term applied to a deep-blue glass, which owes its colour to the presence of oxide of cobalt, and which, when reduced to very fine powder, is employed occasionally by laundresses to correct the yellow colour of newly washed linen, and by paper-makers as a blue pigment for staining writing-paper. Smalt is also used in the production of the blue colours in porcelain, pottery, glass, encaustic tiles, fresco-painting, &c., and forms the principal ingredient in *Old Sevres Blue*, *Thenard's Blue*, *Turquoise Blue*, &c. (see BLUE). A compound containing the oxides of cobalt and zinc is of a beautiful green colour, and is known as *Rinman's Green*. The chloride of cobalt dissolved in much water may be employed as a sympathetic ink (see INK). In dilute solutions it is of a faint pink colour, which is not observable when it is used for writing upon paper; but when heated before the fire it loses water, and becomes blue, and the writing is then capable of being read. On allowing the paper thereafter to lie in a damp place, or exposing it to the vapour of steam from a kettle, water is again absorbed, and the writing returns to its invisible state. The addition of a little perchloride of iron to the ink makes the writing appear green; a solution of zinc imparts a red tint; and a salt of copper, a yellow. See E. Halse, *Cobalt Ores* (1924).

**Cobalt**, a town of Ontario, 330 miles N. of Toronto; the name being given because the characteristic associate of the silver ores found close by is the metal cobalt. Beginning with the spring of 1904, the town grew rapidly, and by 1911 had a population, including that of the near-by mines, of 5638; in 1921 reduced to 4449.

The Cobalt mining area is situated in the district of Nipissing, Ontario, within a few miles of Lake Temiskaming. The mineral deposits which made it famous were discovered during the building of the railway in the autumn of 1903. By 1905 it had become one of the world's most famous mining areas. The ores consist of native silver and compounds of that metal, together with arsenides of cobalt and nickel. The chief value of the ores is in their silver content. At its height not only was Cobalt the world's greatest producer of silver, but it produced more cobalt and more arsenic than any other locality, and was the world's third greatest producer of nickel. The ores are found mostly within an area of 6 sq. miles, in narrow cracks or fissures which do not average more than three or four inches in width. The rocks in which these fissures occur are among the oldest known, and form the southern edge of the great pre-Cambrian region of Canada.

**Cobán**, capital of the department of Vera Paz, in Guatemala, on a fertile plateau 85 miles N. of the town of Guatemala; pop. 31,000.

**Cobbe**, FRANCES POWER (1822-1904), born at Newbridge near Dublin, granddaughter of the archbishop, turned from her early evangelicalism to Theodore Parker for spiritual guidance, associated with Mary Carpenter (q.v.) in good works, and from 1860 was a busy author of books, leader-writer for the London dailies, and contributor to the magazines. She travelled in Italy and the East, and wrote *The Cities of the Past* (1864) and *Italics* (1864). A strong Theist, a supporter of women's rights, and a prominent antivivisectionist, she published her *Autobiography* in 1894.

**Cobbett**, WILLIAM, born at Farnham, Surrey, on 9th March 1763, was the son of a small farmer,

and grandson of a day-labourer. From scaring crows the boy rose to be ploughman; but a visit to Portsmouth and a sight of the fleet had spoiled him for farming, when, in May 1783, a sudden freak took him to London. He reached it with just half-a-crown, and for nine months was quill-driver to a Gray's Inn attorney. Enlisting then in the 54th Foot, he first spent a year at Chatham, where he mastered Lowth's *English Grammar*, and read through a whole lending library—Swift's *Tale of a Tub* had been his boyhood's delight. Next he served as sergeant-major in New Brunswick (1785-91), meanwhile saving 150 guineas, and studying rhetoric, geometry, logic, French, and fortification. On his return he obtained a most flattering discharge; in February 1792 married; but in March went to France to get out of a court-martial on three of his late officers, whom he had taxed with speculation. Six months later he sailed for America. At Philadelphia he taught English to French refugees (Talleyrand wanted to be one of his pupils); translated from the French; and, as 'Peter Porcupine,' wrote fierce onslaughts on Dr Priestley, Tom Paine, and the native Democrats. Twice he was prosecuted for libel, and America got too hot for him, so in June 1800 he returned to England. The Tonies welcomed him with open arms; and in 1802 he started his famous *Weekly Political Register*, which, with one three-months' break in 1817, continued till his death. But, Tory first, it altered its politics in 1804, till at last it 'became the most fierce and determined opponent of the government, and the most uncompromising champion of Radicalism.' A great lover of the country, Cobbett settled at Botley in Hampshire, where he planted, farmed, and went in for manly sports; a true soldiers' fiend, he got two years in Newgate (1810-12), with a fine of £1000, for his strictures on the flogging of militiamen by German mercenaries. In 1817 money muddles and dread of a second imprisonment drove him once more across the Atlantic. He farmed in Long Island, writing all the while for the *Register*, till in 1819 he ventured back again, and came bringing Tom Paine's bones—the one really silly action of his life. Botley had to be sold, but he started a seed-farm at Kensington; and bent now on entering parliament, stood for Coventry (1821) and Preston (1826). Both times he failed; but his ill-advised trial for sedition (1831) was followed next year by his return for Oldham to the first Reformed parliament. His career there, if not quite a failure, was signalised chiefly by a crack-brained attack on Peel; anyhow, the late hours were too much for him, and on 18th June 1835 he died at Normanby farm, near Guildford. He was buried at Farnham.

Coarse, virulent, braggadocio, inconsistent—Cobbett was all this. He was often right, but he must have been oftener wrong, for oftener he came to abuse what once he had eulogised than *vice versa*. He was a very Ishmael of politics; Lord Dalling dubs him 'the contentious man.' Still, a man he was, a genuine John Bull; and if he wrote nonsense about Waterloo and the national debt, and more nonsense than sense about the Reformation, he wrote it in fine strong English. He loathed Whigs and 'mock gentlefolks,' but he honestly loved the poor—loved Nature, too, and could paint her dear English scenery with a freshness and insight wholly and solely his own. The *Rural Rides* (new edition, with notes by Pitt Cobbett, 1885) are unsurpassable. They were a reprint (1830) from the *Register*, and followed or were followed by *Porcupine's Works* (12 vols. 1801), the excellent and entertaining *English Grammar* (1818), the savage *History of the Reformation* (1824-27), the *Woodlands* (1825), the shrewd, homely *Advice to Young*

*Men* (1830), and forty more works. He originated Hansard's *Debates* (1806) and Howell's *State Trials* (1809).

See *Lives* by Huish (1835), E. Smith (1878), E. Carlyle (1904), Melville (1913), and G. D. N. Cole (1924); also, for his interest in the prize-ring, the *Wendham Papers* (1913).

**Cobbold**, THOMAS SPENCER (1828-86), was born at Ipswich, studied medicine at Edinburgh, lectured in London on botany, zoology, comparative anatomy, geology, and helminthology, in connection with various hospitals and colleges, and wrote *Entozoa* (1864), *Parasites* (1879), *Tapeworms* (1866), and numerous other works on kindred subjects.

**Cobden**, RICHARD, a great English politician, 'the Apostle of Free Trade,' was born at Heyshott, near Midhurst, Sussex, 3d June 1804. His father, a thrifless yeoman, had to sell his farm in 1814, and relations charged themselves with the maintenance of the eleven children; Richard, the fourth, being sent to a 'Dotheboys' school in Yorkshire. After five wretched years there, in 1819 he was received into a wholesale warehouse in London, belonging to his uncle, where he soon showed great aptitude for business, and as a commercial traveller he visited Scotland and Ireland. In 1828 Cobden and two of his friends entered into a partnership for selling calicoes by commission in London. They set up an establishment for calico-printing in Lancashire in 1831, and in 1832 Cobden settled in Manchester, the town with which his name is so closely associated. He wrote a comedy which was rejected by the manager of Covent Garden Theatre. In 1835 he visited the United States, and in 1836-37 travelled in Turkey, Greece, and Egypt. The result of his travels appeared in two pamphlets, *England, Ireland, and America* (1835), and *Russia* (1836); the latter intended as an antidote against the 'Russophobia' then prevalent. In these pamphlets he also ridiculed the workings of diplomacy, and asserted England's mission to be the avoidance of war and the extension of commerce. He contested the borough of Stockport unsuccessfully on free-trade principles in 1837. In 1838 he carried in the Manchester Chamber of Commerce a motion to petition parliament for the repeal of all duties on corn. In the same year seven merchants of Manchester formed the association which soon grew into the Anti-Corn-law League. Of this League Cobden was the most energetic and prominent member. His lectures all over the country, and his speeches in parliament (to which he was returned in 1841 by the constituency which had rejected him in 1837), were characterised by clear, quiet persuasiveness; and to them was in great part due, as Sir Robert Peel acknowledged, the abolition of the corn laws at so early a period as 1846.

Cobden's zeal for free trade in corn had, however, to such a degree withdrawn his attention from private business, that he was now a ruined man, and a subscription of £80,000 was raised in recognition of his great services; and with this in 1847 he re-purchased Dunford, the farmhouse in which he was born. As his health, too, had suffered, he re-visited the Continent, and during his absence was elected both for Stockport and the West Riding of Yorkshire. He chose the latter constituency, which he continued to represent till 1857. He shared Mr Bright's unpopularity for opposing the policy that led to the Crimean war; and on an appeal to the country by Lord Palmerston to support him in his Chinese policy, of which Cobden was a strenuous opponent, he retired from the West Riding and contested Huddersfield, where, however, he was defeated. Cobden spent his leisure in a second American tour. During his absence he was elected for Rochdale.

Lord Palmerston, who was at this time forming his ministry of 1859-65, with a just appreciation of Cobden's great services, offered him a seat in the cabinet as President of the Board of Trade; but Cobden, as the uncompromising opponent of Palmerston's policy, felt bound to decline the honour. After his election for Rochdale, the state of his health did not permit him to take any part in parliamentary proceedings, but as Her Majesty's plenipotentiary, he (1859-60) arranged and concluded the treaty of commerce with France. Cobden spoke out strongly in favour of the North during the American civil war, and in 1864 strenuously opposed intervention in favour of Denmark. He died in London, 2d April 1865. In all the relations of life Cobden was a man amiable, single-minded, and earnest. In parliament and on the platform he was a master in the art of clear, persuasive, and convincing speech. He may be regarded as the representative man of the Manchester school, and therefore as the most prominent champion of free trade, peace, non-intervention, and economy.

His *Speeches on Questions of Public Policy* were edited by John Bright and Thorold Rogers (1870). See CORN LAWS, FREE TRADE; the Cobden Club publications; his *Life* by Morley (new ed. 1920); Ashworth, *Recollections of Cobden* (1877); Watkin, *Alderman Cobden* (1891); Balfour, *Essays and Addresses*; Mrs Salis-Schwabe, *Reminiscences of Cobden* (French, 1879; trans. 1895); J. A. Hobson, *Cobden, the International Man* (1919).

**Cobet**, CAREL GABRIEL, Dutch Hellenist, born at Paris in 1813, studied at Leyden, travelled in Italy, and in 1846 obtained a professorship at Leyden, where he died 6th October 1889. He published *De Arte Interpretandi* (1847); collections of *Variae Lectiones* and *Miscellanea*; works on the comic poet Plato, Dionysius of Halicarnassus, and Xenophon; and editions of Diogenes Laertius, Xenophon's *Anabasis* and *Hellenica*, Lysias, and Cornelius Nepos (1881).

**Cobh**, the old name of Queenstown (q.v.) resumed in 1920.

**Cobham**, LORD. See OLDCASTLE.

**Cobi'ja**, a seaport of the Chilean province of Antofagasta (q.v.), on a shallow, open bay. See ATACAMA.

**Coble**. See BOAT.

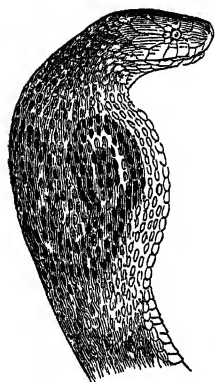

**Coblentz**, or KOBLENZ, capital of Rheinland, 56 miles SSE. of Cologne by rail, is beautifully situated at the junction of the Rhine and the Moselle, the former of which is here crossed by a bridge of boats, and the latter by a fine stone bridge, built originally in 1344. Both rivers are also spanned by railway bridges. An ancient stronghold, Coblentz was, prior to the Great War, still very strongly fortified (see EHRENBREITSTEIN); but by the treaty of Versailles it was dismantled. In the old town, many of the streets are irregular, narrow, and dirty; but the new town, which is situated nearer the Rhine, is handsomely built, spacious, and clean. Among the principal buildings are the church of St Castor, the oldest Christian church in the Rhine district, founded in 836, though dating in its present form from the 12th century; the Kaufhaus (1479); the Protestant Florins Kirche (12th century); the church of Our Lady (1250-1431); and the old Jesuit College, now a gymnasium. The extensive palace built in 1778-86 by the last Elector, and the old archiepiscopal palace built by the last archbishop, have been restored. The favourable position of the place secures it an active commerce in wine, corn, mineral waters, &c. It manufactures Moselle wine, pianos, paper and cardboard goods, machinery, boats and barges, cigars, japanned goods, and furniture. Pop. (1875) 29,290; (1910) 56,478; (1919) 56,637. Coblentz (Fr. *Coblence*) was known to the Romans as *Confluentes*. From 1018 till 1796 it belonged to

Trèves. In 1798 it was made the capital of the new French department, Rhine and Moselle, and by the treaty of 1815 was given to Prussia.

**Cob-nut**, a name given to some of the largest and finest cultivated varieties of the Hazel-nut (q.v.).—In the West Indies the name cob-nut is given to the fruit of *Omphalea trandra*, a tree of the natural order Euphorbiaceæ. It is also called Hog-nut. The tree has a white juice, which turns black in drying, and in Guiana is used instead of ink. The albumen of the seed is eaten, after the embryo, which contains a cathartic principle, is removed.

**Cobourg**, a port of entry and capital of North-umberland county, Ontario, on Lake Ontario, 69 miles NE. of Toronto. It is a railway junction, and contains several woollen-mills, foundries, and breweries. Pop. 5000.

**Cobra da Capello** ('hooded snake'), the Portuguese name for one of the most deadly of the poisonous Indian snakes, technically known as *Naja tripudians*. It belongs to the sub-order of venomous Colubrine snakes (Proteroglyphia), in which the fangs borne on the upper jaw are not perforated by a complete canal, but possess simply an anterior groove down which the poison trickles. The cobra is a large snake, 5 feet or more in length; the

Head of Cobra.

colour varies considerably from pale yellow to dark olive; one variety has spectacle-like black markings on its neck. By the dilatation of the anterior ribs during excitement the neck can be distended so as to produce a hood-like appearance. It is by preference nocturnal, and feeds on amphibians, reptiles, birds, eggs, small mammals, &c. It does not appear to be naturally aggressive, but instinctively assumes a threatening attitude when disturbed. It then dilates its neck, hisses loudly, and prepares to strike by raising its fangs in the usual snake fashion. The habits vary greatly in different

situations. It may haunt human dwellings for the sake of poultry and other food, and is said to occur 8000 feet up the Himalayas. Though essentially land animals and fond of concealing themselves among old masonry, stone heaps and the like, the cobras can swim and climb with ease. In gracefulness of movement they excel. The head and neck are often raised above the level of the rest of the body, which remains horizontal. In spite of pictures to the contrary, they can only raise the front part of the body to a very limited extent.

The bite of the cobra is as usual accompanied by the compression of one of the salivary glands modified as a poison bag. The secretion trickles down the grooves of the fangs, and entering the wound produces rapid nervous paralysis, from which recovery is, to say the least, extremely rare. Great numbers of deaths occur annually in India from cobra bites, but as the assailant often escapes, identification is frequently a matter of conjecture. No certain remedy is known, but excision, cauterising, ligaturing, doses of ammonia, drugging with rum, &c. are often resorted to. The victims are usually natives, who, going about after dark, not unfrequently trample upon the cobra and other snakes. The rattles which they use to warn off the reptiles do not appear to have much more effect

than the spells to which they trust. The cobra has become the centre of numerous native superstitions, the object of animal-worship, and a favourite subject with the adroit snake-charmers.

*Naja tripudians* is found in India, Java, and South China; *N. haje*, an allied species, is common in Egypt and parts of Africa. The coral snake (Elaps), the rock-snake (Bungarus), the venomous water-snake (Hydrophis), are genera within the same sub-order.

**Coburg**, picturesquely situated on the left bank of the Itz, 81 miles SSE. of Eisenach by rail, was capital of the former duchy of Coburg, long part of the united duchy of Saxe-Coburg-Gotha. After the revolution the republic of Saxe-Coburg-Gotha split in two, Coburg uniting (1920) with Bavaria, Gotha with the other former Saxon duchies to form the land of Thuringia. The older part of the town, which is fairly well built, is surrounded by attractive modern suburbs. Coburg was, alternately with Gotha, the ducal residence, and the palace, erected in 1549, rebuilt 1693, is one of the principal buildings in the town. Among the others are the government buildings, the arsenal, containing a public library, the town-house, and another palace. The old castle of Coburg, mentioned in 1057, beside which Coburg originally grew up, is situated on an eminence 530 feet above the town. It afforded Luther a shelter during the Diet of Augsburg in 1530, and in 1632 successfully resisted a siege by Wallenstein. In 1782 it was converted into a prison, but in 1838 it was thoroughly restored, and now contains valuable collections. Luther's apartments are preserved as he used them. Coburg has manufactures of machinery, colours, woollen, cotton, marquetry, baskets, porcelain, furniture, and carriages, and exports beer. Pop. (1875) 14,567; (1919) 23,417. Prince Albert, consort of Queen Victoria, was born at Rosenau, 4 miles N. With their son, Edward VII., the Coburg family ascended the throne of Britain.

**Coburg Peninsula**, the most northerly part of Australia to the west of the Gulf of Carpentaria, runs out in a north-west direction towards Melville Island, from which it is divided by Dundas Strait. On its north side is the bay known as Port Essington, at the head of which was established, in 1831, the settlement of Port Victoria—abandoned, on account of its insalubrity, in 1850. Swamp buffaloes, originally brought from Java, have increased here enormously.

**Cobweb.** See SPIDER.

**Co'ca** (*Erythroxylon Coca*)—which has of course no connection with Cocoa or with Coconuts), a shrub of the order Erythroxylaceæ, of which the leaves furnish an important narcotic and stimulant. The shrub is 6 or 8 feet high, and somewhat resembles a blackthorn bush; the leaves are ovate-lanceolate, simple, and with entire and slightly waved margins, and strongly marked veins, of which two on each side of the midrib run parallel to the margin. It has been in use from a very remote period among the Indians of South America, and was extensively cultivated before the Spanish conquest. Many of the Indians of the Peruvian Andes are to this day excessively addicted to it, and its use is quite general among them, besides extending to men of European race. The dried leaves are chewed with a little finely powdered unslaked lime, or with the alkaline ashes of the Quinoa (q.v.), or certain other plants. An infusion is also occasionally used. An habitual coca-chewer takes a dose about four times daily. In soothing effect it recalls tobacco, but its influence is a much more remarkable one. It greatly lessens the desire for ordinary food, and at the same time permits of much more sustained exer-

tion, even without sleep; it affects the nervous mechanism of respiration, so that the difficulty of breathing, so common in the ascent of long and steep slopes at high elevations, is little felt. These properties readily explain its high esteem among

Coca (*Erythroxylon Coca*):  
a, a flower; b, fruit.

the Indians, to whom long and difficult journeys, heavy burdens, and constant privation have always been familiar.

**COCAINE.**—In Europe, little importance was attached to coca until the veteran pharmacologist Christison awakened interest by personally verifying in old age its sustaining powers. Investigations followed, and the alkaloid *cocaine*, upon which the active properties mainly depend, has now come into regular use as a local anæsthetic, by help of which not merely some of the operations of dentistry, but much more serious surgical operations, can be performed without chloroform. To oculists it is of special value, at once dilating the pupil and removing all sensibility. Cases of intoxication and abuse are not infrequent with the leaves, and the 'cocaine habit' has now to be guarded against both in Britain and the United States.

**Cocana'da**, a seaport and headquarters of Godavari district, Madras, 315 miles N. of Madras. Its roadstead is comparatively safe, and it exports cotton, oil-seeds, sugar, rice, and cigars. Pop. 50,000.

**Cocceius**, or KOCH, JOHANNES, a distinguished theologian, was born at Bremen in 1603, and studied at Hamburg and Franeker. In 1636 he became professor of Hebrew there, and in 1650 of Theology at Leyden, where he died in 1669. His chief work is the *Lexicon et Commentarius Sermonis Hebraici et Chaldaici Veteris Testamenti* (Leyden, 1669), the first tolerably complete dictionary of the Hebrew language. Cocceius held very peculiar hermeneutical principles, which enabled him to discover the whole New Testament in the Old. The representation abundantly employed in the former of a covenant between God and man, usurped the place of the New Testament doctrine of the Fatherhood and Sonship; and Cocceius carried the 'covenant theology,' as it is called, to an absurd extreme (see COVENANT). The most complete exposition of his views is in his *Summa Doctrinae de Fœdere et Testamento Dei* (1648).

**Coccej**, HEINRICH FREIHERR VON, born at Bremen, March 25, 1644, studied jurisprudence and philosophy in Leyden from 1667 to 1670, and

went from thence to England. In 1672 he was made professor of Law at Heidelberg; in 1689, at Utrecht; and in 1690, at Frankfort-on-the-Oder. In 1713 the emperor named him a baron of the realm. Cocceji died in 1719. His work on civil law (*Juris Publica Prudentia*, 1695) was long used as a text-book.—His youngest son, SAMUEL, born at Heidelberg in 1679, acquired no less renown. He too, in 1703, became professor at Frankfort-on-the-Oder, filled several honourable state-offices, and was ultimately the chancellor of Frederick the Great. He died in 1755. He reformed the Prussian administration of justice, and published several works on law.

**Coccidæ.** See COCCUS.

**Coccidia**, a group of sporozoa which live as parasites in mammals, birds, and other animals, chiefly within the cells of an epithelium, and may cause serious disease (coccidiosis). The conjugation of a large female and a small male gamete results in the formation of an oocyst, which passes out of the host. When swallowed by a new host, it breaks up into a number of individuals which attack the cells, and multiply asexually for several generations, eventually producing a new sexual generation.

**Coccinella.** See LADY-BIRD.

**Cocco**, **Coco Root**, or EDDOES, plants of the genus *Colocasia*, and of the nearly allied genus *Caladium*, of the order Araceæ, widely cultivated in tropical and subtropical countries for their edible starchy root-stocks, of which the food-value broadly corresponds to the potato. These are deprived by roasting or boiling of the characteristic acidity of the order, which, indeed, some of them possess in a comparatively small degree. They are sometimes included under the name *Yam*, but are totally different from the true *Yam* (q.v.). The names more strictly belong to *Colocasia antiquorum*, a stemless plant with ovate leaves, and flowers enclosed in a cylindrical erect spathe. This is a native of India, but was early introduced to Egypt and the Mediterranean countries, whence it has now passed even to America. For the kindred *Alocasia macrorrhiza*, also of economic importance in different parts of the world, see TARO. Many species of these and allied genera are to be seen in European hothouses, where their handsome foliage has gained them an important place.

**Coccoliths** are small saucer-like discs found abundantly in the Atlantic ooze, probably unicellular algae. They are sometimes called *coccolites*, a word also used to denote a greenish kind of Augite (q.v.).

**Coccoloba.** See SEASIDE GRAPE.

**Coccomilia**, or CUCUMIGLIA (*Prunus coccomilia*), a species of plum, a native of Calabria, where the bark—particularly of the root—is used for the cure of intermittent fevers.

**Coccos'teus**, a genus of fossil placogonoid fishes, pertaining to the Devonian and Old Red Sandstone system. The head and trunk were protected by bony plates, covered with tubercles, but the rest of the body was naked. The mouth was furnished with small teeth.

**Cocculus Indicus** (Ital. *coccola*, 'a berry') is the fruit of the *Anamirta Cocculus*, a climbing shrub found in the eastern parts of India, and in the Malayan Archipelago. It was introduced into Britain in the 16th century for the purpose of stupefying fish so that they might be caught by hand. It acts as an acrid narcotic poison, and when the berries are thrown into a stream it quickly poisons any fish in the neighbourhood. It contains a crystalline principle called picrotoxin,

which is very poisonous. It imparts to beer a bitter taste, and at the same time a fullness and apparent richness, but its use is now forbidden under heavy penalties, as the effects are very harmful.

*Cocculus Indicus* :

a, branch with leaves; b, panicle of female inflorescence, c, a female flower; d, the same with sepals removed; e, male flower; f, fruit. (From Bently & Trimen.)

In Russia and elsewhere it is a popular remedy for tapeworm, lice, &c.; but when applied to the scalp it is not unattended with danger, as several deaths have occurred from its use.

**Coccus**, a genus of insects in the order Hemiptera, and type of a family (Coccidæ), including many forms very injurious to plants, and a few others which have come to be of use to man. For the latter, see COCHINEAL, LAC, MANNA, WAX. As general characteristics may be noted the beaded feelers, the general absence of wings in the female, the degeneration of suctorial proboscis and posterior wings in the males, and the peculiar history of both sexes. The young forms are somewhat tortoise-like, and run about on plants with some activity. The adult females attach themselves by their proboscis to a juicy part of the plant, and surrender themselves to feeding and maternity. They often become berry-like, plump, much resembling excrescences, or else very flat and scale-like. In the latter form they are often called scale-insects. The body always degenerates more or less, and after fertilisation becomes simply a case, or eventually a dead covering for the eggs and larvæ. The young males also come to rest, and undergo a peculiar metamorphosis. From the resting larva an elegant male insect results, with developed anterior, but degenerate or aborted posterior wings. The males fertilise the females, but being without suctorial proboscis, are probably short-lived. In fact, both male and female adults seem to fall victims to the characteristics of their sex. The young shelter for a while under the dead female, and then start for themselves. For the important species and related genera, see the articles above referred to.

**Coccyx**. See SPINAL COLUMN.

**Coccyzus**. See CUCKOO.

**Cochabamba**, a central department of Bolivia, with offshoots of the Eastern Cordilleras, and extensive plateaus. The climate is equable and healthy. The metals of the department include tin, copper, gold, and silver; and its fertile valleys render it the richest as well as the most picturesque district of the republic. Agriculture and cattle-raising are the chief occupations; but, as else-

where in Bolivia, trade is sadly hampered by the want of roads. A railway to Oruro was opened in 1917. Area, 23,300 sq. m.; population, 600,000. The capital, Cochabamba (8396 feet above the sea), on a tributary of the Guapay, was founded in 1565, as Ciudad de Oropesa. It has a so-called university and high school, and an industrious population (about 30,000), with considerable manufactures.

**Cochba**. See BAR-COCHBA.

**Cochin**, a native state of India, politically connected with Madras, between the British district of Malabar and the state of Travancore, with the Arabian Sea on the SW. It contains 1361 sq. m., and 1,000,000 inhabitants. Its hydrography is singular. The Western Ghats, which have here an elevation of fully 4000 feet, intercept the south-west monsoon, and render the coast one of the most humid regions in the world during June, July, August, and September. As the space between the mountains and the sea is almost on a level with the tide, the countless streams have each two contrasted sections—a plunging torrent and a sluggish river ending in a brackish estuary. Further, these estuaries, almost continuously breasted by a narrow belt of higher ground, form between them a backwater or lagoon of 120 miles in length, and of every width between a few hundred yards and 10 miles, which communicates at only three points with the ocean. The forests produce the coconut, teak, red cedar, and many other woods, while the low country produces drugs, dyes, and gums. The great mass of the population are Hindus, but there are also some Mohammedans and Christians (of the Syrian and Roman confessions), and a few Jews. The capital is Ernakolam. Cochin formed a treaty with the East India Company in 1798. See A. K. Iyer, *Cochin Tribes and Castes* (1912).

**Cochin**, once the capital of the principality above described, but now a seaport of the district of Malabar, in the presidency of Madras, stands on the south side of the principal channel between the open ocean and the backwater mentioned in the preceding article. In spite of the bar, Cochin is next to Bombay on this coast for shipbuilding and maritime commerce, the annual exports reaching a value of £700,000. Here the Portuguese erected their first fort in India in 1503. They were supplanted by the Dutch in 1663; and in 1796 Cochin was captured by the British. Population, 20,000, of whom half are Christians and one-fifth Mohammedans (fanatical Moplahs, descendants of the old Arab traders). Close by, in the native state, is another Cochin.

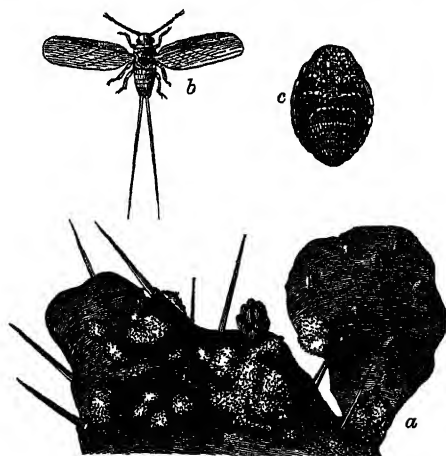

**Cochin-China** is a name sometimes applied to Annam (q.v.), but is specifically used, also for French Cochin-China, a colonial possession of France, occupying the south extremity of the Indo-China peninsula, from 8° 35' to 11° 40' N. lat., and from 104° 26' to 107° 30' E. long., bounded N. by Cambodia and Annam; area, 23,400 sq. m. Through nearly its whole extent Cochin-China is low and almost flat. To the north and east, however, the ground rises into the hills of Cape St Jacques, Ba-ria, and Bien-hoa, and the mountain of Dienba. Cochin-China is watered in the west by two branches of the Mekhong (q.v.), the Han-giang and the Tien-giang, which follow a nearly parallel course for about 120 miles. In the east the Dong-nai River flows from north-east to south-west, receiving the Saigon River from the north-west. The Little Vaco flows parallel to and south of the Saigon River. These rivers are all connected with one another by the innumerable *arroyos* and canals which intersect Cochin-China in all directions. The climate alternates between the rainy season,

from April to October, when it rains almost every day, and the dry, from October to April, when no rain falls. The temperature rises in the dry season to 95° F. by day and 62° by night, and in the wet season varies between 68° and 86°. Of all hot climates that of Cochín-China shows perhaps the least considerable variations. The climate is trying, but its insalubrity has been much exaggerated. The soil, mostly alluvial, is exceedingly fertile, producing the best rice in the world. Sugar-cane, tobacco, cotton, arachis, mulberry, indigo, maize, tea, betel, hemp, coffee, pepper, cardamoms, beans, sweet potatoes, coconuts, areca nuts, and bananas are raised. The province of Bien-hoa and the north of Saigon do not yield to the finest lands of India in the luxuriance of their vegetation and the beauty and variety of their fauna. The province of Vinhlong owes its Annamite name of *vuông* ('garden') to the abundance, variety, and exquisite taste of its fruits.

The population was returned in 1921 as 3,795,613, of whom the vast majority are Annamites by race, the remainder Cambodians, Chinese, Malays, Malabaris, with about 7000 Europeans. There is a considerable immigration from various parts of Asia, amounting to nearly 25,000 in some years, only partly balanced by departures. There is much fishing, especially on the rivers; and fish, fish-oil, isinglass, and shrimps are among the most important exports. The shipping is mainly that of Saigon (q.v.). A railway of 50 miles between Saigon and Mytho, in operation since 1885, is the oldest railway in French Indo-China. Several other railways have since been built, and others are in course of construction. The colony is divided into 21 provinces. It has a representative in the French Chamber. Saigon is the capital not only of Cochín-China, but of French Indo-China as a whole. See Russier and Brenier, *L'Indo-Chine Française* (1911). For an account of the natives and history, see ANNAM; and for fowls, POULTRY.

**Cochineal**, a dyestuff employed in dyeing scarlet and crimson, and in the preparation of the pigments Carmine and Lake (q.v.).

Cochineal consists simply of the bodies of the females of a species of *Coccus* (q.v.), called *C. cacti*, because it feeds upon plants of the Cactus family,

Cochineal (*Coccus cacti*):  
a, living on cactus (*Opuntia*); b, male; c, female.

particularly on one, therefore designated the cochineal plant, but known in Mexico as the Nopal (*Opuntia coccinellifera*), figured in the article

CACTACEÆ. This plant is nearly allied to the prickly pear, and assumes a somewhat tree-like form. The insect as well as the cactus are natives of Mexico and other warm parts of America, but they are now cultivated chiefly in Guatemala. This cultivation was carried on by the Mexicans long before the country was known to Europeans. The insect is not uncommon on wild cacti in Texas and Florida. Both plant and insect have been successfully introduced into the Canary Islands, Algeria, Java, and Australia. But the attempt to produce cochineal in India has been practically a failure.

The cochineal insect is a small creature, a pound of cochineal being calculated to contain 70,000 in a dried state. The male is of a deep-red colour, and has white wings. The female, which is wingless, is of a deep-brown colour, covered with a white waxy powder; flat beneath, convex above.

In some parts of Guatemala large plantations of Nopal exist for the cultivation of the *C. cacti*. Before the rainy season commences, branches of this cactus plant covered with these insects are cut off and stored in buildings to protect them from the weather. When the wet season is over, four or five months afterwards (October), the plantations are again stocked from these supplies. Little 'nests' of some vegetable fibre, each containing about a dozen females, are placed on the spines of the cacti. The eggs are soon deposited, and when the young females are developed, they spread over the plants, attaching themselves to the leaves, and looking more like vegetable excrescences than insects. They become covered with a cottony substance. The first crop of pregnant females, only these being valuable for cochineal, is gathered in December, and several more crops are obtained till the following May.

In the Canary Islands the insects are reared in winter and put out on the cactus leaves from May to July. Small gauze bags containing pregnant females are hung on the cactus plants, from which the young when developed spread over the leaves. In August and September, just before the females are ready to deposit their eggs, they are collected in trays, and those gathered in one day are placed in the evening in an oven heated to 150° F. They are afterwards more thoroughly dried in the sun. Hot iron and boiling water are also used in killing the insects. According to the way the insect is killed and dried, the cochineal is known in commerce as silver or black; an inferior kind being sometimes called foxy. The colouring principle of cochineal is called cochinealin or carminic acid, and the insects scarcely yield more than 10 per cent. of pure dye, although the amount is generally supposed to be much greater. Carmine has also been demonstrated in other kinds of coccus and in aphides.

The cochineal industry has suffered very much through the introduction of aniline dyes.

**Cochlaeus**, or DOBENECK, JOHANN, Luther's opponent, was born near Nürnberg, about 1479, and died a canon of Breslau in 1552. See German monographs by Otto (1874) and Getz (1886).

**Cochlæa**. See EAR.

**Cochlæaria**. See SCURVY GRASS.

**Cochrane**, LORD. See DUNDONALD.

**Cochrane**, ROBERT, a Scottish architect or mason, by James III. created Earl of Mar. Angus and other lords hanged him with three more royal 'favourites' over Lauder Bridge in 1482.

**Cockade** (Fr. *cocarde*, or *coquarde*), an ornament or knot of ribbon or rosette of leather, worn either as a military or naval decoration, or as the badge of a political party. Cockades made of ribbons of the national colours were worn by

soldiers during the wars of the 18th century, the white and red being united in the combined army of France and Spain. In 1767 an authoritative regulation was issued that every French soldier should wear a cockade of white stuff; and in 1782 cockades were prohibited to all but soldiers. From this time till the Revolution the cockade was an exclusively military badge; and, both in France and England, 'to mount the cockade' was synonymous with becoming a soldier. After the Revolution, the tricolor ribbon took the place of the white cockade.

In England, after the expulsion of the Stuart family, the white cockade became the distinctive mark of the adherents of the exiled house, in opposition to the orange of Nassau and the black of Hanover; it is a favourite theme in Jacobite songs. The black cockade, to be seen on the hats of officers' servants, was unknown in Britain till the accession of the House of Hanover, and was then introduced by George I. from his German dominions. It seems to be understood that the right to use it belongs not only to naval and military officers, but also to the holders of some offices of dignity under the crown, including privy-councillors, officers of state, supreme judges, &c., and some would extend it to deputy-lieutenants. The privilege is one of which the law takes no cognisance. See **BADGE**.

**Cockatoo**, a popular name for several genera and species of parrots (*Psittaci*), which may be associated in a family of *Cacatuidæ* or *Plissolophinæ*. Some of them are well known as decorative birds. The general characteristics are the tuft on the head, the strong high beak with a notch behind the point, the frequently bright colours of the plumage, the long wings, the loquacious habit. The cockatoos inhabit Australia, Tasmania, New Guinea, and the Indian Archipelago. The word which the birds seem to say, and which is curiously represented by the English *cockatoo*, is said to be Malayan for 'old father,' and to have been taught to the birds by their captors. Of the genus *Plissolophus*, fifteen Australian and Malayan species are known—e.g. *Pl. sanguineus*, *Pl. molluccensis*, *Pl. cristatus*. The great palm cockatoo (*Microglossus aaterimus*) is the strongest of the parrot tribe, and measures about two feet in length; its colour is mostly black; its special home is New Guinea. The crestless Nasiterna, the smallest of all the parrots, also inhabits New Guinea. The black cockatoos (*Calyptorhynchus*) form another important genus in Australia. The cockatoos feed mainly on fruits and seeds, but do not disdain insect larvæ.

**Cockatrice**, a fabulous monster, often confounded with the Basilisk (q.v.), and regarded as possessing similar deadly powers. To the charms of the basilisk it added a dragon's tail, armed with a sting; and it shared also its power of destroying by a glance, so often referred to in Shakespeare and other early writers. In medieval art the cockatrice is an emblem of sin generally, and the special attribute of St Vitus. The name occurs in the English authorised version of the Old Testament, where the original Hebrew word means evidently 'venomous serpent.' In Heraldry the cockatrice is represented as a winged monster having the head, body, and feet of a cock, the tongue barbed, and the tail of a dragon.

Cockatrice:  
in Heraldry.

**Cockayne**. See **COCKNEY**.

**Cockburn**, SIR ALEXANDER, judge, was born 24th December 1802, studied at Cambridge, was called to the bar in 1829, and soon became distinguished as a pleader before parliamentary com-

mittees. In 1847 he became member of parliament for Southampton in the Liberal interest, became Solicitor-general and was knighted in 1850, was made Chief-justice of the Common Pleas in 1856, and Lord Chief-justice in 1859. He succeeded to a baronetcy in 1858. He was prosecutor in the Palmer case; and among the many famous trials over which he presided were the Wainwright case and the Tichborne case. He represented Britain in the Alabama case. He died 20th November 1880.

**Cockburn**, ALISON, poetess, was born 8th October 1713, the daughter of Robert Rutherford, laird of Fairnilee, Selkirkshire. In 1731 she married Patrick Cockburn, advocate, and in 1753 was left a widow, with an only son, who predeceased her in 1780. She died 22d November 1794, having for sixty years and more been a queen of Edinburgh Society: in person she was not unlike Queen Elizabeth. Of her lyrics the best known is the exquisite version of *The Flowers of the Forest* ('I've seen the smiling of Fortune beguiling'), commemorating a wave of calamity that swept over Ettrick Forest, and first printed in 1765. Mrs Cockburn in 1777 discerned in Walter Scott 'the most extraordinary genius of a boy;' in 1786 she made Burns's acquaintance. See *Songstresses of Scotland* (vol. i. 1871), and Craig-Brown's *Letters of Mrs Cockburn* (1900).

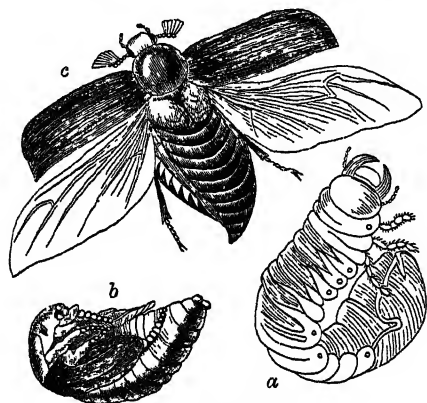

**Cockburn**, HENRY, Scottish judge, was born 26th October 1779, perhaps at Cockpen, but more probably in the Parliament Close of old Edinburgh. He entered the High School in 1787, and the university in 1793, 'being kept,' in his own words, 'nine years at two dead languages which we did not learn.' Dugald Stewart's lectures, then, 'were like the opening of the heavens,' they 'changed one's whole nature;' and through a debating club he became the companion of Jeffrey, Horner, and Brougham, from whom he imbibed Whig opinions, greatly to the annoyance of the hereditary Toryism of his family. He was called to the Scottish bar in 1800; and in 1807 his uncle, the all-powerful Lord Melville, gave him an advocate-deputeship—a non-political post, from which, on political grounds, he 'had the honour of being dismissed' in 1810. He rose, however, to share with Jeffrey the leadership of the bar, and with Jeffrey was counsel for three prisoners accused of sedition (1817-19). His powers were better adapted for success with a popular than with a professional tribunal. Simple, clear, and impressive, at times pathetic, humorous at times, and, when he pleased, eloquent, but always unaffected, always Scottish, he would urge his case with an earnestness and candour that was all but irresistible. A zealous supporter by pen as well as by tongue of parliamentary reform, he became Solicitor-general for Scotland under the Grey ministry in 1830; had the chief hand in drafting the Scottish Reform Bill; was elected Lord Rector of Glasgow University (1831); in 1834 was made, as Lord Cockburn, a judge of the Court of Session; and three years later a lord of justiciary. He died, 26th April 1854, at Bonally Tower, his beautiful home by the base of the Pentlands since his marriage in 1811, and was buried near Jeffrey in the Dean Cemetery, Edinburgh.

Besides five or six pamphlets, and as many articles in the *Edinburgh Review*, dealing mostly with legal and parliamentary reform, Cockburn was author of an admirable *Life of Jeffrey* (1852), and of four posthumous works—*Memorials of his Time* (1856), *Journal, 1831-44* (2 vols. 1874), *Circuit Journeys* (1888), and *Examination of Trials for Sedition in Scotland* (2 vols. 1888). The first three of these form a kind of autobiography, into which are woven characteristic anecdotes of old-world Scottish life, and graphic sketches of the men who composed the brilliant

circle of Edinburgh society in the first four decades of the 19th century. Withal they illustrate his love of nature and veneration for antiquity.

**Cockchafer** (*Melolontha vulgaris*), a common beetle of the Lamellicorn section, too well known in Europe for its voracious destruction of both crops and foliage. It is a comparatively large beetle, about an inch in length; generally of a reddish-brown colour; with fine hairs, scanty on the wing covers, but thick on the breast; and with the expanded ends of its feelers divided in the leaflet-like manner characteristic of Lamellicorns. In Scotland they are less abundant than in England.

The males appear first, usually in the month of May, and are soon joined by their partners. They fly with a whirring noise, and being hungry as well as active, do great damage to many of our common trees. After some weeks of flight, the females heavy with eggs deposit these in the ground and thereafter die. In a month or so the larvæ develop, but do not attain winged life for

Cockchafer (*Melolontha vulgaris*):  
a, full-grown larva; b, pupa; c, perfect insect.

four years. Meanwhile they are anything but idle, are in fact most voracious, and do great damage to crops and herbage. In some years when the conditions are unhappily favourable, they commit ravages estimated in millions. In the fourth year of larval life the young beetles bury themselves, and fall for two months into the usual quiescence of the pupa stage. The liberated insect works its way to the surface, and takes its flight in the spring of the fifth year. In warm seasons and regions the period of larval life may be shortened. The adults do most of their disastrous work in the twilight. The only riddance seems to be the exposure of the larvæ by harrowing, and the destruction of young and old by every possible means. Rooks and other birds, insectivorous animals, and other beetles help to reduce their numbers. They have oftener been plagues on the Continent than in Britain, but in 1574 their corpses are said to have clogged mill-wheels on the Severn, and in 1688 they clung like swarming bees on the trees and hedges in Galway. *Melolontha hippocastani* is another very destructive European species. The May bug of the United States (*Lachnosterna quercina*) is an allied form of similar habits.

**Cocker.** See SPANIEL.

**Cocker,** EDWARD, schoolmaster and author, was born in 1831, and died in London in 1875. His book on arithmetic was the first English work of the kind really adapted to commercial life, and became so widely known that the

name of Cocker is as indissolubly associated with accuracy in figures as that of Murray with the rules of grammar. He attained considerable success as a teacher of arithmetic and writing in London, and is mentioned repeatedly in Pepys's *Diary*, who qualifies him as 'very ingenious and well read in all our English poets.' Cocker published over thirty works on writing or arithmetic, but the famous book so often reprinted, *Cocker's Arithmetick*, was posthumous, being dated 1678, and edited by John Hawkins. De Morgan has contended, apparently on insufficient grounds, that this book, which passed through 112 editions, was not really Cocker's work at all. Among other works published under his name are an English dictionary, and the *Muses' Spring Garden*, which contains some quaint verses of his own composition.

**Cockerill,** JOHN, manufacturer, born in Lancashire in 1790, was the son of William Cockerill (1759-1832), an inventor and machinist who in 1807 settled at Liège in Belgium. John, with an elder brother, succeeded to their father's business in 1812, established a woollen factory in Berlin in 1815, and in 1817 founded the famous works at Seraing (q.v.). He died at Warsaw, 19th June 1840; in 1867 his remains were brought to Seraing, where his statue was erected in 1871.

**Cockermouth,** a town of Cumbeland, 25 miles SW. of Carlisle, and 12 NW. of Keswick. It is pleasantly situated in an agricultural district, and has a walk a mile long beside the Derwent. A ruined castle, founded towards the close of the 11th century, crowns a bold height on the left bank of the Cocker, near its influx to the Derwent. It became Mary Stuart's prison in 1568, and in 1648 was dismantled by the parliamentarians. Near Cockermouth is a tumulus, Toot's Hill; and at Pap Castle are remains of a Roman camp. Wordsworth was born in Cockermouth in an old-fashioned house, still standing; Dalton in the country near by. Population, 5000. Till 1867 Cockermouth returned two members to parliament; till 1885 (when it was incorporated in the county), one.

**Cock-fighting** was common among both the Greeks and the Romans, as to-day it is common in India, the Malay countries, and Spanish America. In England it flourished for fully six centuries, the cockpit at Whitehall having been erected and patronised by royalty. In 1709 a German visitor to London describes the Gray's Inn cockpit as 'round like a tower, and inside just like a *theatrum anatomicum*, the benches rising all round;' with the scene at a cock-fight Hogarth has made us familiar. Cock-fighting was prohibited in 1365, in 1654, and in 1849; but it is still sometimes practised in spite of prohibition. Newspaper readers are familiar with paragraphs on cock-fights interrupted by the police, and fines are from time to time inflicted.

The favourite breed of fighting-cocks is the game-fowl (see POULTRY), and very large sums have been given for chicks. Much art is displayed in the training of cocks, and in trimming and preparing the cock for the combat; the fastening on of the spurs is a matter of considerable experience. Young cocks are called stags; two years is the best age. In fighting a match, a certain number of cocks to be shown on either side is agreed upon, and the day before the match the cocks are shown, weighed with the greatest nicety, and matched according to their weights. Their marks are all also carefully set down to prevent trickery. The cocks within an ounce of each other in weight are said to '*fall in*,' and are matched. Those which do not fall in are matched to fight what are called '*byes*.' Those which do

fall in come into the *main*. The main is fought for a stake upon each battle, and so much for the main, or the winner of the most battles in the main; while the byes have nothing to do with the main, and are usually fought for smaller sums. A middling size is considered the best, and from 3 lb. 6 oz. to 4 lb. 8 oz. is the medium. Cocks sometimes fight in silver spurs, but more often in steel. In a Welsh main the cocks fight until only one is left alive. By the Act of 1849, a penalty of £5 may be levied on any person keeping fighting-cocks, letting a cockpit, or otherwise connecting himself with cock-fighting, for every day that he shall so act.

Strange to say, cock-fighting was a specially sanctioned annual sport of public schools, the schoolmaster receiving a regular tax from the boys on the occasion, which was on Shrove Tuesday. It was so in the days of Henry II.; and in his *Scholemaster* (1570) Roger Ascham announced his intention, never fulfilled, of writing a 'Book of the Cock-pitte,' as 'a kinde of pastime fitte for a gentleman.' As late as 1790 the income of the schoolmaster of Applecross in Ross-shire was formally said to be composed of salary, fees, and *cock-fight dues*. And Hugh Miller, in *My Schools and Schoolmasters*, gives an account of the yearly cock-fights in the grammar-school of Cromarty about 1812. The yet more barbarous custom of throwing sticks at cocks fastened to stakes, was also long practised at Shrove-tide. The slang *cock-shy* is a survival.

**Cockie-leekie** is in Scotland a kind of soup made of a fowl boiled with leeks.

**Cock Lane Ghost.** In the year 1762 London was thrown into a state of extraordinary excitement by the reported existence of a ghost in the house of one Mr Parsons, in Cock Lane, Smithfield. Strange and unaccountable noises were heard in the house, and a luminous lady, bearing a strong resemblance to one who, under the name of Mrs Kemt, had once resided in the house, but who had died two years before, was said to have been seen. Dark suspicions as to Mr Kemt having poisoned the lady were immediately aroused, and were confirmed by the ghost, who, on being interrogated, answered, after the fashion of the spirits of our own day, by knocking. Crowds were attracted to the house to hear the ghost, and the great majority became believers. At length a plan was formed by a few sceptics to ascertain the real origin of the noises. Parsons's daughter, a girl eleven years of age, from whom they supposed the sounds to proceed, was taken to another house by herself, and threatened with the imprisonment of her father in Newgate if she did not renew the rappings that evening, the noises having for some time been discontinued. She was discovered to have taken a board with her into bed, and when the noises took place, no doubt was entertained that they had all along been produced by similar methods. A prosecution was then raised by Mr Kemt, and Parsons was condemned to stand thrice on the pillory for imposture and defamation. Among those who visited the house was Dr Johnson, but it is not true that, with all his natural bent to easy belief in the supernatural, he was one of the dupes of this miserable imposture. Churchill's gross caricature of Pomposo's credulity in his tiresome poem of over four thousand lines, *The Ghost*, was mere false and malicious slander, and deserved the payment that the burly Johnson promised to give Foote upon his own stage if he persisted in taking him off in the same way. See A. Lang's *Cock Lane and Common Sense* (1894).

**Cockle** (*Cardium*), a large and typical genus of bivalve molluscs (Lamellibranchs). The thick,

ribbed, heart-shaped, equal-valved shell, and the large knee-bent 'foot' are characteristics well known to every one. The shell is closed by two muscles; the hinge has large teeth; there are two minute respiratory siphons. About two hundred living species are known, and have a very wide distribution, though most abundant in the tropical seas. They live freely and gregariously, generally buried in the mud or sand. The foot is used for burrowing, but by it the cockle can also jump a few inches. *C. edule* is very largely eaten, and is often sold in great quantities on the streets of British towns. The fossil forms are very numerous, and increase from the Silurian onwards. (For figure and structure, see BIVALVES.)

**Cockle.** See CORN-COCKLE.

**Cocklebur** (*Xanthium*), a small but very widely distributed genus of Composite. The flowers are in unisexual heads, the male heads being at the ends of the branches. The female head has only two flowers, which are so enclosed in a prickly involucre that only the styles project through openings in its two horns. In fruit the involucre is hard and woody, about an inch long, and covered with hooked prickles, forming a bur which is very troublesome to sheep and other animals. So effective is this means of dissemination that it is difficult to determine the native region of the plants. Of the three species which have become familiar pests in the United States, one may be American; the others are probably introduced from the Old World. The progress of one species has been traced from the east of Europe. It reached Wallachia in 1828 on the manes and tails of Cossack horses. Hungarian cattle and wool brought it to Regensburg, and so to Hamburg. In South Africa the value of wool was so seriously affected by cocklebur that stringent laws for its eradication had to be enacted.

**Cockney**, a familiar name for a Londoner; the earlier meaning of which was a foolish, effeminate person, or a spoilt child. The original meaning is very obscure, but in Chaucer *cokenay* (a trisyllabic word) had much the same meaning as this. Professor Skeat points out its obscurity of meaning in two famous passages in *Piers Plowman* (x. 207), and in the last stanza of the 'Tournament of Tottenham' in Percy's *Reliques*. The word occurs twice in Shakespeare (*Twelfth Night*, IV. i. 15; and *Lea*, II. iv. 123), and there with the meaning, according to Schmidt, of a person who knows only the life and manners of the town. The origin of the word *cockney* has been much debated. Wedgwood, followed by Skeat in his 'Errata,' connected it with the French *coquin*, 'a rogue;' itself, according to Littré and Scheler, derived through a Low Latin *coquinus* from Latin *coquus*, 'a cook' or 'kitchen-scullion.' Diez doubted this, and assumed a connection with the old Norse *kok*, the throat. But according to Sir J. A. H. Murray, the word *cokeneye* or *cokenay* means really *cocks'-egg*, i.e. either simply a hen's egg or a diminutive hen's egg; then a 'nestle-cock,' a mother's darling, a cockered or pampered or effeminate person. *Cocken* is genitive plural; *ay* or *ey* the native English word (O.E. *æg*), which has been displaced by the cognate Old Norse *egg*.

**Cock of the Plains.** See GROUSE.

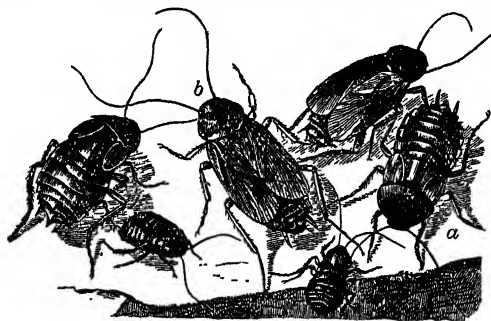

**Cock of the Rock** (*Rupicola*), a genus of South American Passerine birds in the family of Cotingidæ or Chatterers (q.v.), well known for the dancing and display by which the cock birds recommend themselves to the hens. The bill is high and strong, the tail short and straight, the sole naked; the feet are strong and stout. The male is remarkable for a lofty, laterally compressed crest. In the best-known species (*R. crocea*), from

Guiana and the north-east of Brazil, the male is predominantly orange-red in colour, with a dark purple-red crest, and decidedly larger than the sober brown female. It is about the size of a common pigeon.

**Cock of the Woods.** See CAPERCAILZIE.

**Cockpit**, in a ship of war, was the name given to the compartment in the lower part of the ship where the wounded were attended to during action. In the modern navy certain flats below the water-line are fitted up for the purpose. It also means an enclosure for cock-fighting; and the name was given to a 17th-century theatre in London on a site once occupied by a cockpit.

**Cockroach**, a family (Blattidæ) of insects within the order Orthoptera, which likewise includes locusts, grasshoppers, crickets, leaf-insects, earwigs, &c. They are wrongly called beetles. Familiar enough as pests, cockroaches require no minute description. The antennæ longer than the body—i.e. over an inch—the bent-down head (half-hidden by the large first thoracic plate), the long spiny legs compressed terminally, the flat broad segmented abdomen, the cigar-shaped anal appendages (which are supposed by some to represent a pair of rudimentary abdominal legs), are among the more striking external features. The two adult sexes in the common cockroach are readily distinguished, since the female has a somewhat broader abdomen, and only slight traces of wings. In the male, the anterior wings form stiff opaque wing-covers (*tegmina*), while the posterior pair are membranous, really wing-like, and folded longitudinally; in the female, the *tegmina* are very small, and the posterior wings only suggested by marks. Certain cockroaches, however, are wingless in both sexes. There are complex copulatory and egg-laying structures in the respective sexes.

Common Cockroach :  
a, female; b, male.

The essential male organs atrophy in the adult males. The eggs are surrounded by a peculiar hard capsule, which the female carries about for a long time, but eventually attaches by a glutinous secretion to some suitable sheltering object. This cocoon, in the common species, usually contains sixteen eggs, one from each of the ovarian tubes. Like other true Orthoptera, the cockroaches have no marked metamorphosis in their life-history. The larvæ, when developed, appear to soften the edges of a side slit in the inclosing capsule, and emerge through this into active life. They pass through no fasting quiescent state, and when hatched, differ from the adults only in minor quantitative details. They are said to moult seven times before becoming quite adult in the fifth year of their life.

Cockroaches are voracious insects, devouring both animal and vegetable substances, which they seek out by aid of their almost certainly olfactory

antennæ. Their mouth organs (three pairs of jaws) are very typical, and well adapted for biting. The juices of the mouth leave a disgusting smell on the objects over which the insects pass. They are nocturnal in habit, most abundant in warm countries, fond of sheltering in houses, and notoriously a pest to bakers and millers. To get rid of them a tame hedgehog is often employed, or they may be caught in large numbers in a slippery milk basin, baited with treacle, and led up to by a piece of wood which cannot be regained from the bottom. The commonest species in Britain (*Periplaneta orientalis*) had reached England by 1624, perhaps from the Crimea, where it has been found far from man's habitations; *P. americana* has found its way hither in bales, &c., from America. The German cockroach (*Blatta* or *Phyllodromia germanica*) is a troublesome, widely distributed form, which appears, however, to go to the wall before our common pest. Another form (*Blatta* or *Ectobia lapponica*) of smaller size, which occurs commonly in the woods of north and central Europe, is specially important in Lapland, where it sometimes does great injury by devouring the winter stores of salted fish. The largest form known is a native of South America and the West Indies, which measures about 3 inches in length, and makes a loud drumming noise. The cockroach is an ancient insect, having been actually found in Silurian strata. As a tolerably evolved, and yet not too highly specialised type, it is a very convenient type for study. See Miall and Denny, *The Cockroach* (1886); Carpenter, *Insects* (1899); Lucas, *British Orthoptera* (1920).

**Cockscomb** (*Celosia cristata*), an East-Indian annual of the order Amarantaceæ, familiar in conservatories, often also planted out in warm borders, especially in the southern parts of Britain. It grows with an upright stem, which becomes flattened upwards, divides, expands, and forms a sort of wavy crest, covered with pointed bracts, and bearing on its surface many very small abortive flowers, so crowded as often to present a rich velvety appearance. The colours are various, and often very brilliant. In the wild species, however, the flowers are of ordinary type, and in simple spikes and panicles; while in the so-called *C. aurea*, a golden variety formerly much cultivated, only a few flowers of the base of the inflorescence are perfect, the other being represented only by bracts and scales; while in the cockscomb proper the monstrosity known as *Fasciation* (q.v.) has further taken place.

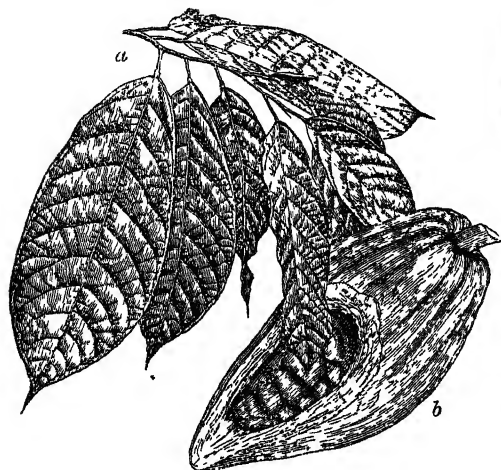

**Cock's-foot Grass** (*Dactylis*), a genus of Grasses, closely allied to Fescue (*Festuca*), but differing in habit. The Common or Rough Cock's-foot Grass (*D. glomerata*) is a native of both palæarctic and nearctic regions, and is very abundant in Britain. It furnishes an important part of both natural and artificial pastures. In America this grass is called Orchard Grass, and is extensively cultivated. To this genus belongs also the Tussock Grass (q.v.). See PASTURE, GRASSES.

**Cockton**, HENRY, comic novelist, was born in London in 1807, and died 26th June 1853 at Bury St Edmunds, where eleven years earlier he had married and settled in business. Unless for their illustrations, all of his ten works are almost forgotten but one—*Valentine Voe, the Ventriloquist* (1840).

**Cocoa**, or CACAO. The different kinds of cocoa are prepared from the seeds of trees of the genus *Theobroma*.

The genus *Theobroma* (Gr., 'food of the gods') belongs to the natural order Sterculiaceæ (q.v.), and contains a number of species, trees of moderate size, with large undivided leaves and clustered flowers, all natives of the tropical parts of America.

By far the most important species of this genus is *T. cacao*, to which the name cocoa-tree is often exclusively appropriated. It is extensively cultivated in tropical America and the West Indies, and its cultivation has been introduced into some parts of Asia and Africa. The fruit is somewhat like a cucumber in shape, is 6 or 8 inches long,

Cocoa (*Theobroma cacao*):  
a, branch with leaves; b, fruit (partly in section).

yellow, and red on the side next the sun; the rind is thick and warty, the pulp sweetish, and not unpleasant; the seeds numerous, compressed, and not unlike almonds, with a thin, pale, reddish-brown, fragile skin or shell, covering a dark-brown, oily, aromatic, bitter kernel. These seeds are the *cocoa beans* of commerce; when bruised so as to be reduced to small pieces, after being shelled or decorticated, they become *cocoa nibs*. The cocoa-tree produces larger seeds in cultivation than in a wild state. The tree attains its full vigour and productiveness in seven or eight years, and generally yields two principal crops in the year. When gathered, the fruit is subjected to five days' fermentation in earthen vessels or in heaps on the ground, and then opened by the hand; or it is buried for a while in the earth till the pulp becomes rotten. The latter method is said to produce the best cocoa (*earthed cocoa* or *cacao terre*). The seeds are then roasted.

The average composition of the shelled and roasted bean is, in round numbers, about as follows. There is considerable variation in different samples.

(Hydrocarbon) Cocoa-butter.....	51
(Nitrogenous food) Gluten, albumen, &c.....	22
(Carbo-hydrates) Starch, gum, &c.....	13
Water.....	5
Mineral matter.....	3½
Indigestible woody matter (cellulose).....	3
Theobromine.....	2½

100

This expresses a very high nutritive value, as will be understood by comparing it with the constituents in a beefsteak, which has 19 per cent. of nitrogenous matter, 4 of fat, no carbo-hydrates such as starch or gum, 5 of mineral matters, and 72 per cent. of water. Cocoa-butter, which is extracted from ordinary cocoa (but is left in what is to be manufactured into sweet chocolate), is largely used to adulterate butter; is an essential constituent of many ointments, toilet soaps, and bon-bons; and is of almost as much commercial value as the cocoa itself. In order to render its large amount of nutritious

matter digestible, the nut must be prepared. The best mode of preparation is by crushing and continuous grinding under rollers until the whole is reduced to an impalpable paste. This, when dried, adheres, and forms a hard cake. In this form it is now supplied to the navy and many merchant ships, and forms a most valuable beverage-food for sailors when scraped or pounded and boiled for a short time in water. The large amount of fatty matter and nitrogenous food renders it especially suitable for men exposed to cold and fatigue. It is a most valuable reserve food for travellers, so much of both heat-giving and flesh-forming nutriment being concentrated in a given bulk and weight. It is thus used by Swiss and Tyrolean mountaineers in the form of edible chocolate. For the preparation of chocolate, see CHOCOLATE.

An infusion of the broken and roasted shells, which are set aside in preparing the best qualities of chocolate, is used in Italy, Spain, and other countries as a cheap substitute for coffee, and bears the name of *miserable* ('poverty stricken'). The pulp of the fruit is eaten in the countries in which the tree grows, and a kind of spirit is obtained from it by fermentation and distillation.

Another mode of preparation consists in adding large quantities of cooked farinaceous material to the ground cocoa, mixing in a pasty condition, then drying. The mixture may contain but little cocoa, producing, with boiling water, merely a gruel flavoured with cocoa. Those who prefer such mixtures will find it economical to prepare their gruel or porridge themselves, and add cocoa to it. By using whole or ground cocoa nibs, a cocoa beverage may be obtained, but for this it is necessary to subject the nibs to very long boiling; a whole day is desirable. The full and peculiar flavour of the nut comes out, and much of the butter floats on top, while the cellulose and other insoluble constituents remain as sediment.

The *Theobromine* or special crystallisable alkaloid of cocoa resembles that of tea and coffee, but contains a larger proportion of nitrogen, and appears to be less stimulating in its action on the nervous system. Some regard it as highly nutritious.

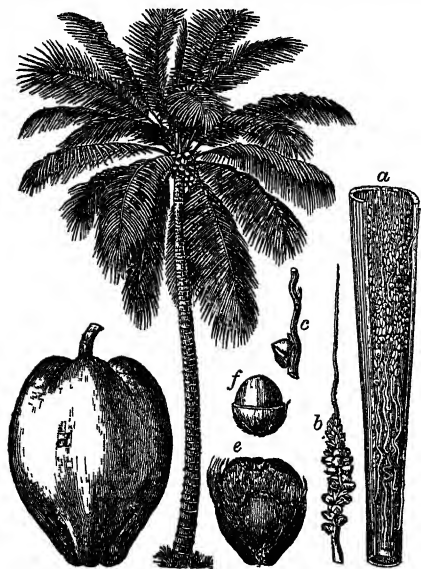

Allegations of slavery induced the British manufacturers of cocoa to send Mr Cadbury to the Portuguese islands of S. Thomé and Principe, from which a great part of the world's supply came. On receiving his report in 1909, they determined to buy no more from these islands until the labour system was changed.

In South Carolina the earth-nut is roasted and used as a spurious cocoa; and in Spain the root of the earth chestnut (*Cyperus esculenta*) is similarly used. See ADULTERATION.

**Coco de Mer.** See COCONUT (DOUBLE).

**Coconut** is the better form of what since Dr Johnson's time has often been spelt *Coccol-nut*; *coco*, 'mask,' being the Portuguese name given to the nut from the resemblance of its lower part to a mask. It is the well-known fruit of a species of palm, *Cocos nucifera*, perhaps originally a native of tropical America, or, as some would have it, of the Indian coasts and South Sea Islands, now diffused over all tropical regions, generally succeeding best in sandy soils, not necessarily near the sea. It is always one of the first of the larger plants to establish itself in the low islands of the Pacific Ocean, so soon as there is soil enough, its nuts being widely distributed by marine currents, while the thick husk protects the embryo from injury. It has a cylindrical stem, about 1½ feet in diameter, and from 60 to 90 feet high, with many rings marking the places of former leaves, and bearing at its summit a crown of from sixteen to twenty leaves, which generally curve downwards, and are from 10

to 15 feet in length. The short racemes bear from five to fifteen or more nuts; and ten or twelve of these racemes, in different stages, may be seen at once on a tree, about eighty or one hundred nuts being its ordinary annual produce, or in modern plantations two hundred and fifty. The tree bears fruit in from seven to eight years (sometimes four years) from the time of planting, and continues productive for seventy or eighty years, the fruit being

Coconut Palm (*Cocos nucifera*):

a, portion of young spathe, with enclosed inflorescence; b, branch of spatix; c, smaller portion enlarged, showing a female flower below and male flower above; d, coconut—e, husk cut open, showing hard endocarp, at f opened to show the single seed.

gathered four or five times annually. This affords to the inhabitants of many tropical coasts and islands great part of their food; it is not only eaten as it comes from the tree, both ripe and unripe, being filled in a young state with a pleasant milky fluid, but it is also prepared in a variety of ways. For the structure of the fruit, see PALMS.

The kernel of the coconut contains more than 70 per cent. of a fixed oil called Coconut Oil, or Coconut Butter, which must not be confounded with the fixed oil of the chocolate, known as cocoa butter. The oil is itself an important article of commerce, being much employed in Europe for the manufacture of candles and of soap. A great impulse has been given to the import by the enormously extended use of coconut oil for edible and cooking purposes (including the making of biscuits and confectionery), and for the manufacture of margarine and other butter substitutes—nut-butter, 'nutter,' &c.—which keep better than cows' butter. It has been recommended as a substitute for lard in the preparation of ointments. It may be used instead of cod-liver oil in consumption, for which purpose it is more palatable and less likely to cause nausea. It is obtained by pressure of copra (dried kernels), or by boiling over a slow fire, and skimming off the oil as it floats on the surface. A quart may be obtained from seven or eight coconuts, and the residue is valuable for cattle-food cake. The oil, which in the tropics is used as a lamp-oil and as an unguent, is liquid in the ordinary temperatures of tropical countries, but in colder climates becomes a white, solid, butter-like oil. It becomes liquid about 74° F. (23·3° C.). It can be separated by compression in

the cold into a more liquid portion called *olein*, and a more solid part termed *cocostearin*, or *cocosin*, which is of complex constitution, and contains at least six fatty acids.

The root of the coconut palm possesses narcotic properties, and is sometimes chewed instead of the areca-nut. The terminal bud (*Palm Cabbage*) is esteemed a delicacy, and trees are often cut down for the sake of it; the central part of the young stem is also succulent and eatable.—The saccharine sap (*toddy*) of this, as of some other palms, is an esteemed beverage in tropical countries, either in the state in which it is obtained from the tree, or after fermentation, which takes place in a few hours; and from the fermented sap (*palm wine*) a spirituous liquor (*arrack*) is obtained by distillation. The juice is often also in the East Indies boiled down to yield sugar (*jaggery*). A variety of arrack is also distilled from the fermented milk.

The dried leaves of the coconut palm are much used for thatch, and for many other purposes, as the making of mats, screens, baskets, &c., by plaiting the leaflets. The midribs of the leaves supply the natives of tropical coasts with oars.—The wood of the lower part of the well-grown stem is very hard, takes a beautiful polish, is employed for a great variety of purposes, and is imported into Britain for ornamental joinery, under the name of Porcupine Wood.—The fibrous tissue of the less mature stems is made into cordage. A kind of gum is also frequently obtained from the stem.—By far the most important fibrous product of the coconut tree is Coir (q.v.), the fibre of the husk of the imperfectly ripened nut. The husk of the ripened nut is used for fuel, and also, when cut across, for polishing furniture, scrubbing floors, &c.

The shell of the coconut is made into cups, goblets, ladles, &c., and is often polished or carved. Within the nut there is occasionally found a small stony substance, of a bluish-white colour, 'a sort of vegetable bezoar,' called in India *Calappa*, to which the Chinese ascribe great virtues. There are about 30 species of the genus, mostly South American, of which *C. butyracea* and *C. coronata* may be mentioned as specially important sources of oil and starch respectively.

**Coconut, DOUBLE** (also called Sea or Maldivé Coconut, or Coco de Mer), is the fruit of the *Lodoicea Seychellarum* palm. Its huge double kernel, the largest fruit known, requiring some ten years to ripen, has long had an extraordinary value over a large area in the East. As a sovereign antidote to poison, and long known only from specimens thrown up on the Maldivé coasts, it was supposed to grow on a submarine tree, and had other fables attached to it. The tree on which it grows is peculiar to some of the Seychelles Islands, reaches a height of 100 feet, and has very large fern-like leaves.

**Coconut Beetle** (*Batocera rubus*), a large Longicorn beetle, the larvæ of which are very destructive in coconut plantations, eating their way in all directions in the stems of the younger trees. They are destitute of feet, large and pulpy, and of repulsive aspect, but are esteemed a luxury by the coolies of the East. They resemble the *grugru* worms of South America.

**Cocoon**, the silken sheath spun by the larvæ of many insects in passing into the pupa or resting stage. The cocoon proper is due to the secretion of special spinning glands, situated anteriorly or posteriorly, but larval hairs and foreign objects of many kinds may also be utilised. The amount of secretion, the arrangement of the threads, and the completeness of the covering vary very widely; nor is the presence of any cocoon whatever essential to the pupa stage. The most typical and perfect

cocoons are those of many moths, a familiar example being that of the silkworm. The delicacy, neatness, and labour exhibited by these last silken robes make them as marvellous as they are useful. See CATERPILLAR, CHRYSALIS, INSECTS, and especially SILK.

**Cocos.** See COCONUT, KEELING ISLANDS.

**Cocy'tus**, a river of Epirus, a tributary of the Acheron, supposed to be connected with the lower world. Homer makes it a branch of the Styx; Virgil makes the Acheron flow into the Cocy'tus.

**Cod** (*Gadus*), a genus of bony fishes in the soft-rayed order (Anacanthini), and type of a family (Gadidae) which includes some valuable food-fishes, such as Ling (Molva), Hake or 'Stockfish' (Merluccius), Burbot (Lota), &c. The genus *Gadus* itself is undoubtedly the most valuable. A moderately elongated body with small smooth scales, the three dorsal and two anal fins, the distinctness of the tail from the fins, the position of the pelvic limbs on the throat, the toothed vomer and toothless palatine, are among the more important distinctive features. The genus includes about a score of species, distributed in the cold and temperate seas of the northern part of the globe, and well known to be very abundant off Newfoundland, at the Lofoten Islands, and on the Dogger Bank. They seem to follow the herring shoals. As part of our food-supply, and as sources of cod-liver oil, the species of *Gadus* are of great economic importance.

Besides the cod proper (*G. morrhua*), the following species are well known: the Haddock (q.v., *G. aeglefinus*), the Whiting (q.v., *G. merlangus*), the Bib or Whiting-pout (*G. luscus*), the Power-cod (*G. minutus*), the Pollack (*G. pollachius*), the Coal-fish (*G. virens*).

The cod itself is too familiar an animal to demand description. It attains a length of 2 to 4 feet, and may weigh as much as 100 lb. The sensitive barbule on the chin is tolerably long. The colour varies considerably. A smaller variety (dorse) is sometimes distinguished—e.g. in the Baltic. The cod occurs between 50° and 75° N. lat. in great profusion, to a depth of 120 fathoms, but is not found nearer the equator than 40° lat. It spawns from January to May, according to the climate, and it is only at this season that numbers crowd together. The cod is very voracious, and feeds at the bottom on crustaceans, molluscs, worms, and even on small fishes. They are very prolific, and it has been calculated that the roe of a large female may contain towards 9 million eggs. The productiveness of the great banks of Newfoundland excels that of all others, but the cod-fisheries near the coasts of Sweden, Iceland, and the north of Scotland are also important. The Dutch were engaged in the cod-fishery as early as the middle of the 14th century, and the English resorted for this purpose to the coasts of Iceland about the same period. The French have also engaged largely in the cod-fishery. The fishery is always carried on by means of lines and hooks, partly by *long-lines* and partly by *hand-lines*. Whelks and the like are used for bait. One man has been known to catch from 400 to 550 fish, on the banks of Newfoundland, in ten or eleven hours; and eight men to take eighty score in a day on the Dogger Bank. Great quantities of dried cod are carried from Newfoundland to the West Indies, and are consumed also in the Roman Catholic countries of the south of Europe. The principal seat of the cod-liver oil industry, in which other species are also utilised, is on the Norwegian coast. The preserved 'sound' or swim-bladder of the cod is esteemed a delicacy. It is also used in a dried state as isinglass. See Day's *British Fishes*, and Günther's *Introduction to the Study of Fishes*.

**Coda** (Ital., 'a tail'), a passage at the end of a musical composition, intended to round it off and give a sense of completeness in form. In early music it consisted often of a few simple chords; but it was enlarged, by Beethoven more especially, into a feature of the greatest importance and dimensions, it being one of the most characteristic features in the form of his symphonies; and other composers have with rare exceptions followed his lead. See SYMPHONY.

**Code** (Lat. *codex* and *caudex*). The primary meaning of the Latin word was the trunk or stem of a tree; afterwards it came to signify in a special sense wooden tablets bound together, and covered with a coating of wax, which were used for writing on. After parchment and paper were substituted for wood, the name *codex* was similarly applied to them. By Cicero and writers after him it was also often used to signify a book of account (e.g. *Codex rationum*); it was also used to indicate a MS. volume or book; but it was not till still later, in the times of the emperors, that it was used to express a collection of laws.

In its modern sense the word *Code* may be defined as a systematic statement of the laws of a country (either the whole law, or any special department of it) having the authority of an act of the legislature. In other words, it is the expression of the law of a country, in whole or in part, in a systematic and authoritative form. This definition distinguishes it, on the one hand, from a *digest*, which, in modern usage, properly signifies a collection of the decisions and rules of the common law arranged on a methodical plan, and, on the other hand, from a *consolidated statute*, which is nothing more than the incorporation of all the statutes in force relating to a particular branch of the law into one general enactment. While the *digest* differs from a code in so far as it wants the authority of a legislative enactment, the *consolidated statute* differs from it in that it does not deal with the unwritten or common law.

Whether it is for the advantage of a community that its laws should be expressed in the form of a code is a question which has been much discussed both in Great Britain and abroad. On the Continent it has been practically settled in the affirmative, while in Great Britain and in some of the states of America (particularly the state of New York) the controversy is still keenly maintained. Two principal objections urged by the opponents of codification may be thus summarised: (1) that it checks the natural growth of the law and hinders its free development; and (2) that, as law is progressive, there would be no finality—that it would be necessary to be constantly altering the code in order to adapt it to the new conditions of society. The answer usually made to the first of these objections is, that although law is a flexible and progressive science, it is nevertheless capable of being known as it exists at any given time, and if so it must be capable of being expressed in language. 'The law of a country,' observes the late Dudley Field, the distinguished American jurist, 'may be likened to its language, and to make a code of the one is like making a dictionary of the other.' If the law is not expressed in language, it must almost necessarily be left to the fluctuating opinion of judges to say whether a particular set of facts is in any given case of legal effect or not. To the second of the above objections the answer is: Granted that a code cannot be made for all time, there is nevertheless no reason why any changes required by altered conditions of society should not be adequately met by periodical revision. A commission of lawyers might be appointed for that purpose, and revision might take place, say, every ten

years. On the other hand, the arguments specially urged in favour of codification are: (1) that it simplifies the law, by getting rid of a vast mass of statutes and judicial decisions, whose authority has become more or less doubtful; and (2) that by simplifying the law it is made accessible to and comprehensible by ordinary citizens.

Historically, the name code has been given to a number of compilations or collections of laws, both of ancient and modern times, though some of these do not properly conform to the definition of code, in its modern sense, that we have given above. For convenience' sake we may divide them into three classes, viz. I. Primitive Codes; II. Codes of Roman Law during the Empire; III. Modern Codes.

I. PRIMITIVE CODES.—Among a number of early civilised peoples we find that attempts were made, more or less thorough, to put their customs and laws into writing in a definite shape. The object of these early efforts at codification seems to have been to make known to the peoples concerned the customs and laws under which they lived, rather than to put these into systematic and artistic form. Three of these primitive codes, of which we have some definite knowledge, may be mentioned, viz. the so-called Code of Hammurabi, or Khammu-rabi (see BABYLONIA), the Tables of Gortyn, and the Twelve Tables of Rome. The Code of Hammurabi was discovered in the beginning of this century. It is carved on diorite, and its supposed date is about 2250 B.C. It is thus the oldest known code in the world. Despite its antiquity, many of its provisions show a considerable degree of enlightenment.

The 'Tables of Gortyn' were discovered at Gortyn in Crete about 1884, carved on rock in a mill stream. Their date is generally supposed to be about the first half of the 5th century B.C. A number of their provisions, e.g. in the matter of adoption, have a similarity to the laws of the Twelve Tables, and throw considerable light on the early laws of Greece. The Twelve Tables (q.v.) is generally held to have been published in 303 A.U.C. (351 B.C.), though this date has been challenged, as being much too early, by Professor Pais of Turin and Professor Lambert of Lyons. Unlike the two codes last mentioned it is not extant, but a large number of its laws have been handed down to us by ancient writers in a more or less fragmentary shape, and it has thus been found possible to restore it to some extent. The Twelve Tables, though containing provisions relating to public as well as private law, did not embody the whole law; in particular, the rules of procedure were omitted. Other primitive codes or quasi-codes, such as the Laws of Solon, it is unnecessary to notice.

## II. CODES OF ROMAN LAW DURING THE EMPIRE.

—By the Romans during the empire the term Code (*Codex*), as applied to a collection of laws, was technically given to the constitutions (i.e. the *decreta*, *rescripta*, &c.) of the emperors, and had not its more extensive modern meaning. Notable codes in this narrow signification were: (1) *Codex Gregorianus*, (2) *Codex Hermogenianus*, (3) *Codex Theodosianus*, (4) *Codex Justinianus* (or *Justinianus*).

The first two of these it is unnecessary to describe here. They were both the work of private hands, although they were ultimately declared authoritative by a decree of Valentinian and Theodosius. The Gregorian is supposed to have been published about the end of the 3d century, and the Hermogenian a few years later. Only fragments of each have been preserved. About the other two codes a few words must be said.

*Codex Theodosianus*, named after the Emperor Theodosius the Younger, during whose reign it was compiled. The original idea of Theodosius was to prepare a complete body of the law, collected from the writings of the jurists as

well as the constitutions of the emperors, but his instructions to this effect were never carried out. The *codex*, as we have it, occupied three years in preparation, and was promulgated as law for the Eastern empire on 1st January 439, and a few days thereafter adopted and declared to be law for the Western empire by Valentinian III. This *Codex Theodosianus* has been in a great measure preserved. It consists of sixteen books, which are subdivided into titles, and a chronological order in the arrangement of the constitutions has been followed. All but the first five books (containing the purely private law) have come down to us. By means, however, of the so-called *Breviarum Alaricianum*, mentioned below, it has been possible to reproduce a considerable portion of the earlier books. From other sources also a number of genuine constitutions not to be found in Alarie's Breviary were during the 19th century recovered. The best edition of this code is that of Mommsen, published in 1904, but the old edition of Jac. Gothofredus, published in 1665, is still valuable for the celebrated commentary he there made upon it.

*Codex Justinianus*, named after the Emperor Justinian, in whose reign it was prepared. In the year 528 A.D. a commission of ten persons, with the famous Tribonian at their head, was appointed by Justinian to compile a code, incorporating in it the laws, so far as still in force, of the earlier codes of Gregorianus, Hermogenianus, and Theodosius, and also the various constitutions issued subsequent to these codes. The work was performed in fourteen months, and it was then declared that the new code should supersede the older compilation. A second edition of this work, revised and having a number of new enactments of Justinian himself incorporated, was promulgated in 534 under the name of the *Codex repetita praelectionis* (i.e. Code of the Revised Version). This is what has come down to us, and forms part of the *corpus juris*. It consists of twelve books, each divided into titles, the titles being composed of laws (constitutions).

The name Code is often also given in modern times to Justinian's compilations as a whole (i.e. the *Digest*, *Codex*, *Institutes*, and *Novels*); in other words, the *corpus juris*. And this is not altogether inaccurate, as undoubtedly the *Digest* and *Institutes* received statutory force from Justinian, and the compilations thus taken as a whole comply so far with the definition of a code already given. As no attempt was made, however, to fuse the common law and constitutions into a systematic whole, the *corpus juris* does not truly represent a code in the modern sense. (See JUSTINIAN.)

Along with the four *codices* just mentioned, as falling under head II., may be taken—

*Romano-Barbarian Codes*.—In some respects they approach more nearly the true conception of a code than those just considered. Several collections were made of the laws of the barbarians of western Europe after they had become free from the domination of Rome. To three of these collections the name of the Romano-Barbarian Codes is usually applied. They are (1) the *Edictum Theodorici*, compiled, about the year 500, under Theodoric, king of the Ostrogoths, and consisting of 154 sections (unsystematically arranged), dealing with all departments of the law, its materials being derived mainly from the Gregorian, Hermogenian, and Theodosian Codes. (2) The *Lex Romana Visigothorum*, prepared under Alaric, king of the Visigoths, and published in the year 506. This collection was one of great importance, and during a considerable part of the middle ages was treated in western Europe as the principal authority for Roman law, exercising great influence upon the laws of the barbarians. It was compiled by commissioners, appointed by Alaric, who derived their

materials in great part from the Theodosian Code, and the 'Sentences' of Paul, and the Institutes of Gaius. This codex is commonly described as the *Breviarum Alaricianum*. (3) The *Lex Romana Burgundionum*, also published about the beginning of the 6th century, under Gundobald, king of the Burgundians. It was compiled from much the same sources as the code of Alaric II., but was much less important.

III. MODERN CODES.—As already observed, the idea of a code in the modern sense—a complete statement of the whole law, or any particular department of it—was not realised by the ancients. Of modern codes there are an immense number of more or less excellence. The following may be noticed :

(1) *Prussian Code*.—The first of the modern codes (leaving out of view certain *ordonnances* of a general nature promulgated at an early date in France and some other countries, which hardly deserve the appellation Code) was the celebrated *Landrecht* of Prussia—the *Code Frédéric*—published in 1751. This work was due to the genius of Frederick the Great, and was intended by him firmly to cement the union between the various parts of his kingdom. In the introductory plan (or *projet*) Frederick tells what induced him to undertake the work—viz. the great uncertainty in the law arising out of the want of uniformity in the customs and statutes prevailing in the different parts of his dominions, and the excessive and costly litigations due to this uncertainty. This code has been entirely superseded by recent German codes to be noticed below.

(2) *Code Napoléon*.—This is the most celebrated of the modern codes. At the time of the great Revolution there was an endless variety of particular laws and customs (*droit écrit et droit coutume*) prevailing in the different parts of France, entailing great uncertainty and expense in the administration of justice, and preventing anything like true solidity and unity in the nation. Napoleon realised the necessity of the unification of the local laws by a code applicable to the whole country. No doubt, a good deal had been done towards unification by the preparation of an admirable act of *ordonnances* in the reigns of Louis XIV. and Louis XV., but they only went a small way in rectifying the evils. The *Constitution* of 1791 and *Projet de Code Civil* of Cambacérès (q.v.) partly anticipated the *Code Napoléon*, which, elaborated in four months by a commission comprising Tronchet and three others, was published and promulgated between 1804 and 1810. It consisted of five parts—viz. the 'Code Civil,' dealing with the main body of the private law; the 'Code de Procédure Civile,' the 'Code de Commerce,' dealing with the laws relating to commercial affairs; the 'Code d'Instruction Criminelle;' and, finally, the 'Code Pénal.' Each of these five parts was independent of the others, though prepared on the same system and governed by a uniformity of plan. In order to prevent absolutely an appeal in any case to the authority of the old laws and customs, it was expressly enacted that if cases should occur for which the code had made no provision, the judge should decide according to what he might consider to be good sense and equity or ancient custom—the code in this respect differing from some other modern codes, which require that any questions unprovided for by it shall be referred by the judge to a legislative commission for decision. The *Code Napoléon* (or, as it has been re-christened under the Republic, the *Code Civil*) remains in force as the law of France at the present day, and despite many defects in its original construction—necessitating a large number of interpretative commentaries—it has, beyond doubt, proved a great boon to that country. Napoleon (though he had,

of course, no share in the legal work performed by Cambacérès, Tronchet, and others) is said to have been prouder of it than of any of his victories. The best test of its excellence is that it has been (in whole or part) the model for a large number of Continental codes—e.g. those of Belgium, Italy, and Greece.

(3) *German Codes*.—Prior to the constitution of the German empire of 1871, two important codes of the German commercial law had been prepared and adopted by the North German Confederation. These were the *Wechsel-Ordnung*, codifying the laws relating to bills of exchange, which was published in 1848, and the *Allgemeines Handelsgesetzbuch*, codifying the whole commercial law, exclusive of bills of exchange and bankruptcy, which was published in 1861. After 1871 these two codes were made applicable to the whole of the empire, and three other departments of the law were codified—viz. the law of bankruptcy (*Konkursrecht*), the law of procedure, and the criminal law. After the Franco-Prussian war a commission was appointed for codifying practically the whole private law of Germany, exclusive of the departments just mentioned. This enormous work was successfully accomplished after about twenty years' labour, and the new code came into force on 1st January 1900, and is known as the *Bürgerliches Gesetzbuch*.

Nearly all the states of Europe now possess codes of their private law—e.g. Austria, Belgium, Italy, and Spain. Japan also has codified its law.

(4) *United States Codes*.—In most of the states codification, either of the whole law or of particular branches of it, has been effected. At the same time it is noticeable that in one or two of the states the expediency of codifying the private law is still much controverted. This is particularly the case with the state of New York, where in 1857-65 a draft civil code was prepared (mainly by the distinguished jurist, Dudley Field), but did not receive the sanction of the legislature. This draft civil code was adopted by California and Dakota, and many of its provisions have passed into the laws of Montana, Utah, Wyoming, and other states. A penal code was adopted by New York in 1882.

(5) *British and Colonial Codes*.—The main results in the way of codification achieved in the United Kingdom are the Bills of Exchange Act (1882), the Partnership Act (1890), the Sale of Goods Act (1893), and the Marine Insurance Act (1910). By the Bills of Exchange Act the statute and common law of the three kingdoms relating to this important department of mercantile jurisprudence was in great measure reduced to the form of a code; though it did not profess entirely to shut the door of the common law in questions affecting bills—decisions prior to the act being still authoritative so far as they are not inconsistent with its express provisions. But in other respects it fulfils the proper requirements of a code. Having been drafted with much care and skill, it has, since it came into force, proved of great value and benefit to the mercantile community in the way of diminishing litigation and otherwise. Efforts have been and are now being made by law-reformers (prominent among whom was Sir James F. Stephen) to have other branches of the law codified, and more particularly the law of evidence and the law of crimes, and criminal procedure. An excellent code exists in Canada, and in India several branches of the law have been codified by the celebrated Anglo-Indian codes. The criminal code of India was drawn up in the year 1837 under the auspices of Lord Macaulay, though it was not promulgated till 1860.

For codes in another sense, see SIGNALLING, TELEGRAPH, CRYPTOGRAPHY.

**Codeine**, an alkaloid obtained from poppy heads. See POPPY.

**Codex** (pl. CODICES : see CODE for etymology), the name applied to ancient manuscripts, as of the classics or of the Scriptures. Of the latter class the four great Codices are the Codex Sinaiticus, discovered in 1844 and 1859 in the monastery of Mount Sinai by Tischendorf, and the Codex Vaticanus, both of the 4th century; and the Codex Alexandrinus (see under ALEXANDRIA) and Codex Ephraemi of the 5th century. All four originally contained the Old and New Testament complete, but none are perfect copies, while the last, besides having great lacunæ, is almost illegible. See PALÆOGRAPHY; BIBLE.

**Codiaum.** See CROTON.

**Codicil** (Lat. *codicillus*, diminutive of *codex*), a supplement to a will, whereby anything omitted is added, or any change demanded by the altered circumstances of the testator or the beneficiaries, is effected. A codicil is authenticated in the same manner as a will, and possesses the same privileges when holograph, or written by the hand of the testator himself. See WILL.

**Codilla** is the coarsest part of hemp and also of flax, sorted out and separated from the rest.

**Codlin Moth** (*Carpocapsa pomonana*), the moth whose larvæ cause the 'worm-eaten' apples, which fall prematurely off.

**Cod-liver Oil** is generally obtained from the livers of the common Cod (q.v.), but likewise from allied species, as ling, dorse, coal-fish, torsk, &c. In these fish the Adipose Tissue (q.v.) containing oil is almost entirely confined to the liver, in which they agree with the shark tribe, whilst in other fish, as in the herring and salmon, the oil is diffused over the entire structure of the animal. The supplies of medicinal cod-liver oil used to be derived mainly from Newfoundland, but Norway now supplies the bulk of that used in Great Britain. The most famous of the Norwegian fishing-grounds is that of the Lofoden Islands. On the outer shores of these islands immense shoals of fish begin to arrive in December, but owing to the storms to which the coasts are liable, only a comparatively small number of boats engage in the fishing. In the beginning of January the fish pass in between the islands to the calmer waters of the Vestfjord to spawn. Then the fishermen, assembling in immense numbers, catch the fish by net or baited line. The fishing-grounds being near the shore, the fish are at once cleaned, and the livers removed. These may be treated in different ways, the various qualities of cod-liver oil being the result. The finest oil, known as 'non-freezing pale oil,' is obtained by warming the livers by means of steam heat, when the oil separates, and is either removed by straining or by allowing it to float to the surface. It is then cooled to 14° F. (-10° C.), and filtered, either by mechanical pressure or in the usual way. A white tallow-like substance remains in the flannel filter, and a bright cod-liver oil passes through, which is now capable of being exposed to frost without turning turbid.

In the case of those fisheries which are situated at some distance from the shore, the livers are placed in tanks, till a sufficient quantity has been collected, with the result that partial putrefaction occurs. The oil so obtained is of a dark-brown colour, and has a nauseous empyreumatic taste.

A still coarser variety is manufactured for use in leather-making. In it the livers of cod, herring, haddock, &c. are indiscriminately used, a very fishy-tasted oil being the result.

Cod-liver oil consists mainly of oleic, stearic, and palmitic acids, in combination with glycerine. In addition to these, *gaduin*, a substance of biliary origin, but possessing no recognised medicinal

virtues, is present along with a little iodine and bromine. With nitric acid, cod-liver oil yields a purple colour, changing to a brown; while a drop of sulphuric acid produces a violet colour, soon changing to brownish-red.

Cod-liver oil is one of the most important remedies in the *Materia Medica*. Although highly esteemed on the Continent, it was not till 1841, when Professor Hughes Bennett (q.v.) of Edinburgh wrote a treatise on it, that it came into general use in Britain. It is valued in cases of pulmonary consumption, chronic rheumatism, and gout.

**Codogno**, a town of northern Italy, 17 miles SE. of Lodi by rail; pop. 10,000.

**Codrington**, SIR EDWARD, a British admiral, was born of a good old Gloucestershire family, 27th April 1770, and entered the navy in 1783. In 1794 he was lieutenant of Lord Howe's flagship, and took a prominent part in the action off Ushant on the glorious 1st of June. At Trafalgar, in 1805, he was captain of the *Orion*, and leader of a squadron. He afterwards served in the North Sea, in Spanish waters, and in North America, and rose to the rank of vice-admiral in 1821. In 1826 he was appointed commander-in-chief of the Mediterranean squadron, and in that capacity took the leading part in the battle of Navarino (q.v.), which destroyed the Turkish navy. In reward for this victory he received the Grand Cross of the Bath, with Russian and French orders; but the battle being considered an 'untoward event,' Codrington was recalled. He attained the full rank of admiral of the red in 1837, and in 1839 was appointed commander-in-chief at Portsmouth. He was M.P. for Devonport from 1832 to 1839. He died April 28, 1851. The 'Narrative' written to prove that at Navarino he had not exceeded his instructions, is printed in the *Memoir* by his daughter, Lady Bourchier (2 vols. 1873).—His son, GENERAL SIR WILLIAM JOHN CODRINGTON, G.C.B. (1804-84), was commander-in-chief in the Crimea from 11th November 1855.—Another son, ADMIRAL SIR HENRY JOHN CODRINGTON, K.C.B. (1808-77), took part in the destruction of St Jean d'Acre, and served in the Baltic in 1854-55.

**Codrus**, the last king of Athens, was the son of Melanthus, and according to Greek legend, sacrificed his life for his country about the year 1068 B.C. A war raging between the Athenians and Dorians, the oracle declared that the victory should belong to those whose king was slain by the enemy; whereupon Codrus, attiring himself as a peasant, entered the Dorian camp, and having picked a quarrel with some of the soldiers, contrived to have himself slain. See ARCHON.

**Cody**, SAMUEL FRANKLIN (1862-1913), popularly known as 'Colonel' Cody, and distinguished as a kite-flier and aeronaut, was born at Birdville in Texas, and perished by accident near Aldershot. His first record as an aeronaut and biplane-builder was in England in 1908, and he gained the prize for a circuit of Great Britain in 1911. He was no relation of 'Buffalo Bill' (William Frederick Cody; 1846-1917) of the 'Wild West' Show, born in Iowa.

**Coefficient**, the numerical or literal factor prefixed to an unknown quantity in any algebraic term. Thus in the expression  $ax - 2by^3 + \sqrt{3}x^2 - (a+5)y$  there are four terms, and the coefficients are, in order,  $a$ ,  $2b$ ,  $\sqrt{3}$ , and  $(a+5)$ . A special and very important instance is found in the phrase *Differential Coefficient* (see DIFFERENCE) of a given function with reference to one or more of the variables involved. In the theory of equations, also, coefficients play an important part: thus, in the cubic  $x^3 + ax^2 + bx + c = 0$ , we know that (supposing

the 3 roots are  $p, q, r$ )  $p + q + r = -a$ ,  $pq + qr + rp = b$ , and  $pqr = -c$ .

**Coehoorn**, or COHORN, MENNO, BARON VAN, called the Dutch Vauban, was the son of a captain of infantry, and born near Leeuwarden in 1641. He studied fortification and mathematics at Franeker, and already captain of a company in his sixteenth year, he greatly distinguished himself at the siege of Maestricht, and in various battles. At the siege of Grave, in 1673, he demonstrated that the small portable mortars named after him might be advantageously employed. Coehoorn covered himself with honour at Senef (1674), before Kaiserswerth (1689), and at Fleurus (1690). He fortified Namur, and defended it against Vauban in 1692; besieged that fortress in 1695, and retook it; was appointed lieutenant-general and director-in-chief of the Dutch fortifications, and fortified several towns, of which Bergen-op-Zoom was considered his masterpiece. In the war of the Spanish succession he defeated the French more than once, and took Huy and Limburg. He died at The Hague, on his way to meet Marlborough, 17th March 1704. He left two important works on fortification.

**Coe horns**—named from the military engineer who introduced them—are small bronze Mortars (q.v.),  $\frac{3}{4}$  cwt. in weight, and of  $4\frac{1}{2}$  inches calibre. Being easily carried, they are useful in sieges, to annoy working parties, and in situations where guns cannot be employed, such as the attack of hill-forts in India.

**Cœlenterata**, or CœLENTERA, a great division of the animal kingdom, including zoophytes and medusoids (Hydrozoa), jelly-fishes (Scyphomedusæ), sea-anemones and corals (Anthozoa), and the aberrant class of free-swimming Ctenophores. With the exception of three or four fresh-water polyps, and as many fresh-water medusoids, all are marine.

Cœlenterates are almost always radially symmetrical animals, in which the primary long axis of the gastrula embryo becomes the long axis of the adult. This kind of symmetry, as opposed to the bilaterality of more vigorous animals, is well suited for easy-going sedentary life, or for somewhat aimless floating and leisurely swimming in the open sea. In many cases, as in sea-anemones, the superficial radial symmetry does not hold quite good when the details of internal structure are considered. As the name Cœlenterate is intended to express, there is no body-cavity (or coelom), distinct from the digestive cavity (enteron) and its outgrowths. In the simpler forms the primary opening of the enteron becomes the mouth of the adult, but in the more specialised forms there is an (ectodermic) oral invagination which forms an inturned gullet-tube. Between the external ectoderm and the internal endoderm of the body-wall, there is developed to a variable extent a middle supporting stratum, or mesogloea, often of gelatinous consistency. This is the 'jelly' of jelly-fishes. In the simplest cases the mesogloea is a secretion quite devoid of cells; but cells may secondarily migrate into it from the endoderm. In the aberrant Ctenophores, a more definite mesoderm (as in higher animals) is established at an early stage in development. The contrast between mesogloea and mesoderm is in part a question of degree, but it is usual to distinguish the Cœlenterates as diploblastic (two-layered) animals, in contrast to the triploblastic (three-layered) higher forms. The general retention of the embryonic radial symmetry, the absence of a coelom, and the usual non-development of a definite mesoderm may be said to mark off the Sponges and the Cœlentera from the higher animals, most of which show bilateral symmetry, a triploblastic embryo, and a distinct body-cavity (Coelomata).

Throughout the Cœlenterates characteristic stinging-cells or cnidoblasts are almost invariably present, and they do not occur elsewhere. In most of the Ctenophores, which some would separate off because of their numerous divergent features, the stinging-cells are usually replaced by adhesive cells. A typical stinging-cell contains a coiled protrusible lasso, lying in an irritant gelatinous substance. They are microscopic weapons, which function only once, and are very useful in paralysing small animals used as food.

The Cœlenterates exhibit two main types of structure—polypoid and medusoid—which recur in diverse forms throughout the series of classes, and may be both present in the course of one life-history, illustrating the phenomenon known as Alternation of Generations (q.v.). The polypoid type, cylindrical and tubular, with a crown of tentacles around the mouth, is well suited for sedentary life. Multiplication by budding is common, and often results in the formation of great colonies with hundreds of united individuals, among which there may be considerable division of labour or polymorphism. In many cases, again, the sedentary polyps form calcareous skeletons, resulting in the production of diverse kinds of 'coral.' The medusoid type is specialised for locomotion, and is illustrated by the small swimming-bells or Hydro-medusæ, and the larger jelly-fishes or Scyphomedusæ. The medusoids may also form elaborate colonies like the Portuguese man-of-war, and show a polymorphism even more extraordinary than any that occurs in sedentary polypoid colonies.

The Cœlenterates may be conveniently divided into four classes. (i.) The Hydrozoa include the fresh-water hydras, the hydroid zoophytes (Tubularians, Sertularians, Campanularians, &c.), the free-swimming medusoids liberated as sexual individuals from many of the hydroid colonies, the calcareous millepores or Hydrocorallinae, the Tachymedusoids which usually exist only in the medusoid form, and the free-swimming Siphonophora, like the Portuguese man-of-war, colonies of modified medusoids. It is probable that the entirely extinct Graptolites (q.v.) were Hydrozoa. (ii.) The Scyphomedusæ or Acraspeda include the true jelly-fishes and some sedentary fixed forms of this type known as Lucernarians. (iii.) The Anthozoa or Actinozoa include (1) the sea-anemones, the madrepore corals, and the black-corals or Antipatharians, which are all united as Zoantharia or Hexacoralla; and (2) the Alcyonarians or Octocoralla, such as Dead-men's Fingers (Alcyonium), organ-pipe coral (Tubipora), red-coral (Corallium), and Sea-pens (Pennatula). (iv.) The Ctenophora are delicate free-swimming forms, such as *Berœ*, very divergent from the rest.

See Fowler and Bourne in Lankester's *Treatise on Zoology*, part ii. (1900); and Hickson in the *Cambridge Natural History*, vol. i. (1906).

**Cœle-Syria** ('Hollow Syria'), now called by the natives El-Buk'a'a, 'the deep plain,' a valley of Syria, extending between the ranges of the Lebanon and Anti-Lebanon. It is 1706 feet above the sea, and is watered by the Orontes (now El-Asi). Above the valley stand the ruins of Baalbek.

**Cœlom**. See BODY-CAVITY.

**Cœnobites** (Gr. *koinos*, 'common,' and *bios*, 'life'), the name given to those monks who live together, in contradistinction to anchorites or hermits, who withdraw from all society, and live in a solitary fashion. See MONACHISM.

**Coffee** (Turkish *qahveh*, from Arabic *qahveh*, originally meaning 'wine'). This well-known beverage is an infusion of the roasted seeds of trees of the genus *Coffea*, notably *Coffea Arabica*, a native of Abyssinia, early introduced into Arabia

and many parts of Africa, and later into many of the tropical countries colonised by Europeans. There are some forty species of *Coffea*, but few of them seem to possess valuable properties; the seeds of *C. Mauritiana*, prepared in the same way, are bitter and slightly emetic. The genus belongs to the natural order Rubiaceæ. It has a tubular 4-5-cleft corolla, and a succulent fruit containing two cells lined with a cartilaginous membrane, and each containing one seed.

In a wild state, it is a slender tree of 15-25 feet high, with few branches; in cultivation,

Coffee; branch with fruit.

it is seldom allowed to become more than 6-10 feet high, and is made to assume a sort of pyramidal form, with horizontal branches almost from the ground. The leaves are evergreen, opposite, very shining, oblong, and leathery; the flowers are small, clustered in the axils of the leaves, and snow-white; the whole appearance of the tree is very pleasing; and the smell of the flowers is delicious. The ripe fruit is dark-scarlet, the seeds (incorrectly called *beans* or *berries*) semi-elliptic and of a horny hardness.

The coffee-tree succeeds only in countries where the average temperature of the year is about 64-70° F. In Peru and Quito it is acclimatised at an elevation of 6000 feet, where, however, frost never occurs; but as it delights in a moist atmosphere, it nowhere thrives better than in tropical islands. In the hothouses of Britain the coffee-tree frequently flowers and the fruit ripens. Coffee plantations are laid out pretty much in the same way everywhere. In quadrangles, bordered by fruit-trees, the coffee-trees stand in rows; they are pruned to the same height, and the ground between them is carefully kept clear of weeds. Where the climate is dry, abundant irrigation is necessary, but the supply of water is cut off as the fruit begins to ripen, in order to improve the aroma of the seeds. The tree yields its first crop in the third year; from a full-grown tree it may amount to a pound of coffee beans. As the coffee-tree continues flowering for eight months, its fruits are at any given time of very unequal ripeness; in the West Indies and Brazil three gatherings are therefore made annually. For the dry method the fruits are placed on mats or large floors specially adapted for the purpose, where they are

dried by the sun's rays, being meanwhile frequently turned. They are passed between rollers to remove the dry pulp of the fruit, and the membranes which enclose the seeds. The coffee is afterwards freed from impurities by winnowing, and conveyed in bags to the seaports. The wet method of preparation is more efficient. The fruits are placed in a tank and run off in a stream of water into a machine which removes most of the pulp. The remainder is got rid of by fermenting and washing. The fruits are then dried, by sun or artificially, or both, and the outer 'parchment' and inner 'silver-skin' are removed by another machine. The various grades are sorted out by a sizing machine. According to care bestowed on preparation, there are great differences in quality and price.

The earlier history of the coffee-tree is not very clear. Coffee was not known to the Greeks or Romans; but in Abyssinia and Ethiopia it has been used from time immemorial. In Arabia it was certainly in use in the 15th century, and over the rest of the East in the 16th century. Towards the end of the 17th century, Wieser, a burgo-master of Amsterdam, carried the coffee-tree from Mocha to Batavia, where it was soon extensively planted, and at last young plants were sent to the botanical garden at Amsterdam, from which the Paris garden obtained a tree. A layer of this was carried out to Martinique in 1720, where it succeeded so well that in a few years all the West Indies could be supplied with young trees. A large industry in Nyasaland has sprung from a plant sent from Edinburgh Botanic Gardens. Brazil is the chief producer of coffee.

The devastation of the Ceylon plantations by the leaf-disease (see CEYLON) led to the introduction of the stronger, but coarser, *Coffea Liberica*, or Liberian Coffee. *Coffea robusta*, discovered in 1898 in the Congo region, has since 1900 been cultivated in Java and the Federated Malay States. It grows more rapidly than *C. Liberica*, fruits sooner, is stronger, less dependent on weather and climate, and less subject to attacks from leaf-disease. It is grown in rubber plantations, where it competes so seriously with the rubber plants that it has to be cut out after five years. Several other West and Central African species are in cultivation.

Cheaper substitutes are Chicory (q.v.), dandelion root, carrot, the seeds of the common yellow iris, and the seeds of *Astragalus Beticus* or *Svedish Coffee*. They are prepared by roasting like coffee. But all these substitutes want the most important constituent of true coffee, *caffeine*. Ground coffee is subject to great Adulteration (q.v.).

In France and other Continental countries ground coffee is largely mixed with caramel or burnt sugar. This is for the most part prepared by skilfully roasting the 'foots' or dregs obtained in the refining of sugar. In moderate quantities it imparts a flavour considered by many to improve the infusion. The so-called 'French coffee' now so largely sold in England contains more or less of caramel—commonly much more than is desirable, its commercial value being very small. A rough test or indication of this is easily obtainable by dipping a bright silver or plated spoon into the infusion. The caramel infusion adheres to the spoon much more decidedly than the pure coffee infusion, and leaves a darker stain. Infusion of chicory behaves similarly to that of caramel.

The leaves of the coffee-tree are used in the western part of Sumatra instead of the seeds. They are prepared by quick drying in a manner similar to that in which tea-leaves are prepared, and in this state contain even a larger proportion of caffeine than the coffee beans of our shops.

Coffee owes its exhilarating and refreshing properties to the presence of three substances: (1)

*Caffeine* (q.v.), which occurs in the roasted bean to the extent of  $\frac{1}{2}$  to 1 per cent.; (2) a *volatile oil*, which is not present in the raw bean, but is developed during the process of roasting to the extent of only one part in about 50,000 of the roasted coffee; and (3) astringent acids, resembling tannic acid, but called *caffeo-tannic* and *caffeic* acids. The average composition of un-roasted coffee is as follows:

Caffeine . . . . .	0.8
Legumin (vegetable Caseine) (q.v.) . . . . .	13.0
Gum and sugar . . . . .	15.5
Caffeo-tannic and Caffeic acids . . . . .	5.0
Fat and volatile oil . . . . .	13.0
Woody fibre . . . . .	34.0
Ash . . . . .	6.7
Water . . . . .	12.0
	100.0

When the beans are roasted till they assume a reddish-brown colour, they lose 15 per cent. by weight, and gain 30 per cent. in bulk; when further roasted till they become chestnut brown, they have lost 20 per cent. by weight, and increased 50 per cent. in bulk; whilst if the roasting is continued till the beans become dark brown, they lose 25 per cent. in weight, and acquire 50 per cent. in bulk. When the roasting is carried too far, more or less charring is the result, and a disagreeable burnt smell is produced, which tends to overcome the natural pleasant aroma.

In Britain coffee is usually under-roasted, probably in order to escape the loss of weight, as the roaster is also the retailer. But in France, in Norway, in Germany, and other countries where it is roasted at home, the roasting is carried to the dark-brown stage. The superiority of the coffee made in these countries has been attributed mainly to this and the use of freshly roasted and ground coffee. The Norwegian peasant usually adds a very small quantity of butter to the beans while roasting; her simple apparatus, like a covered shovel or frying-pan, she continues shaking all the time while over the fire. Every tourist praises the result.

The important offices which coffee fulfils are, to allay the sensation of hunger; to produce an exhilarating and refreshing effect; and, according to some authorities, to diminish the amount of wear and tear, or waste of the animal frame. See DIET, DIGESTION, FOOD.

An endless variety of apparatus have been contrived—some of them of great complexity—for preparing coffee for the table. The chief object aimed at is to obtain the liquor free from all sediment. The simplest and cheapest device is that of placing a bag or metal strainer—by means of a suitable rim—in the upper part of the coffee-pot, placing the ground coffee in this, and pouring boiling water through it. Or the ground coffee may be simply placed in a saucepan or coffee-pot, hot water poured upon it, and boiled for a few minutes. After this the grounds will settle down, and the coffee may be poured off fairly clear.

Many forms of coffee-pot have been devised in which atmospheric pressure is applied for forcing the hot water through the ground coffee resting upon a metal strainer, doing this in such a manner that the water shall all pass through while just at the boiling heat, and then shall leave it.

The question whether coffee should be boiled at all, or simply infused like tea, has been much discussed. In countries where pure coffee is used, boiling is practically in favour. It has been shown, experimentally, that pure coffee is improved by two or three minutes' boiling, while chicory is rendered bitter and unpalatable by such treatment. Soyer recommends that, before the boiling water is poured in, the saucepan should be set dry on the fire, and the powder stirred till it is quite hot, but not in the least burned. In France an equal measure of

boiling milk is added to a very strong infusion in making *café au lait*. The chief effect of adding chicory to coffee is to deepen the colour. When milk is added to coffee it should be boiled; cream may be used without boiling. The Turks drink it thick with sediment; some Arabs make a tea-like beverage from the dried pulp; the Somali boil the berries in oil, and soak maize in the mixture. Raw coffee beans are improved by age. Essence of coffee is a highly concentrated infusion, mixed to the consistence of treacle with extract of chicory and burnt sugar; mixed with boiling water, it makes a tolerable beverage.

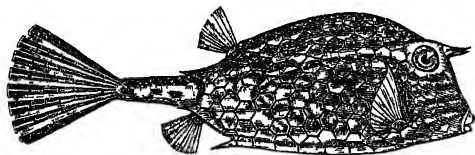

The destructive coffee-bug is a *Coccus* (q.v.), specifically *Coccus* or *Lecanium adomdum*. *Hemileia vastatrix*, the fungus which causes leaf-disease, is one of the Uredinæ. Bright orange patches appear on the leaves. The fungus grows within the leaf, and puts forth spore-bearing filaments through the stomata.

**Coffee-houses** were first heard of in Europe at Constantinople, in the middle of the 16th century, and are spoken of as among Turkish habits by Burton (1621) and Bacon (1627). They were introduced at Venice in 1645. Jacobs, a Jew, opened one at Oxford in 1650. The first in London was set up about 1652 in St Michael's Alley, Cornhill, by Pasqua Rosee, a Ragusan. The Rainbow was the second (1656). The first coffee-house in France was opened at Marseilles in 1671, and some years later an Armenian kept one in Paris. The *Café Procope* (1725), the first of the Parisian literary cafés, was founded by a Sicilian, Procopio Cuttelli. The *Régence* became favoured in after-years by the *romantiques*. Coffee-houses were established in Sweden in 1674, at Hamburg in 1679, and at Vienna in 1683. In 1675 an attempt was made by Charles II. to suppress them by proclamation as the resort of political agitators. For nearly a century they were in England much what they have remained in France to the present day, free and open clubs. Among the most famous were Garraway's, where tea was first retailed, and Jonathan's, both in Change Alley, the latter the stock-jobbers' resort; Dick's; Lloyd's (q.v.); the Jerusalem, one of the earliest city news-rooms; Don Saltero's, at Chelsea, with an absurd museum of curiosities; St James's, the resort of the Whigs from the reign of Queen Anne to the close of George III.; and Wills's, the predecessor of Button's, and the resort of Dryden. Addison and Swift patronised Button's. Other coffee-houses were Tom's in Birchinn Lane, Cornhill; the Bedford, Tom King's, and the Piazza, in Covent Garden; the Chapter in Paternoster Row; and Child's in St Paul's Churchyard. Cocoa and chocolate houses were coffee-houses under other names. See Robinson's *Early History of Coffee-houses* (1893).

**Cofferdam**, a watertight structure used in engineering for excluding the water from the foundations of bridges, quay walls, &c., so as to allow of their being built dry. Cofferdams are generally formed of timber piles driven close together (called sheeting) in two or more rows, according to the depth of water and the nature of the bottom, the space between the rows, which may vary from 4 to 10 feet, being spooned out, down to the solid and impervious bottom, and filled up with clay puddle. Sometimes they are made of only one row of piles of the full height, caulked above low-water, with a low or dwarf row outside to confine the puddle up to that level, or, where there is no wave or current, with a mere bank of clay thrown against the outside; and occasionally the upper work is formed of horizontal planking, fixed on open main piles, and caulked in the joints. When the bottom is rock, so as to prevent piles being driven, and is not much

below low-water, cofferdams are occasionally formed of two stone walls, with a space between filled with clay. Cofferdams require to be strongly shored within, to prevent their being forced inwards by the pressure of the external water; and the rows of piles require to be strongly bolted together, to resist the pressure of the clay puddle, which otherwise would burst them. This method of founding is now seldom practised; it is costly and obstructive to the stream. See CAISSON.

**Coffer-fish** (*Ostracion*), a peculiar genus of bony fishes in the small order Plectognathi, and in the family Sclerodermi, which also includes the file-fishes. The body is inclosed in a firm box formed of hexagonal bony scales fitted into one

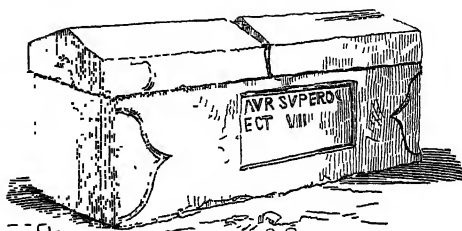

Coffer-fish.

another like a mosaic. The snout, the bases of the fins, and the end of the tail are the only soft-skinned parts. Over a score of species are known from tropical and subtropical seas. The best-known form is *O. quadricornis* from the tropical Atlantic. See GLOBE-FISH, and SUN-FISH.

**Coffin** (Lat. *cophinus*, Gr. *kophinos*, in both languages signifying a basket, coffer, or chest, but never a coffin). Coffins for the bodies of the dead constructed of wood are known to have been used in prehistoric times in Europe. The earliest form of the wooden coffin is simply a suitable length of an oak-tree trunk split, and hollowed out for the reception of the body. Two such coffins containing the skeletons of a man and a woman of the bronze age, with their clothing undecayed, and their weapons, are preserved in the museum at Copenhagen. The wooden coffins of the iron age were sometimes of tree trunks, and at other times of hewn planks fastened with clinker nails. From Bede we learn that the English occasionally employed wood; but the common people, both then and in the Norman and subsequent eras, were simply wrapped in cloth, and so put into the ground. The same custom has been followed by some monks (as the Carthusians) down to the present time, and is still in use among the poorer classes in the East. See EMBALMING.

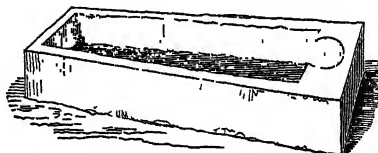

It has been keenly disputed amongst scholars, whether it was more usual with the Greeks to bury their dead or to burn them (see BURIAL); but both customs unquestionably prevailed. Greek coffins were called by various names (*soroi*, *puetoi*, &c.), and composed of various materials, the most common being baked clay, or earthenware. Their forms also varied. In Rome the ancient practice was to bury the dead, not to burn them; though under the Empire, and previous to the recognition of Christianity, the latter custom became almost universal. The coffin in Rome was called *arca* or *loculus*, and was frequently made of stone, sometimes of a peculiar kind of stone brought from Assos, in Troas, which was said to consume all the body except the teeth in forty days, and which, from this circumstance, was called *sarcophagus*—an eater of flesh (see SARCOPHAGUS). Roman stone coffins, both of the heathen and early Christian time, have been found in Britain. Cremation was repugnant to the feelings of the primitive Christians, who buried their dead in receptacles of stone. These were either hewn out

of the rock as in the catacombs, or were sarcophagi elaborately sculptured with scenes from Scripture history and emblems of the faith. The simplest form of stone coffin was that used in prehistoric

Roman Stone Coffin, found at York.

times throughout Europe, consisting of unhewn stones set on their edges, so as to cover the sides and ends of the grave, one or more flat stones being then laid over the body to form a lid. This form of rude stone cist or coffin was continued long after the introduction of Christianity in most European countries, and many ancient cemeteries, formerly regarded as pagan and prehistoric, are now recognised as Christian by the orientation of their stone-lined graves. To these succeeded stone coffins, which were commonly used for persons of the higher classes throughout the middle ages; and so late as 1686 the antiquary Dugdale was buried

Stone Coffin, Temple Church, London.

in a stone coffin. These stone coffins were generally of a single block, commonly tapering from the upper end. In the hollow for the reception of the body, there was from the 12th century a part peculiarly fitted for the head, and a hole in the bottom to allow of the escape of moisture. Such coffins, for the most part, were not buried deeply in the earth, and were frequently placed so near the surface that the lids were visible, which, within a church, often formed part of the pavement, and were covered with elaborate sculpture representing crosses and other ornaments. Sometimes they were even above the ground altogether, and thus became the originals of the table-tombs and altar-tombs of the middle ages. Lead coffins were also occasionally used in the middle ages, as those in the Temple Church in London testify, but the slight wooden cases now in common use appear to be of comparatively recent origin. The practice of surrounding the wooden shell with a coffin of lead, and inclosing both in an oak casket, is, for sanitary reasons, to be discouraged. Even a wooden coffin, if well made, greatly retards decomposition, and keeps the process long incomplete; and to remedy this the use of wicker coffins, of white or stained osiers, has been suggested. In America, however, zinc or copper lining and lids of heavy French glass are employed by undertakers to render their work as far as may be airtight and indestructible; and of late years caskets of zinc or copper, and even of iron or rolled steel, have come into use. The modern hexagonal form of coffin is peculiar to Great Britain. The sides of the American casket are parallel, the ends either rounded or broken into three panels; the exterior is sometimes ornamented with carved work,

but is more commonly covered and draped with broadcloth, velvet, or satin, fringed and tasseled. Expensive woods and silvered handles and nails are frequently employed; and the lid may have a removable face glass. French and German coffins are of a similar shape, but plainer. The colour in Germany is usually brown. At Leipzig formerly coffins were always painted green, as a symbol of hope.

**Coggeshall**, a town of Essex, on the Blackwater, 44 miles N.E. of London. It has a school, founded by Sir Robert Hitcham (1636), remains of a Cistercian abbey (1142), a good Decorated church (restored 1868), and some manufactures of silk, velvet, and lace. It is supposed to have been the Roman *Canonium*, and the remains of a Roman villa have been found. John Owen was minister here. Ralph de Coggeshall, abbot here (1207-18), wrote a *Chronicon Anglicanum* (of the period 1161-1224), edited by J. Stevenson in 1875. See Beaumont's *History of Coggeshall* (1890).

**Cognac**, a town of France, in the department of Charente, on an old castle-crowned hill over the Charente, 42 miles S.E. of Rochefort by rail. The cultivation of the vine and distillation of Brandy (q.v.) form the chief industry of the district; in the town casks and bottles are manufactured, and sulphate of lime. Francis I. was born at Cognac. Pop. 19,000.

**Cognate**. See AGNATE.

**Cognizance**, in Heraldry, a Badge (q.v.), in the more restricted sense of that term.

**Cognoscenti** (Ital., from Lat. *cognosco*, 'I know'), persons professing a critical knowledge of works of art, and of a somewhat more pretentious character than amateurs.

**Cogno'vit** (viz. *actionem*, 'he has confessed the action'), in the law of England, is the defendant's written confession that the plaintiff's cause against him is just and true. By this confession before or after issue, the defendant suffers judgment to be entered against him without trial, in which case the judgment is called judgment by confession.

**Cogswell**, JOSEPH GREEN, LL.D., American bibliographer, born at Ipswich, Massachusetts, in 1786, studied at Harvard and Göttingen, and was professor of Geology at Harvard from 1820 to 1823, when he established the Round Hill School with Bancroft (q.v.). He was for some years editor of the *New York Review*, and, with Halleck and Washington Irving, assisted in planning the Astor Library, of which he was for many years superintendent. He died in 1871.

**Cohabitation**. See CONCUBINAGE, MARRIAGE.

**Cohesion** depends upon the molecular forces which keep together the parts of bodies, and are insensible at sensible distances. In the case of a small body these forces are much more efficient in keeping the parts together than are the mutual gravitational attractions of the parts. On the other hand, in the case of a large body, such as the earth, gravitation is much more powerful in preventing rupture than cohesion. The term *adhesion* is generally, though quite unnecessarily, used when the cohering particles are dissimilar—as when water clings to glass.

After the parts of a body have been separated, so as to form an incoherent mass, the force of cohesion may be again brought into action by the application of pressure sufficient to force the particles close enough together. Thus two smooth, freshly cut pieces of lead can be made to adhere by slight pressure accompanied by a screwing motion. Also two very smooth slabs of marble adhere, if pressed together, so that considerable force must be exerted to separate them. Barton made a set of cubes with surfaces so true that, if twelve of them were

piled one over the other, the whole series could be lifted by raising the upper one. Lead pencils are made by applying pressure to powdered graphite, so as to make it cohere.

**Cohesion Figures**. See SURFACE TENSION.

**Cohoes**, a prosperous manufacturing city of Albany county, New York, on the Hudson, at the mouth of the Mohawk, 3 miles above Troy, and on the Erie Canal. It has large cotton-mills, knitting-mills, and woollen-mills, besides iron-foundries, and manufactures of axes, piping, machines, boxes, &c. Pop. 23,000.

**Cohort**, in the ancient Roman armies, was a portion of a legion, consisting usually of 600 men. Generally, there were ten to a Legion (q.v.).

**Cohune Nuts and Oil**. See PALM.

**Coif** (Fr. *coiffe*, Ital. *cuffia*, 'a cap'), a covering for the head in general, but more especially the close-fitting cap of white lawn or silk, originally worn by Serjeants-at-law (q.v.). Like the *Binetta* (q.v.), it always represented distinct rank and dignity. Its use on all professional and official occasions was both an obligation and a privilege. Later it was the custom to wear a small skull-cap of black silk or velvet over the white coif; and in the beginning of the 18th century, when the fashion of powdered wigs in lieu of natural hair invaded the law-courts, in order that the badge of the order might not be concealed, the perquiers contrived a small round patch of black silk edged with white, to be worn on the crown of the wig. The notion that the coif was a device merely to conceal the tonsure of the monkish lawyers rests only on a loose conjecture of the commentator Spelman, and, though carelessly fostered by Lord Campbell, may be assigned to the same category as the conceit, preserved in Brand's *Antiquities*, which derives the head-dress from a child's caul worn for luck. See Serjeant Pulling's *Order of the Coif* (1884).

**Coimbatore**, the capital of a district of Madras Presidency, on the Noyil, 304 miles S.W. of Madras by rail. It lies 1437 feet above the sea, is well built and drained, and has a cool temperature that renders it a comparatively suitable residence for Europeans. Pop. 47,000. Pop. of district, 2,000,000.

**Coimbra**, capital of the Portuguese province of Beira, on a hill above the river Mondego, here crossed by a stone bridge, 135 miles N.N.E. of Lisbon by rail. Its streets are steep, narrow, and dirty, its manufactures confined chiefly to earthenware and combs, and its interest consists mainly in its historical associations. The place derives its name from the Roman *Conimbria*, traces of which lie to the south; it was held by the Goths, and from them passed to the Moors, from whom it was finally conquered in 1064, by Fernando the Great, aided by the gallant Cid. Coimbra was the capital of Portugal for about two centuries and a half from its erection into a kingdom, in 1139, and many of the early kings are buried in and around the old town. Of the public buildings, the most noteworthy are the older of the two cathedrals, the church of San Salvador, and the ruined convent of Santa Clara; across the river is the *Quinta das Lagrimas* ('House of Tears'), where Inez de Castro (q.v.) was murdered. The university of Coimbra, long the only one in Portugal, was originally established at Lisbon in 1288, but was permanently transferred here in 1537. It has five faculties and some 1300 students, and is still held in repute; attached to it are a museum, an observatory, a botanical garden, and a library of 200,000 volumes. Pop. 20,000.

**Coín**, a town of Spain, 20 miles W.S.W. of Málaga, with marble-quarries; pop. 12,000.

**Coining.** The privilege of coining money being an exclusive prerogative of the crown, the crime of counterfeiting the king's money, as it was called, was declared to be treason, both by the common law of England and by many statutes. In Scotland, there continued to be some differences in regard to this crime, even after the Union had extended the treason laws of England to that kingdom, and prosecutions were in use to be laid at common law. That practice is now abandoned, and the laws of the two countries were assimilated by a series of statutes, which are codified in the Act of 1861 passed to consolidate the law relating to offences against the coin. All such offences are now prosecuted under this statute. By this act it is a high crime and offence, punishable by penal servitude for life, to counterfeit gold or silver coin; or to colour coin or metal with intent to make it pass for genuine gold or silver coin; or to buy, sell, or import counterfeit gold or silver coin; or unlawfully to make, mend, buy, sell, or possess instruments used in fabricating gold or silver coin; or to convey such instruments out of the mint. To impair or diminish or lighten gold or silver coin (as by clipping or sweating) is punishable with fourteen years. It is an offence punishable with penal servitude for seven years to unlawfully possess gold or silver taken from any coin; or to counterfeit copper coin; or unlawfully to make, mend, buy, sell, or possess instruments for counterfeiting copper coin; or to deal in base British copper coin; or to utter or import base foreign gold or silver coin. Several offences of a less heinous nature are dealt with in the act. In order to bring these offences within the limits of the statute, it is not necessary that the resemblance of the false to the true coin shall be very perfect; for the statute deems every offence complete 'although the coin be not in a fit state for uttering, or the counterfeiting be unfinished or imperfect.' For false bank-notes, see **FORGERY**.

In the United States, the crime of counterfeiting coin or money is punishable with fine and imprisonment at hard labour for a term of from two to ten years; and includes falsely making, forging, or counterfeiting coins or notes, postal money orders, postal cards, government stamps of all kinds, and government securities, as also importing, possessing, uttering, or passing false coins or notes with fraudulent intent. Mutilating and debasing the coin is also counterfeiting, but is not so severely punished as the making of counterfeit coins.

For coinage and coins, see **MINT**, **NUMISMATICS**, **MONEY**, **BULLION**, **CURRENCY**.

**Coir**, or **COCONUT FIBRE**, is the fibre of the husk of the coconut. The husks are steeped in water, in pits, for six months, or even for a year, and then beaten with a stick till the fibre readily separates. The material is largely used for floor-matting where there is much traffic, and for making hall and door mats; also for coarse brushes, for ships' fenders, and, to some extent, for ropes and cables. In the South Sea Islands ropes of coir fibre, made by the natives, are extensively used. Coir rope, on account of its lightness, possesses some advantages for maritime purposes. The Chamærops (q.v.) is sometimes called the coir-palm.

**Coire.** See **CHUR**.

**Cojute.** See **JOB'S TEARS**.

**Cojutepeque**, a town of San Salvador, Central America, 15 miles E. of the capital; pop. 10,000.

**Coke**, a fuel obtained by carbonising a bituminous 'caking' coal, in specially designed ovens at high temperatures, whereby its volatile constituents are driven off. The character and density of the product depend, primarily, upon the percentage of 'volatiles' expelled from the coal at

900° to 1000° C. (say 1650° to 1830° F.), and also, in a secondary degree, upon the temperature to which it is subjected, and upon the character and amount of ash associated with the coal. The best coking coals are those containing between 18 and 30 per cent. of 'volatiles.' The strength and quality generally of the coke from coals yielding more than 30 per cent. 'volatiles' deteriorates, at first gradually, and then rapidly, as the percentage of such volatiles increases. The higher the temperature at which the coal is carbonised (*ceteris paribus*) the harder and more valuable is the resulting coke; also a coal with a highly ferruginous ash yields a stronger coke than another (otherwise similar) coal with a non-ferruginous ash.

Coke is a hard, brittle, porous solid, with a steel-gray colour, and, in the best qualities, somewhat metallic appearance, and it does not soil the fingers when handled. It is chiefly valued for the intense heat which it develops on combustion in a good air draught, and for its smokeless burning. It contains, besides carbon and mineral ash, small quantities of hydrogen, nitrogen, sulphur, and oxygen; the best cokes, when dried, contain upwards of 90 per cent. of carbon, and less than 8 per cent. of ash, and have a calorific value of upwards of 13,000 B.Th.U.s. per lb. The moisture content should not exceed 3 per cent.

The principal uses of coke are: (1) as a blast-furnace fuel in iron, copper, and lead smelting, and for this purpose a combination of hardness with a fair degree of porosity is sought for; (2) as a foundry cupola fuel, and for firing crucible furnaces in the manufacture of high-class crucible steel, aluminium and brass melting, and the making of alloys generally, for which purposes hardness and low sulphur content are important; (3) in the manufacture of water-gas; and (4) as a domestic fuel. For the two last-named purposes an inferior 'gas-coke' is preferably used.

Formerly metallurgical coke was universally manufactured by the wasteful 'bee-hive' oven process, involving the loss of the whole of the valuable by-products (*vide infra*), and even to-day this obsolete method is still largely in vogue in Great Britain and the United States, although it has long ago been entirely abandoned in Germany and in Europe generally in favour of the much more scientific and economical 'by-product recovery' oven system. But in the year 1917 some 8700 by-product ovens were operating in Great Britain, with a total carbonising capacity of 17.5 million tons of coal per annum, and it is presumably only a question of time before the 'bee-hive' oven process entirely disappears. The average yields of by-products obtainable per 100 tons of coal carbonised are, approximately, 4.5 tons of tar, 1.0 ton of ammonium sulphate, 300 gallons of crude benzol, 500,000 cubic feet of gas of gross calorific value 500 to 550 B.Th.U.s. per cubic foot (in addition to that consumed in firing the ovens), and a small quantity of naphthalene, whilst the yield of coke is somewhat higher in the new process than in the old.

In the 'by-product recovery' process the coal is carbonised in rectangular ovens, 30 to 35 feet long, by 18 to 24 inches wide, by 6 to 7½ feet high, fired by the combustion in horizontal or vertical side flues of about half the gas evolved during the process. The air-supply to these flues is pre-heated at the expense of the sensible heat in the burnt gases, by passage through some form of heat recuperative or regenerative system. The ovens are built in batteries of from 30 to 60 ovens, capable of carbonising 150 to 350 tons of coal per day. The ovens are connected with suitable plant for the recovery of the aforesaid valuable by-products. The surplus gas obtained is used for power and heating purposes in metallurgical (steel) works and, in some

localities, as a public supply for lighting and heating. Coke is also produced in large quantities in the manufacture of coal-gas in retorts ('gas coke'), but gas coke is generally inferior in quality to metallurgical coke for industrial purposes, although the coke from the modern vertical gas retorts is generally harder and of better quality than that from horizontal retorts.

**Coke, SIR EDWARD**, jurist, was born of a good old Norfolk family, at Mileham, 1st February 1552. From Norwich grammar-school he passed in 1567 to Trinity College, Cambridge, in 1571 to Clifford's Inn, in 1572 to the Inner Temple; and he was called to the bar in 1578. His rise was rapid—from recorder of Coventry (1585) to member for Aldborough (1589), Solicitor-general (1592), Speaker of the House of Commons (1593), Attorney-general (1594), Chief-justice of the Common Pleas (1606), Chief-justice of the King's Bench and privy-councillor (1613). Meanwhile he had married twice, first, in 1582, Bridget Paston, who brought him £30,000, and died 27th June 1598; next, nineteen weeks later, Lady Elizabeth Hatton, the granddaughter of his patron, Lord Burghley. The rancour shown by him in the prosecutions of Essex and Southampton, Raleigh, and the Gunpowder conspirators (1600-3-5) has gained him little credit with posterity; but from 1606 he stands forth as a vindicator of the national liberties, opposing, unlike Bacon, every illegal encroachment on the part of both church and crown. He dared to cite Bracton's words to James's face, that 'the king should be subject not to man, but to God and the law'; alone of twelve judges, he resisted the royal prerogative; and in the Overbury case he showed an indiscreet zeal to come at the real truth. His removal from the bench on most trivial grounds (November 1617) was aggravated by a quarrel with his wife; and though ten months afterwards he was recalled to the council, his conduct in parliament from 1620 as a leader of the popular party, an opponent of Spain and of monopolies, estranged him for ever from the court party. In 1621-22 he suffered nine months' durance in the Tower; still, old though he was, he carried his opposition into the next reign, the Petition of Right (1628) being largely his doing. He died at Stoke Poges, 3d September 1634, and was buried at Tittleshall in his native county.

Coke was a great lawyer, withal an honest lover of legality, but too bitter and narrow-minded to be really a great man. His four *Institutes* (1628-44) deal with tenures, statutes, criminal law, and the jurisdiction of the several law-courts. The first of these, and most famous, which in 1832 reached a 19th edition, is the so-called *Coke upon Littleton* (q.v.)—a commentary that, in spite of its puerile etymologies, has still a real, if mainly historical, value. Eleven of the thirteen parts of his epoch-making Law Reports were published during his lifetime (1600-15); and the whole, translated out of the original French and Latin, fills 6 vols. in Thomas and Fraser's edition (1826). Mr G. P. Macdonell mentions six minor works in his able and exhaustive article on Coke in the *Dictionary of National Biography* (vol. xi. 1887). See also the Lives by Woolrych (1826) and C. W. Johnson (2 vols. 1837). For a descendant, see LEICESTER OF HOLKHAM.

**Coke, THOMAS**, Methodist bishop, born at Brecon in 1747, graduated in 1768 at Oxford, from which university he received the degree of D.C.L. in 1775. He settled as a curate in Somersetshire, but a course of open-air preaching and cottage services, initiated after his introduction to John Wesley in 1776, brought about his dismissal by his rector, and he joined the Methodists, by whom he was attached to the London circuit. In 1782 he

became first president of the Irish conference, and he was elected president of the English conference in 1797 and 1805. In 1784 he was set apart by Wesley as 'superintendent' of the societies in America, to which country he made nine voyages, the last in 1803, and where his outspoken opposition to slavery aroused much hostility; in 1787 he induced the American conference to alter his title to that of bishop. In 1784 Coke had drawn up the first plan of the Methodist foreign missions, and to this cause he devoted the later years of his life with untiring zeal and skill, retaining to the last the direct control of the system he had created. He died in the Indian Ocean on a missionary voyage to Ceylon, 3d May 1814. He published, besides religious works, extracts from his *American Journals* (1790), a *History of the West Indies* (3 vols. 1808-11), and, with Henry Moore, a Life of Wesley (1792), intended to forestall Whitehead's labours, with whom the two others, being joint literary executors, had disagreed.

**Col** (Fr., 'neck'), in Geography, is a depression or pass in a mountain-range. In those parts of the Alps where the French language prevails, the passes are usually named cols—as the Col de Balme, the Col du Géant, &c.

**Cola Nut.** See KOLA NUT.

**Colard, MANSION**, the first printer of Bruges, was of French extraction. He published twenty-one works, all in French, save one Latin one; and died in 1484.

**Colberg**, or KOLBERG, a seaport and watering-place of Prussia, in the province of Pomerania, on the Persante, near its mouth in the Baltic, 170 miles NNE. of Berlin by rail. It stands on a hill, surrounded with three suburbs. The principal church dates from 1316. In 1102 Duke Boleslaus of Poland vainly besieged Colberg, which endured long sieges in the Thirty Years' War, in the Seven Years' War, and again in 1807, when it was most gallantly defended against the French. No longer a fortress, Colberg has manufactures of chemicals and soap, and salmon and lamprey fisheries. Pop. 30,000.

**Colbert, JEAN BAPTISTE**, one of the greatest French statesmen, was born at Rheims in 1619. Before he was twenty years of age he obtained a post in the War Office under Le Tellier, and at once began a very successful career. In 1651 he entered the service of the great minister Mazarin, who soon employed him in most important affairs of state. On his death-bed Mazarin warmly recommended Colbert to Louis XIV. 'I owe you everything,' Mazarin is reported to have said to the king, 'but I pay my debt to your majesty in giving you Colbert.' It was in 1661 that Colbert became the chief-minister of Louis XIV. He found the finances in a ruinous condition, and immediately began his reforms. Fouquet, the superintendent under Mazarin, was found guilty of impoverishing the state by his maladministration, and imprisoned for life. The farmers of the state-revenues were forced to yield up the resources of the crown of which they had fraudulently possessed themselves. The debts of the state Colbert reduced by arbitrary composition. In all the departments of finance he introduced order and economy as far as he could. So complete and thorough was the change which Colbert effected, that in ten years the annual revenue had risen to 104 million livres, of which 27 were spent in collection and administration; whereas, when the management of the finances was intrusted to him, the revenue amounted to only 84 million livres, and 52 millions were absorbed in its collection. The financial reforms of Colbert, however, only served as a

basis for a thorough reorganisation of the entire administration. He took measures to improve agriculture. Commerce was extended, roads and canals—including that of Languedoc—were made. In every way he sought to apply the protective system then in vogue to promote the industries of France. He organised anew the colonies in Canada, Martinique, and St Domingo, and founded others at Cayenne and Madagascar. He found France with a few old rotten ships, and in a few years had provided her with one of the strongest fleets in the world, with well-equipped arsenals and a splendid body of seamen. Colbert improved the civil code, introduced a marine code of laws, and drew up the so-called *Code Noir* for the colonies.

While attending to material interests, he did not neglect the arts and sciences; all men of learning and genius found in Colbert a generous patron. The Academies of Inscriptions, Science, and Architecture were founded by him. In short, Colbert was the patron of industry, commerce, art, science, and literature—the founder of a new epoch in France. His aim was to raise the strength of France by developing every side of the national life. In this he entirely succeeded during the early part of the reign of Louis XIV., but his work was not destined to last; the wars of Louis and the extravagance of his court undid all that had been accomplished by Colbert. The rigorous order and precise rules which he established might be beneficial in such hands as his own, but when abused by a selfish or incompetent despotism, could only have the most mischievous results. Colbert died in 1683, bitterly disappointed at seeing the failure of his plans for the regeneration of France. The people were so enraged with the oppressive taxes, for which they blamed him, that his corpse had to be removed from his house by night in order to avoid their fury. Colbert had indeed carried out many measures that were arbitrary and oppressive. He had served a despotic king, who posed as the representative of all that was fair in the government, and left the disagreeable tasks of administration to his ministers. See his *Lettres, Instructions et Mémoires* (8 vols. 1862–82); Lives by Clement (1892), Neymarck (1877), and Gourdauld (6th ed. Tours, 1885); studies by the Comte de Cosnac (1892), and La Roncière (1919, 1920).

**Colburn, ZERAH**, a mathematical prodigy, born in Vermont, U.S., in 1804, displayed such remarkable powers of calculation that in 1810 his father left Vermont to exhibit him. At this period he answered correctly such questions as 'How many hours in 1811 years?' in twenty seconds; and a few years later much more complicated problems were solved with equal rapidity. He was shown in Great Britain, and for some time in Paris; from 1816 to 1819 he studied at Westminster School at the expense of the Earl of Bristol. His father died in 1824, and he returned to America; here he was a Methodist preacher for nine years, and from 1835 professor of Languages in Norwich University, Vermont, where he died 2d March 1840. His remarkable faculty disappeared as he grew to manhood.

**Colchester**, an ancient municipal and (till 1918) parliamentary borough in Essex, on the right bank of the Colne, 51 miles N.E. of London, and 12 miles from the sea. It is built on the ridge and sides of a promontory, with a port on the river at a suburb called the Hythe, which has a quay for vessels of 150 tons. It is a town of special historical and antiquarian interest. Before the Roman conquest of the island it was the British 'Royal Town' of *Cunobelin* (the *Cymbeline* of Shakespeare): and when the Emperor Claudius

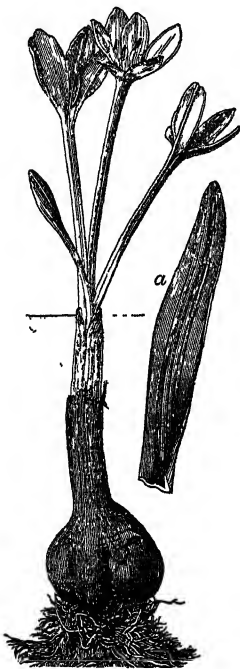

had conquered the south-eastern part of the island, he founded a *colonia* here—the first Roman town in Britain. There are still many remains of *Camulodunum*. The walls are the most perfect Roman walls in England. Immense quantities of pavements, coins, pottery, and other Roman remains have been found. Roman streets and houses have been traced. A large cemetery has yielded a valuable collection of sepulchral remains. Many of these are in the town museum, which is housed in the castle, the largest Norman keep in England. Its substructure seems to have been a Roman temple. The tower of Holy Trinity Church has all the characteristics of Saxon architecture. In the Norman west front of St Botolph's Priory the Roman bricks are a striking feature; and all the old churches have an intermixture of Roman brick in their walls. The Domesday Survey is very full, and gives a complete census of the people. Two taxations of the beginning of the 13th century give not only a complete census of the inhabitants, but also an inventory of their domestic furniture and stock-in-trade, and present a complete view of an English borough of the period. The Protestant refugees from the Low Countries at the end of the 16th century introduced the bay and say (baize and serge) trade, which became an important manufacture, and spread into the neighbouring towns and villages. Colchester was one of the eight 'Dutch Congregations' incorporated by royal license. The wars with Spain in the reign of Queen Anne closed the markets for these goods, and the trade died out. The only important historical event of later times was the siege of Colchester, one of the last events of the Civil War between Charles I. and the parliament. The royalists of Essex and Kent under Goring took possession of the town, and were besieged by Fairfax from the middle of June 1648 till the middle of August, when the town, starved out, surrendered, and Sir Charles Lucas and Sir George Lisle were executed by sentence of court-martial. From 1895 Colchester had a bishop-suffragan under St Albans; since 1913 under Chelmsford.

The chief cause of the prosperity of the town throughout its history has been that it was the principal town and natural market of an extensive and fertile corn-growing district, inclosed on three sides by the rivers and the sea. It was during the great continental wars of the beginning of this century, and has again in later times become, a large military depot; and the number of troops quartered here, with their officers and their families, have contributed to its prosperity. The fishery of the Colne and its creeks has for centuries been famous for its oysters, and has been a valuable portion of the property of the corporation, to which it has belonged from the Norman Conquest, or even before. There is a Technical and University Extension College. Colchester has never been the county town, owing probably to its being too far down in the Essex peninsula. Pop. (1851) 19,443; (1881) 28,395; (1921) 43,377. See *Cutt's Colchester* (1888), Benham's *Colchester Worthies* (1892), and *The Red Paper Book of Colchester* (1903).

**Colchester, CHARLES ABBOT, LORD**, Speaker of the House of Commons, was born at Abingdon, Berkshire, 14th October 1757. He was educated at Westminster School (1763–75) and Christ Church College, Oxford, and in 1779 entered the Middle Temple. In 1792 his practice was bringing him £1500 per annum; and two years later he received the post, worth £2700, of clerk of the rules in the Court of King's Bench. Returned to parliament as a strong Tory in 1795, he effected in his first session an improvement in the legislation regarding temporary and expiring laws; and it is due to his exertions that municipal bodies receive a copy of all new acts as soon as they are printed. The country

is mainly indebted to him for the Private Bill Office and for the royal record commission, whose proceedings he for many years superintended. But his greatest service was in the Act (1800) for taking the first census. In 1802 he was elected Speaker, the duties of which high and honourable office he continued to discharge with as much impartiality as distinction until May 1817, when ill-health compelled him to resign. He received a pension of £4000 a year, and was raised to the peerage as Baron Colchester, his father having been rector of All Saints, Colchester. He died 7th May 1829. See his *Diary and Correspondence* (3 vols. 1861), edited by his son Charles, second Lord Colchester (1798-1867), who was postmaster-general in 1858.

**Colchicum**, a genus of Liliacæ, sub-order Melanthacæ. The species, which are few in number, are stemless, with flowers half subterranean like the crocus, the limb of the perianth and

Meadow Saffron  
(*Colchicum autumnale*):  
a, a leaf.

part of the tube only rising above ground. The flowers much resemble crocus-flowers, but are readily distinguished by having six instead of three stamens, and three styles instead of one. The superior ovary does not remain to ripen underground, but after the flowering is over, rises in the form of three little follicles slightly adhering to each other, on a lengthened stalk. The only British species is *C. autumnale*, the Meadow Saffron, sometimes also, but incorrectly, named Autumn Crocus, which is plentiful in meadows and pastures in some parts of England and of the continent of Europe. The flowers are pale purple; they appear in autumn, unaccompanied by any leaves; the leaves, which are large and broadly lanceolate, appear in spring, when the stalk which bears the ripening fruit arises amongst them. The whole plant

is very acrid and poisonous, chiefly owing to the presence of an alkaloid called *Colchicine* or *Colchicia*. Cattle are not unfrequently injured by it in pastures where it abounds. It is a valuable medicinal plant, and is administered, in small doses, to allay the pain of gout and rheumatism. Repeated doses produce vomiting, purging, increase of the urinary secretion, and profuse perspiration. The parts chiefly used for medicinal purposes are the corm (popularly called the root) and the seeds. The seeds are round, brown, rather larger than mustard-seed. Other species of colchicum appear to possess similar properties. The *hermodactyls* of the druggists' shops, which for many centuries have enjoyed an extensive celebrity for soothing pains in the joints, and are brought from the Levant, are believed to be the corms either of *C. variegatum* or *C. bulbocodoides*. *C. autumnale* is not unfrequent in flower-borders, particularly a variety with double flowers.

**Colchis**, a province of ancient Asia, on the east coast of the Pontus Euxinus or Black Sea, situated north of Armenia and south of the Caucasus. Colchis was famous in Greek mythology as the land of Medea (q.v.) and the goal of the Argonauts (q.v.); afterwards it was better known to the Greeks as the seat of some colonies of the Milesians. It was noted for its wines and fruits. The principal town was Dioscurias; the principal river the Phasis. The Colchians were at one time subject to Persia, and subsequently to Mithridates, king of Pontus, and ultimately passed under the mighty empire of Rome.

**Colcothar** is the name given by the alchemists to the red powder (mainly red oxide of iron) which remains in the retorts when green vitriol or the sulphate of iron is calcined. It is used for polishing glass and the like, and is called *crocus* by artists.

**Cold** is the term by which we signify a relative want of sensible heat. There are therefore no determinate boundaries between cold and heat, and it is a mere arbitrary distinction to call the degrees of the thermometer below the freezing-point degrees of cold. When the atmosphere, or any substance which comes in contact with our body, is at a lower temperature than the skin, it absorbs heat from it, and we call it cold. See **HEAT**.

The physiological action of cold on the animal organism requires a brief notice. All animals (the warm-blooded animals to the greatest extent) have a certain power of maintaining the heat of the body, in defiance of external cold, as has been shown in the article **ANIMAL HEAT**. This power is mainly due to a process analogous to combustion, in which carbon and hydrogen taken into the system in food are made to unite with oxygen derived from the air by respiration. If the combustible materials are not duly furnished, or if the supply of oxygen be deficient (as in various diseased conditions), there must be a depression of temperature. Now, if the temperature of a bird or mammal (except in the case of hibernating animals) be lowered about 30° below its normal standard (which in birds ranges from 100° to 112°, and in mammals from 96° to 102°), the death of the animal is the result. The symptoms indicating that an animal or a man is suffering from a depression of the temperature of the body are—retardation of the circulation of the blood, causing lividity of the skin, which is followed by pallor, in consequence of the blood being almost entirely driven from the surface through the contraction of the vessels; a peculiar torpor of the muscular and nervous systems at the same time manifests itself in an indisposition to make any effort or exertion, and in intense sleepiness. The respiratory movements become slower (see **RESPIRATION**), and the loss of heat goes on, therefore, with increasing rapidity, till the fatal limit is reached, and death supervenes.

In hibernating animals (the marmot, dormouse, bat, &c.) the power of generating heat within their own bodies is very slight, their temperature following that of the external air, so that it may be brought down nearly to the freezing-point. See the articles **hibernation**, **FAST**, **SLEEP**, **LIFE**, **DESICCATION**; also, for other phenomena connected with cold, **HEAT**, **CLIMATE**, **FREEZING**, **ICE**, **THERMOMETER**, **TEMPERATURE**, **GAS**.

Great or prolonged atmospheric cold is a most powerful depressing agent, and is a fruitful cause of disease and even of death. Whenever the temperature of the atmosphere is suddenly reduced, and particularly when it is reduced below the freezing-point, a considerable addition takes place to the mortality of the country at large. The

effects of cold are, in ordinary circumstances, most apparent among the aged and the very young, and among those suffering from chronic disease; but when a very low temperature is long continued, even the healthy are sure to suffer, when impoverished so as not to have sufficient means of external warmth in their homes. The most direct effects of cold are in the production of what is commonly called Frost-bite (q.v.).

Cold is applied in various ways in the treatment of disease. In some forms of fever, a cold bath, or cold wet pack, is the best means of reducing a very high temperature which of itself threatens life. In many inflammations relief is best obtained by the local application of ice, or of a coiled tube through which cold water circulates. The tonic and stimulating effects of a temporary application of cold are familiar in the cold morning bath, or the use of cold water sprinkled on the face of a person who has fainted. The disease commonly termed a 'cold' has been already described under CATARRH.

**Cold Cream** is the term applied to an ointment containing rose-water which is used as a mild and cooling dressing for the skin. It may be prepared by melting together almond-oil five parts, spermaceti one part, and white wax one part. Three parts of rose-water are then added with brisk stirring, which is continued till the whole is cool, and of a soft creamy consistence. As cold cream prepared in this way is liable to turn rancid, glycerine is sometimes added, or the almond-oil is replaced by white vaseline. Cold cream is a pleasant application to irritated surfaces, protecting them from the influences of the weather, and promoting the healing of wounds and chapped hands.

**Cold Storage.** See REFRIGERATION, ICE, PRESERVED PROVISIONS.

**Coldstream**, a town of Berwickshire, 15 miles SW. of Berwick, on the Tweed, over which there is a fine bridge by Smeaton (1766). At Coldstream was the famous ford by which Edward I. entered Scotland in 1296. By this ford also the Scots invaded England in 1640. Being convenient as a Border town, Coldstream, like Gretna Green and Lamberton toll-bar near Berwick, was formerly celebrated for its clandestine marriages. Pop. 1300.

**Coldstream Guards**, a regiment in the Foot Guards (see GUARDS), the oldest in the British army except the 1st Foot, now called the Royal Scots. Raised in 1660 by General Monk at Coldstream, it was at first called 'Monk's Regiment'; but when parliament consented to give a brigade of guards to Charles II., this corps, under the name of Coldstream Guards, was included in it. See the history of Col. Ross (1896).

**Coldwater**, capital of Branch county, Michigan, 156 miles E. of Chicago, on the Lake Shore Railway, has several foundries, flour-mills, engine-works, cement-works, shoe-factories, and a state public school; pop. 6000.

**Cole**, SIR HENRY, was born at Bath, 15th July 1808, educated at Christ's Hospital, and became assistant-keeper of the Records in 1838. He wrote much for the newspapers and reviews, and under the name of 'Felix Summerly' produced about twenty children's books. He was chairman of the Society of Arts, did valuable service on the committee of the Great Exhibition of 1851, was the founder of the South Kensington Museum, and in 1860 became its director. For his services on innumerable committees and councils, and in promoting valuable reforms, he was made K.C.B. in 1875; and he held several foreign decorations. He died 18th April 1892. See his Autobiography (2 vols. 1884).

**Cole**, THOMAS, painter, born at Bolton-le-Moors in 1801, removed to America in 1819, where he became one of the best-known landscape-painters. In 1830 two of his pictures appeared in the Royal Academy, and he afterwards made sketching tours through England, France, and Italy; but all his best landscapes were American. He died 11th February 1848.

**Cole**, VICAR, landscape-painter (especially of Surrey scenes), was born at Portsmouth, 17th April 1833, and from 1853 was a frequent contributor to Royal Academy exhibitions. Chosen A.R.A. in 1870, and R.A. in 1880, he died 6th April 1893. See Life by R. Chignell (3 vols. 1898).

**Colebrooke**, HENRY THOMAS, the pioneer of Sanskrit scholarship in Europe, was born in London, 15th June 1765, the son of Sir George Colebrooke, banker, and eventually chairman of the board of directors of the East India Company. He was educated at home, and early showed a strong disposition for mathematical studies. In 1782 his father's influence procured him a writership in the Bengal service. He was a voracious reader, and his alert mind found its relaxation in the change from administrative to scientific labour. His duties as revenue officer at Tirhut led him to make a minute study of the state of husbandry in Bengal, and his Remarks thereon (Calcutta, 1795, privately printed) formed so searching a criticism of the existing policy that the work could not be published in England. At Purneah his legal functions led him to study Indian law and learn Sanskrit; and he began in 1794 publishing essays on Indian religion, poetry, and science in the *Asiatic Researches* of the recently founded Asiatic Society of Calcutta. His removal in 1795 to the magistracy of Mirzapur gave him the opportunity of cultivating the acquaintance of the learned men of the neighbouring Sanskrit college at Benares, and with this advantage he brought out his *Digest of Hindu Law on Contracts and Successions* (translated from the Sanskrit, 1798, 4 vols. Calcutta). A mission to Nagpur (1799-1801) interrupted his work, and on his return he was appointed a judge of the new court of appeal at Calcutta, and at the same time honorary professor of Hindu Law and Sanskrit at the college of Fort William. Yet he contrived during this busy period to publish the first (and only) volume of his *Sanskrit Grammar* (1805), based upon Pāṇini and the native commentators, to write his famous articles on the Vedas and on the sect of Jains, besides many other valuable essays for *Asiatic Researches*, and also to supplement his *Digest* by *Two Treatises on the Hindu Law of Inheritance* (1810). Before this he had reached the eminence of a seat on the governor-general's council (1807), and was using his influence earnestly in the direction of administrative reform and the encouragement of oriental studies. He retired in 1814, and devoted himself to scholarly work in England, especially to eastern science. Several of his essays in *Asiatic Researches* related to Hindu astronomy, meteorology, mathematics, geology, and botany. He contributed also to the *Transactions of the Astronomical Society*, to the *Quarterly Journal of Science*, the Linnæan and the Geological Societies, as well as, more especially, to the Royal Asiatic Society, which he helped to found in 1823. His last years were troubled by care, blindness, and much bodily suffering, endured with fortitude; and on 10th March 1837 he died at the age of seventy-two. His translation of the *Sāṅkhya Kārika* was posthumously edited by Professor H. H. Wilson. His work as a Sanskrit scholar possessed the highest merits of extreme conscientiousness and caution, scientific accuracy, and a stern repression of the tendency to fanciful exaggeration which marked the early theories of European

scholars on Indian science and religion. His life has been well written by his son, Sir T. E. Colebrooke (1873), and his immense services to Sanskrit scholarship are lucidly criticised in Max Muller's *Biographical Essays* (1884).

**Colenso**, JOHN WILLIAM, D.D., Bishop of Natal, the son of a Cornish gentleman, was born at St Austell, January 24, 1814. He was educated at St John's College, Cambridge, where he graduated as second wrangler in 1836, and became fellow and assistant-tutor of his college. From 1838 to 1842 he was an assistant-master at Harrow, and for the next four years a tutor at Cambridge. Appointed, in 1846, rector of Forncett St Mary, Norfolk, he published *Miscellaneous Examples in Algebra* in 1848, *Plane Trigonometry* in 1851, and *Village Sermons* in 1853, in which same year he was appointed first Bishop of Natal. With that energy of character which always distinguished him, Dr Colenso at once began a close study of the natives and of the Zulu language, and after a time prepared a grammar and dictionary, and made a translation of the English Prayer-book and a portion of the Bible, printing them in his own house. In 1860 he memorialised the Archbishop of Canterbury against compelling those natives who had already more than one wife to renounce polygamy as a condition to baptism, alleging that he could find no warrant for such compulsion either in the gospel or in the ancient church. In 1861 he published his *Translation of St Paul's Epistle to the Romans, commented on from a Missionary Point of View*, in which he objected to the doctrine of eternal punishment. He next announced that he had become convinced of the improbability of many statements of facts and numbers in the historical books of the Bible; and in 1862 there appeared the first part of his work on *The Pentateuch and the Book of Joshua Critically Examined*. This treatise brought down upon its writer an avalanche of criticism and remonstrance. He had called in question the historical accuracy and Mosaic authorship of the books cited, and his work was condemned as heretical by small majorities in both Houses of Convocation of the province of Canterbury. The bishop was entreated to resign his see by his episcopal brethren, some of whom inhibited him from preaching in their dioceses. The second part of his work appeared in 1863. Convocation censured him in the succeeding year, and he was declared to be deposed from his see by his Metropolitan, Bishop Gray of Capetown. He appealed from this judgment in 1865, when the Privy-council declared the deposition to be 'null and void in law.' The bishops constituting the council of the Colonial Bishops Fund, however, refused to pay him his income, upon which he appealed to the Court of Chancery. On October 6, 1866, the Master of the Rolls delivered an elaborate judgment, ordering the payment of the bishop's income, with all arrears and interest, unless his accusers should bring him to trial for heresy; but this they declined to do. Immediately before Dr Colenso's return to his diocese in August 1865, his English friends presented him with £3300 as a testimonial. The Anglican community at the Cape was now divided into two camps, and although Dr Colenso remained the only bishop of the Church of England in Natal, Bishop Gray publicly excommunicated him, and in 1869 consecrated Dr W. K. Macrorie as Bishop of Maritzburg, his authority practically extending over the same diocese. In 1874 Dr Colenso visited England to report upon the affairs of his diocese to the Archbishop of Canterbury, and to consult with the heads of the church upon its relations to the new see of Maritzburg. While in England he pleaded the cause of Langalibalele,

a dispossessed Zulu chief. On his return to South Africa he warmly espoused the interests of the natives against the oppression of the Boers, and the encroaching policy of the Cape officials. He opposed the attitude of Sir Bartle Frere and the home government during the Zulu war, and earnestly strove to make peace between the contending parties. Owing to his exertions, Cetwayo was allowed to visit England and plead for his rights. Dr Colenso's defence of the aboriginal claims lost him much valuable support; but the bishop and his daughter never swerved from what seemed to them to be the wisest as well as the only honourable course to pursue towards the natives of South Africa. In addition to the works already named, Dr Colenso was the author of *Ten Weeks in Natal* (1855); *The New Bible Commentary Literally Examined* (1871-74); *Lectures on the Pentateuch and the Moabite Stone* (1873); and a volume of *Sermons* (1873). His critical analysis of the Pentateuch, completed by a seventh part in 1879, had some influence on contemporary thought; but from the progress of criticism, his contentions have ceased to be of primary importance. Colenso died at Durban, Natal, 20th June 1883. See his *Life* by Sir G. W. Cox (2 vols. 1888).

**Colenso**, a small town in Natal, 15 miles S. of Ladysmith by rail, where the Tugela River is crossed by the railway from Ladysmith to Durban. It is famous on account of the disastrous defeat there of General Buller, on 15th December 1899, on his first attempt to relieve Ladysmith during the Boer war.

**Coleoptera**. See BEETLE.

**Colepeper**, JOHN, was a native of Sussex, but, save that he had seen much foreign service, little is known of him till his return for Kent in 1640 to the Long Parliament. There he pursued a course much the same as Hyde's (see CLARENDON), and in January 1642 was created Chancellor of the Exchequer, a twelvemonth later Master of the Rolls, and in 1644 Lord Colepeper. With Hyde he attended Prince Charles to the western counties, and from Jersey he brought him to Henrietta Maria, to whose party he thenceforth attached himself. He lived to see the Restoration, dying on 11th June 1660. He was an able, far-seeing councillor, but rough and unstable.

**Coleraine**, a seaport in County Londonderry, on the right bank of the Bann, 4 miles from its mouth, 33 by rail N.E. of Londonderry, and 61 N.W. of Belfast. It has manufactures of fine linens, pork-curing, distilling, and important fisheries in the river. The Bann is here spanned by a fine stone bridge, 288 feet long, which connects Coleraine with its suburb on the left bank of the river, Waterside or Killowen. Vessels of 200 tons can discharge at the quay—those of greater burden lie at Portrush, 6½ miles off. Population, 7800. Until 1885 Coleraine returned a member to parliament.

**Coleridge**, HARTLEY, eldest son of the great Coleridge, was born, an eight months' child, at Clevedon, Somersetshire, 19th September 1796. Very early he showed uncommon parts, and a singular power of living entirely in a make-believe world of dreams and imagination. Wordsworth's lovely and touching poem to the child at six years of age was strangely and sadly prophetic of his after-life; hardly less the concluding lines of his own father's two poems, *The Nightingale* and *Frost at Midnight*. Hartley was brought up, after the separation of his parents, by Southey at Greta Hall, and was educated chiefly at Ambleside school. In 1815 he went to Oxford as postmaster of Merton College. His scholarship was great but unequal, and not such as to lead to high distinc-

tions in the schools. His failure after no less than three attempts to gain the Newdigate filled him with 'a passionate despondency,' from which he turned for relief to a fatal remedy. When at length he had gained with credit an Oriel fellowship, at the close of his probationary year he was judged to have forfeited it mainly on the ground of intemperance. 'The sentence might be considered severe,' says his brother; 'it could not be said to be unjust.' Unhappily it ruined his life, crushed his spirit, and made recovery impossible. With £300 given him by the college, Hartley spent the next two years in London, then tried for four or five years taking pupils at Ambleside, occasionally writing for *Blackwood's Magazine*, next lived some time at Grasmere, and then went to live at Leeds with one Bingley, a publisher, for whom he agreed to write a biographical work on the worthies of Lancashire and Yorkshire. Of these but thirteen lives had already been written when Bingley failed. These were published under the titles of *Biographia Borealis* (1833) and of *Worthies of Yorkshire and Lancashire* (1836). Bingley also printed a small volume of his poems in 1833. Hartley next returned to Grasmere, the only remaining interruptions to his ordinary life being two short and not unsuccessful intervals of teaching at Sedburgh grammar-school. His father, who died in 1834, made a special provision for him in a codicil to his will, and his mother's death in 1845 made him by an annuity completely independent. He continued to write poetry, and wrote a life of Massinger for an edition projected by Moxon. His days were spent in fitful study, lonely reverie, and wanderings over the Lake Country, with, unhappily, occasional lapses into intemperance. The dalesmen everywhere treated 'Poet Hartley' with a singularly affectionate respect, not without a kind of awe at his *eerie* appearance, his abstracted air, his small stature, prematurely white hair, and gentle manners. He loved children and animals, and was fondly loved by them in return. He died 6th January 1849, and was buried beside what was soon to be Wordsworth's grave.

Hartley Coleridge's poetry falls short of the great, but sometimes approaches it, and even nearly. It is graceful, tender, and sincere, pervaded throughout with a charm of a nature rare and almost unique, alternately wise and playful, and often perfect in the expression of the thoughts it has to convey. He is greatest in the sonnet—a form which seems exactly to have been the measure of his powers, or rather of the fitful periods of his poetic passion. *Leonard and Susan*, a narrative in blank verse, and *Prometheus*, a dramatic fragment, are the only poems of any length.

His *Poems* were collected by his brother Derwent, with a *Memoir* (1851); also his *Essays and Marginalia* (1851). See also Miss Towle, *A Poet's Children* (1912).

**Coleridge, LORD.** John Duke Coleridge (eldest son of Sir John Taylor Coleridge, the great poet's nephew, and himself the biographer of Keble) was born in 1821, and educated at Eton and Oxford, was called to the bar in 1847, and was for some years leader of the western circuit. Appointed recorder of Portsmouth in 1855, he took silk in 1861, and from 1865 to 1873 represented Exeter in parliament. He was successively Solicitor-general (1868), Attorney-general (1871), Chief-justice of the Common Pleas (1873), and (1880) Lord Chief-justice. An occasional contributor to the reviews, and a man of exceptional culture and polished eloquence, he died 14th June 1894.

**Coleridge, SAMUEL TAYLOR,** was born at Ottery St Mary, Devonshire, October 21, 1772, where his father was vicar, and master of the grammar-school. He was the youngest of ten

children of his father's second marriage. A singularly precocious child, he had read the *Arabian Nights* in his fourth year; but he said of himself, 'I never thought as a child.' On his father's death he was sent, in his ninth year, to be educated at Christ's Hospital, where he had Charles Lamb for a school companion. He was poorly fed, and badly taught; but he plunged with eagerness into a whole library of literature, and read Homer and Virgil for the mere pleasure of it. Remaining at Christ's for eight years, he became head of the school, and showed a remarkable capacity for assimilating all sorts of knowledge. He was a mental rover from his boyhood onwards, with a very miscellaneous intellectual appetite. At school he translated the hymns of Synesius, studied works on medicine in Latin, on metaphysics in Greek, and fell in love with the sister of one of his companions. His last years at school, however, were years of suffering. He used to bathe in the New River, plunging into the water with his clothes on, and after a swim, resumed his games, or returned to his books, without changing his garments. The inevitable result was rheumatic fever and other ailments. While at school he had a passing attraction not only to his schoolmate's sister, but to the shoemaker's craft. This was a short-lived fancy; and in October 1791 he passed to Jesus College, Cambridge, a few months after Wordsworth had taken his B.A. degree, and left the university. During his first year at college he did good work in classics, and became one of four selected candidates for the Craven scholarship in 1793; but his bent not being mathematical, and having little chance of winning the chancellor's medal, he gave himself up to general literature. He also became interested in politics, took a strong position on the Liberal side, and won distinction, even thus early, as a marvellous talker. He got into difficulties in Cambridge, through extravagance in furnishing his rooms, became depressed, and in a panic fled to London, where he enlisted in the 15th Dragoons, under the name of Silas Tomkyn Comberbacke (a name assumed to conceal and yet reveal his identity as S. T. C.). He never could learn, however, how to manage a horse, never rose out of the awkward squad; and a chance accident disclosing his knowledge of classics, led to his discovery by his friends, and to his being bought out of the service. At the close of the summer term, he went on a visit to Oxford; and there, at Balliol College, he for the first time met Southey. In July he took a pedestrian tour in North Wales, after which he went to Bristol, and there again met both with Southey and with Robert Lovell, the latter of whom had just married a Miss Fricker, to whose sister (Edith) Southey had engaged himself. Coleridge at once followed his example, and became engaged to another sister (Sara); and amongst them they formed the Quixotic plan of emigration to the banks of the Susquehanna in America, where they were to form a 'Pantisocracy'—an ideal community on the principles of Communism. Two hours of daily labour were to suffice for providing the necessities of life, the rest of their time being devoted to intellectual work and social converse. They were to have all things in common; and, as a result of the experiment, were to bring in a golden age, for themselves and others. It was a dream; and it passed, as dreams do.

Coleridge had left Cambridge without taking a degree. In the late autumn of 1794 he went up to London, and there renewed his acquaintance with Lamb. But in December he was brought back to Bristol by Southey, who feared he might come under some new fascination in the metropolis. He had to find the means of livelihood, not on the Susquehanna, but in the west of England; and

he began a course of miscellaneous lecturing on literary and political subjects. It was now that he made the acquaintance of Joseph Cottle, the Bristol bookseller, who became so kind a friend. Cottle offered to publish a volume of poems for him, giving him thirty guineas for the copyright; and, vexed at his delay in completing the volume, subsequently offered him a guinea for every hundred lines of verse he would write, after this first volume was printed. With this promise, and what he thought provision for life, he ventured to marry; and in October 1795 Sara Fricker became Mrs Coleridge. They went at once to a small cottage, which is still to be seen at Clevedon in Somerset. Here, however, Coleridge did not long remain. We find him in Bristol in December getting his first volume of poems ready for the press (it was published in April 1796), and at the same time attempting to start a weekly journal to be called the *Watchman*, which was to contain general news, parliamentary reports, literary intelligence, and reviews. In his efforts to float this journal he went north to Birmingham, Manchester, Sheffield, &c., to procure subscribers. He succeeded in starting it, Cottle being the publisher; but it only reached its tenth number, and failed—the generous publisher bearing all the loss. Coleridge next tried the experiment of preaching in the Unitarian chapels around Bristol. Cottle gives an account of his appearance in one of these at Bath on a Sunday, 'in blue coat and white waistcoat,' to discourse on the corn laws and the powder tax. This eccentricity did not last. Another friend, and a somewhat remarkable man—Thomas Poole of Nether Stowey—provided him with a small house and garden in the village of Stowey; and there Coleridge went to live, in January 1797, with his wife and child (whom he had named Hartley, from his admiration for the philosophy of David Hartley). Poole also very generously raised a sum of money to provide an annuity for his friend.

Before this date Coleridge had made the acquaintance of Wordsworth. In the early spring of 1796 Wordsworth went up to Bristol from Racedown in Dorsetshire, to see both Coleridge and Southey; and, in a list of authors with whom he was acquainted, drawn up by Coleridge in March of that year, Wordsworth's name occurs. In the following year Coleridge went down from Stowey to Racedown to return the visit. As late as 1845 Mrs Wordsworth gave a graphic account to Sara Coleridge of her father's 'leaping over a gate, and bounding down a pathless field' on this first visit to Racedown. In July 1797 the Wordsworths moved from Racedown to Alfoxden, partly to be nearer Coleridge; and during that winter—which William and Dorothy Wordsworth spent in Somerset—Coleridge was their almost daily companion, roaming the woods and coombs of the Quantocks with them, or spending the night at Alfoxden. Wordsworth and he discussed together the principles of poetry, and planned a joint volume of verse to illustrate these principles; Wordsworth undertaking to invest commonplace themes with an imaginative interest, by disclosing what underlay them; and Coleridge taking supernatural or romantic incidents, humanising the stories so as to give new life to them. This was the origin of the *Lyrical Ballads*, the little volume which more than any other marked a new departure in poetical literature at the beginning of the 19th century. To it Coleridge contributed the *Ancient Mariner*. The book was published in 1798.

This meeting of Coleridge and Wordsworth was one of the most remarkable conjunctions of genius in the literary history of England, and the days they spent together in Somerset were perhaps the

most joyous in their lives. While living at Nether Stowey, Coleridge kept up the practice of occasional preaching; and 'to prevent the necessity of his going into the ministry,' another admiring friend, Josiah Wedgwood, sent him a draft for £100. He returned it to the donor; but, soon afterwards, Coleridge accepted an annuity of £150 from the brothers Wedgwood, given to him on the condition that he would devote his life wholly to poetry and philosophy. In 1798 he started with the Wordsworths for Germany, crossing from Yarmouth to Hamburg; and while Wordsworth went to Goslar, Coleridge proceeded to Ratzeburg, to study the language and literature of the country. He moved on to Gottingen in January 1799. An interesting picture of his life in Germany is given in Satyrane's Letters. He returned to England in June; in August we find him at Stowey; and in September in Yorkshire with the Wordsworths. They had some idea of settling together, to renew the fellowship of the Quantock days. On the approach of winter, however, Coleridge went up to London, and there translated *Wallenstein*, one of the best bits of work he ever did. He now made fresh attempts at journalism, and wrote both prose and verse for the *Morning Post*; but, while some of his articles were admirable, he was such an irregular contributor, that his connection with the *Post* lasted only for a few months. In July he went north to Keswick, and took up his residence at Greta Hall, which Southey also made his home in 1803. At Keswick he continued his poetic work, and wrote the second part of *Christabel*. The Wordsworths had now been settled for some time at Dove Cottage, Grasmere, and there Coleridge was their frequent guest. Dorothy Wordsworth's Grasmere journal (ed. Knight, 1897) is full of allusions to his visits, and to the wonderful friendship of these days—a friendship immortalised in her brother's *Stanzas written in a pocket copy of Thomson's Castle of Indolence*. But during the years he spent at Keswick, Coleridge came under the influence of what was henceforward to be the very curse of his life. His health had never been robust; rheumatism and neuralgia had tortured him; and, becoming his own doctor, he had recourse to the anodyne of opium. Little by little the habit grew, and the 'Kendal black drop' at length enslaved him. It injured his constitution and killed his imagination; it enfeebled his will and destroyed his sense of truth and honour. Few things in literature are so pathetic as his own lament over the deterioration of his nature, in his *Dejection, an Ode*. The details of this malady, and what it led to, have not yet been fully told.

Charles Lamb came to visit him at Keswick in 1802. In 1803 he started with the Wordsworths, on their memorable Scottish tour; but left them in a fortnight, and did wonderful feats of walking alone. He now thought of many plans for the recovery of health, which were really but plans to flee from his own shadow. The frugal Wordsworth forced him to accept a loan of £100. He was befriended by others, and he sailed for Malta in April 1804. There he became secretary to the governor, Sir Alexander Ball, an office for which he was entirely unsuited. His letters from abroad were hypochondriacal, valetudinarian, and sad in many ways. From Malta he went to Sicily, to Naples, and to Rome; but he had to leave Italy with some abruptness, an order, it is said, having been issued by Napoleon for his arrest, on the ground of some republican utterances years before; and the vessel in which he sailed being chased by a French cruiser, he threw all his papers (which included many of Wordsworth's poems) overboard. In August 1806 he returned to England. It is unnecessary to trace his subsequent wanderings to and fro, from

London to Keswick, to Penrith, to Coleorton, to Bristol, and to Bridgwater. At London he began what might have been a very remarkable series of lectures at the Royal Institution; but the experiment failed, for the same cause as previous ones had failed. He next thought of a fresh venture in journalism, and projected a new weekly paper, *The Friend*, for which he got a number of subscribers. It was printed at Penrith at his own expense. The Wordsworths took him into their house at Allan Bank, Grasmere, for the winter; and while Coleridge wrote most of the papers for *The Friend* himself, Wordsworth supplied him with some of the articles, and Sarah Hutchinson transcribed them week by week for the press. The paper lived from August 1809 to March 1810. The habit of opium-eating, which had now obtained a fatal ascendancy, could not be hidden from his friends; and at this juncture the Wordsworths, with the greatest delicacy, tried their utmost to help and to befriend him. They were misunderstood. He went up to London in 1810, and a strange cloud (the full story of which has yet to be told) obscured for a time the old relationship between the households. A partial estrangement lasted for some years, but was at length overcome by the friendly offices of Henry Crabb Robinson.

During Coleridge's later years in London he lived for four years with an old Bristol friend, John Morgan, at Hammersmith. He first tried the experiment of lecturing on Shakespeare. Occasionally his appearances were brilliant; more usually they were absolute failures. His conversational powers, however, seem to have increased, while his success as a lecturer diminished. All his life he had been in the habit of receiving gifts freely from such friends as the Beaumonts, and the Wedgwoods, from Stuart, and Wordsworth, and De Quincey; and though he occasionally did generous things to others, his neglect of the primal duties to his own family put a severe strain upon the tie that bound these friends to him.

The remaining years of his life were spent at Highgate with Mr and Mrs Gillman, whose kindness and consideration were unbounded. Though a wreck of his former self, the baleful opium-habit lessened, as Coleridge grew older, and he was able to do a good deal of miscellaneous writing. Some of his best prose work was written at Highgate. Though a dreamy and often unintelligible sage, he became a sort of oracle to a circle of enthusiastic admirers that gathered round him, and he completely fascinated the young men, who made their weekly pilgrimages to Gillman's house to hear him talk. As the years went on, his health somewhat improved, and he was even able to make occasional visits. In 1829 he took a short tour with the Wordsworths, accompanying the poet and his daughter to the Rhine. He died on the 23d July 1834, and was buried at Highgate.

As a Poet, Critic, and Philosopher (the three functions having been combined by Coleridge as they had never been by any previous Englishman) he was certainly a star of the first magnitude in the firmament of letters. For originality, insight, grace, musicalness, deft subtlety of thought, naturalness and charm of diction, he had only one rival amongst the poets of the Renaissance. It is true there have been greater poets in England, but there has been no greater poetical critic in British literature. Coleridge was a critic of poets (and the poets have, as a rule, been the best critics of each other). As yet there is no estimate of the literary revival which Coleridge and Wordsworth inaugurated that is superior to what the former wrote in his *Biographia Literaria*; and he was a philosophical critic, because he was a philosopher amongst the poets. He may be said to have inaugurated a new

era by his poetic idealism, and by introducing the spirit of Plato alike into his poetry and his literary criticism. As a philosopher, however, he does not occupy the foremost place. He was too miscellaneous, too assimilative, and his intellect too meteoric and vagrant for speculative originality of the highest order. But he was one of the most suggestive of critics. Though not profoundly learned, he was very widely read; and he did more to leaven English philosophy, literature, and theology with the depth and the free spirit of Germany, than any one of his contemporaries. He vitalised whatever he discussed; and his writings will probably continue to kindle successive generations, and to fascinate them, even while they fail to convince.

Coleridge's chief works are: *Poems* (1796); *Wallenstein* (1800); *The Friend* (1809-10); *Remorse* (1813); *Christabel*, *Kubla Khan*, &c. (1816); *The Statesman's Manual* (1816); *Sibylline Leaves* (1817); *Biographia Literaria* (1817); *Aids to Reflection* (1825). Posthumously published—*Literary Remains* (4 vols. 1836-38); *Confessions of an Enquiring Spirit* (1840); *Essay on Method* (1845).

The main authorities are *Letters, Conversations, and Recollections*, by Allsop (1836); *Cottle's Early Recollections* (1837); *Gillman's Life* (1838); *Coleridge's Letters to Sir George and Lady Beaumont* (1886); *Mrs Sandford's Thomas Poole and his Friends* (1889); the *Biographia Literaria* (1817); *De Quincey's Recollections of the Lakes* (1857); *Eliza Meteyard's Group of Englishmen, 1796-1815* (1871); the *Memoirs of Wordsworth* (1851); *Southey's Life and Correspondence* (1850); *Lamb's Letters*; *Brandl's S. T. Coleridge and the English Romantic School* (1882); the short *Lives by Traill* (1884) and *Hall Caine* (1887); the *Life by Dykes Campbell*, prefixed to his admirable edition of the poetical works, and separately published (1893, 1894); the *Letters* (1895) and *The Complete Poetical Works* (2 vols. 1912), edited by Ernest Hartley Coleridge; *Lord Coleridge's Story of a Devonshire House* (1905); and *H. Fanson Fausset, Samuel Taylor Coleridge* (1926).

**Coleridge, SARA**, the gifted daughter of the great Coleridge, was born, 23d December 1802, at Greta Hall, Keswick, where she was brought up by Southey. Her 'depth of meditative eye' is noticed by Wordsworth in his (rather poor) *Triad* (1828). Sara early showed remarkable powers of mind, with all her father's leaning towards psychology and abstract thought. At twenty she published, to aid her brother Derwent's college expenses, a translation of Martin Dobrizhofer's Latin *Account of the Abipones* (1784), and three years later the 'Loyal Servitor's' memoirs of the Chevalier Bayard. In 1829 she married her cousin, Henry Nelson Coleridge, and on his death in 1843 succeeded him in the task of annotating and editing her father's writings. Her health failed early, and she died 3d May 1852. Her own works were *Pretty Lessons for Good Children* (1834), and *Phantasmion* (1837), a somewhat remarkable fairy-tale. Her *Memoirs and Letters* were edited by her daughter in 1873.—Her son, HERBERT COLERIDGE, born in 1830, was educated at Eton and Balliol College, took a double-first in 1852, and was called to the bar, but devoted himself to the study of comparative philology. He was editor of the *Philological Society's New English Dictionary* in its earlier stages. His own works were a *Glossarial Index to the Printed English Literature of the Thirteenth Century* (1859), and an essay on King Arthur, printed after his death (23d April 1861) by the Philological Society.

**Coleridge-Taylor, SAMUEL** (1875-1912), composer, born in London, the son of a West African and an Englishwoman, studied under Stanford at the Royal College of Music. His compositions include *Hiawatha* (1898-1900) and other cantatas (*The Blind Girl of Castel Cuille*, *Meg Blane*, *The Atonement*), orchestral and pianoforte works, and a violin concerto. See his *Life and Letters* by Sayers (1915).

**Coleroon**, the largest and most northerly branch from the Kaveri, flows, chiefly between Trichinopoly and Tanjore, into the Bay of Bengal.

**Coles**, COWPER PHIPPS, naval architect, born in Hampshire in 1819, early entered the navy, and became captain in 1856. In 1855 he constructed a gun-raft, which was favourably reported on; from 1856 he was engaged in experiments, and ultimately produced a form of turret-ship, the general idea of which had probably occurred to him independently, although its development owed much to Ericsson (q.v.). The *Captain*, built from his designs, turned bottom upwards in a gale, and sank off Cape Finisterre on 7th September 1870, almost all on board, including Coles, being drowned.

**Coleseed**. See RAPE.

**Coleshill**, a market-town of Warwickshire, 10 miles ENE. of Birmingham.

**Colet**, JOHN, born in London about 1467, was the eldest son of a family of twenty-two. His father, Sir Henry Colet, was twice Lord Mayor of London. Colet studied at Oxford with the view of entering the church, and about 1493 made a prolonged visit to the Continent, travelling through France into Italy. While in Italy he became acquainted with the views of Savonarola, which subsequent study and experience led him to regard with increasing approval. Having returned to England in 1496, and been ordained priest, he delivered at Oxford a series of lectures on the Epistles of St Paul, which attracted great attention, his principles of interpretation being at every point opposed to those of the scholastic theologians. In 1498 Erasmus came to Oxford, and it is one of Colet's chief claims to remembrance that he powerfully influenced that scholar's opinions on the proper methods of Scripture interpretation and on the value of the scholastic philosophy. In 1505 Colet was made Dean of St Paul's, London, and in this office still continued to deliver lectures on different books of Scripture, which gave rise to much diversity of opinion. With the large fortune he inherited on the death of his father, Colet founded St Paul's School (q.v.). At this school 153 scholars were received, whose education was conducted in a spirit far in advance of the time. On account of Colet's vigorous denunciation of the ignorance and corruption of the clergy, charges of heresy were brought against him, but Archbishop Warham refused to support them. Colet also spoke out strongly against the French wars of Henry VIII., who, nevertheless, always treated him with regard. In 1518, feeling his end approaching, Colet appointed the Mercers' Company of London as managers of his school—a step of decisive importance, as it was the first example of lay management of an educational institution. He died of dropsy, 16th September 1519.

Of late years it has been conclusively shown that Colet was one of the most striking figures of his time in England. He was not a great scholar, and he left no writings that entitle him to remembrance; but by his clear view of the urgent need of reform in the church, and by the intensity of his religious convictions, he gave an impulse to men like Sir Thomas More and Erasmus, which influenced their whole life-work. At the same time, Colet, though an ardent religious reformer, never entertained the thought of a formal rupture with Rome. His foundation of St Paul's School, and the character he gave to that institution, entitles him to an eminent place among educational reformers. See Seebohm's *Oxford Reformers* (2d ed. 1869), and the Rev. J. H. Lupton's *Life of Colet* (1887; new ed. 1909).

**Colewort**. See CABBAGE.

**Colfax**, SCHUYLER, American statesman, born at New York, 23d March 1823, removed in 1836 to

Indiana, where in 1845 he acquired a newspaper at South Bend, which he made the most influential Whig journal in the district. He was a delegate to the Whig conventions of 1848 and 1852; he was returned to congress in 1854 by the newly-formed Republican party, and re-elected until 1869, being thrice chosen Speaker; and in 1868 he was elected vice-president of the United States, in Grant's first term. Implicated, apparently unjustly, in the Crédit Mobilier charges of 1873, he spent the remainder of his life in political retirement, making public appearances only on the lecture platform, and died at Mankato, in Minnesota, 13th January 1885. See his *Life* by O. J. Hollister (New York, 1886).

**Colgate University**. See HAMILTON (N. Y.).

**Colic** (Gr. *kolon*, 'the large intestine'; see INTESTINES), a name employed by the later Greek and the Roman physicians to denote diseases attended with severe pain and flatulent distension of the abdomen, without diarrhoea or looseness of the bowels. The disease (commonly called *gripes* or *belly-ache*) is now generally believed to be spasmodic in character, and to be dependent upon irregular contractions of the muscular coat of the intestines—its supposed particular connection with the colon, or large intestine, however, is not usually to be made out from the symptoms. Painful disorders of the bowels are very frequent in persons who are not attentive to the regular evacuations, especially when they are exposed to cold so as to experience chill or coldness of the feet, which will often suffice to bring on an attack of colic. The disease is usually attended with Constipation (q.v.), and ceases when the regular action of the bowels is restored, although often in this case the operation of medicine is attended by continued pain for a time. Warm fomentations, or other warm applications such as a hot water rubber bag, to the abdomen may usefully be employed, and great relief is sometimes experienced from friction with a warm liniment, such as opodeldoc, or the soap and opium liniment. Pressure with the hand over the painful part commonly diminishes the suffering for the time in simple colic, but increases it in more serious diseases. Warmth to the feet, and the recumbent posture, are also to be recommended. In very severe or protracted cases opium may be taken internally. A good remedy in such cases is a full dose of castor-oil (one ounce or more for an adult), with 10 or 15 drops of laudanum, or of solution of morphia. (Opiates should not be given to children except under medical advice, and in very reduced doses.) When colic resists such mild and simple remedies as the above—when it is accompanied by tenderness of the belly, or by hard swelling in any part of it—when constipation is obstinate, or vomiting is present—when there is feverishness, or tendency to exhaustion—or when there is reason to believe that it may depend on any other cause than the mere accumulation of the products of digestion in the intestines, no time should be lost in seeking the best medical assistance that can be procured; for colic is closely allied as a symptom to several very severe and dangerous diseases, e.g. appendicitis. Some of the severer forms also demand special, often surgical, treatment at the earliest available opportunity—for example, colic due to obstruction of the bowels, whether caused by a twist, an old adhesion, or a hernia that has become strangulated. Colic pains are also present in peritonitis (see PERITONEUM), another most dangerous form of disease; and form one marked symptom of the slow poisoning by lead, occasionally observed as the consequence of contamination of drinking water by leaden cisterns, &c. In this form the treatment is different

from that of simple colic, and will be treated of under LEAD-POISONING.

Two other forms of colic should also be mentioned, *renal colic* and *biliary colic*. The former is due to the passage down towards the urinary bladder of a stone formed in the kidney, and the latter is caused by the presence of a gall-stone in the bile ducts (see CALCULUS).

Colic is also a disease of the lower animals, especially of high-bred horses.

**Coligny**, GASPARD DE, one of the greatest Frenchmen of the 16th century, was born at Châtillon-sur-Loing, February 16, 1519. At the age of twenty-two he began his career as a soldier, and greatly distinguished himself in the wars which Francis I. and Henry II. carried on against Spain. By Henry II. he was appointed colonel-general of the French infantry, and the severe system of discipline he introduced gave a new character to the art of war in the 16th century. In 1552 he was made admiral of France, though he never commanded on the sea. By holding the town of St Quentin (1557) with a handful of men for seventeen days against the army of Spain, he was the means of saving his country. It was during his imprisonment, after the capture of this town, that he embraced the views of the Huguenots, to the furtherance of which the rest of his life was consecrated. On the accession of Francis II. in 1559, the Guises became all-powerful, and their interest and fanaticism led them to oppose all toleration of the Huguenots. To obtain this toleration, however, was Coligny's great aim, and by his high character and his abilities as a statesman and general, he succeeded in conjunction with the heads of the Bourbon family in effecting the treaty known as the 'Pacification of Amboise' (1563), by which the Huguenots were allowed freedom of worship. This concession having been gradually withdrawn by the queen-mother, Catharine de' Medici, the second Huguenot war broke out in 1567, when, on the death of the Prince of Condé, Coligny was appointed generalissimo of the forces of Henry of Navarre, afterwards Henry IV. of France. Both parties having grown weary of the war, peace was concluded in 1570 on the basis of the treaty of Amboise, mainly through Coligny's energy. Catharine de' Medici, however, again becoming alarmed at the growing power of the Huguenots, and especially at the ascendancy of Coligny over the young king, Charles IX., determined by one desperate stroke to regain her power. In 1572, a numerous body of the Huguenot nobles having been drawn to Paris by the marriage of Henry of Navarre with Margaret, the sister of the king, the massacre of St Bartholomew took place, when Coligny (wounded by a shot two days before) was murdered in his bed, and his body thrown into the street by Henry of Guise and his followers.

In his personal character Coligny was one of the noblest Frenchmen of his time. His religious zeal was purely disinterested, and he had deeply at heart the welfare of his country. His great aim was to make the Huguenots a national party, and by their enthusiasm to defeat the schemes of Spain, who he saw was bent on supremacy in western Europe. Had he lived a few years longer the history of French Protestantism would have been different. Coligny's wide views are further seen in his unsuccessful attempts to found Protestant colonies in Brazil and North America. See his *Life* by Blackburn (2 vols. Phila. 1869), Bersier (Eng. trans. 1884), Delaborde (3 vols. Paris, 1880), Marks (Stuttg. 1892), and Whitehead (1904).

**Colima**, a Mexican state on the Pacific coast, with an area of 2300 sq. m. and a population of 80,000. The soil is very fertile, the climate warm ;

large quantities of coffee, sugar, rice, tobacco, maize, and cotton are grown. The capital, Colima, 1650 feet above the sea, about 40 miles ENE of Manzanillo, is regularly built, with narrow streets ; it has several large cotton-factories, and is the commercial centre of the state. Pop. 25,000. Beyond the state frontier, 35 miles NE. of the capital, rises the volcano of Colima (12,750 feet).

**Colin**, or VIRGINIAN QUAIL. See QUAIL.

**Coliseum**. See AMPHITHEATRE.

**Colkitto**. See MONTROSE (MARQUIS OF).

**Coll**, one of the Argyllshire Hebrides, 16 miles W. of Tobermory in Mull. It is 13 miles long, 1 to 3½ broad, and 30 sq. m. in area. It nowhere exceeds 326 feet in height ; gneiss is the predominant rock ; and more than a third of the surface is cultivated or in pasture. Pop. 400.

**Collapse**. See SHOCK.

**Collar-bone**, or CLAVICLE (q.v.), is in man, as in most mammals, the only bone directly connecting the upper extremity with the skeleton of the trunk. It is consequently very often broken, more often than any other bone except perhaps the radius. Under proper treatment, in children sometimes even without treatment, it readily reunites without any impairment of the usefulness of the limb. But it is very difficult to maintain such exact adjustment that no irregularity of the surface of the bone will remain ; and as it lies close under the skin, the resulting deformity is often visible.

**Collateral**. See CONSANGUINITY, SUCCESSION. Collateral Security is an additional and separate security for the performance of an obligation.

**Collation**. See BENEFICE.

**Coltè**, a town of Italy, on the Elsa, 24 miles SSW. of Florence. It has an old cathedral and castle. Pop. 2000.

**Collect**, a short form of prayer, peculiar to the liturgies of the Western Church. It consists of a single sentence, conveying one main petition, which is based on an attribute ascribed to God in the opening invocation, and closing with an ascription of praise or a pleading of the merits of Christ. Thus much for the structure of these prayers, which, whether in Latin or English, may be described, alike from their noble rhythmical harmony and from their pathos and devout simple earnestness, as models of liturgical petitions ; the etymology of their name is more difficult to determine, beyond the fact that it is from the Latin *colligere*, 'to collect.' According to some, the prayer was so called because, as in the English Prayer-book, it collects or condenses the teachings of the epistle and gospel for the day ; but this explanation applies only to the class of special collects. According to others, the term implies that the prayer collects and sums up all the previous petitions, or gathers and offers up in one comprehensive form all the spoken and unspoken petitions of the people. Both these derivations are open to serious objections, and neither has any historical basis ; the most probable view is that which traces the name to the *collecta*, or assembly of the people for divine service, at which certain prayers (*orationes ad collectam*) were said, distinct from the later prayers of the mass (*orationes ad missam*). Of the collects used in the liturgy of the Church of England, some, including most of those for saints' days—since the old collects were mainly prayers for the saints' intercession—were composed at the Reformation, or even later ; but most, taken from the old Roman Missal, are derived from the Sacramentaries of Popes Leo, Gelasius, and Gregory (5th and 6th centuries). The remoter source of the weekly

collects Freeman finds in the hymns of the Eastern Church, founded on the gospels, of which these collects would thus be the 'very quintessence.' In the English Prayer-book, for every Sunday there is a proper collect, with corresponding epistle and gospel; and this collect stands for every day in the following week, except in the case of festivals and their eves or vigils, which have collects of their own. Good Friday alone has three collects; and during Advent and Lent the collect for the first day of the season is repeated after the collect for the week.

**Collections at Churches.** The collections which are still made at all churches in Scotland—either at the church-doors before the service, or in the church after it—were, till a comparatively recent period, the principal fund for the support of the poor. The proceeds of these collections were originally under the control of the kirk-session, and remain so under certain restrictions. By a proclamation of the Privy-council in 1693, it was ordered that one-half of the sums so collected, and of dues received by the kirk-session, be paid over into the general fund for the support of the poor. The other half has generally been applied for the relief of sudden or temporary distress. The kirk-session may be called upon by any single heritor to account for its management of this remaining half. By the Poor-law Amendment Act, 1845, it is enacted that in all parishes in which it has been agreed that an assessment shall be levied for the relief of the poor, all moneys arising from the ordinary church collections shall in future belong to, and be at the disposal of, the kirk-session; provided, however, that they shall be applied to no purposes other than those to which they were, in whole or in part, legally applicable before the date of the act. A power is reserved to the heritors to examine the accounts of the kirk-session, and to inquire into the manner in which the collections are applied; and the session-clerk is enjoined to report annually as to the application of the moneys, to the Board of Supervision. The collections made at Dissenting meeting-houses, under which denomination Episcopal chapels are included, are entirely at the disposal of the congregations, and do not form part of the poor's funds. The making of a collection is properly the province of the minister and elders; but when they neglect the duty the heritors have been in use to perform it. See Black's *Parochial Ecclesiastical Law of Scotland* (1888), p. 145.

In England there are no regular collections at churches as in Scotland. The alms collected in chapels, as well as in parish churches, during the reading of the offertory, are declared by the rubric to be at the disposal of the incumbent and churchwardens of the parish, and not of the minister or proprietor of the chapel. If the minister and churchwardens disagree as to the distribution of the alms, they shall be disposed of as the ordinary shall appoint.

**Collectivism** is a word of recent origin, intended to express the central idea in the economic theory of socialism, that industry should be carried on with a collective capital. It means that capital should not be owned and controlled by individuals, but by groups of associated workers, that it should be the joint property of the community or other form of social organisation. Its exact meaning depends very much on the form of socialism with which the principle is connected. See **SOCIALISM**.

**College** (Lat. *collegium*, 'a collection or assemblage'). In its Roman signification, a college signified any association of persons for a specific purpose, and was in many cases practically what we call a corporation. It required also to be incorporated by some sort of public authority, springing

either from the senate or the emperor. A college could not consist of fewer than three persons, according to the well-known maxim, 'three make a college' (Dig. 50, tit. 16, l. 85). Some of these colleges were for purely mercantile purposes, but there were others which had religious objects in view, such as the colleges of pontifices and augurs, &c., and some were political, as the colleges of the tribunes of the plebs. With us, a college is an incorporation, company, or society of persons joined together generally for literary or scientific purposes, and frequently possessing peculiar or exclusive privileges. See, for instance, **PHYSICIANS (COLLEGE OF)**, **SURGEONS (COLLEGE OF)**, **HERALD**. Very often in England a college is an endowed institution connected with a university, having for its object the promotion of learning. In this relation a college is a sub-corporation—i.e. a member of the body known as the university. For a more detailed account of college in this sense, see **UNIVERSITY**, **OXFORD**, **CAMBRIDGE**. In Scotland and in America the distinction between the college as the member and the university as the body has been lost sight of; and we consequently hear of colleges granting degrees, a function which in the English and in the original European view of the matter belonged exclusively to the university. Where there is but one college in a university, as is the case in Edinburgh University, the two bodies are of course identical. Trinity College, Dublin, is practically the university. The two colleges of Aberdeen were separate universities till 1860. University College is a very usual name for recently founded institutions for the higher learning in the United Kingdom. Some of the public schools are colleges, and many secondary schools are so called. Theological schools often bear this name, which is sometimes given to a hospital. In Germany there are no colleges in the English sense. In France the name of college is sometimes given to a school, corresponding, however, more to the *Gymnasium* (q.v.) of Germany than to the grammar-school of this country. For the *Collège de France*, see separate article. The principal colleges have articles under special heads; see **KING'S COLLEGE**, **QUEEN'S COLLEGE**, **NEWHAM COLLEGE**, &c.

**Collège de France**, originally a *Collège de Trois Langues* merely, founded by Francis I. in 1530, is now a very important educational institution, giving instruction over a very wide field of literature, history, and science. It is independent of the University of Paris, is directly under the Minister of Public Instruction, and is supported by the government. As in the Sorbonne (q.v.), the lectures are gratuitous, and for the most part are designed to attract auditors older than ordinary university students. The college comprises two faculties, one literary, one scientific; and each has about thirty professors. Amongst the professors have been some of the most distinguished scholars and scientists in France, such as Renan, Laboulaye, Darmesteter, Gaston Paris, Bédier, in the literary, Brown-Séquard, Janet, in the science division. Amongst the subjects discussed are political economy, Assyrian and Egyptian archaeology, Arabic, Slavonic literature, French literature; physiology, anatomy, and embryology.

**College of Arms.** See **HERALD**.

**College of Justice.** See **COURT OF SESSION**.

**Collegiate Churches**—so called from having a college or chapter, consisting of a dean or provost and canons, attached to them—date from the 9th century, when such foundations in large towns became frequent. They are under the jurisdiction of the bishop of the diocese in which they are situated, and he exercises visitatorial powers over them. There were about ninety collegiate churches

in England and Wales at the beginning of the 16th century, but nearly all of them were suppressed or dissolved in Edward VI.'s reign under the Acts of Henry VIII. which followed upon the dissolution of the monasteries, and granted the hospitals, chantries, and colleges to the crown. Those remaining in England are Westminster, Wind-or, Wolverhampton, Haytesbury, Middleham; also Brecon in Wales, and Galway in Ireland. Ripon, Manchester, and Southwell have been constituted the cathedrals of new dioceses. Some churches called collegiate (such as Beverley) have no chapters. In the Roman Catholic Church, no new collegiate church can be founded without the sanction of the pope, acting on the favourable report of the Congregation of the Council of Trent, that the necessary conditions have all been fulfilled, such as suitable population and locality, adequate buildings, sufficient endowments, and the assent of the diocesan bishop; while a priority of rank in their class is conceded to some such churches, distinguished by the title 'eminent' (*insignis*). The *History of Banffshire* (1886) contains a very full and interesting account of the collegiate church of Castle-Semple, founded in 1304.

**Collembola**, the name first given by Lord Avebury to a tribe of wingless insects, to which the *Podura* belongs (see *SPRING-TAILS*); though he and other entomologists question their claim to be called insects.

**Colley**, SIR GEORGE, major-general, was born in 1835, and in 1852 received an ensigncy in the 2d or Queen's Foot, whose headquarters, then in the eastern frontier of Cape Colony, he joined in 1854. He was a border magistrate in 1857-58, surveyed the Trans-kei country, and served with his regiment in China in 1860. He was then for some years major of brigade at Plymouth, and a professor at the Staff College. He ably managed the transport service in the Ashanti expedition, and in 1875 accompanied Sir Garnet Wolseley to Natal, where he was for some time colonial treasurer, and prepared a valuable report and map of the Transvaal and Swaziland. From 1876 to 1880, except for a short period of service as chief of Wolseley's staff in Zululand and the Transvaal, he was private secretary to Lord Lytton, then viceroy in India. Appointed governor and commander-in-chief of Natal in April 1880, he commanded his small force against the Boers at Laing's Nek and Ingogo, and fell, shot through the forehead at Majuba Hill, February 27, 1881. See *Life* by Sir W. Butler (1899).

**Collie**. The origin of the collie is somewhat obscure, but great antiquity is claimed for it. Buffon has gone so far as to call it the oldest known breed of dogs, an opinion not now generally entertained; though it is only reasonable to suppose that the ancients, after providing a dog for the chase, next turned their attention to obtaining a guardian for their flocks. For many years collies were confined to Scotland and the northern counties of England, until their good points as graceful and intelligent companions attracting more attention, they were taken south in large numbers, and became the most popular breed of the day. Thanks to judicious breeding and a large expenditure of money, the best show collies are now all found in England. Tempted by the demand for black-and-tan dogs, a cross with the Gordon setter was resorted to, producing many collies with the flat ears and open coat of the setter, a cross to be avoided at all costs. In judging the collie the fact should never be forgotten that it is meant to do work in all weathers, requiring the best of legs and feet, a close coat, and a strong active body capable of great speed; and that a long and beautiful coat, if unaccompanied by a thick under-coat,

is a hindrance, not a protection. The chief points of the collie are—head long and sharp, with bright, keen eyes, set rather close together, and a small ear drooping slightly at the tips; back strong and muscular; legs with plenty of bone and not too much feather, bare below the hocks; feet round and cat-like. The collie should have a short dense under-coat fitted to withstand the severest wet or cold, with a long and beautiful outer-coat springing from it; round the neck this coat develops into a 'ruff' or 'frill' which sticks out in front and on each side to a great length, adding largely to the dog's beauty. Many anecdotes are told of the collie, who from his intimate association with man has acquired almost human intelligence, a good dog being able to separate the sheep under his care from those of other flocks. The collie often deteriorates in intelligence when kept merely as a companion; he is apt to get cross-tempered, a fact which the shepherd does not consider a fault, as it prevents strangers interfering with the sheep. But when not spoilt no dog makes such an agreeable companion as the collie, as his instinct is to attach himself to one person to whom he becomes devoted.

**Collier**, ARTHUR, metaphysician, the son of a clergyman, was born in 1680 at Steeple Langford, Wiltshire, studied at Oxford, and became rector of the family living at Langford in 1704, remaining there till his death in 1732. At Balliol College, Collier had devoted himself to the study of Descartes and Malebranche; and his notable book, *Charis Universalis, or a New Inquiry after Truth, being a Demonstration of the Non-Existence and Impossibility of the External World* (which, though published in 1713, was written ten years before), coincides in a remarkable way with Berkeley's *Theory of Vision* (published 1709). He was a High-Churchman, and wrote also *A Specimen of True Philosophy* (1730) and a *Logology* (1732).

**Collier**, JEREMY, nonjuror and purifier of the English stage, was born at Stow cum Quay, in Cambridgeshire, 23d September 1650. His father was a clerical schoolmaster at Ipswich, and here and at Caius College, Cambridge, he was educated, graduating B.A. in 1672. For six years he was rector of Ampton, near Bury St Edmunds, and for some years before the Revolution he was lecturer at Gray's Inn. His reply to Dr Gilbert Burnet's *Inquiry into the State of Affairs* (1688) cost him some months' imprisonment in Newgate. He next waged warfare on the crown with a succession of incisive pamphlets, carrying his refusal to recognise the authority of the government so far as hardly to be persuaded by his friends to let them bail him out of prison when arrested in 1692 on suspicion of being involved in a treasonable plot. In 1696, along with two other clergymen, he outraged public feeling by solemnly pronouncing absolution, without any public confession, on the scaffold at Tyburn upon the heads of Friend and Parkyns just before their execution for a plot to murder the king. For this gross and public offence he was obliged to go into hiding, but though he was formally outlawed, no attempt was made to punish him. In 1697 he published his famous *Short View of the Immorality and Profaneness of the English Stage*, which fell like a thunderbolt among the wits. The boldness of the onslaught can only be understood by remembering the greatness of the odds and the might of his antagonists. 'It is inspiring,' says Macaulay, 'to see how gallantly the solitary outlaw advances to attack enemies, formidable separately, and, it might have been thought, irresistible when combined, distributes his swashing blows right and left among Wycherley, Congreve, and Vanbrugh,

treads the wretched D'Urfey down in the dirt beneath his feet, and strikes with all his strength full at the towering crest of Dryden.' Collier's argument carried the country with it, and brought back the English drama to good morals and good sense. That excessive stage-profligacy which was a mere reaction against the rigidity of Puritanism, and had far outrun the parallel laxity of contemporary social morals, at once disappeared, and the theatre in England again became a mirror in which nature and truth were reflected without distortion. But it was not without a struggle that the wits consented to be worsted. Congreve and Vanbrugh, with many of the smaller fry, answered angrily but weakly, and were crushed anew by the redoubtable nonjuror, who was 'complete master of the rhetoric of honest indignation.' 'Contest,' says Dr Johnson, 'was his delight; he was not to be frightened from his purpose or his prey.' The great Dryden stood apart at first, but at length in the preface to his *Fables* (1700) acknowledged with a noble honesty that he had been justly reprov'd. 'I shall say the less of Mr Collier,' he says, 'because in many things he has taxed me justly; and I have pleaded guilty to all thoughts and expressions of mine which can be truly argued of obscenity, profaneness, or immorality, and retract them. If he be my enemy, let him triumph; if he be my friend, as I have given him no personal occasion to be otherwise, he will be glad of my repentance. It becomes me not to draw my pen in the defence of a bad cause, when I have so often drawn it for a good one.' But Dryden complained, and fairly, that his antagonist had often perverted his meaning, that he was 'too much given to horse-play in his railery, and came to battle like a dictator from the plough.' Spite, however, of all its pedantry and overstatement of the case, and its faults of taste and of relative proportion in charges made with equal indignation, the *Short View* was a noble protest against evil, and was as effective as it deserved to be.

Collier continued to preach to a congregation of Nonjurors (q.v.), and was consecrated bishop in 1713. A great controversy soon rent the nonjuring community on the lawfulness of returning to certain 'usages' allowed in the communion-office of the first prayer-book of Edward VI., which Collier's party preferred to the revision of 1552. Collier at length pronounced these usages *essential*, and not unnaturally laid himself open to a charge of holding Romish views. He masqueraded as 'Jeremias, Primus Anglo-Britanniae Episcopus' in some abortive attempts to form a union with the Eastern Church. His last years were racked by the torments of the stone, from which he found relief in death, April 26, 1726. Of his forty-two books and pamphlets, those on the stage alone are still read. The fifth edition of his famous treatise (1730) contains all the successive pamphlets which fortified the first. His largest works were the *Great Historical, Geographical, Genealogical, and Poetical Dictionary* (4 vols. folio, 1701-21), and *An Ecclesiastical History of Great Britain . . . to the end of the Reign of Charles II.* (2 vols. folio, 1708-14; new ed. by T. Lathbury, with Life, 9 vols. 1852).

**Collier, JOHN**, known under the pseudonym of 'Tim Bobbin,' was the son of the curate of Stretford, near Manchester, and from 1739 to his death in 1786 was master of a school at Milnrow, near Rochdale. He early wrote verse and painted grotesque pictures; his rhyming satire, *The Blackbird*, appeared in 1739, and his *View of the Lancashire Dialect* (in humorous dialogue), his most notable production, in 1775. It has been often reprinted. Other works are *Truth in a Mask, The Fortune-teller, The Human Passions*. See *Life* by

Fishwick, prefixed to his works (Rochdale, 1895).

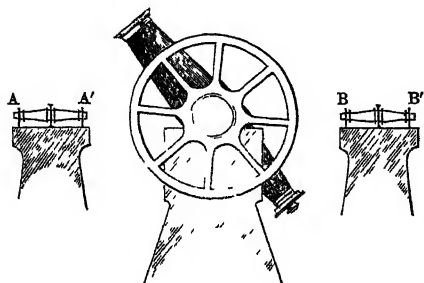

**Collier, HON. JOHN**, British painter, was born in London, 27th January 1830, the second son of the first Lord Monkswell. Educated at Eton and Heidelberg, and in art at Munich, Paris, and the Slade School, he first exhibited at the Royal Academy in 1874. As a painter of portraits, and of historical-dramatic and domestic-dramatic scenes and events, his work is excellent in composition, in colour scheme and execution, and in draughtsmanship; his historical paintings are noted for accuracy in archaeological detail. Among his best-known works are 'The Last Voyage of Henry Hudson' (1881, Chantrey Bequest), 'A Glass of Wine with Cæsar Borgia' (1893), 'Pope Urban VI.' (1896), 'The Cheat' (1905), 'Sentence of Death' (1908), 'A Fallen Idol' (1913), 'Clytemnestra' (1914). See W. H. Pollock, *The Art of the Hon. John Collier* (1914).

**Collier, JOHN PAYNE**, Shakespearian critic and commentator, was born in London, 11th January 1789, son of an unprosperous merchant who had succeeded as a reporter and journalist. His parents were friends of Lamb, Hazlitt, Coleridge, and Wordsworth. The boy passed some years at Leeds, and early began to write. Still a boy, he became parliamentary reporter for the *Times*, next for the *Morning Chronicle*, and wrote regularly for the latter down to 1847. His call to the bar was delayed till 1829, probably through the odium he incurred by a foolish volume of satirical verse. His real literary career commenced in 1820 with the publication of *The Poetical Decameron*. From 1825 to 1827 he issued a new edition of *Dodsley's Old Plays*, and in 1831 his best work, a *History of English Dramatic Poetry to the Time of Shakespeare, and Annals of the Stage to the Restoration*. This opened up to him the libraries of Lord Francis Gower, afterwards Lord Egerton and Earl of Ellesmere, and of the Duke of Devonshire, the latter appointing him his librarian. From 1835 to 1839 Collier published his *New Facts* regarding the life and works of Shakespeare, followed by an edition of Shakespeare (8 vols. 1842-44), and supplemented by *Shakespeare's Library* (2 vols. 1844), a reprint of the histories, novels, and early dramas on which Shakespeare founded his plays. He was one of the leading members of the Camden Society from its foundation in 1838, and he edited for its issues *Bale's Kynge Johan* (1838), the *Egerton Papers* (1840), and the *Trevelyan Papers* (1857 and 1863). He contributed ten publications (1840-44) to the Percy Society, and twenty-one (1841-51) to the Shakespeare Society, of which he was long director. In 1852 he announced his discovery of an extensive series of marginal annotations in a 17th-century hand on a copy of the second Shakespeare folio (1631-32) he had bought—the famous Perkins folio, so called from a name inscribed on the cover. Late in the same year he published these to the world as *Notes and Emendations to the Plays of Shakespeare*, and calmly lifted them into the text in his 1853 edition of Shakespeare, and again in his annotated six-volume Shakespeare in 1858. The emendations caused a great commotion in the literary world, and were furiously applauded or furiously assailed. The best Shakespearian students were more or less sceptical, but S. W. Singer and E. A. Brae were the first to express openly an unfavourable opinion. The latter also attacked Collier's alleged discovery of his suspiciously long-lost notes of Coleridge's lectures on Shakespeare and Milton, delivered in 1811. Collier, in the course of abortive proceedings for libel against Brae's publisher, swore to the truth of his statements respecting both the Perkins folio and his

Coleridge notes. Meantime he had been judicious enough to keep his folio from the eyes of experts, but at length in 1859, the Duke of Devonshire, to whose predecessor Collier had given it in 1853, sent it, at Sir F. Madden's request, to the British Museum for examination. The result was a conclusive proof, by Mr N. Hamilton in letters to the *Times*, and more completely in his *Inquiry* (1860), that the boasted 17th-century emendations were entirely recent fabrications. Still further forgeries were later brought to light in Mr Warner's Catalogue of MSS. at Dulwich College (1883), from which Collier had prepared three publications for the Shakespeare Society. Collier replied angrily in the *Times*, in his long *Reply* (1860), the disingenuousness of which injured his reputation as much as the facts of his antagonist. The controversy widened, but every competent writer concluded against Collier, the only question that remained uncertain being whether he himself was merely a dupe or more. Unhappily for the name of a sound scholar ruined by one fatal weakness, this too was answered by the discovery after his death of some manipulated books in his own library. In 1847 Collier was named secretary to the Royal Commission on the British Museum, and in 1850 he removed to Maidenhead, where he died 17th September 1883. He had enjoyed since October 1850 a civil list pension of £100. His later books were *A Booke of Roxburghe Ballads* (1847), *Extracts from the Registers of the Stationers' Company* (2 vols. 1848-49), *The Dramatic Works of Thomas Heywood* (1850-51), a good edition of Spenser (5 vols. 1862), a series of small reprints of rare 18th and 17th century pieces in prose and verse (1863-71), *Bibliographical and Critical Account of the Rarest Books in the English Language* (1865), and *An Old Man's Diary Forty Years Ago* (1871-72). See Dr Ingleby's *Complete View of the Shakspeare Controversy* (1861), which contains a bibliography of the books.

**Colliers and Salters.** See SLAVERY.

**Collimator**, a subsidiary telescope used to detect or correct errors in collimation (i.e. in directing the sight to a fixed object) when adjusting for transit observations. When the vertical thread in the field of view exactly coincides with the vertical axis of a telescope, the instrument is *collimated* vertically; and when the horizontal spider's thread just covers the horizontal axis, the instrument is correct in horizontal collimation. If

three solid piers stand on the meridian, so that the telescope to be tested can be laid between the collimators and have its axis coincident with both of theirs, the principle of correction becomes almost self-obvious. Removing the great telescope, the collimators (AA' and BB' in fig.) are adjusted till the cross-wires in one coincide perfectly with those of the other in all possible positions. Then replacing the 'transit circle,' it is examined and tested by reference, first to one, and then the other collimator, the verification requiring that it be

turned through 180° till the threads in the three fields of view absolutely coincide, and the collimation is pronounced perfect.

Practical astronomers set great value on the collimator (in the arrangement just described) for having entirely superseded the 'meridian mark.' By Rittenhouse's principle a telescope can become its own collimator, especially in determining the nadir point. When the axis is vertical over a vessel containing mercury, the telescope will be collimated when the cross-wires are brought to exact coincidence with their image seen in the mercury. See TELESCOPE.

**Collingwood**, a town of Ontario, on the south shore of Georgian Bay, where it connects the railways with the Huron lake steamers. It has several factories, ship-yards, and grain-elevators, and a considerable trade in lumber and grain. Population, 6000.

**Collingwood**, CUTHBERT, LORD, admiral, was born at Newcastle-upon-Tyne, 26th September 1750. Sent to sea as a volunteer at the age of eleven, his life thenceforth, with the exception of some half-dozen years, was spent wholly on board ship. From 1778 his career was closely connected with that of Nelson, whom he followed up the ladder of promotion step by step, until Nelson's death left the topmost round vacant for himself. Among the great naval victories in which Collingwood bore a prominent part, were those of Lord Howe off Brest in 1794; of Lord Jervis off Cape St Vincent in 1797; and of Trafalgar in 1805, where he held the second command. In the last-named engagement, his ship was, by Nelson's command, the first to break through the line of the combined French and Spanish fleets; and after Nelson had received his death-wound, he assumed the chief direction. A peerage was his reward for his gallant conduct in this battle. He died at sea, March 7, 1810, but was buried beside Nelson, in St Paul's. Collingwood was not the stuff great tacticians are made of, and his talents as a commander-in-chief were at best mediocre; but he was a brave and capable seaman, earnest and pious as a man, firm and mild as an officer, and admirable as a second in command. See his *Correspondence and Life*, by his son-in-law (1828), and shorter *Lives* of him by W. Davies (2d ed. 1878) and Clark Russell (1891).

**Collins**, ANTHONY, deist, was born 21st June 1676, at Heston, near Hounslow, in Middlesex, and was the son of a country gentleman. He studied at Eton and at King's College, Cambridge, and became the disciple and friend of John Locke. In 1707 he published his *Essay concerning the Use of Human Reason*; and in 1709, his *Priestcraft in Perfection*. The controversy excited by this last work induced Collins to write his *Historical and Critical Essay on the Thirty-nine Articles* (1724). He wrote a *Vindication of the Divine Attributes*, in reply to King, Archbishop of Dublin, who asserted the compatibility of Divine Predestination and Human Freedom. Collins was a philosophical Necessitarian, and afterwards advocated his opinions more fully in his *Philosophical Inquiry concerning Liberty and Necessity* (1715). In 1711 he visited Holland, where he made the friendship of Le Clerc and other eminent *littérati*. In 1713 he published his *Discourse on Free-thinking*, the best known, and the most important of all his works; to it Bentley made reply in his famous *Remarks*. In 1713 Collins made a second visit to Holland; and in 1718 he was made treasurer for the county of Essex. In 1724 appeared his *Grounds and Reasons of the Christian Religion*. The contention that no fair interpretation of the Old Testament prophecies will secure a correspondence

between them and their alleged fulfilment in the New Testament created a violent controversy, and called forth no fewer than thirty-five replies. Two years later he defended himself in his *Scheme of Literal Prophecy*, and in 1727 he published his last work, the *Scheme of Literal Prophecy Considered*. Collins died 13th December 1729.

**Collins, MICHAEL**, Sinn Féin leader, was born, the son of a farmer, at Woodfield, Clonakilty, County Cork, 16th October 1890. Educated at the local national school, he entered the Civil Service as a boy, and was for a time in the employ of the post-office in London, before becoming a bank-clerk there, and later an accountant. Leaving London in 1915 to join the Irish Republican Army, he fought in the Easter Rebellion of 1916, and was taken prisoner. After his release at the end of the year, he took part in every phase of the 'Irish War,' becoming head of the Irish Republican Army; as the most wanted man in Ireland, he made many miraculous escapes. Elected in 1918 to Dail Éireann as member for County Cork, he became later Minister of Finance, a position he held till his death. As a plenipotentiary, he did much to negotiate the Irish Free State Treaty of 1921, and subsequently in the face of powerful opposition strongly advocated its acceptance; but in the irregular warfare which followed, he was killed in an ambush between Bandon and Macroom, 23d August 1922.

**Collins, MORTIMER**, a versatile writer, was born, the son of a solicitor at Plymouth, 29th June 1827. He was educated at private schools, and held for some years a mathematical mastership in Guernsey, which he resigned in 1856 to devote himself entirely to literature. He settled at Knowl Hill in Berkshire, and kept up an incessant activity in the varied forms of articles on current politics, novels, and playful verses until his death, 28th July 1876. His physical was equal to his mental vigour; he was tall and remarkably strong, an athlete, a lover of dogs, flowers, and outdoor-life. His old-world Toryism and hatred of irreverence and irreligion, his humour, his wonderful facility in extemporising clever verse, his chess-playing, not to say his mathematics, endeared him to such friends as R. H. Horne, Frederick Locker, Edmund Yates, and R. D. Blackmore. One of his most popular books was *The Secret of Long Life* (1871), a collection of essays at first published anonymously. See his wife's account of his life (1877), and his *Select Poetical Works* (1886). His second wife, who died 17th March 1885, collaborated with him, and wrote alone *A Broken Lily* (1882).

**Collins, WILLIAM**, a distinguished English poet, was born at Chichester, 25th December 1721. His father was a hatter in that town, of which he was twice mayor. Collins received the rudiments of his education at the prebendal school of his native town. At the age of twelve he was sent to Winchester School, where he remained seven years. While there he wrote his *Oriental Eclogues*, which in his own day, and for a considerable period afterwards, were the most popular of his productions. He was himself convinced that this preference was misplaced, and the world has long since come round to his opinion. In 1741 he proceeded to Oxford, where he was distinguished by 'his genius and indolence.' Having taken the degree of Bachelor of Arts in 1743, he shortly afterwards left the university for reasons which are not accurately known. His private means being but slender, he obtained the title to a curacy, but was dissuaded from entering the church. As his only other alternative, he took up his residence in London, and sought to make a living by literature, a profession for which he was utterly unfitted by his desultory

ways and uncertain health. He now fell into what are vaguely described as 'irregular habits,' and was at times reduced to the greatest straits. On one occasion Dr Johnson rescued him from the hands of bailiffs by obtaining an advance from a bookseller on the promise of Collins to translate the *Poetics* of Aristotle. It was during this period, however, that he wrote his Odes, upon which his fame as a poet now rests. They attracted no notice at the time of their publication, and they were little valued even by such contemporaries as Gray and Dr Johnson. By the death of an uncle in 1749, Collins inherited the sum of £2000, which enabled him to retire to Chichester, and apparently to pursue a regular course of study. It was about this time that he met Home, the author of *Douglas*, to whom he addressed his *Ode on the Popular Superstitions of the Highlands of Scotland*, a poem in which, according to Russell Lowell, 'the whole Romantic School is foreshadowed.' The ode was first published in the *Transactions of the Royal Society of Edinburgh* (1788). Before 1753, Collins felt the approaches of the mental disease to which he finally succumbed, and sought relief in a visit to France. On his return he gradually became worse, and in 1753 his reason completely gave way. He lived for six years longer in this state, though with lucid intervals. He died on 12th June 1759, so unknown to fame that no newspaper or magazine of the day has any notice of his death.

Collins, like Gray, holds a middle position between the school of Pope and the school of Wordsworth. In his maturer work he is almost completely free from the so-called 'poetic diction' of the 18th century. He has not the passionate feeling for nature of later poets, but his feeling is at least real and not conventional. In respect of natural poetic gifts, Coleridge, Swinburne, and many of the best critics place him high above his contemporary, Gray. His choice of subjects, however, and his subtler modes of treatment, debar him from the popularity of the author of the *Elegy*. His most highly finished ode is that *To Evening*: the allegorical element in those on *The Passions*, *To Liberty*, *To Mercy*, and *To Pity*, serves not a little to remove them from direct human sympathy. But Collins shows both simplicity and pathos in his poem on the death of Thomson and in his lines beginning 'How sleep the brave.'

Editions of his poems have appeared in 1765, 1771, 1781, 1797 (Mrs Barbauld's), 1827 (Dyce's), 1858 (Aldine edition, with memoir by Mox Thomas), 1898 (with memoir by Bronson), 1917 (ed. Stone and Poole).

**Collins, WILLIAM, R.A.**, landscape and figure painter, was born in London, September 18, 1788, of a Wicklow family. In 1807 he entered the Royal Academy as a student, and in the same year he exhibited two small landscapes. In 1812 his 'Sale of the Pet Lamb' was sold for 140 guineas, and from this time his pictures became popular. He exhibited 169 works, of which the best known are the 'Blackberry Gatherers' and 'The Birdcatchers' (1814), which gained his associateship; 'Scene on the Coast of Norfolk' (1815), now at Windsor; 'The Fisherman's Departure' (1826), 'As Happy as a King' (1836), and 'Early Morning' (1846). Collins was elected R.A. in 1820. He studied and sketched in Italy in 1836-38, and in 1839 sent to the Academy several Italian subjects. Two pictures on sacred subjects (1840-41) were not particularly successful, and he wisely fell back on his green fields, his sea-beaches, his rustics, and his children at their games. A visit to the Shetland Islands in 1842 supplied materials for the illustrations of Scott's *Pirate*. Collins died in London, 17th February 1847. See his Life (1848) by his elder son, William Wilkie Collins (q.v.).—His second son, CHARLES ALLSTON COLLINS (1828-73), in early life painted

a number of pictures which are highly valued by collectors. In 1860 he married the younger daughter of Charles Dickens, and having already turned his attention to literature, produced *The Eye-witness* essays (1860), two novels, and other works, all exhibiting high promise.

**Collins, WILLIAM WILKIE**, novelist, elder son of William Collins, R.A., was born in London, 8th January 1824. He was educated partly at High-bury, but during 1836-39 was with his parents in Italy. After his return he spent four years in business, and then entered Lincoln's Inn; but gradually took to literature, the *Life of his father* (1848) being his earliest production. To it succeeded *Antonina, or the Fall of Rome* (1850); *Basil* (1852); *Hide and Seek* (1854); *The Dead Secret* (1857); *The Woman in White* (1860); *No Name* (1862); *Armada* (1866); *The Moonstone* (1868); *The New Magdalen* (1873), &c.—in all, fully a score of novels and collections of novelettes. Several of them originally appeared in *Household Words*, *All the Year Round*, the *Cornhill*, and other periodicals. The best is *The Woman in White*, whose 'Count Fosco' is really a creation, and in which the author's almost invariable method of unfolding an intricate plot by narratives of the chief *dramatis persone* had not grown hackneyed. *The Moonstone* also is a strong story. He died 23d September 1889. See Swinburne's *Studies in Prose and Poetry* (1894).

**Collinson, PETER**, botanist, was born at Hugal Hall, near Windemere, 14th January 1694, and became a manufacturer of hosiery. He was early distinguished as a naturalist, studied entomology and botany, and in 1745 communicated to Franklin his first intimation of the recent advance of electrical science in Europe. But it was as a botanist he was most distinguished. He introduced the culture of numerous European plants into the United States, and introduced American trees into England. He died 11th August 1768. A genus of labiate plants was named *Collinsonia* after him.

**Collisions.** See RAILWAYS, WRECK, RULE OF THE ROAD.

**Collodion** (Gr. *kollaō*, 'I stick') is a solution of Gun-cotton (q.v.) or pyroxylin. Cotton itself is not soluble in alcohol or ether, but when treated, either in the form of cotton-wool, rags, or paper, with a mixture of five parts of strong nitric acid, and six of sulphuric acid, it is found that it can now be dissolved in ether, or in a mixture of ether and alcohol. To this modification the name pyroxylin is applied. There are many varieties of collodion divisible into surgical or medicated collodions, and photographic collodions. When one part of pyroxylin is dissolved in thirty-six parts of ether and twelve parts of alcohol, a thickish liquid is obtained, which evaporates rapidly, leaving a thin film of pyroxylin. As an application to wounds, where it is desired to keep the edges close together, this form of collodion is of use, owing to the contractility of the pyroxylin film which it leaves, but for general purposes a flexible or flexible collodion, as it is called, is desirable. This is produced by the addition of a little Canada balsam and castor-oil to the ordinary variety. Flexible collodion is largely used as a covering for abraded surfaces, as a remedy for burns, for sore nipples, &c., and it is also the basis for many medicated collodions, such as styptic collodion, cantharidal or blistering collodion, &c. Salicylated collodion is well known as a popular corn cure, and it is certainly most effectual in removing hard or soft corns with but slight inconvenience. It contains, in addition to salicylic acid, the active principle, a little extract of Indian hemp, which prevents the slight pain, which might otherwise prove

troublesome. Collodion plays a very important part in Photography (q.v.).

**Colloid** is a name applied by Graham to any soluble substance which, when exposed to dialysis (see OSMOSE), does not pass through the porous membrane. Starch, gum, albumen, and gelatin are examples; and the name is used in contradistinction to *crystalloids*. See PHYSICAL CHEMISTRY.

**Collet d'Herbois, JEAN MARIE**, a French revolutionist of infamous notoriety, was born in Paris in 1751. Originally a provincial actor, he was attracted by the Revolution to Paris, where his impudence, his loud voice, and his *Almanach du Pere Gérard*, secured him the public ear and his election for Paris to the National Convention. In 1793 he became president of the Convention and a member of the murderous Committee of Public Safety. Sent by Robespierre to Lyons in November of the same year, he took bloody revenge by guillotine and grapeshot on the inhabitants for having once hissed him off the stage in the theatre. His popularity at length exciting the envy of Robespierre, Collet d'Herbois for his own safety joined in the successful plot for the overthrow of Robespierre, 1794; but the reaction that followed proved fatal to himself. He was expelled from the Convention, and banished to Cayenne, where he died, January 8, 1796.

**Collotype**, one of the modifications of the gelatine process in Illustration of Books (q.v.).

**Collusion**, a deceitful agreement between two or more persons to defraud or prejudice a third person, or for some improper purpose. The most common cases of collusion occur in arrangements between bankrupts and their creditors, such as payment by anticipation to a favoured creditor on the approach of bankruptcy, arrangements for granting preferences by circuitous transactions or otherwise. Transactions in which there is evidence of collusion are reducible at common law, and many of the same nature are struck at by the bankruptcy statutes. Collusion in judicial proceedings is an agreement between two persons that one should institute a suit against the other in order to obtain a judicial decision for some sinister purpose. The judgment so obtained is null. Collusion between petitioner and respondent in a suit for dissolution of marriage bars the suit.

**Collyrium** is a term for various kinds of eye-salve or eye-wash.

**Colman, GEORGE**, commonly called 'the Elder,' a dramatic author and theatrical manager, was born at Florence in 1732. In 1760 his first dramatic piece, entitled *Polly Honeycomb*, was produced at Drury Lane with great success. Next year he gave to the world his comedy of *The Jealous Wife*, and in conjunction with Garrick, he wrote *The Clandestine Marriage*, which was played at Drury Lane, 20th February 1766. In 1767 he became one of the purchasers of Covent Garden Theatre, and held the office of acting manager for seven years, after which period he sold his share. In 1777 he purchased the patent of the theatre in the Haymarket from Mr Foote. In 1785 he was attacked by paralysis, which caused a gradual decay of his mental powers, and he died in confinement on 14th August 1794. Colman was an industrious author; besides poetry and translations, he wrote and adapted upwards of thirty dramatic pieces.

**Colman, GEORGE**, 'the Younger,' son of the preceding, was born October 21, 1762. His bent lay in the same direction as his father's, during whose illness he acted as manager of the Haymarket Theatre; and on the death of the elder Colman, George III. transferred the patent to his

son. Colman held, till the time of his death, the office of Examiner of Plays, to which he was appointed on 19th January 1824, and in which he behaved with great arrogance. In industry he rivalled his father, and he received large sums for his dramatic writings, some of which continue in possession of the stage. He was twice married, and died on the 17th October 1836. In 1830 he published a very imperfect autobiography, which he named *Records of My Life*; but his most notorious work is the preface to his play of *The Iron Chest*, in which he furiously attacked John Kemble.

**Colman**, SAMUEL, American painter, born in Portland, Maine, in 1832, studied in Europe in 1860-62, was elected a member of the National Academy in 1862, and first president (1866-71) of the American Society of Painters in Water-colours. He has travelled extensively, and his pictures include scenes from Algeria, Germany, France, Italy, and Holland.

**Colmar**, or KOLMAR, the capital of the district of Upper Alsace, stands on a plain near the Vosges, 42 miles SSW. of Strasburg by rail. Among the principal public buildings of Colmar are the church of St Martin (1263), the Dominican convent of Unterlinden, now a museum, the college, court-house, and town-hall. Colmar is one of the chief seats of the cotton manufacture in Alsace. Other manufactures are paper, leather, ribbons, and hosiery. Colmar is an old place, having been raised to the rank of a free imperial city in 1226. It rapidly became one of the most prosperous towns in Upper Alsace. Fortified in 1552, its fortifications were razed in 1673 by Louis XIV. Pleasant boulevards now occupy their place. Colmar was formally ceded to France in 1697, recovered by Germany in 1871, ceded again 1919, and included in Haut Rhin. Pop. (1875) 23,778; (1921) 42,255.

**Colne**, a town in the east of Lancashire, on a high ridge near the source of the Calder, a western branch of the Ribble, 26 miles N. of Manchester by rail. It has manufactures of cotton calicoes and mousselines-de-laine; and it was formerly a seat of the woollen industry. Slate and lime abound in the vicinity. Many Roman coins have been found at Colne. With Nelson it is a parliamentary borough (1918). Pop. of municipal borough, 25,000.

**Colney Hatch**, a Middlesex village, 6½ miles N. of London, with a great lunatic asylum (1851).

**Colocasia**. See Cocco.

**Colocynth** (Gr. *kolokynthis*), a well-known medicine, much used as a purgative, is the dried and powdered pulp of the *Colocynth Gourd*, *Coloquintida*, *Bitter Apple*, or *Bitter Cucumber*, a globose fruit about the size of an orange, of a uniform yellow colour, with a smooth, thin, solid rind. The plant which produces it, *Citrullus* (or *Cucumis*) *Colocynthis*, is of the same genus as the water-melon. It is found very widely distributed over the Old World, growing in immense quantities on the sand hillocks of Egypt and Nubia. It is also common in India, Portugal, Spain, and Japan. It has long been known for its purgative properties, and as early as the 11th century was in use in Britain. The main supplies of the drug are from Smyrna, Mogador, Spain, and Syria. The fruit is gathered when it begins to turn yellow, peeled, and dried quickly either in a stove or in the sun. It is chiefly in the form of a dried extract that it is used in medicine. It owes its properties to a bitter amorphous glucoside, *Colocynthine*, which is more or less abundantly present in the fruits of many of the gourd family. It is a curious fact, but one to which there are many analogies, that the seeds of the colocynth plant, produced in the midst of its medicinal pulp, are perfectly bland, and they even form an important article of food in the north

of Africa.—The name False Colocynth is sometimes given to the Orange Gourd (*Cucurbita aurantia*), sometimes cultivated as an ornamental plant in our gardens, on account of its globose, deep-orange fruit. The pulp of the fruit possesses the properties of colocynth, but in a milder degree.

Colocynth is administered in the form of pills, in which the extract is associated with aloes, scammony, and in some cases with calomel or with extract of hyoscyamus. In small doses, the colocynth acts as a safe and useful purgative; and when accompanied by hyoscyamus, the latter prevents much of the pain and griping which are attendant on the use of colocynth by itself. In large doses, colocynth is a poison. Colocynth enters into the composition of some moth powders, and renders them very efficacious.

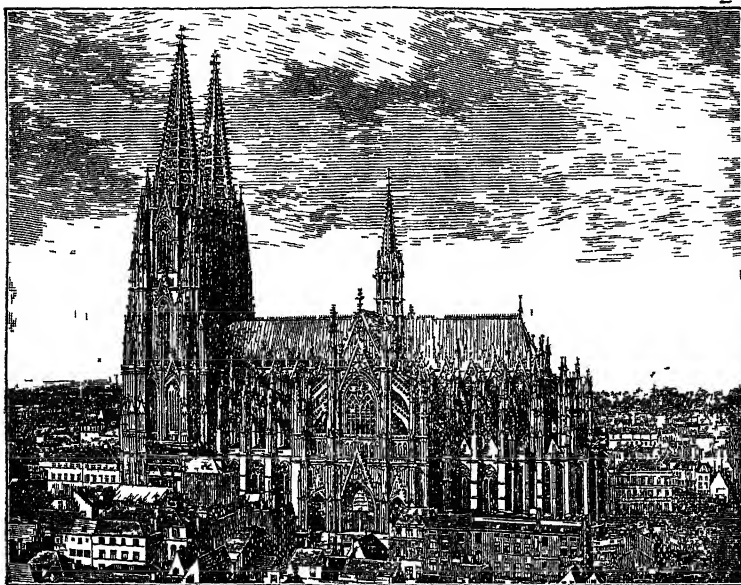

**Cologne** (Ger. *Köln*, *Coln*), a city and port on the left bank of the Rhine, 362 miles by rail WSW. of Berlin, 175 SE. of Rotterdam, 149 E. of Brussels, and 302 NE. of Paris. Formerly an independent city of the Empire, it is now the chief town of Rheinland, and third city of Germany. It was a fortress of the first rank, forming a semicircle, with the town of Deutz on the opposite bank as tête-de-pont. It is connected with this suburb by a bridge of boats, and an iron bridge 1362 feet in length, for railway and carriage traffic. Pop. (1871) 129,233; (1891) 282,537; (1900) 372,229; (1910) 516,527; (1919) 633,904. The old streets are narrow and crooked, and quaintly named; but the area freed by the removal of the ancient fortifications, which dated originally from the 13th century, is laid out on a more spacious plan. This area, which doubled the town, was purchased in 1882 by the corporation; its most prominent feature is the handsome 'Ringstrasse' or boulevard, 4 miles in circuit, nowhere less than 60 feet wide, which encircles the entire old town. The newer fortifications, which consisted of a number of detached forts planted round Cologne and Deutz, within a radius of about 4 miles from the cathedral, were demolished in accordance with the treaty of Versailles.

The ancient buildings in Cologne, both secular and ecclesiastical, are of great architectural interest; the Romanesque and Transition styles are specially well represented in the numerous churches of the 11th, 12th, and 13th centuries. The church of St Maria im Capitol, consecrated in 1049, is the earliest example in Cologne of a church with a trefoil-shaped ground-plan for transepts and choir. In the church of St Ursula are preserved the bones of the 11,000 virgins, companions of St Ursula (q.v.). The church of St Gereon boasts of the possession of the bones of St Gereon, and of the 308 martyrs of the Theban legion, slain during Diocletian's persecution. The church of St Peter contains the altar-piece of the crucifixion of St Peter by Rubens, and that of the Minorites the tomb of the famous scholastic, Duns Scotus.

The chief object of interest in the city, however, as well as its greatest ornament, is the cathedral, one of the noblest specimens of Gothic architecture in Europe. This cathedral is said to have had its origin in an erection by Archbishop Hildebold, during the reign of Charlemagne in 814. Frederic Barbarossa bestowed upon it, in 1162, the bones of the three Magi (q.v.), which he took from Milan, and this gift greatly increased its importance. The bones are retained as precious relics to this day; but the old structure was burned in 1248. According to some accounts, the present cathedral was begun in the same year, but others fix the date of its commencement in 1270-75. To whom the design of this noble building is to be ascribed is uncertain. The choir, the first part completed, was consecrated in 1322. The work was carried on,

sometimes more actively, sometimes more slowly, till 1509, when it was suspended; and during the subsequent centuries what had been already executed was not properly kept in repair. Since

but a colony being planted here in 50 A.D. by Agrippina, the wife of the Emperor Claudius, it received the name of *Colonia Agrippina*. At the partition of the Frank monarchy in 511, it was

Cologne Cathedral.

the beginning of the 19th century, however, the necessary funds to repair and complete it according to the original design, have been supplied by subscriptions from all parts of Germany. The work of renovation began in 1823, and in 1842 the foundation-stone of the new part was laid. The naves, aisles, and transepts were opened in 1848; the magnificent south portal was completed in 1859; in 1860 the iron central *fleche* was added; and with the exception of the western spires, the church was completed in 1863. The spires, the crown of the edifice, were finished in 1880. The body of the church measures 440 feet in length, and 240 feet in breadth; the spires rise 515 feet above the pavement of the nave. For the 'Kaiserglocke,' see BELL. Among the chief secular buildings of Cologne are the town-house, begun in the 14th century upon Roman foundations; the Gurzenich (1441-52), the finest secular Gothic erection in Cologne, a public banqueting-hall, now containing the exchange; the modern law-courts; and the Wallraf-Richartz Museum, containing a good collection of paintings.

The educational and benevolent institutions of Cologne are numerous and well equipped. The university (1389) was in abeyance from 1798 to 1919. The town has acquired a high reputation for music. The situation of Cologne is extremely favourable for commerce. It has extensive and important railway connections. The dismantling of the fortress removed an obstacle to its growth; and the Rhine-Meuse-Scheldt and Rhine-Main-Danube canals, and a new port, are expected to lead to great development. Various branches of manufacture are carried on, of which the chief are the making of beet-sugar, chocolate, tobacco, glue, carpets, soap, leather, furniture, pianos, chemicals, and spirits of wine, besides the characteristic manufacture of Eau-de-Cologne (q.v.).—The city was founded by the Ubii about 37 B.C., and was at first called *Ubiarum oppidum*;

included in Austrasia; and by a treaty in 870, it was united to the German empire. It entered the league of the Hanse towns in 1201, and contended with Lubeck for the first rank. The merchants of Cologne carried on commerce far and wide, and had warehouses in London, near the Guildhall. Cologne was at a very early period the seat of a bishopric, which was elevated, at the end of the 8th century, into an archbishopric.—The archbishops acquired considerable territories, some of them distinguishing themselves as politicians and warriors. They took their place amongst the princes and electors of the empire, but were involved in a protracted contest with the citizens of Cologne, who asserted against them the independence of the city; and the archiepiscopal resi-

dence was therefore removed to Bonn. The archbishopric was secularised in 1801, when the city also lost its independence, and the congress of Vienna did not attempt to restore to it its former character, but assigned the whole territories to Prussia. The archbishop has now no political power.

**Colombia**, a republic occupying the north-west corner of the South American continent from the frontiers of Ecuador, Peru, Brazil, and Venezuela to those of Panamá (till 1903 part of Colombia), with 500 miles of coast on the Caribbean Sea and 600 on the Pacific. Its area is estimated at 440,000 sq. miles. The population amounts to about 5,500,000, including some 30,000 uncivilised Indians who inhabit the remote forests. The situation of Colombia, washed by two oceans, possessing commodious bays and lagoons all along the Atlantic shore and several fair harbours even on the less-favoured Pacific coast, presents great commercial possibilities—though it has lost by the secession of Panamá. The surface of the country is extremely varied, with lofty mountains in the west, and vast plains in the east scarcely above the level of the sea. For the mountains, see ANDES. This system spreads out in three great ranges, like the rays of a fan, from the extensive plateau of Pasto in the south-west, thus forming valleys running from north to south parallel to the three chains, except where disproportionate activity of the volcanic forces has caused an upheaval of the country near them. The fundamental formations of the country are igneous and metamorphic, and everywhere are traces of the disturbances (still not infrequent in the form of earthquakes) that have upheaved plateaus. Of the sections outside the main Cordilleras, the principal are the Sierra Nevada de Santa Marta, in the north, and the low Baudo range, along the north-west coast, extending into Panamá. From the Central Cordillera descend the two principal rivers of Colombia, the Magdalena and its

tributary the Cauca, which flow north into the Caribbean Sea, besides several affluents of the Amazon in the east, and the Patia, which forces its way to the Pacific, through a gorge between cliffs 10,000 to 12,000 feet high, and forms the only notable break in the long wall of the Western Cordillera from Darien to Patagonia. The Eastern Cordillera, by far the largest chain, consists of a series of extensive tablelands, cool and healthy, where the white race flourishes as vigorously as in Europe. This temperate region is the most thickly populated portion of the republic; and on one of its plateaus, at an elevation of 8694 feet, stands the capital, Bogotá (q.v.). Eastward from this Cordillera stretch vast *llanos* or plains, through which flow the Meta, the Guaviare, and other tributaries of the Orinoco. Besides these, the chief rivers are the San Juan, on the Pacific coast; the Atrato (q.v.) and Zulia, flowing north; the Arauca, which feeds the Orinoco; and the Caquetá and the Putumayo, tributaries of the Amazon. The lakes are unimportant.

*Climate and Productions.*—In the course of one day's journey the traveller may experience in this country all the climates of the world; perpetual snows cover the summits of the Cordilleras, while the valleys are smothered in the rich vegetation of the tropics. The mean temperature ranges from 32° to 82° F. according to the elevation. The rainy season falls from November to April, except among the low-lying forests of the south-east, where the rainfall is distributed throughout the year, and in the Chocó coast district of the west, where, shut in from the north-east winds, the heavy atmosphere hangs motionless, and mists and torrents of rain alternate. Colombia naturally yields a variety of productions corresponding to its great diversity of climate and of elevation. The hot region, extending to an elevation of about 3200 feet, produces in abundance rice, cacao, sugar-cane, bananas, yams, tobacco, indigo, cotton, rubber, vegetable ivory, and many medicinal plants; and the forests, with their tagua and other stately palms, their rare balsamic resins and valuable dyewoods, are ablaze with flowers and creepers, and steeped in the perfume of the delicate vanilla orchid. In the temperate zone, from 3200 to 8500 feet above the sea, many of these are equally common, but the coconut palm gives place to the oak, the encenillo, groups of laurels, and arborescent ferns, and here flourish the coffee plant, the odorous Cherimoya (q.v.) and curibano, the fig, and the cinchona-tree. The Wax-palm (q.v.) extends beyond this region, and is found at a height of nearly 11,000 feet, and large crops of potatoes, grain, and leguminous plants are raised in the cold region; but from 10,000 feet rises the bleak *paramo*, with its scanty vegetation, ending in lichens at the snow-line. The fauna of Colombia is very extensive. Both coasts abound with turtles and pearl-oysters; the rivers swarm with fish and alligators, and on their marshy banks the capybara is found; the forests are the haunt of the tapir, armadillo, cavy, opossum, and deer, and during the day are alive with monkeys (of which no less than seventeen species are common), squirrels, paroquets, and numerous bright-plumaged birds, whose notes give place at night to the plaintive cry of the sloth. Beasts of prey are the jaguar, puma, ocelot, margay, and bear. The boa and numerous other snakes are common, but venomous serpents cease at an elevation of 6000 feet. Centipedes and chigoes are not met, beyond 9850 feet, while the plague of mosquitoes and ants, and of other dangerous insects, is mainly confined to the lowlands. In the north, and in the immense *llanos* of the east, great herds of cattle, descended from those

imported by the Spaniards, are reared; in the central districts, shorthorns and other English, Dutch, and Norman cattle and horses have been introduced, and are largely raised throughout the temperate zone. Fish life ceases in the lakes at 13,000 feet; and in the solitudes above, the condor dwells alone.

In minerals the country is exceedingly rich, although its scanty population, their poverty, and the absence of roads have combined to limit the exploitation of the precious metals. The principal mines (chiefly gold and silver) are in Antioquia, Caldas, Nariño, Cauca, Bolívar, Tolima, and Magdalena. The salt-mines at Zipaquirá, near Bogotá, are a monopoly of government, and yield a considerable revenue. There are extensive deposits of iron, coal, and petroleum. Copper, lead, sulphur, zinc, antimony, arsenic, manganese, mercury, fireclay, cinnabar, crystal, granite, marble, lime, gypsum, jet, amethysts, rubies, porphyry, and jasper are also found; while much of the world's platinum is obtained from the upper San Juan, and the principal source of the finest emeralds is at Muzo in Boyacá, although there are other mines near Nemocón, in Cundinamarca.

*Commerce, &c.*—The only industries common to all the departments of Colombia are agriculture and the rearing of cattle. Straw-hats, known abroad by the name of Panama, are almost the only manufactured article exported. But the exports are few, considering the vast size of the country, only a small part of which is under cultivation, and they suffer from want of transport and communication. There is trade in coffee (the staple crop), gold, silver, and other ores, rubber, bananas, ivory-nuts, divi-divi, tobacco, cacao, cotton, cinchona, cattle, balsams, timber and dyewoods, hides and wool. Most of the inland traffic is by the rivers, the Magdalena being navigable for about 900 miles. The roads are only tracks, but they are being improved. There are a few short railways. Others are projected.

*Population.*—The chief aborigines of the country, the *Chibchas* or *Muyscas*, who inhabited the plateau of Bogotá, ranked among the nations of the New World second to the Aztecs and Peruvians alone. They worshipped the sun, had a calendar, and a government closely resembling that of Japan, lived in communes, were industrious farmers, and dressed in garments of cotton. Their rich, beautiful language has been forgotten by their descendants, but is preserved in a grammar published at Madrid by the Dominican missionary, Bernardo de Lugo, in 1619. The rest of the country was occupied by a great number of tribes, with as many dialects as divisions, sinking from the grade of the Chibchas to the naked savages of the plains. Some of the intermediate races, while understanding Spanish, have preserved their primitive speech; the uncivilised Indians are now mostly confined to the eastern plains, the northern portion of Magdalena, and the district of the Atrato. The pure whites form about a fifth of the entire population, and the Indian half-breeds more than half; there are now scarcely any pure negroes left in the country, but the mulattoes and *zambos*, resulting respectively from the union of negroes with whites and Indians, exceed a sixth of the whole. Slavery was finally abolished in 1852, and in 1870 a system of compulsory education was adopted which has on the whole proved successful. Parochial, secondary, normal, and technical schools are now within general reach, and there are several state and departmental universities of more or less efficiency. Journalism is largely represented in most of the large towns; and at the capital a considerable number of books are published every

year The state church is the Roman Catholic, which in the management of its own affairs is independent of the civil authority; religious orders were suppressed in 1863, and toleration in matters of religion is guaranteed; but, by the terms of a concordat entered into with the holy see in 1888, in the universities and all educational establishments public instruction is directed in conformity with the dogmas of the Roman Catholic Church, religion is one of the obligatory subjects of study, and diocesans are empowered to suspend teachers or professors who neglect or disobey this order.

*History.*—The northern coasts of Colombia were visited by Ojeda and Amerigo Vespucci in 1499, and afterwards by Bastidas; in 1502 Columbus explored part of the country, and endeavoured to found on the Isthmus of Panamá the first Spanish colony on the American mainland. In 1513 Balboa (q.v.) discovered the Pacific, and Pizarro and Almagro sailed along the western coast of Colombia on their way to Peru in 1526. Ten years later Jiménez de Quesada broke the power of the Muyscan empire, and the *Nuevo Reino de Granada* was formed. As the country was opened up, the Indians sank, in spite of legislation designed for their protection, to the condition of serfs, and the policy of the crown, aided by the Inquisition, which was introduced in 1571, put an end to the democratic institutions of the early settlers. The region was administered by the Council of the Indies; nearly all posts were sold to Spanish speculators, who recouped themselves at the expense of the colonists; and even the commerce of the new possessions was granted as a monopoly to the merchants of Seville. The country formed a presidency (except during the years 1718–24) from 1564 to 1739, a period memorable for the disastrous descents of Drake, Morgan, Dampier, and others on the coast towns; it was then raised to a viceroyalty, which lasted until the war of independence.

On the 20th July 1810 the colony shook off the yoke of the mother-country, and entered upon the long struggle which ended in the election of Bolívar (q.v.) to the presidency of the *Republic of Colombia*, a term which, like the viceroyalty, embraced all that now belongs to Venezuela, Colombia, and Ecuador. Independently of the singular difficulties of communication, and of the resulting absence of anything like natural unity, this unwieldy state contained from the beginning the germs of its own dissolution in the national character of its inhabitants. So long as union was necessary to meet external dangers, it maintained an imposing attitude in the eyes of the world; but gradually sectional interests and political jealousies did their work, and in 1831 the ill-assorted elements of the confederation were separated for ever. What is now Colombia was then formed under the title of the *Republic of New Granada*; but in 1861 a fresh civil war led to the establishment of the *United States of Colombia*. In 1863 a constitution was adopted, based on that of the United States of America, with a president elected for two years; but this proved altogether unsuited to the Colombians, and, after twenty years' trial, brought about the revolution of 1884–85. In 1886 a fresh constitution was adopted for the new *Republic of Colombia*, placing the central authority in the strengthened hands of the federal government, and reducing the nine former self-governing states of Antioquia, Bolívar, Boyacá, Cauca, Cundinamarca, Magdalena, Panamá, Santander, and Tolima to departments, further reduced to eight by the independence of Panamá (q.v.) in 1903. The country has since been divided anew. The boundary with Ecuador was fixed in 1917, with Venezuela in 1922; those with

Peru and Brazil remaining indefinite. Colombia had in the first sixty years of its statehood no less than twenty-seven civil wars, in one of which alone (1879) it lost 80,000 of its citizens. Again in 1899–1901 it lost 50,000.

See García Calderón's *Latin America, its Rise and Progress* (1913); Sir Clements Markham's *True History of the Conquest of New Granada* (1913); books by Scruggs (1910), Mozans (1910–11), Eder (1913), Lévine (1914), F. Lorraine Petre (1906).

**Colombo**, the capital of Ceylon, is situated on the western side of the island. By the completion of the great breakwaters and graving-dock, diedging, &c. (1874–1914; see **BREAKWATER**), the harbour was greatly improved and commerce largely increased; Colombo having superseded Galle as a coaling station for large steamers. It contains the government offices, is the seat of an Anglican bishop, and is an important centre of missionary enterprise. It has a university college and other educational institutions. Among the chief buildings are the government house, court house, town-hall, asylum, and colleges. The fortifications of Colombo were constructed by the Dutch. Colpetty, a beautiful suburb, shaded by groves of the coconut palm, is a favourite retreat. The humble, mud-constructed dwellings of the Dutch, Portuguese, Eurasians, Singhalese, Tamils, Moors, and Malays are outside the city walls. The *pettah* or Black Town, the only ancient quarter, extends to the river Kalany-ganga. Pop. (1871) 100,238; (1921) 244,100. Colombo is connected with the two ends of the island, with Adam's Bridge, and Kandy by railway. The early name of Colombo, *Kalan-totta*, the 'Kalany Ferry', the Moors corrupted into Kalambu, and by this designation it was described by Ibn Batuta about 1340 A.D. as the finest city of Serendib. The Portuguese, who fortified it 1517 A.D., wrote the name Colombo, in honour of Christopher Columbus. The Dutch succeeded to the Portuguese, and Colombo was taken by the British, 16th February 1796. See **CEYLON**.

**Colón.** See **ASFINWALL**.

**Colon**, that portion of the large intestine which extends from the Cæcum (q.v.) to the rectum, which is the terminal portion of the intestinal canal. See **DIGESTION**.

**Colonel** (from Ital. *colonello*, the 'leader of a column') is the grade of officer next below that of colonel-commandant (till 1920 brigadier-general). The chief officer of an English regiment at one time bore the title of captain, but since 1588 that of colonel has been substituted. In the British army, the infantry 'regiment' not being either a tactical or an administrative unit, the colonel of a regiment has practically a sinecure, bestowed upon a retired officer as a recognition of good service. The commander of a cavalry regiment, or a brigade of artillery, or a battalion of infantry is a lieutenant-colonel. In the artillery and engineers the colonel is an active officer. 'Officers are only promoted to the rank of substantive colonel to fill a vacancy in the establishment which was fixed, by army order 45 of 1908, at 350 for the British service, and 110 for the Indian army;' and 'lieutenant-colonels may be promoted to the rank of colonel by brevet on appointment as aide-de-camp to the sovereign; for distinguished service in the field, or for meritorious or distinguished service of an exceptional nature other than in the field.' See **COMMISSIONS, ARMY**; and for colonel-commandant, see **BRIGADIER**.

In the great foreign armies, the infantry 'regiment' is a tactical and administrative unit, containing three battalions. Consequently the colonel is an important active officer. The battalions are under lieutenant-colonels, as in Britain, and six of

them—that is, two regiments—form a brigade of infantry (see BRIGADE).

**Colonia**, a department of Uruguay, on the Plata, below the Uruguay River. The uplands are barren, but in the fertile valleys and plains are numerous European colonies, engaged in agriculture and stock-raising. Area, 2200 sq. m.; population, 100,000. The capital, Colonia del Sacramento, a small town on the Plata, about 100 miles above Monte Video, has a good harbour, a dock for vessels of 1000 tons, and ruined fortifications.

**Colonial Animals**, organisms which cannot be fairly regarded as unities, but consist of numerous more or less similar individuals united in a common life. Among the usually single-celled simplest animals or Protozoa, loose colonies not unfrequently occur, and are of not a little importance as suggestions of the bridge between the single-celled and many-celled animals. Such colonies arise when the original cell, instead of reproducing discontinuously, retains its daughter-cells in union with itself or with one another, just like the egg-cell of a higher animal. By sacrifice of individuality at the epoch of reproduction, a higher unity is formed. In the same way a simple cup-shaped sponge, by continuous budding, forms a colony of similar forms, which may possess more or less distinct individuality. The common fresh-water *Hydra*, to mount a step higher, buds off daughter *Hydræ*, which remain for a while connected with the parent organism, and make it temporarily colonial. This becomes constant in the myriad colonies of hydra-like forms which are known as Zoophytes, or Hydrozoa (q.v.). The same formation of colonies is well illustrated in the higher polyps of the sea-anemone type, where in dead-men's fingers and in most corals, compound or colonial organisms are beautifully illustrated. Some jellyfish-like or medusoid types also become compound, and lead on to the order Siphonophora, where, as in the Portuguese man-of-war (*Physalia*) or in *Velella*, the occurrence of compound forms is a constant character. But in this last case a further step has been made, for the individuals not only share a common nutritive life, but are bound together in a more intimate way into a true unity of a higher order. Among simple worm-like forms, chains of individuals are occasionally formed, as in *Catenula*, and these point to the probable origin of the higher or segmented worms which consist of a series of similar 'joints.' Even among the higher worms, temporary compound forms occasionally occur, as in the fresh-water *Nais* or the marine *Syllis*. The Polyzoa afford good illustration of colonial life as an almost constant character of a class. Finally, passing beyond the limit of invertebrate animals, we find the last examples of true colonial organisms in the Ascidians (q.v.) or Tunicata. The occasional development of double or multiple forms from a single ovum is among higher animals the only suggestion of compound organisms.

From the above illustrations a few general conclusions may be drawn. The process of asexual budding, which leads to the formation of compound organisms, is commonest in relatively passive vegetative animals, like sponges, hydroids, corals, polyzoa, and ascidians, and is an expression of their general physiological constitution. When the colonial organism is free-living, as in Siphonophora and some Tunicata, the individual members are more closely knit together, and the colony is more perfectly integrated. As above suggested, some colonial forms are of importance as illustrating in loose union an order of individuality, which in higher types becomes more firmly unified. We first find loose 'aggregates,' at a higher level these become 'integrated.' The loose colonies

of some medusoid types are thus succeeded by more perfectly integrated forms in the Siphonophora. Finally, colonial organisms are of the highest physiological interest in illustrating division of labour. In a compound organism the internal and external conditions of life are not uniform for all the members; certain 'persons,' as the individuals are technically called, exhibit the predominance of one function, and others of another; the differences in function thus started bring about more or less marked difference of structure as its consequence; and thus division of labour and 'polymorphism' or difference in form are established.

**Colonial Conference.** See CONFERENCE.

**Colonial Corps** was a name for regiments of British regulars, paid from home, but permanently stationed in the colony. The system was unsatisfactory, and was abandoned. At present there are two classes of colonial forces. (Note that India is not a 'colony' in this connection.) 1st Class—those raised in a colony by order of his Majesty, paid from home, and subject to the Army Act (see ARMY DISCIPLINE). 2d Class—those raised and maintained by a colony, only subject to the Army Act when with his Majesty's forces. The 1st Class comprises several regiments in the West Indies and Africa, and Artillery (q.v.). The 2d Class contains a large, and yearly increasing, body of troops, details of which are in the official *Handbook of the Land Forces of the British Colonies*. During the Boer war (1899-1902) the 2d Class contributed 83,000 men, from Canada, Australia, New Zealand, and South Africa, and in the Great War about half a million.

**Colonial Institute**, THE ROYAL, was founded in 1868 (incorporated by Royal Charter in 1882) to provide a London place of meeting, of a strictly non-party character, for persons connected with the colonies and British India, and to fulfil kindred purposes. It has an excellent library.

**Colonial Office.** See SECRETARY OF STATE.

**Colonial System**, also called COMMERCIAL SYSTEM, a name for the theory long acted on by European nations, that their settlements abroad were to be treated as proprietary domains, exploited for the benefit of the mother-country, which did everything it could to import their produce as cheaply as possible, and encourage them to a large consumption of home manufactures. The system was carried to its furthest extent by Spain. See COLONY, FREE TRADE, MERCANTILE SYSTEM, MONOPOLY, NAVIGATION LAWS, UNITED STATES.

**Colonisation Society.** See LIBERIA.

**Colonna**, CAPE (Lat. *Sunium Promontorium*), a headland of Greece, forming the southmost point of Attica, and crowned by the ruins of a temple of Athena, thirteen of whose white marble columns, from which the cape derives its modern name, are still standing.

**Colonna**, a celebrated Roman family, which took its name from a village among the Alban Hills, 12 miles ESE. of Rome, and which, from its numerous castles, vast estates, and crowds of clients, enjoyed a powerful influence from the 11th to the 16th century. From it have sprung a pope (Martin V., q.v.), several cardinals, generals, statesmen, and noted scholars, and VITTORIA COLONNA, the most celebrated poetess of Italy. She was the daughter of Fabrizio Colonna, Constable of Naples, at whose estate of Marino she was born in 1490. When four years old, she was betrothed to a boy of the same age, Ferrante d'Avalos, son of the Marchese de Pescara; at seventeen they were married. After her husband's death in the battle of Pavia (1525), Vittoria Colonna

found her chief consolation in solitude and the cultivation of her poetical genius. During seven years of her widowhood she resided alternately at Naples and Ischia, and then removed to the convent of Orvieto, afterwards to that of Viterbo. In her later years she left the convent, and resided in Rome, where she died in February 1547. She was the loved friend of Michelangelo, admired by Ariosto (see canto xxxvii. of the *Orlando*), and the intimate associate of the reforming party at the papal court. Her poems belong chiefly to the period following her husband's death, and are remarkable for truth of sentiment and enlightened piety. They were first published at Parma in 1538. See Mrs H. Roscoe's *Vittoria Colonna, her Life and Poems* (Lond. 1868), and studies by the Hon. Alethea Lawley (1888) and Maud F. Jerrold (1906).

The family is still distinguished in Italy, three of its four lines being princely. The Colonna palace, situated at the base of the Quirinal (Rome), is celebrated for its splendid gallery and treasures of art.

**Colonna**, GIOVANNI PAOLO, composer, born about 1640, either at Brescia or Bologna, became principal of the musical academy at Bologna. Of some 44 works, nearly all were for the church; his opera, *Amilcare*, was first performed in 1693. He died 28th November 1695.

**Colonsay and Oronsay**, two of the Argyllshire Hebrides, 16 miles NNW. of Port Askaig in Islay, separated from each other by a sound, 100 yards wide, and dry at low-water. Colonsay, which rises to a height of 493 feet, is 16 sq. m. in area; Oronsay, only 3. On the latter are a sculptured cross and a 14th-century Austin priory, with some curious effigies; whilst in the former are standing stones, a bone cave, Colonsay House (1722), and an obelisk to the memory of the lawyer Duncan McNeill, Lord Colonsay (1794-1874). Pop. (1851) 933; (1921) 284, nearly all in Colonsay.

**Colony**, the English form of the Latin *colonia* (from *colere*, to cultivate), denotes in British law any part of the British dominions other than the British Islands and British India. In popular usage, and especially as regards foreign countries, the term bears the more general sense of any overseas dependency, irrespective of its technical legal designation. The word, however, suggests, as contrasted with dependency, territory occupied by agricultural settlers from the mother-country, but this implication is not necessary. Ceylon is as much a British colony as Australia itself, and of late the name has ceased to be used officially as a description of the great self-governing British territories, which are now styled 'Dominions,' the ground for the change being that 'colony' implies subordination. By a wider, and historically older, use the word designates a body of persons of one nationality who have taken up residence in some foreign place, especially, but not solely, where the home government retains some legal power over the settlers, as in the case of British residents in Egypt or Shanghai.

*Ancient and Mediæval Colonies.*—The idea of the maintenance of systematic control by a mother-country over distant possessions is one of slow evolution. In the main the colonies (*apoikiai*) of the Greek and Phœnician cities were hivings off of superabundant citizens, who founded new cities, which recognised with pride their derivation from the metropolis as the mother-city, but accepted no political tie; such were the relations of Syracuse to Corinth, of Tarentum to Sparta, of Miletus to Athens, and of Carthage to Tyre. Athens, however, in the 5th century B.C., when seeking to secure her imperial position in Greece, developed the practice of sending out settlers to establish themselves in dependent territories, as in Eubœa,

and act as strongholds of Athenian influence, a policy which finally was destroyed with the ruin of the Athenian efforts at empire. The Roman republic developed, with greater success, the same policy; in conquered lands there were planted settlements of landholders, who were at once to cultivate the territory and act as military garrisons, and, with modifications, the policy persisted under the empire. At the same time the term *colonia* came to acquire a wider sense; the settlers as Roman citizens had a distinctive status, and it was possible to confer this status on a city, although only a fraction of its population was made up of Roman settlers, as in the case of Philippi in Macedonia. The Roman colonies were widely scattered, as the names of Lincoln and Cologne remind us. Carthage, the great rival of republican Rome, also aimed at colonisation, and established both settlements on the African coast in the territory of dependent tribes, and trading posts in Spain and Sicily. The doctrine of colonial dependencies was thus firmly implanted in the communities of the Mediterranean area; and in the middle ages, as civilisation recovered from the shock of the barbaric invasions, the Italian cities, especially Genoa and Venice, appear with dependencies of commercial importance, Venice having strong positions in Crete. These cities also laid the foundation for the extra-territorial rights enjoyed until 1923 by foreign communities in the Turkish dominions, securing from the sultans of Turkey special places of residence in Constantinople, and the right of jurisdiction over their own subjects resident there.

*Modern Colonisation.*—It was, however, the re-discovery of America, and the revelation of the route to the east *via* the Cape of Good Hope, that inaugurated the era of modern colonising activity. The lure of wealth and dominion, rendered less sordid by the spirit of high adventure, and tempered by missionary zeal—unhappily often distorted to evil ends—brought into fierce competition Spain, Portugal, France, Holland, and Britain. Spain by conquest attained vast areas in Central and South America; but the revolt of the New England colonies against Britain and the French Revolution had their inevitable sequel in the determination of these territories to acquire independence, while the war with the United States of 1898-99 deprived her of her last important territory, Cuba, together with the Philippines and Porto Rico, leaving to her only an unprofitable protectorate over a part of Morocco, the islands of Fernando Po and Annabon, and strips of the Saharan and Guinea coasts. Though the Spanish colonies were acquired by conquest, no small number of adventurers made their homes there, and, as usual with the peoples of the south of Europe, they mingled freely with the native races, giving rise to the semi-Spanish inhabitants of Central and South America.

Portugal, with much inferior natural resources, rivalled Spain in colonising power, largely because of her taste for combining trade with conquest. At the height of her power she had establishments in Africa, India, the East Indian Archipelago, the Malay Peninsula, and China. Too great diffusion of effort, coupled with the misfortune by which the mother-country fell for a time under Spanish dominion, led to serious defeats and losses, especially at the hands of the Dutch, who beat the Portuguese even as traders. The sympathy of Britain, among other factors, has latterly enabled Portugal to retain an unexpectedly large area of her colonial dominions, including in Africa the Cape Verde Islands, Principe and St Thomas, Portuguese Guinea, Angola, and Mozambique, with Goa and other small places in India, Macao in China, and the eastern portion of the island of Timor. Their great rivals, the Dutch, fought

also a long struggle with the British, with whom they vied in the West Indies and the East Indies, adopting exploitation by companies similar to the British East India Company. As settlers, they occupied what is now New York and the Cape of Good Hope, but these were lost in the 17th and 19th centuries, and their possessions are now essentially tropical dependencies: in the west, Dutch Guiana or Surinam, with Curaçoa and a few minor islands; in the east, the populous and valuable territories of Java, Sumatra, Celebes, the Moluccas, and the greater part of Borneo, as well as part of New Guinea. To Portugal and Holland alike these tropical possessions have appeared in the light of legitimate sources of revenue for their owners, and though the policy of exploitation has now been modified in the interests of the natives, the territories are strictly controlled as regards administration and legislation from the metropolis.

Of still greater importance have been the efforts of France to attain colonial possessions, which at one time seemed to promise her dominion on a great scale in North America and in India. Her failure ultimately to hold her own against Britain, and the sale of Louisiana by Napoleon, have left her in America only the tiny islands of St Pierre and Miquelon, and French Guiana or Cayenne, with the West Indian islands of Martinique and Guadeloupe. In India, Pondicherry and Chandernagore are faint relics of the great struggle of Duplex. On the other hand, France has acquired important areas in Indo-China, including Annam, Cambodia, Cochin-China, Laos, and Tongking; and, in successful rivalry with Britain, has established a colossal empire in North Africa, including Algeria, Tunis, a protectorate over the greater part of Morocco, the Senegal, Upper Senegal and Niger, Mauritania, French Guinea, the Ivory Coast, Dahomey, French Equatorial Africa, and French Somaliland. But for the frustration in 1898 of Marchand's mission to Fashoda, practically all North Africa, save Egypt, would have been under French control. France has also, in the Indian Ocean, Réunion, Madagascar, and the Comore Islands; in the Pacific, New Caledonia, Tahiti, and other islands; and in China, Kwangchow. The vast area and diversified conditions of this empire demand different methods of administration. Algeria is treated as an integral part of France; certain colonies have the right to representation in the French parliament by elected representatives; while large areas in Africa are governed on the basis of a protectorate. The measure of local autonomy allowed varies greatly, and is subject to the fact that France controls entirely the foreign relations of all parts of the empire, and maintains strict watch over finance, tariffs, and defence.

No other foreign powers have any colonial possessions of great importance. Belgium holds the Congo as a legacy from King Leopold, its original sovereign, but subject to the terms of the Berlin Act of 1885, as remodelled in 1919, so as to secure equal conditions for the trade of foreign countries and preservation of native interests. Italy has acquired Tripoli and the Cyrenaica in North Africa, Eritrea on the Red Sea, and a portion of Somaliland. Denmark, having parted with her West Indian and West African holdings and granted complete autonomy to Iceland, retains as a dependency only Greenland. The United States holds Hawaii, part of the Samoan islands, the Philippines, and Porto Rico. Her control of her possessions differs from that of the other minor colonial powers by the encouragement of autonomy among the governed, which has been carried to a very marked extent in the Philippines, probably as a preliminary to the ultimate concession of

independence similar to that enjoyed by Cuba since her liberation from Spain.

*The Acquisition of the British Colonies.*—The 17th century saw the inception and establishment of a large number of true colonial settlements effected on partially occupied territories in America. Newfoundland had been annexed by Sir Humphrey Gilbert in 1583, but the earliest real settlement was that effected in 1607 in Virginia by the Virginia Company; in 1620 the *Mayflower* bore the Pilgrim Fathers to New England; the Quaker, William Penn, and the Catholic, Lord Baltimore, established Pennsylvania and Maryland; and by the close of the century, of the thirteen colonies which by their revolt established the United States of America only Georgia remained to be founded. Newfoundland was colonised from Bristol, and settlers established themselves in Bahamas, Barbados, Bermuda, Antigua, St Kitts, Nevis, Montserrat and the Virgin Islands, while Jamaica was added by conquest under Cromwell from Spain. In India the East India Company, whose charter was granted by Elizabeth on 31st December 1600, established themselves, primarily as traders, at Madras, Bombay, which was ceded by Portugal to Charles II. as part of his queen's dowry, and Calcutta, while other chartered companies operated on the Gambia and the Gold Coast. The Hudson Bay Company, incorporated in 1670, began operations important in the future for securing that bay to Britain. So far, colonisation had been on the whole pacific; in the following century acquisitions were in the main the outcome of war; Gibraltar was taken in 1704 from Spain; France in 1713 had to cede Acadia, which became Nova Scotia, her claims over Newfoundland and Hudson Bay, and her share of St Kitts, while the outcome of the Seven Years' War brought Britain Canada, St Vincent, Grenada, and Dominica, as well as the triumphs of Clive in India, which led almost immediately to the virtual possession of Bengal and paramount power in the peninsula. But the removal of the danger from France left the American colonies free to resent British control; George III.'s struggle to reassert the royal power in England had its counterpart in the attempt to dominate the colonies—largely autonomous—in New England, with the result of the declaration of independence in 1776, and the final surrender by Britain in 1783. The loss of the most important of British settlements was in some degree compensated for by a revival of energy which seized upon Australia, though at first mainly as a penal settlement. The Napoleonic wars renewed the acquisitions of 1763; by the treaty of Amiens in 1802 Ceylon was acquired from the Dutch, by that of Paris in 1814 the Cape of Good Hope and part of Guiana followed suit, while France surrendered St Lucia, Tobago, Malta, Mauritius, and Seychelles, and Spain Trinidad. Contemporaneously the wars of Wellesley in India placed the predominance of Britain beyond question and added largely to the territory under British rule; Penang and Province Wellesley were acquired; British Honduras established its independence as against Spanish claims, and a more or less successful effort was made by philanthropists to establish a colony of freed slaves in Sierra Leone. The attainment of peace in Europe after Waterloo slackened the pace of acquisition, but before 1837 there were added Arakan, Tenasserim, and Assam as the result of the first Burmese war; Malacca, ceded by Holland in return for British possessions in Sumatra; Singapore, and the Falkland Islands. Under Queen Victoria, commercial needs and humanitarian ideals co-operated with the aspirations of an abundant population and large capital resources

in adding, in the main peacefully, large areas to the empire. British Columbia was settled, Canada was given in 1867 a federal constitution, and in 1870 the vast territories of the Hudson Bay Company were entrusted to the Dominion government. The colonies of Australia threw off all connection with penal settlements, and achieved in 1900 federation in a powerful Commonwealth. New Zealand was occupied and prospered in remarkable measure, while the chiefs of Fiji ceded their islands to the crown, a large part of New Guinea was annexed, and the Solomon and other islands brought under a protectorate. The more important of the Malay States were accorded protection, and finally induced to federate, while the territories of the Raja of Sarawak and the Sultan of Bunei, and those held by the British North Borneo Company, were accorded the status of protectorates. Hong-kong, destined to become a great entrepôt of trade, and Labuan with minor islands were annexed. In India the temperate zeal of one viceroy added Scind to the British dominions; the Punjab was annexed to save it from anarchy and British territory from invasion; and the insensate pretensions of the Burmese kings caused first the annexation of Lower, then the taking possession of Upper Burma also, while the security of the route to India dictated the occupation of Aden and Perim. The mutiny of a large part of the Indian army resulted in 1858 in the decision to terminate the rule of the East India Company, the authority of Britain being transferred directly to the crown, which later assumed the title of Empress of India. In Africa grave difficulties arose from the reluctance of the home government to annex territory, the resentment of the Dutch of South Africa at the emancipation of the slaves and British native policy, the rise of a war-like Zulu kingdom, and after 1880 the vehement competition of European powers, in part instigated by Germany, to attain dominion, which was complicated by the rivalry of France and Britain as regards Egypt. The situation in Europe from 1880 on seriously hampered British action, but a timely revival of the system of chartered companies, on the model of those of the 17th century, but under more effective control, secured the creation of the Royal Niger Company, the Imperial British East Africa Company, and the British South Africa Company. Thanks to the co-operation of these bodies substantial gains were recorded despite the competition of the powers. While the Gambia was encircled, and Sierra Leone left with a very modest hinterland, the northern territories of the Gold Coast and Ashanti became British, together with the vast area of Nigeria. In the east Uganda, British East Africa, and Zanzibar, and to the north Somaliland became protectorates, a status also granted to Nyasaland and Northern Rhodesia in the centre. In the south, while the Orange Free State and the South African Republic were granted independence, large areas, including British Bechuanaland and Griqualand West, were added to the Cape; the colony of Natal was created; Zululand, Amatongaland, and Basutoland annexed; and protectorates established over Bechuanaland and Southern Rhodesia, whose name records the invaluable work of Cecil Rhodes. Britain's services to Turkey in 1877-78 were recognised by the grant of Cyprus as a protectorate, while Egypt fell definitely under British control, and the Sudan, reconquered by Lord Kitchener, was declared under the joint rule of Britain and Egypt. Wei-hai-wei was acquired on lease (terminated in 1923) from China as an offset to the seizure by Russia of Port Arthur. The close of the Queen's reign was marked by the practically inevitable conflict be-

tween Great Britain and the Dutch republics in South Africa, both of which were finally incorporated in the empire in 1902, and in 1906 long friction with France was ended by arranging a joint protectorate over the New Hebrides, while under the Anglo-French agreement of 1904, in return for British support in Moroccan matters, France acquiesced in British predominance in Egypt. In 1909 a union was arranged of the four South African colonies, and by agreement with Siam protection was accorded to several Malay states.

The war of 1914 was immediately followed by the annexation of Cyprus and the declaration of a protectorate over Egypt, extinguishing the claims of the Sultan of Turkey to suzerainty over these territories. But in the peace settlement the colonial possessions acquired by Germany after 1884 (Togoland, the Cameroons, German Southwest and German East Africa, German New Guinea, Samoa, and other Pacific islands) were disposed of by the Allies under the system of mandates, in lieu of annexation.

*The Administration of the British Colonies.*—Legal theory draws a distinction between colonies acquired by cession or conquest, in which case the crown is held to have full power over the territory, and settled colonies, to which the colonists are held to carry the law of England, so that the crown has no power to legislate for such colonies, except with the aid of the British parliament or a local legislature of the same elective type. The New England colonies were essentially of the latter class; they soon developed legislatures which were often in conflict with the executive, representing the crown, and which finally denied the right even of the British parliament to legislate for them. The successful revolt of these colonies led to a reversal of British policy; parliament was induced to legislate to deny Canada in 1774 the normal right to a legislature independent of the executive, which was only conceded in 1791, and representative government was refused to Australia on various grounds until 1842. By that time, however, experience in Canada had shown that an elective legislature and an irresponsible executive were incompatible; revolts in both Upper and Lower Canada led to Lord Durham's despatch there, and evoked the suggestion of responsible government for the colonies, a system which, despite logical difficulties pointed out by Lord John Russell, was in substance conceded by the British government and made effective by Lord Elgin in Canada in 1848. The doctrine was thus, in effect, established that British subjects overseas should be accorded as much autonomy as was compatible with their own interests and the safety of the empire as a whole, and the whole history of the British colonies is the working out in its application to the different types of community of this doctrine. Hence the constitutional position of these territories is singularly complex, and is subject to a continuous, if gradual, process of development in the sense of the emancipation of overseas territories from control from Britain.

*I. The Dominions.*—The process of emancipation is most complete in the case of the self-governing Dominions, so styled since the Colonial Conference of 1907, viz. the Dominion of Canada, the Commonwealth of Australia, the Dominion of New Zealand, the Union of South Africa, and the Dominion of Newfoundland. In the strict legal aspect all these are colonies; their legislation may be disallowed by the crown, their laws may be overridden by imperial acts, the head of the executive government is appointed by the king on the advice of the British government, and appeals lie from their courts to the Judicial Committee of the Privy-council. In practice they are almost autonomous;

the governors-general are appointed in accordance with the wishes of the dominion; disallowance of their acts is obsolete or nearly so; the British parliament has ceased to legislate for them save with their consent; and, if they desired, the right of appeal to the Privy-council would doubtless be cancelled. Save Canada, they have a wide power of constitutional alteration, though they cannot sever their connection with the British crown. The chief sign of their condition of quasi-dependence is the fact that under international law they are not, for many purposes, treated as independent states; the governors-general and ministers cannot declare war or make peace or enter into treaties, except under the authority of the king, on the advice of the British government. But these restrictions are of less importance in practice than in theory, for in all important political treaties since the Peace Conference of 1919, the Dominions (other than Newfoundland) have separate representation, and their consent is obtained before ratification, while no commercial treaty since 1880 has been made binding on them without their consent, and special treaties are negotiated for them by their own representatives, acting with the authority of the British government. Further, the Dominions (except Newfoundland) are distinct members of the League of Nations, side by side with the British empire as a whole, and as such members act independently of, and sometimes in opposition to, the British empire representatives. The Dominions have not the power to declare themselves neutral in any war into which Britain enters, but they may refuse any active aid, and they obviously can claim that they should participate in framing British foreign policy, so as to obviate their being involved in war without consultation and full knowledge. Effective arrangements exist under which, in matters immediately and directly affecting them, the British government does not act without Dominion concurrence, but the problem of consultation on general foreign policy is not yet solved. It is complicated by the fact that the Dominions, while able to maintain internal order, are not yet prepared to undertake proportionately the same burden of defence expenditure as is borne by the United Kingdom.

The status of the Free State in Ireland is essentially that of a Dominion on the model of Canada, but that status is possessed under the terms of a formal treaty of 1921 between Great Britain and Ireland, and the terms of that treaty provide certain powers which Great Britain can exercise in respect of defence matters, and definitely limit the right of the Irish Free State to maintain naval and military forces, matters left indefinite in the case of the Dominions.

II. *India*.—British India, together with the Indian or native states, is destined to hold the position of a Dominion, and is an independent member of the League of Nations. But at present, under the Act of 1919 bestowing the existing constitution, India is not governed by ministers responsible to elective parliaments in all internal matters, as is the case in the Dominions. Only in certain spheres of provincial action is this the case, while in other matters the executive government is carried on under the direct control of the British government through the Secretary of State for India in Council, and the whole of the central government of India is thus controlled. The Indian legislatures, central and provincial, are now predominantly elective, but powers are given to the governor-general and the governors to secure essential legislation and expenditure in all matters not definitely assigned to ministers.

III. *Colonies possessing Responsible Government*.

—This rank has been conceded to Malta, also to Southern Rhodesia in 1923 in substitution for a

curious form of government under the British South Africa Company with an elective legislature. In these cases self-government is strictly confined to domestic issues; all foreign relations remain in the hands of the British government, which in the case of Rhodesia also asserts control in certain matters affecting lands, native rights, taxation, &c.

IV. *Colonies possessing Representative Government*.—In such colonies there survives the British form of government prior to the reign of George I. The executive is independent of the legislature, but can obtain legislation only by its consent, save in the rare event of intervention by the British parliament. Bahamas, Barbados, and Bermuda hold this rank, which was formerly held by Jamaica and other West Indian islands, but was surrendered on various grounds.

V. *Crown Colonies*.—In the vast bulk of the remaining British possessions the executive is able to control the legislature, because that consists of a body in which there is either a majority of officials or a majority of official and nominee members, even when some members are elective, while in some cases, such as Gibraltar, the governor constitutes the legislature. This form of constitution is appropriate and necessary where it would be impossible to create an elective legislature which would effectively represent the people as a whole and conserve their interests, for example, in colonies with large native populations still unfitted for political activity. In cases where political education is evolving higher capacity the elective element in these legislatures is being increased; thus in Ceylon it is in a majority; but, to prevent deadlocks, the governor is empowered in cases affecting vital interests to carry legislation by the votes of the official members; a somewhat similar condition of affairs exists in Jamaica. Throughout the empire the increase in the number and effective powers of the elective members in the legislatures is now being aimed at. The final control of administration and legislation in all these cases still rests with the British government through the Secretary of State for the Colonies.

VI. *Protectorates*.—Very closely allied in constitution to crown colonies are the protectorates, such as the Nigeria Protectorate, those attached to the Gold Coast, the Gambia and Sierra Leone, Somaliland, or the Solomon Islands. The inhabitants of protectorates are not British subjects, and the territory is not part of the possessions of the crown or the British dominions; but these distinctions are not of much practical importance, and as a territory advances in development it may be annexed, as of late years the East Africa Protectorate has given place to the Kenya Colony, and the Gilbert and Ellice Islands Protectorate to the colony of that name. Historically the declaration of a protectorate was often easier and more convenient than annexation; a native ruler would readily accept protection when he could not consider cession, and during international rivalries it was desirable to be able to vary territorial claims without the difficulties attending cession of territory.

VII. *Protected States* differ from protectorates of the colonial type in that, while in the latter the administration is carried on for the British crown by its servants, in the former the foreign state preserves its legal identity unimpaired. Great distinctions of character exist among such states; thus under the declaration of 1888 Sarawak's foreign relations are under British control, but the state in its internal government is independent. The Federated Malay States, on the other hand, are largely run on the model of a crown colony, but the British officers act in the name of the sovereigns of the states; the unfederated states

represent a stage intermediate between that of Saaawak and the Federated States. Under the British declaration of 1922 Egypt has ceased to be under British protection, but her independence is qualified by certain special rights claimed in the interests of Britain.

VIII. *Mandated Territories.*—Britain holds East Africa, under the style of the Tanganyika Territory, and portions of what were formerly German Togoland and the Cameroons under mandate, conferred by the principal allied and associated powers, under the treaty of Versailles of 1919, subject to the supervision of the League of Nations. Similar mandates were issued to Australia for German New Guinea and the Pacific islands south of the equator, save Samoa, which was assigned to New Zealand, while the islands north of that line were allotted to Japan; to the British empire for the island of Nauru; to the Union of South Africa for German South-west Africa; and to France for parts of Togoland and the Cameroons and Syria. Britain received also mandates for Mesopotamia and Palestine. The mandates vary in terms, conceding virtual annexation in the case of the Pacific islands and South-west Africa, according a more independent status in the other African mandates, and contemplating considerable autonomy in those for Turkish territories, subject in the case of Palestine to the onerous obligation of securing the establishment of a Jewish home. In Mesopotamia the king has received the concession of an alliance preparatory to independence. In all cases annual reports must be rendered to the League of Nations, which has the right to criticise, though not to give instructions to the mandatory power, and the holder of the mandate must study the interests of the natives and further their advancement; save in mandates which practically allow annexation, equal opportunities in matters of trade must be conceded to all nationals of states, members of the League.

To complete the complexity of the empire, it may be added that Canada, the Commonwealth, the Union of South Africa, and India have both central and local governments, true federations in the first two cases, quasi-federations in the latter, and that in addition to their mandated territories Australia controls Papua and Norfolk Island, and New Zealand the Cook Islands, while the government of British India exercises control over a large number of Indian states enjoying British protection.

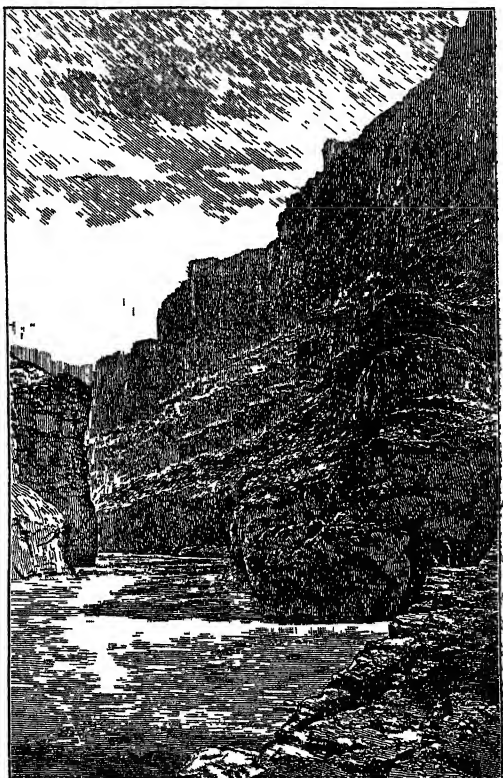

The older standard treatises on colonies include Heeren's *Manual of the Political System of Europe and its Colonies* (1841); Sir G. Cornwall Lewis's *Essay on the Government of Dependencies* (new ed. 1891); H. Merivale's *Lectures on Colonies and Colonisation* (new ed. 1861); A. Ireland's *Tropical Colonisation* (1899) and *The Far Eastern Tropics* (1905). Sir H. Johnston's *A History of the Colonisation of Africa by Alien Races* (1913), Sir F. Lugard's *The Dual Mandate in British Tropical Africa* (1922), and Sir C. Lucas's *The Partition and Colonisation of Africa* (1922) present more recent views. On the British empire, beside the important older works of Seeley (*The Expansion of England*, 1883) and Sir C. Dilke (*Problems of Greater Britain*, 1890), may be consulted Sir C. Lucas's *Historical Geography* (8 vols. 1905-20); W. Tilby's *The English People Overseas* (6 vols. 1908-14); H. E. Egerton's *Short History of British Colonial Policy* (1908) and *British Colonial Policy in the Twentieth Century* (1922); H. Robinson's *The Development of the British Empire* (1923); A. B. Keith's *Responsible Government in the Dominions* (1912), *Imperial Unity* (1916), and *War Government of the Dominions* (1921). A complete *Survey of the British Empire* was issued at Oxford in 1914; a similar survey will be issued in London contemporaneously with the British Empire Exhibition of 1924. The annual issues of the *Colonial Office List* and *The Statesman's Year Book* give the latest details.

**Colophon**, an Ionian city of Asia, about 15 miles N. of Ephesus, and not far from the coast. It

was the native city of Mimnermus, the elegist, and claimed to be the birthplace of Homer. The Greek proverb, 'to put the colophon on it,' meaning to terminate an affair, Strabo referred to the belief that the cavalry of Colophon was so excellent that its charge always decided a battle. Hence, in old printed books, any device, or printer's name, or the place and year of printing, printed at the end, was called a *colophon* (see BOOK).

**Coloquin'tida.** See COLOCYNTH.

**Colorado** (Span. for 'red' or 'reddish'), a remarkable river of North America, formed in 38° 17' N. lat., 109° 50' W. long., by the union of the Grand and Green rivers, and flowing through the great plateau region. The Green River rises in Wyoming, and drains the south-west portion

Grand Cañon of the Colorado, looking up.  
(From a Photograph by E. Baer, of Prescott, Arizona.)

of that territory; it also receives affluents from Utah and the north-west angle of the state of Colorado. The Grand River rises in Colorado, where its more common name is the Gunnison. Its main tributaries in that state are the Bunkara, or Blue, and the Dolores. Below the junction of the Green and Grand rivers the main affluent in Utah is the San Juan, which drains an interesting region in the south-west of Colorado and the north-west of New Mexico. In Arizona the main affluents are the Colorado Chiquito or Flax River, the Bill Williams, and the Rio Gila, all from the left. The only important affluent the Colorado receives from the right is the Rio Virgen. From the junction of the Grand and Green, the general course of the stream is to the south-west, through the southern part of Utah and the north-west of Arizona; and it afterwards separates Arizona from Nevada and

California. The lower part of its course is in Mexican territory, where it flows into the north extremity of the Gulf of California. The most striking features of the Colorado basin are its dryness, and the deeply channelled surface of the greater part of the country. Almost every stream and water-course, and most of all the Colorado itself, has cut its way through stratum after stratum of rock, until now it flows, in a great part of its course, at the bottom of a deep trench or cañon. The main stream for nearly 400 miles below the mouth of the Colorado Chiquito thus makes its way through a great plateau, forming the Grand Cañon of the Colorado (a national park, 1919), the most extensive and marvellous example of the kind anywhere known. The cañon-walls throughout the upper part of the great cañon are from 4000 to 7000 feet in height, and are often nearly perpendicular. At some points the walls on either side rise sheer from the water; at others there is a talus of fallen rock, or occasionally a strip of fertile soil, on one or both banks. This over-drained river basin has an area of 240,000 sq. m. Its former adaptedness to the support of human life on a considerably greater scale than at present seems to be evidenced by the presence of great numbers of abandoned and prehistoric dwellings, sometimes perched upon cliffs within some cañon, or on a high ridge or *mesa*, as if for protection from hostile attack. The Moqui towns in Arizona are still inhabited by interesting tribes of semi-civilised aborigines, no doubt relics of a race once very much more widely spread. The whole course of the river below the junction is about 900 miles; to its remotest sources it is 2000 miles. Navigation is possible for light-draught steamers for over 600 miles. At extreme high water, steamboats sometimes go up to the mouth of the Rio Virgen to load rock-salt. The lower portion of the river is visited at certain seasons by *boces*, or high tidal waves, a phenomenon to be seen in only a very few North American rivers. The non-tidal portion of the river is subject to vast and frequent changes of volume, and except where confined by cañon-walls, the river channel shifts to and fro in its sandy alluvial bed to a very remarkable degree. Its waters are largely employed in southern Arizona for irrigation purposes, and with valuable results.

**Colorado**, a river of Texas, rises by many head-streams in the south part of the Llano Estacado, of north-west Texas. Its two main head-streams are the Concho or Salt Fork, and the Red or North Fork. The river takes a devious south-eastward course of about 900 miles, and discharges its waters by two main outlets into Matagorda Bay. Its drainage area is put at 24,700 sq. m. Sand-bars at its mouth impede navigation. Steamboats have ascended the river as far as Austin, the capital of the state; but the stream is not much navigated. The basin of the river is in part very level, but in some parts of its course the banks are bold and bluff. The valley of the Colorado is fairly supplied with timber, and the soil is generally fertile; but the rains are much less abundant than in the river basins lying farther to the eastward. It is stated that this river was named Brazos by the Spanish colonists, and that the Colorado of the same settlers was what is now called the Brazos, the names having been misapplied or transposed in later times by mistake. The Colorado is the largest river wholly within the state of Texas, except only the Brazos.

**Colorado** (popularly known as the 'Centennial State'), a state of the American Union, in 37°-41° N. lat., and 102°-109° W. long., traversed from north to south by ranges of the Rocky Mountains. It takes its name from the river Colorado, to

the basin of which all the western slope of the state belongs—as the eastern to the Mississippi valley—while part of the south is drained by the Rio Grande and its head-streams. The area is 103,925 sq. m.; so that Colorado ranks as seventh in area, being surpassed by Texas, California, Montana, New Mexico, Arizona, and Nevada. The vast ranges which traverse this region have mostly an approximate north and south direction, with many deviations. The high plains and over-drained *mesas* to the west are not clearly marked off from the mountain region; and much of the western slope is actually mountainous. The eastern slope, which embraces about two-fifths of the whole state, is, apart from the foot-hills skirting the flank of the mountain-region, an open and comparatively treeless plain, with a surface singularly monotonous, and for the most part devoted to the pasturage of cattle and sheep, an interest which is of high importance in nearly all parts of Colorado. This level region averages 5000 feet in altitude, and its lowest point is 3000 feet above sea-level. The mountain-region contains many peaks exceeding 14,000 feet in height, the loftiest being Blanca Peak (14,464 feet); while the summits exceeding 13,000 feet are stated to be more than one hundred in number. The mountains, notwithstanding their general parallelism, are greatly broken into short and variously named chains, there being no one ridge that can distinctly claim to rank everywhere as the main range of the system. Six passes cross mountain-ranges at points over 12,000 feet high; the Argentine Pass is 13,000 feet in altitude. Railways are led across many of the passes, and their construction through the valleys and cañons has called for many brilliant displays of engineering skill and boldness. A marked feature of the mountain-region is presented in the *parks*, or rich mountain-valleys, often very spacious, and generally bearing evidence of being the basins of lakes once extensive, but now nearly or quite dried up. The central mountain-region, with its parks, cañons, and hot springs, and its rich mineral deposits, has attracted most attention. The western part of the state is far less accessible and less developed, although its mineral wealth and the construction of railways have led to the settlement of some parts of the region.

The rainfall of Colorado is small; yet the great altitude causes a considerable local fall of rain and snow, and several important streams take their rise in the state, including several tributaries of the Colorado; the Arkansas and South-Platte, flowing to the Mississippi; and the Rio Grande, the only stream which reaches the sea under its own name. Extensive and important irrigation-works are fed by some of these streams. Colorado has a great reputation as a health-resort, especially for persons with pulmonary disease. The dryness of the air is the great factor in the recovery of consumptive patients in this region; but some invalids only after a considerable period become so habituated to the rarefaction of the atmosphere as not to be seriously annoyed by it. The medicinal and thermal springs of the state are numerous, and are visited by large numbers. A peculiar disease called 'mountain fever' is endemic in some places, attacking principally strangers from lower levels of country.

Wheat, maize, barley, oats, hay, potatoes, fruits, and garden and dairy products are the staples of agriculture, which is remunerative in all sections where irrigation can be effected. Thousands of miles of irrigating canals and ditches have been made. A mountain-cut tunnel has turned the waters of a river, the Gunnison, into a large desert area. Visitations of insect-plagues, including the well-known Colorado potato-beetle, have hitherto

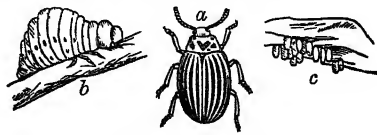

proved very destructive in this state; but the Rocky Mountain locust (see LOCUST), formerly a terrible enemy to the farmers, has of late years been comparatively harmless. Cattle and sheep are important and increasing industries, and dairying is becoming a prominent industry. Lumber-cutting also employs a number of hands.

The discovery of gold (1858) in the neighbourhood of Pike's Peak led to the first important settlements of English-speaking people in this region. The earliest discoveries were of placer-deposits; but quartz-mining soon followed, and although many of the quartz-lodes yield a highly sulphuretted material, the introduction of improved methods of treatment has finally rendered these ores, so refractory under the old processes, highly important as a source of gold. In more recent years a considerable proportion of gold has been afforded by the richly argentiferous lead-carbonate ores, for which the state is famous. From 1873 on the silver production exceeded that of gold in importance; and the state ranked as the first in the United States in outturn of silver, second or third in its gold, and first or second in the production of the precious metals in general. In the working of the best silver ores much lead is obtained, and Colorado still takes rank as one of the first states in lead production as it does in gold, though hardly now in silver. Vast sums of money have been invested in the construction of works for hoisting and reducing the ores; and railways have been built along the mountain-cañons, generally at a very high cost, so as to make the mines accessible. Mining and smelting operations have been much facilitated by the discovery of large beds of coal, usually of good quality, though classed as a lignite. Iron and Bessemer steel rails are among the manufactures of the state; zinc, copper, tungsten, radium, cement, fireclay, and manganese are wrought to a greater or less extent; and there are many petroleum wells near Florence. There is a good yield of coal. Two senators and four representatives are sent to Congress.

**History.**—Not quite one-half of this region was acquired by the United States from France in the Louisiana purchase of 1804; the remainder was ceded by Mexico under the treaty of 1848, together with California and New Mexico, of which last it formed a portion. The southern part of Colorado has for many years had a small Spanish-speaking population, partially of Indian descent. Colorado was organised as a territory in 1861, and was admitted as a state in 1876. The population is of mixed origin, but is largely derived from the older states of the Union. The distinctly American traits of enterprise and progress, shown alike in business methods and in measures for the spread of popular education, are nowhere more conspicuous than here. The principal towns are Denver, the capital, and Pueblo. There are also a number of minor towns, most of them mining centres; but the fall in the value of silver, and the closing of many of the mines (after 1893), unfavourably affected not a few of them. Pop. of Colorado (1860) 34,277; (1870) 39,864; (1880) 194,327; (1900) 639,700; (1910) 799,624; (1920) 939,629.

**Colorado Beetle** (*Chrysomela* or *Doryphora decemlineata*), a North American beetle which commits fearful ravages among potatoes. First discovered near the upper Missouri in 1824 by Thomas Say, it belongs to the sub-order of Coleoptera known as Tetramera or Cryptopentamera, and is a good type of the family Chrysomelidae. It is an oval insect, from 9 to 11 millimetres in length, of an orange colour, with black spots and lines as seen in the figure. The antennæ are club-shaped. The larvæ and adults live on the potato-plant, and have sometimes (as in 1859) quite

destroyed the crop in certain parts of America. They pass the winter underground, and emerge from their hiding-places in the beginning of May. The female lays many hundreds of eggs in groups of twelve to twenty on the under side of potato-leaves. The larvæ, which emerge in about a week, are reddish and afterwards orange. They grow up quickly, and produce a second generation, which

Colorado Beetle :

a, beetle, natural size; b, caterpillar, c, eggs.  
(From Miss Ormerod's *Injurious Insects*.)

may again produce a third in the same summer. Their rate of multiplication is therefore very rapid.

The home of the Colorado beetle is in the western states; 'from Nebraska and Iowa it travelled eastward, until, in 1873-76, it reached the eastern shores of America. In 1877 it was found at Liverpool in a cattle-boat from Texas.' Owing in great measure to the stringent regulations of an order in council, which provides that 'it shall not be lawful for any person to sell, keep, or distribute living specimens of the Colorado beetle in any stage,' this pest has fortunately not succeeded in establishing itself in Britain. The surest remedy in case of attack is said to be a preparation of arsenic known as 'Paris Green' or 'Scheele's Green.'

The genus *Chrysomela* ('golden beetle'), to which the Colorado beetle belongs, is represented by many hundred often beautifully metallic species in temperate and tropical countries. *C. cerealis*, sometimes injurious to grasses and cereals, *C. staphylea*, *C. or Lina populi*, found on poplars, are common species.

**Colorado Springs**, a popular summer-resort of Colorado, situated in the midst of beautiful scenery on the Fontaine qui Bouille Creek, 75 miles S. of Denver by rail, and about 10 miles E. of Pike's Peak; pop. 30,000.

**Coloration, PROTECTIVE and WARNING.** See MIMICRY.

**Colossæ.** Colossæ was a town of Asia Minor, in the southern part of the province of Phrygia, situated on the river Lycus, a tributary of the Mæander, 12 miles east of Laodicea. It is mentioned by Xenophon as 'a populous city, prosperous and great,' but in the time of Strabo had become 'a small town.' It was ruined by an earthquake in 61 A.D. (Tac., *Ann.* xiv. 27); but it was again rebuilt, and in the middle ages was named Chonæ. See COLOSSIANS.

**Colosseum.** See AMPHITHEATRE.

**Colossians, THE EPISTLE TO THE,** a letter written by the Apostle Paul during his imprisonment at Rome to the church at Colossæ—a town in the Lycus valley near to the more famous cities of Laodicea and Hierapolis. The church at Colossæ was founded by Epaphras, and, as far as we know, was never visited by Paul himself. Colossians is a twin epistle with Ephesians, and the relation between these two letters constitutes a very interesting problem in criticism. The object of the letter is to repel a serious attack which had been made upon some of the foundation principles of the Christian faith. A dangerous heresy had arisen, which is nameless and has never been absolutely identified. Lightfoot thinks that it originated with the Essenes, but there is no clear trace of Essenism outside the borders of Palestine; other scholars regard it as a form of incipient Gnosticism. The

creed of these heretics seems to have consisted of three main articles: (a) Knowledge is far more important than faith, and should be the goal of the religious quest. (b) Ritual and rigid asceticism are absolutely necessary to the religious life. (c) God and the world are separated by an impassable gulf, but this gulf has been bridged over by a hierarchy of mediatorial angels. Angel-worship, therefore, is of the very essence of religion. These heretics appear to have been willing to regard Christ as one of the lowest in this series of angelic mediators. That is a position which the Apostle Paul vigorously denounces. He declares with the utmost emphasis that Christ is not to be ranked among the lowest angels, for 'in him dwelleth the fullness of the Godhead bodily.' The chief characteristic of Colossians, therefore, is its exalted Christology. He is the 'image of God,' the source of the universe, the principle that holds it together, and the goal towards which it moves. A full discussion of the critical problems will be found in Moffatt's *Introduction to the Literature of the New Testament*. The best commentaries in English are those of Lightfoot, Abbott (*International Critical Commentary*). The best monograph on the critical problems is Holtzmann, *Kritik der Epheser und Colosser-briefe*.

**Colossus**, a Greek word of unknown origin, used to denote a statue of gigantic size. The colossus was a common feature of all ancient art, and in particular of Egyptian and Assyrian architecture and sculpture. The image set up by Nebuchadnezzar (*Daniel*, iii. 1) was of enormous proportions. Even Greek art, through Aristotle, laid down the principle that only the large can be noble, and carried it out in its statues of gods and heroes. Of the many colossi of which accounts have come down to us, the most famous was the bronze colossus of Rhodes, representing Helios (the Sun), the national deity of the Rhodians, which was reckoned among the seven wonders of the world, though it was by no means a masterpiece of Greek sculpture. It is said to have been the work of Chares of Lindus, a distinguished pupil of Lysippus, who gave twelve years to the casting, and completed his work in 280 B.C. Its height is variously given at from 90 to 120 feet. It stood near the harbour; but the legend that placed it astride the entrance is certainly apocryphal, and probably arose from a misunderstanding of the statement that it was so high that a ship might sail between its legs. Fifty-six years after its erection it was thrown down by an earthquake, and there its ruins lay, the marvel of the place, till in 653 A.D. an Arab general sold them to a Jew from Edessa for old metal. Other famous colossi of antiquity were the Chryselephantine (q.v.) statues of Athena on the Acropolis, 37 feet, and of Zeus at Olympia, 40 feet, both by Phidias; the Zeus at Tarentum, by Lysippus, 107 feet; a bronze Apollo, 66 feet, brought from Apollonia to Rome by Lucullus; and a marble statue of Nero, 131 feet, set up by the emperor before the palace, but removed by Vespasian to the Via Sacra, where Commodus afterwards superseded the head by one of himself. Colossi came in again with the Renaissance, and in later times the most noteworthy have been the S. Charles Borromeo (1697), on the bank of the Lago Maggiore, 72 feet; the 'Bavaria' national statue at Munich, 67 feet; the Arminius (q.v.), 90 feet; the Virgin of Puy, 51 feet; the Germania (see BINGEN), 112 feet; and Bartholdi's 'Liberty' (1886), in New York harbour, of which the figure is 151½ feet high and the pedestal 155 feet. The Dai-butsu ('Great Buddha') of Kamakura, which dates from 749 A.D., and is the most famous but not the most artistic of Japanese colossal statues, is 50 feet high.

See BAMIAN, EASTER ISLAND; Lesbazeilles, *Les Colosses Anciens et Modernes* (1876); Torr, *Rhodes* (1885-87).

**Colostrum**. See BREASTINGS.

**Colour** is not a material existence; it is a sensation. The colour of an object varies slightly with the brilliancy of the light emanating from it to the eye; and where the eye is abnormal, as in the 'colour-blind,' the apparent colours of objects may differ widely from their colours as perceived by normal eyes. Light is due to waves—or other periodic disturbances whose recurrence resembles that of waves—in the ether of space; and just as air-waves of a certain definite frequency of recurrence will induce in the ear the sensation of a sound of a particular *pitch*, so will the impact of 'ether-waves' of a certain particular frequency induce in the eye a sensation of light of a particular *colour*. But the eye is blind to all except a comparatively narrow range of ether-waves—viz. those of frequencies from 392 billion to 757 billion per second (see LIGHT). Within that comparatively small range, however, we have a large choice of fractional and integral numbers; and each number, each *frequency*, has its own colour. When we look at the spectrum or rainbow we have marshalled before us a series of colours, of which the extreme visible red is produced by about 392 billion, the extreme visible violet by about 757 billion, vibrations per second. Between these the eye may rest upon certain distinctive colours, such as yellow, blue, and so on; and the frequencies corresponding to these respective colours are, taking the centre of each distinctive colour as displayed in the spectrum—red, 492·4; orange-red, 484·1; orange, 503·3; orange-yellow, 511·2; yellow, 517·5; green, 570; blue-green, 591·4; cyan-blue, 606; blue, 635·2; violet-blue, 685·8; puce-violet, 740·5—all in billions (1,000,000,000,000)—per second. Light due to wave-motion of one simple frequency would be 'homogeneous' or 'monochromatic' light; it would produce the simplest colour-sensation; but no such thing is experimentally attainable. The light from burning sodium is a compound of two yellow lights, very near one another in the spectrum, and corresponding to the respective wave-frequencies of 508·9 and 510·6 billions per second; and this is the nearest attainable approximation to monochromatic light.

The eye takes up, singularly enough, any congeries of several monochromatic lights impinging simultaneously upon the same spot in the retina, and the resulting sensation is always that of a single colour, not necessarily resembling any of the components. Nearly every example of what we call coloured light is in reality an admixture of several monochromatic lights; e.g. the light passing through a piece of green glass is composed—as will be found on trying to make a spectrum of it by means of a prism—not only of green light, but also of blue and yellow, and, often enough, of red and violet; but the resultant sensation is that of green, a simple colour.

White light is in general due to a simultaneous impact of wave-motions of all visible frequencies. But the sensation of whiteness may also be produced by the simultaneous impact on the retina of two suitable spectral colours, such as yellow and ultramarine-blue, and such a pair of colours are said to be *complementary* to one another; other examples are red and greenish-blue, greenish-yellow and violet, orange and cyan-blue (a rather greenish blue). It will be observed that it is said that yellow and ultramarine blue lights make white light, while it is well known that yellow and blue pigments make a *green* pigment. The explanation of this is that the light from the yellow pigment is not pure; it contains green

light; similarly that from the blue pigment contains green light; when the pigments are mixed, the eye receives a simultaneous impression of blue, yellow, and green; but the blue and the yellow destroy one another, being, to the eye, complementary colours; jointly they produce white light; and thus the green alone remains, diluted with white. Complementary coloured lights may both or either be of any degree of complexity; if an aggregate impression of yellow be superimposed on the same part of the retina, whatever be the mode of their production, the result may be the same—an impression of white light.

Colours vary in hue, in purity, and in luminosity. The hue determines the name of the colour—e.g. vermilion, scarlet; the purity or absence of admixture with white light determines its richness—vermilion reflects 80 per cent. of red light mixed with 20 of white; the luminosity or brightness determines the shade or tone of colour. Interfere with any of these and the impression produced upon the eye is modified. Take, for example, a definite red light, saturated or unadulterated with white light, such a red as may be found in the spectrum; progressively lower its purity by mixing it with white light—it becomes brighter, but passes through light red and pink to pinkish-white tints; lower its luminosity—it passes through terra-cotta tones to brown, which is a dull red; interfere with both purity and luminosity by mixing with various grays—it goes through russets and maroons, the so-called tertiary colours. Any colour in nature can be matched either by a spectral colour or by a purple, treated in this way; and for each such modification of the original colour there will be a different complementary, which when mixed with it forms not a white but a gray.

The colour of transparent objects is due to Selective Absorption. A red object seen through greenish-blue glass appears black; greenish-blue glass is opaque to the light from the red object. Hold the same piece of glass up to the sky, and the red lights, which are components of the white light of day, are cut off; what passes through produces a sensation of greenish-blue. The red, which is cut off by absorption, and the greenish-blue, which passes through, are complementary to one another—both being really complex, not monochromatic. The colour of a transparent body will also apparently depend upon the thickness of the layer examined: a thin layer of iodine-vapour absorbs all the constituents of visible white light except blue and red; it therefore appears in daylight to be purple; a thicker layer effects the complete absorption of the red but not that of the blue, and a thicker layer of iodine-vapour therefore appears blue. If looked at in red light, a thin layer of iodine-vapour appears red, while a thick layer will present the blackness of opacity.

Before a non-luminous object can be seen otherwise than by transmitted light it must reflect light; if it reflect none it will appear black; a dustless pool in a mountain-hollow, a liquid in a deep black vessel, may reflect no light to the eye of the observer, and will appear black. (Black is the negation of colour, because it implies that there is no sensation of light; gray, produced by mixing white and black, is white deficient in luminosity). Let the pool become turbid, and there will be some light reflected towards the observer. A coloured liquid in a deep black vessel will have its colour revealed by sprinkling a white powder into it. White light (daylight) enters the liquid; it is reflected in all directions by the white powder; but it is in part absorbed by the liquid, which accordingly appears coloured. Of precisely the same kind is the reflection of light by a solid object. Bodies allow light to traverse them to a

very small depth, and then the light is, by internal reflection, turned back in all directions; absorption, meanwhile, comes into play, and the result is that the object appears to have a definite colour, the purity of which is marred by surface-reflection. The white light reflected from the surface of a metal masks its true colour, which is brought out by repeated reflection. Gold is deep orange; copper, scarlet; silver, yellowish-bronze; brass, a rich golden red.

If the light supplied to an object do not contain those kinds of light which it can reflect, the object will appear black or colourless; a bunch of flowers looked at by the yellow light of burning sodium, or of a spirit-lamp with common salt in the wick, will all appear black or colourless except those which are yellow. Surface-reflection modifies the result.

There is one class of cases in which colour is not due to absorption. A haze is blue if its particles be fine enough: if it be composed of coarse particles it at once reflects white light in all directions; but fine particles cause repeated reflection, and at each reflection the reflected light becomes bluer; because those rays which would have been most refracted (the blue and violet) are in fact most largely reflected. The colour of the sky is that of a haze, reflecting light downwards; if there were no dust-haze or water-haze above us, the sky would be black. The light which is not reflected from such a haze is either transmitted through it, yellower or redder in colour, or else it is entirely absorbed. The sun thus appears yellower than it would do if our atmosphere did not intervene.

See also COLOUR-BLINDNESS, COLOUR-PERCEPTION, DICHROISM, DYEING, EYE, INTERFERENCE, IRIDESCENCE, LIGHT, OPTICS, PHOSPHORESCENCE, PLEOCHROISM, POLARISATION, RAINBOW, SPECTRUM, VISION, and the articles on the several colours. For Heraldic Colours, see HERALDRY; for the Ecclesiastical Colours, VESTMENTS; and for Colour in Animals, MIMICRY, PIGMENT.

**Colour-blindness**, a term introduced by Sir David Brewster to denominate a defect of vision owing to which some persons are unable to distinguish certain colours correctly. It is also called *Achromatopsia* (Gr.) and *Daltonism*, from Dalton the chemist, who suffered from the defect, and who gave the first detailed description of it (1794).

Experience proves that this defect is generally hereditary, and is quite incurable. The eyes may be, and usually are, perfect in every other respect; no difference has been detected in their structure, either during life or after death; so the cause of their defective perception remains absolutely unknown. Numerous careful and extensive researches both in various countries of Europe and in the United States have found this defect to be present in about 4 per cent. of the males (or one in twenty-five) and less than 0.5 per cent. of the females in those countries. Further research may prove it to be commoner than this. Mendelian investigators assert that all the sons of a congenitally colour-blind woman are colour-blind. Her daughters by a normal father may transmit colour-blindness to their sons or through their daughters, but are themselves normal. A colour-blind man and a normal woman have normal children, but the daughters, as in the other case, may transmit colour-blindness, while the sons apparently cannot.

Colour-blindness more or less complete may also result from disease of the eyes (particularly atrophy of the optic nerve), and from excessive use of tobacco. See EYE, and AMAUROSIS. In the former, the distance from the direct line of sight at which colours can be recognised is diminished; in the

latter, the colour of a small disc is not recognised when it is in the direct line of sight, though it may still be perceived at a little distance to one side; and large objects give no difficulty. The presence of the latter form in engine-drivers, &c., may cause even greater risk than the congenital form of colour-blindness.

Degrees of colour-blindness are classified as follows by Holmgren of Uppsala: (1) *Total colour-blindness*, where there is no perception of colours as such, but only of gradations of light and shade; (2) *Complete partial colour-blindness*, where some bright colours, different in different cases, are confused with each other, though other colours are correctly perceived; (3) *Incomplete partial colour-blindness*, where bright colours are recognised, but more delicate shades are confused. The first form is rare, and generally, perhaps always, associated with other defects in the eyes; the third is probably common, though not of great importance; indeed everybody is more or less colour-blind in a dim light.

Dr Edridge-Green classifies the forms of colour-blindness thus: (1) defective hue-discrimination; (2) defective light-perception; (3) defective perception of colour through the foveal or central region of the retina not being normal or normally supplied. To this last class belongs the peculiar form due to tobacco described above. Under the second head come cases of defective sensibility for certain wave-lengths. A portion may be cut off entirely from one end of the visible spectrum. For persons defective in this way extreme red light (or violet, as the case may be) is darkness; mixtures in which it is included appear as if it were not there; and objects reflecting it appear black unless they reflect some other rays as well, which determine the colour they assume. In like manner the visible spectrum for some extends beyond its normal limits. Defects in hue-discrimination are very varied.

Light from different parts of the spectrum can be brought together instrumentally for comparison. By passing progressively along the spectrum until a point is found at which the eye can detect a difference in hue from the light of the starting-point, the whole can be divided up into sections, each of which appears monochromatic. For normal vision there are about eighteen of these sections. In extreme cases as many as twenty-nine may be discriminated. Dichromics (see COLOUR-PERCEPTION) are found to be defective here, trichromics less so, and so on; but each class varies much. Dichromics may even succeed as artists. A dichromic is liable to confuse red, yellow, and green, all of which appear a single colour. Owing to the gap in his spectrum green may be confused with gray and purple. A trichromic has distinct sensations of red, green, and violet. Yellow appears to him either red or green; blue he confuses with green or violet. The tetrachromic also confuses blue with green or violet, but has a distinct yellow sensation. The pentachromic is not in the ordinary sense colour-blind. He distinguishes blue, but considers orange to be yellowish-red.

For practical purposes confusion of red with green is most serious. Some confuse a bright red with a green that appears to a normal eye a much lighter colour; some with a green that appears darker. But if suitable tests be applied it will be found that they do not distinguish red and green *as such*. Experience, however, and observation of the different apparent brightness of ordinary reds and greens, enable them to distinguish between them in most cases with wonderful accuracy, so that they may remain unconscious of their defect till some striking mistake, or the application of a systematic test, reveals it. Now red and green are the very colours

which are most largely used for the purpose of signalling both at sea and on railways; and it must be obvious that most disastrous results may follow if the person whose duty it is to distinguish them from each other is unable to do so. There are difficulties in the way of substituting any other colours than red and green for signals. Blue and yellow are the only others sufficiently definite and contrasted for the purpose. But blue is much more quickly lost in passing through the air than other colours; and yellow is just the colour to which haze or distance reduces white. It is then an important practical question how the defect may best be recognised. Authorities on the subject are agreed that any test which requires the *naming* of colours is unsatisfactory, and that for two reasons. First, a person may perceive colours correctly, but may make mistakes through imperfect knowledge of their names; second, a person may be colour-blind, and yet, by his perceptions of different brightness in the tests, may name the colours correctly. Holmgren of Uppsala used a number of skeins of wool of different shades. One of these was placed before the person to be tested, generally in the first instance a pale green, and he was asked to select from the remainder those which most resembled it. If colour-blind, he might pick out some of the 'confusion colours,' pale-grays, buffs, &c., to match the green; and further similar tests could then be applied to determine more precisely his defect. This test is said to have allowed over 50 per cent. of dangerously colour-blind persons to pass, besides rejecting many normal persons; and it is now generally abandoned. Many other tests have been devised. A spectrometer may be used to investigate the candidate's vision for various parts of the spectrum; or he may be set to copy pictures. Beads may be used, or a lantern with coloured glasses. Dr Edridge-Green devised a set of cards coloured in spots. The spots of one colour form a letter which in some case or other the colour-blind candidate will fail to pick out.

For further information, see the Brit. Assoc. Report (1886); Roy. Soc. Report (1892); and works on colour-blindness and colour-vision by Jay Jeffries (Boston, U.S.), Edridge-Green (1891-1920), and Abney (1895-1913); and the writings of Sir David Brewster, George Wilson, Clerk-Maxwell, Peddie (1923), Mary Collins (1925)

**Colour-music**, a nascent art in which it is sought to make colour play the part that pitch does in music. Initial difficulties occur from the fact that the parallel on the physical side does not hold on the physiological and psychical. When a number of colours are thrown simultaneously on a screen, we do not see anything answering to a chord, but simply another colour. Again, the visible spectrum has a range of not quite one octave. It is impossible, therefore, to translate music into colour. Some have sought to get over these disadvantages in one way or other. Thus the scale can be extended through many octaves by taking saturation into account as well as hue. Various keyboard instruments ('colour-organs') have been devised and made for the performance of colour-music. Among those who have been interested were Sir Hubert von Herkomer and Scriabin. The latter wrote a colour accompaniment to his *Prometheus* and his unfinished *Mystery*.

**Colour-perception** has commonly been explained by the trichromatic theory of Thomas Young (q.v.), developed by Helmholtz, or by some modification thereof. The retina is composed of numerous ultimate nerve-elements, each of which, according to this theory, is capable of perceiving one of three physiologically primary colours. These colours are red, green, and violet (Young and Helm-

holtz); vermilion, emerald-green, and ultramarine-blue (Clerk-Maxwell); or red, green, and blue (Pick). Simultaneous affection of the elements sensitive to red and of those sensitive to green produces, according to the ratio between the respective irritations, any colour of the spectrum from red through orange and yellow up to green; similarly, green and violet lights blended in different proportions produce all the intermediate blues; and when all three sets of nerve-elements are irritated, the sensation is still that of a simple colour, or, it may be by due adjustment, of white light. The eye does not distinguish between a simple homogeneous light—say, yellow—and a mixture of quite different lights—red and green. Coloured lights may be mixed so as to show this, either by causing coloured lights from different sources to coincide in the eye or on a screen, or else, as in the colour-top, by causing ocular impressions of different colours to succeed one another in the eye with such rapidity that the eye or the brain blends them.

While the trichromatic theory is in harmony with these facts, it yet introduces difficulties of many kinds. To meet these Dr Edridge-Green proposed another theory. The impact of a ray of light on the retina liberates the visual purple from the rods (see EYE); and the decomposition of the visual purple by the light may be likened to the behaviour of a photographic plate exposed in a camera. The cones are stimulated thereby and transmit impulses to the brain, differing according to the wave-length of the light. Thus there is no need to assume a difference invisible to the anatomist and physiologist between one cone and another. The visual purple diffuses from the rods into the surrounding liquid, so that the absence of rods from the fovea centralis is no objection to the theory.

Certain colour sensations seem to the observer to be fundamentally distinct, while others are felt to be mixtures or modifications, though both definite colours and modifications may be obtained alike either by mixing of lights or by isolating a small region of the spectrum. Thus blue-green is felt to be composed of blue and green; but green is not felt as yellowish-blue or bluish-yellow. To the normal sighted red, yellow, green, and blue are fundamental sensations, and perhaps orange and violet, though some would call orange a reddish-yellow. A few would add a seventh colour between blue and violet. To this colour Newton, whose vision seems to have been of this 'heptachromatic' class, gave the name of indigo. Others prefer to call it ultramarine. On the other hand, below the 'hexachromatic' there are persons who may be classed as pentachromatic, tetrachromatic, trichromatic, dichromatic, and achromatic. To the trichromatic yellow is greenish-red, blue is greenish-violet. The dichromatic see the spectrum coloured at the ends only (red and violet), with a neutral gap. The achromatic see merely variations in brightness. See COLOUR-BLINDNESS.

**Colour-printing.** See ILLUSTRATION, LITHOGRAPHY, PHOTOGRAPHY, PRINTING.

**Colours, MILITARY,** are the flags carried by certain regiments of the British army. Those of the infantry were originally called ensigns, a name still used in the navy. In former times there was one for each company, but now there is, in each Battalion (q.v.), a 'pair of colours,' one (the 'Union Jack,' on a blue ground) called the royal or king's colour is the more important, and of the same pattern for all regiments; the other, or regimental colour, matches the facings of the regiment, and has in one corner the blue union, in the centre a wreath of roses, shamrocks, and thistles, with the name, crest, and motto of the regiment, and the campaigns in which it has taken part.

The facings of all regiments having the title 'Royal' are blue, otherwise they are white for English, yellow for Scottish, and green for Irish. The East Kent Regiment, formerly famous as the 'Buffs,' retains the buff facings, and is the only exception. English regiments have the St George's cross in red on their white colours. All colours are made of silk, 3 feet 9 inches by 3 feet, fringed with gold, and have crimson and gold cords and tassels, on a staff 8 feet 7 inches long. They are carried on parade by the two junior second lieutenants (formerly ensigns), and guarded by two sergeants and two men, forming what is called the 'colour party.' Since the Franco-German war of 1870-71 it is recognised that they make too conspicuous a mark; and since the defeat at Laing's Nek (28th January 1881), when they were nearly captured, British colours have not been taken into action. At Isandula (1879) an officer trying to save them was drowned in the Tugela, and the colours were found wrapped round his body. Regiments of guard cavalry have oblong 'standards,' 30 inches by 27, and dragoon regiments have 'guidons,' 41 inches by 27, slit in the fly, with the upper and lower corners rounded off at 1 foot from the end. These flags are all of crimson silk, with gold fringe, cord, and tassels, and bear the crest and campaigns of the regiment. The Royal Artillery, Royal Engineers, Lancers, Hussars, Rifle regiments, and temporary regiments have no colours. When a regiment obtains new colours, they are usually solemnly presented by a royal personage or some lady of distinction, with much military pomp, after a special religious service. The old colours are hung up in the cathedral or parish church at the territorial headquarters. A member of the Herald's College is 'inspector of regimental colours.' *Camp* colours are small flags matching the facings of the regiment, to designate the part of the camp it occupies.

**Colour-sergeant** (so called as being a sergeant who, in addition to other duties, guarded the colours), now called company sergeant-major, is the chief non-commissioned officer in a Company (q.v.) of British infantry. On his efficiency its good order mainly depends, as he is the channel of communication between the Captain (q.v.) and the men in almost everything. The distinctive badge consists of crossed colours worn on the sleeve above the Chevrons (q.v.). The pay is 10s. a day. The corresponding rank in the cavalry is squadron sergeant-major (corporal of horse in the Life and Horse Guards). In the United States army each battalion has a colour-guard, composed of a colour-sergeant and seven corporals. The colour-sergeant carries the national colours.

**Colquhoun, JOHN**, second son of Sir James Colquhoun of Luss, was born in Edinburgh, 6th March 1805, studied at Edinburgh University, served in the army 1829-34, and became a supreme authority on sport in Scotland. The famous record of his experiences, *The Moor and Loch*, published in 1840, was much extended and improved in the 4th (1878) and 5th (1884) editions. *Rocks and Rivers* appeared in 1849; *Salmon Casts and Stray Shots*, 1858; and *Sporting Days*, 1866. He died at Edinburgh, 27th May 1885.

**Colquhoun, PATRICK**, born at Dumbarton, 14th March 1745, became provost of Glasgow in 1782, went to London in 1789, and in 1792 became a police-magistrate there. He was indefatigable in forwarding administrative legislation, educational and commercial reforms, wrote innumerable pamphlets, and published two important works—*Police of the Metropolis* (1795); and *Population, Wealth, Power, and Resources of the British Empire* (1814). He died 25th April 1820.

**Colston**, EDWARD (1636–1721), a Bristol merchant, Tory and high-churchman, bestowed over £70,000 in establishing or endowing almshouses, schools, and other public benefactions. From 1689 he lived chiefly at Mortlake. His 'day' falls on 13th November, and is celebrated yearly at Bristol in dinners held by Conservative, Liberal, and non-political societies founded in honour of his memory. See the *Life* (with an account of the work of the societies) by Dr H. J. Wilkins (1920).

**Colt**, SAMUEL, inventor, born in Hartford, Connecticut, in 1814, ran away to sea in 1827, and about 1832 travelled over a large part of America, delivering lectures on chemistry by which he obtained the funds required to prosecute his invention. In 1835 he took out his first patent for a revolving pistol, which after the Mexican war was adopted as a regular weapon for the United States army, and since then has been adopted universally. Colt expended over \$2,500,000 on an immense armoury in Hartford, where he died 10th January 1862, and where his widow erected a handsome Episcopal church to his memory. See **REVOLVER**.

**Colt's-foot**. See **TUSSILAGO**.

**Coluber**, a genus of non-venomous snakes, of almost world-wide distribution. It forms a type of the family Colubridæ, in which the common Ringed English Snake (*Tropidonotus natrix*) is also included. The Æsculapian Snake (*Coluber æsculapii*), so familiar from ancient times as a symbol of medicine, is the best-known species. It is very common in Italy, is the species of the Schlangenbad, and is widely distributed in Europe. It is of a predominantly brown colour, attains a length of 4 or 5 feet, and is readily tamed. All the members of the family are very typical snakes. See **SNAKE**.

**Colugo**, GALEOPTHECUS, or FLYING LEMUR. See **FLYING ANIMALS**, with figures; **INSECTIVORA**.

**Colum**, PADRAIC, born at Longford in 1881, wrote a number of plays for the Abbey Theatre, of which the best known are *The Land* (1905), *The Fiddler's House* (1907; in an earlier form called *Broken Soil*), and *Thomas Muskerry* (1910). *Wild Earth* (1907) is a book of poems. He edited *Broad Sheet Ballads* (1913) and *Poems of the Irish Revolutionary Brotherhood* (1916).

**Columba**, Sr—called also Colum-cille ('Columba of the Churches') and Colm—was born (it is believed at Gartan, County Donegal) in the north of Ireland, on 7th December 521. His father Fedhlimidh, of the tribe of the Cinel Conaill, was a kinsman of several of the princes then reigning in Ireland and in the west of Scotland; and his mother, Eithne, was also of royal blood. After studying under St Finnian at Moville on Strangford Lough, and under another St Finnian at Clonard (where he had as companions St Comgall, St Ciaran, and St Caineach), he spent some time near Dublin; but in 546, when no more than twenty-five, he returned to the north and founded Derry, and, six or seven years afterwards, Durrow, the greatest of all his Irish monasteries. The belief that he had caused the bloody battle of Culdremhne in 561 led to his excommunication by an Irish ecclesiastical synod, and practically to exile from his native land.

Setting out in 563, when in his forty-second year, and accompanied by twelve disciples, he found a resting-place in the little island of Hy or Iona, now better known as Iona (q.v.), or I Colum-cille, and having planted a monastery there, he set himself to the great work of his life, the conversion of the Pictish tribes beyond the Grampians. His missionary efforts were highly successful, but unfortu-

nately very little is known of the way in which he effected his purpose. Bede speaks simply of his 'preaching and example.' Adamnan, extolling his gift of miracles, tells how the gates of the Pictish king's fort near Inverness burst open at his approach, and how, as he chanted the 45th Psalm, his voice was preternaturally strengthened so as to be heard like a thunder-peal above the din and clamour by which the Pictish magicians tried to silence his evening prayer under the walls of the Pictish palace. We get another glimpse of his missionary footsteps from the *Book of Deer* (q.v.), which records how 'Colum-cille and Drostan, the son of Cosreg, his disciple, came from Hy, as God had shown them, to Aberdour,' in Buchan; how 'Bede, a Pict, was then high-steward of Buchan, and gave them that town in freedom for evermore;' how 'they came after that to another town, and it was pleasing to Colum-cille, for that it was full of God's grace; and he asked of the high-steward Bede that he would give it to him, but he gave it not; and, behold, a son of his took an illness, and he was all but dead, and the high-steward went to entreat the clerics that they would make prayer for his son that health might come to him; and he gave in offering to them from Cloch-in-Tiprat to Cloch-Pette-mic-Garnait; and they made the prayer, and health came to him.' In some such way as this St Columba and his disciples seem to have traversed the Pictish mainland, the Western Islands, and the Orkneys, establishing humble monasteries whose inmates ministered to the religious wants of the people. The parent house of Iona exercised supremacy not only over all those monasteries, but over all the monasteries that St Columba had built in Ireland, and over those that were founded by his disciples in the northern provinces of England. Thirty-four years appear to have been spent by St Columba in raising up and perfecting his ecclesiastical system in Scotland. But the labour did not so wholly engross him but that he found time for repeated voyages to Ireland, and for a visit to Glasgow, where St Kentigern or Mungo was restoring Christianity among the Welsh or British tribes of Cumbria and Strathclyde. The health of St Columba seems to have begun to fail in 593, but his life was prolonged till he reached his 76th year, when he breathed his last as he knelt before the altar of his church in Iona a little after midnight, between the 8th and 9th June 597. He was buried within the precinct of his monastery, and his bones—which were afterwards enshrined—the stone pillow on which he slept, his books, his pastoral staff, and other things which he had loved or used, were long held in great veneration.

Whether any original composition of St Columba's still survives is doubtful, though an *Altus* published by Dr Todd in the *Liber Hymnorum*, and republished by the Marquis of Bute in 1882, has been ascribed to him by unbroken tradition. Be this as it may, he was certainly eminent as a transcriber. Adamnan tells us that on the night before his death he was engaged on a transcript of the Psalter, and in the *Annals of Clonmacnois* it is stated that 'he (Columba) wrote three hundred books with his own hand . . . which books have a strange property, which is that if they or any of them had sunk to the bottom of the deepest waters they would not lose one letter, or sign, or character of them, which I have seen tried, partly by myself on that book of them which is at Dorowe.' The two existing specimens of St Columba's work, both preserved at Dublin, are the Book of Durrow just mentioned, and the Psalter known as the Cathac or Batlier. This name it has received from the custom of bearing the relics of the ancient Celtic saints into battle as sacred

victory-bringing ensigns. St Columba's crossier was also used in this way.

St Columba's character was very complex, but marked in all things by enthusiasm and earnestness. Warlike and aggressive by temper and descent, as well as from the spirit of the times, he was naturally more inclined to action than to melancholy, and yet he had a tendency to expatiate amid visions; and though his disposition was prevailingly austere, he had frequent gleams of tenderness and kindness. 'Angelic in appearance,' says Adamnan, 'graceful in speech, holy in work, with talents of the highest order and consummate prudence, he lived during thirty-four years an island soldier. He never could spend the space even of one hour without study, or prayer, or writing, or some other holy occupation. So incessantly was he engaged night and day in the unwearied exercises of fasting and watching, that the burden of each of these austerities would seem beyond the power of all human endurance. And still in all these he was beloved by all; for a holy joy ever beaming on his face revealed the joy and gladness with which the Holy Spirit filled his inmost soul.'

In the ecclesiastical system of St Columba as in that of Ireland, the church was essentially monastic with 'neither a territorial episcopacy nor anything like presbyterian parity, but the same anomalous position of the episcopal order. The bishops were under the monastic rule, and as such were in respect of jurisdiction subject to the abbot, even though a presbyter, as the head of the monastery;' but while the power usually reserved to the episcopate was thus transferred to the abbatial office, 'the episcopal orders were fully recognised as constituting a grade superior to that of the presbyters,' and as carrying with them the functions of ordination and celebration of the eucharist according to the episcopal rite. St Columba himself, as well as his followers generally till the year 716, kept Easter on a different day, and shaved their heads after another fashion than obtained in other parts of Western Christendom. But with these exceptions, their creed and rites appear to have been substantially the same.

The chief authority for the life of St Columba is the account written by St Adamnan (q.v.), who was abbot of Iona from 679 to 704, and who incorporated in his work an earlier life by Cuimine (abbot, 657-669). Of this Dr Reeves published an edition in 1837 for the Bannatyne Club, re-issued in the 'Scottish Historians' series (1874); and there are others by J. T. Fowler (1894; 1920). See also Smith's *Life of St Columba* (Edin. 1798); Lanigan's *Ecclesiastical History of Ireland* (1822); Father Innes's *History of Scotland* (Spalding Club, 1853); Montalembert's *Monks of the West*, vol. iii.; Forbes's *Kalendar of Scottish Saints* (Edin. 1872); and Skene's *Celtic Scotland*, vol. ii. (Edin. 1877).

**Columban**, or COLUMBANUS, ST, one of the most learned, eloquent, and devoted of the many missionaries whom Ireland sent forth to the Continent during the Dark Ages, was born in Leinster in the year 543. Having studied under St Comgall, in the great monastery of Bangor, on the coast of Down, he passed over to France, in his fortieth year, accompanied by twelve companions, and founded successively the monasteries of Anegray, Luxeuil, and Fontaine, in the Vosges country. His adherence to the Irish rule for calculating Easter involved him in controversy with the French bishops in 602; and a few years later, the courage with which he rebuked the vices of the Burgundian court, led to his expulsion, largely at the instigation of the notorious Brunhilda, the king's grandmother. After various travels and adventures, and having for a year or two settled at Bregenz,

near the Lake of Constance, he passed into Lombardy, and in 612 founded the famous monastery of Bobbio, in the Apennines, where he died on the 21st November 615. His life, written within a century after his death, by Jonas, one of his successors in the abbacy of Bobbio, has been repeatedly printed. The writings of St Columban, which are wholly in Latin, consist of a rule for the government of his monastery, six poems on the vanity of life, several letters on ecclesiastical affairs, seventeen short sermons, and a commentary on the Psalms (first published at Rome in 1878). The most complete edition of his works is in Patrick Fleming's *Collectanea Sacra* (Augsburg, 1621; Louvain, 1667), followed by the *Bibliotheca Patrum*, and Migne's *Patrologiae Cursus* (1844). The town of San Colombano, in the province of Milan, takes its name from the Irish monk, as St Gall (q.v.), in Switzerland, perpetuates the name of the most favoured of his disciples. See the *Vita* by his successor Jonas of Bobbio (tr. by D. C. Munro, 1896), Montalembert's *Monks of the West*, and Wright's *Biographia Literaria*.

**Columbarium** (Lat.), a dovecot or pigeon-house, which probably differed little in form from those in modern use, but was sometimes built on a much larger scale, as we read in Varro of as many as five thousand birds being kept in the same house. The same name was applied to the niches or pigeon-holes in a particular kind of sepulchral chamber in which the urns (*ollæ*) containing the ashes of dead bodies burned were deposited. Each niche usually contained two urns, and the four walls of the sepulchre sometimes contained as many as one hundred niches or more. The names of the persons were inscribed underneath. Tombs of this description were chiefly used by great families for depositing the ashes of their slaves and dependants.

**Columbia**, the name of over fifty places in the United States, of which the most important are: (1) The capital of South Carolina, at the head of navigation on the Congaree River, 125 miles NNW. of Charleston. The town is regularly built, with several handsome streets, and contains a fine granite state-house and other official buildings. It is the seat of a Presbyterian theological seminary, and of the university of South Carolina (1806), and other colleges. Pop. (1920) 37,524.—(2) A borough of Lancaster county, Pennsylvania, on the Susquehanna, which is here crossed by a railway bridge, 80 miles W. of Philadelphia, with several iron-furnaces and rolling-mills, and manufactures of machinery, flour, &c. Population, 11,000.—(3) The capital of Maury county, Tennessee, on the Duck River, 38 miles SSW. of Nashville, with manufactures of ploughs, furniture, and flour. Population, 5500.—(4) The capital of Boone county, Missouri, 24 miles E. of Boonville, with manufactures of flour, wooden goods, and shoes. It is the seat of the state university (1840), not to be confused with Columbia University, New York. Pop. 10,000. See also DISTRICT OF COLUMBIA.

**Columbia**, or OREGON, after the Yukon the largest river on the west side of America, rises in a small lake (Lake Columbia), in British Columbia, on the west slope of the Rocky Mountains, about 50° N. lat., doubles round the north end of the Selkirk Range, passes through the Upper and Lower Arrow Lakes, follows a very irregular course, generally south-west, through Washington, forms the northern boundary of Oregon for about 350 miles, and enters the Pacific by an estuary 35 miles long and from 3 to 7 wide. Its estimated length is 1400 miles. The area drained by this stream and its affluents, of which the largest

are Clarke's Fork and the Snake River (with very remarkable cañons), has been computed at 298,000 sq. m. The river is broken by falls and rapids into many separate portions, and the ingress and egress are embarrassed by a surf-beaten bar. Still, it is open to steamboat navigation from its mouth to the Cascades (160 miles), and goods are carried past the obstruction, for 6 miles, by canal or railway; the next reach, of 50 miles, extends to Dalles. For 14 miles there are falls and reefs; two upper reaches are navigable for small steamers. The extraordinarily abundant salmon-fisheries have been largely developed; the canneries are mostly near the mouth of the river.

**Columbia, BRITISH,** Canada's maritime province on the Pacific, has an area of 355,855 sq. m.—an irregular quadrangle about 700 miles from north to south, with an average width of 400 miles, between latitudes 49° and 60° north. It is bounded S. by the United States, W. by the Pacific Ocean and Alaska, N. by the Yukon and North-west Territories, and E. by Alberta. The long-debated boundary between it and Alaska was definitively settled by a joint British and American commission in 1903 (see ALASKA). This country, then known as New Caledonia, formed part of the Hudson Bay Company's concession, but in 1858 it was constituted a crown colony, owing to the large immigration consequent on the discovery of gold. In 1866 the colonies of British Columbia and Vancouver Island were united, and in 1871 British Columbia entered the Canadian Confederation; it is now represented by six members in the Senate and fourteen (since 1924) in the House of Commons of Canada. The population in 1901 was 178,657; in 1911, 392,480, including 29,000 Indians, 17,000 Chinese, 16,000 Japanese, and 5000 Hindus; in 1921, 524,582. Some of the principal cities and towns are Victoria, the capital (pop. 39,000); Vancouver (117,000); New Westminster (14,500); Nanaimo (9000); North Vancouver (8000); Prince Rupert (6000); Nelson (5000).

The vast tract comprised within the limits of the province, extending as it does through nearly twelve degrees of latitude, naturally affords a great diversity of climate. The coast region has been described as 'having a climate wonderfully like that of England, only the summers are much drier.' The warm tropical waters of the Pacific Gulf Stream (Japan Current) give to Vancouver Island and the coast generally a mild and agreeable climate; there is little frost or snow, and there is a difference of at least ten degrees of latitude in favour of places on the coast as compared with corresponding positions on the Atlantic seaboard. The interior is subject to greater extremes both of heat and of cold, especially east of the Rocky Mountains.

The provincial government is administered by a lieutenant-governor and Legislative Assembly of forty-seven members. The members are elected for four years, every male or female adult (being a British subject) having resided six months in the province being entitled to vote.

The provincial University of British Columbia, at Vancouver, was founded in 1907, and opened for teaching in 1915. The number of schools in operation is about 900, under 2000 teachers, with an enrolment of 70,000 pupils. The schools are free and non-sectarian; no religious dogma or creed is permitted to be taught. School districts are formed wherever there are twenty children between the ages of six and sixteen years.

The provincial revenue increased from \$1,736,445 in 1903 to upwards of \$12,600,000 in 1919-20. The trade of the province is developing rapidly; in 1918-19 the imports amounted to \$63,700,000, and the exports to \$77,000,000. Exports consist of minerals (chiefly gold, silver, copper, and coal), sea products (chiefly salmon, halibut, herring, whale products

and oil), lumber, fruit, furs, skins, &c. A large portion of the salmon, canned and pickled, goes to Great Britain, Germany, eastern Canada, the United States (including Hawaii), Australia, and Japan; the United States consumes a large share of the exported coal; and immense quantities of lumber are shipped to Great Britain, South Africa, Japan, China, India, Australia, Mexico, and South America. The fruit industry assumed large proportions in the early years of the 20th century, and promises to become the leading industry of the province; apples, pears, strawberries, plums, cherries, grapes, tomatoes, prunes, and peaches being the most extensively produced, but nectarines, apricots, figs, almonds, and several other kinds of fruits and nuts have been grown with success in southern British Columbia. The valuable furs—seal, sea otter, and other peltries—are sent to Great Britain and the United States (see SEAL, OTTER). China also buys a considerable amount of lumber, timber, and furs. Valuable shipments of oil, principally obtained from whales and dog-fish, are consigned to Great Britain and the United States. A large interprovincial trade with Alberta, Saskatchewan, Manitoba, and the eastern provinces is rapidly developing, the fruit grown in British Columbia being largely sent to the prairie provinces, where it finds a good market. Whaling is a recent industry, and its produce makes an important item in the export trade.

The principal minerals are gold, silver, lead, copper, zinc, and coal. Molybdenum, platinum, arsenic, asbestos, graphite, and gypsum are also got; and there are immense deposits of magnetite and hematite iron of the finest quality which still remain undeveloped. British Columbia's coal-measures are sufficient to supply the world for many centuries. It possesses the greatest compact area of merchantable timber in North America; the importance of the fisheries, apart from salmon-fishing, is only beginning to be realised; about one-tenth of the available land is settled upon, not to say cultivated; the province has millions of acres of pulpwood as yet unexploited; most of the territory is unexplored and its potential value unknown. There is estimated to be about 5,000,000 horse-power in water-powers undeveloped in the province. A great advance has been made in metal-mining; the oldest districts have increased their production, while new fields have been opened up. There has been a corresponding increase in the population; some of the new mining districts, of late inhabited by only a few hardy prospectors, are now dotted with active and prosperous mining-towns.

The Canadian Pacific is the principal railway. It has three main lines through the province, the Transcontinental, Crow's Nest Pass, and Kettle Valley lines, and several branches, connecting with United States railway systems; also steamboat connections on the land lakes, besides a large fleet of ocean-going and coasting steamers. Of the Canadian National lines, the Grand Trunk Pacific main line was built eastward from Prince Rupert, and completed the second Canadian transcontinental route in 1914; and the Canadian Northern Pacific has lines from Tête Jaune Cache to Vancouver City, and in Vancouver Island. The railway mileage of the province is over 4000 miles.

Until the completion of the Canadian Pacific Railway in 1885, British Columbia was isolated from the rest of the Dominion. It occupies a favourable position for trading with the west of South America, and for becoming more and more the entrepôt of the through trade between Canada, China, and Australia. Lines of steamers now connect Vancouver, Hong-kong, and Australasian ports; and the Panamá Canal greatly promotes its

commerce by sea. The section of the 'All British' telegraph cable from Vancouver to Australia was completed in 1902.

See A. Begg, *History of British Columbia* (1896); F. Maenab, *British Columbia for Settlers* (1898); W. A. Bailhe-Grohmann, *Sport and Life in British Columbia* (1899); J. T. Bealby, *Fruit-Ranching in British Columbia* (1909); and the provincial year-books.

**Columbia University**, in New York city, was founded in 1754 as King's College, and reincorporated as Columbia College in 1784. The first class, of eight, met in the vestry of old Trinity Church in 1754; in 1760 the college settled in a building near the city-hall, removed to a new site in 1867, and in 1895 was once more transferred to a new site and new buildings. Under President Barnard (1864-89) the college was greatly extended; and under the Hon. Seth Low (1890-1902) the several flourishing schools were consolidated. In 1896 the name Columbia University was adopted for the whole institution, 'Columbia College' being restricted to the undergraduate department. In the university there are, besides Columbia College, Barnard College for women, schools of law, medicine, pharmacy, journalism, business, dentistry, philosophy and pure science, applied science, courses in fine arts, teachers' college, summer school, and university extension courses, with some 30,000 students in all. See the history of the university by G. H. Moore (1890), and Brander Matthews, *American Universities* (1895).

**Columbine** (Ital. *colombina*, 'little dove'), the female character in Italian Pantomime (q.v.).

**Columbine** (*Aquilegia*), a genus of Ranunculaceæ, with five coloured sepals, which soon fall

Common Columbine (*Aquilegia vulgaris*).

off, and five petals each terminating below in a horn-shaped nectary. The name (from Lat. *columba*, 'a dove') is derived from the resemblance of the flower to a cluster of doves, of which the convergent nectaries suggest the heads and necks, and the divergent sepals the fluttering wings. They are natives of the temperate and colder regions of the northern hemisphere. One, the Common Columbine (*A. vulgaris*), is found in woods in some parts of Britain, and has long been familiar as an inmate of flower-gardens. It is a perennial, generally 2 to 3 feet high, with flowers of considerable beauty. Columbine was formerly much esteemed for medi-

cinal virtues, which are now seldom heard of.—Some of the other species are very ornamental, and are pretty common in flower-borders.

**Columbium**. See NIOBIUM, TANTALUM.

**Columbus**, the capital of the state of Ohio, stands on the Scioto River, 120 miles NE. of Cincinnati. Its site is level, its streets are broad, and in the centre of the city is a public square of 10 acres, in which stands the state capitol, a fine stone structure. Among other noted edifices are the city-hall, containing a public library and city offices; a court-house; United States government and Board of Trade buildings; a large state penitentiary; a hospital for the insane, with a farm of 300 acres, and capacity for over 1000 patients; and institutions for the blind, the deaf and dumb, &c. Here also are located the Ohio State University, with its grounds of 320 acres, and the Capital University (Lutheran), both liberally endowed; and there are other important educational institutions. Fourteen lines of railway radiate from the Union Depot in this city in all directions, which, added to the natural advantage of its proximity to the great coal and iron fields of the state, tend to a rapid development of its industry and commerce. There is a large trade in grain, wool, live-stock, iron, and coal, and important manufactures of iron and steel, agricultural implements, shoes, automobiles, &c. In a terrible flood of March 1913 many lives and much property were lost. Columbus was founded in 1812. Pop. (1870) 31,274; (1910) 181,511; (1920) 237,031.

Columbus is also the name of some twenty other places in the United States, the most important being: (1) Capital of Muscogee county, Georgia, situated on the Chattahoochee River at the junction of several lines of railroad, 100 miles SSW. of Atlanta. It has a large trade in cotton, and extensive manufactures of cotton and iron goods. Pop. 31,100.—(2) Capital of Bartholomew county, Indiana, 41 miles S. by E. of Indianapolis, with which it is connected by railway; there are tanneries, lumber-mills, &c.; pop. 9000.—(3) Capital of Lowndes county, Mississippi, on the Tombigbee River, and on a branch railroad about 150 miles NE. of Jackson; much cotton and lumber is shipped; pop. 10,500.—(4) Capital of Colorado county, Texas, on the Colorado River, 95 miles SSE. of Austin; cotton, cane, rice, dairy produce, hides, corn, and hay are extensively shipped; pop. 2000.

**Columbus**, CHRISTOPHER (a Latinised form of the Italian *Cristoforo Colombo*; the Spanish form, *Cristóbal Colón*), corresponds to another Latinisation into *Colonus*), the discoverer of the New World, was born at Genoa, though some would make him a Spaniard. The date was probably 1446, though variations range from 1436 to 1457. His father, Domenico Colombo, seems to have been a cloth-weaver or wool-comber, ultimately very prosperous, and it would appear that in early youth his son Christopher worked at the same trade; but he spent some time, probably not much, at the university of Pavia. When fourteen years old he went to sea. The mariners of those days were fighting men, and we find notices of the young Columbus in an expedition against Naples while in the service of the good King René, Count of Provence, who, on one occasion, sent the young man to Tunis, to cut out a captured galley. It is not a little remarkable that on this occasion his men, like so many of his later crews, refused to obey his orders; and he was obliged, as more than once in later years, to deceive them as to his real course. The accounts of his early voyages are obscure and of doubtful accuracy. About 1470 he was wrecked in a sea-fight off Cape St Vincent, and reached the shores of Portugal on a plank. In

Lisbon he married Filipa Moniz, a lady who had been connected with the convent of All Souls there; she was related to one Perestrello, an Italian navigator, who had governed Porto Santo, off Madeira, for the Portuguese king.

As early as 1474 he had conceived the design of reaching India by sailing westward; and in this intention he was encouraged by Toscanelli, a Florentine astronomer. In 1477, he tells us, he 'sailed 100 leagues beyond Thule,' probably to or beyond Iceland (where he may have got some hint of the old Norse adventures in Vinland, q.v.); he seems also to have visited the Cape Verd Islands and Sierra Leone. Columbus soon after this began to seek a patron for his intended expedition. He applied once or more to King John II. of Portugal; later by letters to Henry VII. of England; then to the rich and powerful dukes of Medina Sidonia and Medina Celi, in Spain, of whom the last named at length referred him to Isabella the Catholic, queen of Castile. His application to the queen was submitted to a body of jurors, most of them ecclesiastics, who reported adversely to the project of the Genoese mariner. Finally, through the intervention of Juan Perez de Marchena, a monk who had been the queen's confessor, he was brought in contact with their Catholic majesties, Ferdinand and Isabella. His plans and demands were once more rejected, but afterwards reconsidered; and finally, after seven years of alternate encouragement and repulse, his proposals were accepted by the monarchs, in the camp of Santa Fe, April 17, 1492. On Friday, August 3, 1492, Columbus, now an admiral, set sail from the bar of Saltes, an island near Palos, in command of the small ship *Santa Maria*, with 50 men, and attended by two little caravels, the *Pinta* and the *Niña*, the whole squadron comprising only 120 adventurers. He first made the Canary Islands, whence, on the 6th of September, he set sail westward. On the 13th a variation of the magnetic needle was observed, a circumstance which struck terror into the hearts of his followers. From this and various other causes he found it hard to keep up the courage and patience of his crews. On Friday, October 12, land was descried. There is no doubt that this first landfall, named San Salvador by Columbus, was one of the Bahama Islands; and the more general recent opinion would appear to be that it was what is now called Watling's Island; but this is not by any means certain. He then visited Cuba and Hayti, which he named Hispaniola or Little Spain, and where he planted a small colony of Spaniards. He set sail on his return with his two caravels (for his flagship had been wrecked), and after an exceedingly tempestuous voyage, the *Niña* alone cast anchor in the Tagus. He re-entered the port of Palos, March 15, 1493. On the very same day the *Pinta* also, which had parted company from him more than a month before, entered the same port, having been driven out of her course to Bayonne. The voyagers brought back with them some gold, various plants, birds, and land animals, and six natives of the West Indies. Columbus was received with the highest honours by the court, then at Barcelona, and was hailed as admiral of the sea and a grandee of Spain.

He sailed on his second voyage on the 24th of September, with three carracks and seventeen small caravels, and on the 3d of November sighted the island of Dominica in the West Indies. His remaining career presents one long series of failures, vexations, and miseries. After a succession of wretched quarrels with his associates, and a long and desperate illness in Hispaniola, he returned to Spain much dejected in 1496. His third voyage, begun in 1498, resulted in the discovery of the South American mainland. In 1500 Columbus and

his brother were sent home in irons by a newly-appointed royal governor; but the king and queen repudiated this action, and restored Columbus to favour. His last great voyage (1502-4), along the south side of the Gulf of Mexico, was accomplished in the midst of great hardships and in many distresses of body and mind. Spanish jealousy of the foreigner and of his well-earned honours worked against him on sea no less than at court. Columbus died at Valladolid, May 20, 1506. He was buried there; but in 1513 his remains were translated to Seville, thence in 1536, with those of his son Diego, to Santo Domingo, in Hispaniola. In 1796 they (or perhaps Diego's only) were transferred to the cathedral at Havana. After the Cuban war, the bones were brought from Havana to Spain (1899), kept for a time at Granada, and finally deposited in 1902 in a special mausoleum built at Seville for their reception.

A man of ardent impulses and strongly poetical imagination, Columbus was hardly the stuff that leaders are made of; consequently he failed to control the turbulent and adventurous spirits among his followers. Although an honestly and earnestly religious and truly conscientious man, he was not seldom guilty of acts which subsequently brought him many compunctions of conscience. Irritable and impetuous, he was, nevertheless, magnanimous and benevolent. His conduct in the capture and sale of slaves, though justified by the jurists and divines of the time, was indignantly condemned by the queen, and can only be explained by the desire of Columbus and the crown to obtain some revenue from his new discoveries, and by the hope that while detained in slavery the natives might become christianised.

His brother BARTHOLOMEW, who died in Cuba in 1514, was a man of high character and excellent abilities, and assisted Columbus effectively in his labours.—Another brother, GIACOMO (called in Spain DIEGO), who also assisted him in his West Indian government, was a man of gentle and pacific disposition, but was no match for the turbulent adventurers he attempted to control.—Christopher's eldest son, Diego (about 1480-1526), was the heir to his honours, merits, and misfortunes. The great discoverer left also a natural son, Don Fernando (1488-1539), who wrote an important Life of his father, preserved only in an Italian translation (published at Venice, 1571; Milan, 1614; and London, 1867). In 1578 the last legitimate descendant of Columbus in the male line died.

It is doubtful if any of the portraits of Columbus are authentic. Las Casas says: 'He had a figure that was above medium height, a countenance long and imposing, an aquiline nose, clear blue eyes, a light complexion tinged with red, beard and hair blonde in youth, but early turned to white.'

The best Lives in English are those of Irving (1881), St John (1850), Crompton (1859), Helps (1868), Winsor (1890), Elton (1892), Sir Clements Markham (1892). See also *The Narrative and Critical History of America*, edited by Winsor, vol. ii.; Harriette, *Colomb* (Paris, 1884); Varaldo, *Cristoforo Colombo* (1887); *The Select Letters of Columbus*, edited by Major (2d ed. London, 1870); the *Journal* of his first voyage, ed. in English by Markham (Hakluyt Soc. 1893); Stevens's *Columbus's Book of Privileges* (1894); the monumental Spanish work by Asensio (1891), and Filson Young, *Christopher Columbus* (1906). Thacher's *Life* (1903-6) is not flawless. Samuel Kettell translated the *Journal* of the first voyage as *Personal Narratives* (Boston, 1827); it was reprinted as *Christopher Columbus: the Journal of his First Voyage to America* (1925).

**Columella**, L. JUNIUS MODERATUS, the most learned of Roman writers on practical agriculture, was born at Gades, in Spain, and flourished in the earlier part of the first century of the Christian

era. For some time he resided in Syria, but lived chiefly at Rome, and died most probably at Tarentum. His great work, *De Re Rustica*, in 12 books—the tenth upon gardening, written in dactylic hexameters

—is addressed to one Publius Silvinus, and treats of arable and pasture lands, culture of vines, olives, &c., care of domestic animals, &c., respective duties of masters and servants, &c. A supplementary treatise relates to trees. This ancient 'Book of the Farm' is written in good Latin, and the information is copious, though not precise, and in some points of questionable accuracy. Editions are by Schneider in *Script. Rei Rust.* (1797), and Postgate in *Corpus Poeticum Latinum* (1904).

**Column**, a round pillar, usually provided with a base and capital, employed in architecture for the support of an Entablature (q.v.) or other superstructure. Fig. 1 shows in detail the names of the different parts of a column. Columns are doubtless derived from the primitive use of stems of trees in a similar position. Thus the early Egyptian columns are evident imitations of bundles of reeds bound together, or of the stems of palm-trees (figs. 2 and 3). A flat stone laid beneath to prevent the column from sinking, and another on the top to receive the lintel, would naturally suggest the base and capital. In the Classic 'orders' the column played an important part, the proportions of all the different members being regulated by the diameter of the column. In Greek Doric the height of the column varied from 5 to 8 diameters, and the other orders from 8 to 10 diameters. Columns invariably taper from base to cap, with a slight swelling

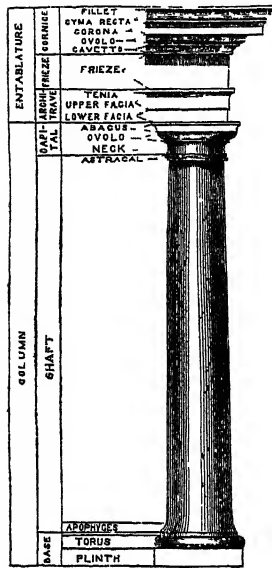

Fig. 1.—Tuscan Column.

in architecture for the support of an Entablature (q.v.) or other superstructure. Fig. 1 shows in detail the names of the different parts of a column. Columns are doubtless derived from the primitive use of stems of trees in a similar position. Thus the early Egyptian columns are evident imitations of bundles of reeds bound together, or of the stems of palm-trees (figs. 2 and 3). A flat stone laid

Fig. 3.

in the centre called the entasis, and they were frequently carved with flutings or channels (see FLUTING). The most conspicuous distinction was the capital. The characteristics of the three Grecian orders, with the plain Doric capital, the Ionic volutes, the Corinthian leafage, will be seen from the accompanying cuts (figs. 4, 5, 6), and will be further dealt with in GREEK ARCHITECTURE; the Tuscan column is also shown in fig. 1. The composite column retained the general proportions of the Ionic, with the Corinthian capital. For a Byzantine capital, see BYZANTINE ARCHITECTURE. In Gothic, columns are also much used, but their variety is infinite, and not regulated by any fixed proportions like the Classic columns. The articles on the various styles of architecture show many

forms of columns. A single column was sometimes erected to commemorate some remarkable

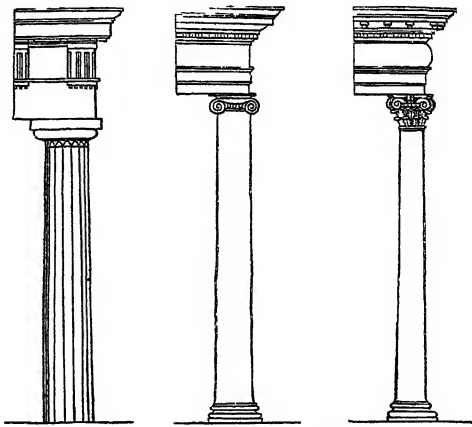

Fig. 4.—Doric.

Fig. 5.—Ionic.

Fig. 6.—Corinthian.

event or great personage, such as Trajan's Column in Rome.

**Column** is a military formation adopted for convenience of movement. Any body of troops in line, forming itself into a narrower front, is said to form column. Thus a company, which has four platoons, can form a column with a front of one platoon, the other three following in rear. A battalion, of four companies, can form a column with a front of one company, the other three following in rear. This would be called 'battalion in column,' or 'battalion in quarter column,' according as the distance between companies was equal to the front of a company, or was only six paces. A brigade (four battalions) can form a column with a front of one battalion, the others following at full distance or quarter distance; or with a front of half a battalion, when there would be eight units in the column; and so on.

A cavalry squadron (see CAVALRY) can form a column with a front of one troop, the other three following; a cavalry regiment, with a front of one squadron, the other two following, or with a front of one troop, when there would be twelve units in the column. A battery of horse or field artillery (see BATTERY) can form a column with a front of two guns (a 'section'), with the other two sections following.

The usual march column, 'column of route,' is, for infantry, a column having a front of 'fours'—that is, four men abreast; for cavalry, column of sections—that is, four abreast; for artillery, a front of one piece, followed by its ammunition wagon or wagons, these followed by the next gun and its wagons. Artillery also march, on a broad road or in the open, in 'column of sub-sections,' when a gun and wagon abreast form each unit.

In the collision with the enemy, column is in modern days impossible, owing to the destructive power of modern weapons on compact bodies. But column remains the formation for the march, or for manoeuvre out of the enemy's range or sight.

British infantry always fought in line, while the European powers adhered to the attack in column until after the Crimean war (1854), and some even later. But the growing value of fire, and the comparative lack of fire from a column, added to the column's vulnerability, gradually banished the column from the field of fire.

The word column is also used to name many of the trains that follow an army. Thus, brigades of artillery (see BRIGADE) are followed by an

ammunition column, divisions by a transport and supply column (see COMMISSARIAT).

**Colure.** See ARMILLARY SPHERE.

**Colvin,** SIR SIDNEY, was born at Norwood, 18th June 1845. He was educated at Trinity College, Cambridge, where in 1865 he gained the chancellor's medal for English verse, and graduating in 1867 as third classic, became a fellow of his college in 1869. He was elected Slade professor of Fine Art in the university of Cambridge in 1873, and director of the Fitzwilliam Museum in 1876, and was keeper of the Department of Prints and Drawings in the British Museum (1884-1912). His numerous contributions to periodicals, marked by accurate scholarship and poetic feeling, include 'Albert Dürer, his Teachers, his Rivals, and his Scholars' (*Portfolio*, 1877); and his separate works are *Notes on the Exhibitions of the Royal Academy and Old Water-Colour Society* (1869); *A Word for Germany by an English Republican* (1870); *Children in Italian and English Design* (1872); *Drawings by Flaxman* (1876); *Landor* (1881); two books on Keats (1886 and 1917); *A Florentine Picture-Chronicle* (1898); *Early Engraving and Engravers in England* (1906); and *Memories and Notes* (1921). He edited *Selections from Landor* (1884), Keats (1915). As R. L. Stevenson's literary executor, he superintended the Edinburgh edition of his works (1894 *et seq.*), and edited his *Samoan Letters* (1895) and *Letters* (1899 and 1911).

**Colza.** See RAPE.

**Coma,** a state of more or less profound insensibility allied to sleep. In coma the patient lies on his back, and is either simply insensible to external impressions, or has a confused and dull perception of them, with restlessness and low Delirium (q.v.). The former kind of coma occurs in apoplexy and epilepsy, and also in many other organic diseases of the brain and its membranes, of which, indeed, it may be said to be the natural termination. It is also seen in narcotic poisoning, and most characteristically in poisoning by Opium (q.v.). In the most fatal forms, the breathing is very slow and noisy (snoring or stertorous), accompanied with puffing of the cheeks; the pulse is at first strong and regular, afterwards feeble; there is often lividity; and the pupils are either contracted or excessively dilated, but in either case immovable, and totally insensible to light. In the second variety of coma, there is perpetual restless delirium, without enough of sensibility to lead to spontaneous and regular voluntary movements; the patient mutters slightly, and grasps feebly and without purpose at any object in his way; the pupils are commonly contracted, and the tongue is apt to be dry and brown. This kind of coma is mainly seen in many fevers, and forms one of the modes of their fatal termination. The treatment of coma is that of the disease or accident leading to it. Where there is a reasonable chance of recovery, the patient must be roused to consciousness as much as possible, either by frequent movements or strong impressions on the skin, so as to maintain the respiration (see OPIUM). Blistering of the head is also sometimes resorted to with good effect.

**Comac'chio,** a walled town of Italy, 30 miles ESE. of Ferrara, on an island in the east of the Valli di Comacchio, a shallow lagoon, about 90 miles in circumference, shut out from the Adriatic by a belt of land, 3 miles wide. It is a bishop's see, and has several fine churches. There are large salt-works and extensive fisheries, the fry of the eel and mullet being admitted to the lagoon in spring by canals opening to the sea, and exit after the fish are grown being prevented by nets and other contrivances, which are referred to both by

Tasso and Ariosto. The trade is in pickled eels and sardines, fruits, and wine. Pop. 10,000.

**Comanches,** a tribe of American Indians, belonging to the Shoshone family, and roaming for the most part over the prairie-lands of Texas and Mexico. Splendid horsemen, warlike, and fond of plunder, they have until very recently been troublesome neighbours; but they are now among the most tractable and progressive of the Indians called 'blanket Indians.' Honesty, truthfulness, self-respect, and regard for chastity are marked characters of this tribe. They are to some extent addicted to intoxication, which they procure by means of a species of cactus which has narcotic qualities. Their numbers were estimated at 12,000 in 1847; now they are about 1000.

**Comat'ula.** See CRINOIDEA.

**Comaya'gua,** a city of Honduras, Central America, is situated in a fertile valley, 1935 feet above the sea, on the Rio Humuya, 190 miles E. of Guatemala. Founded in 1540, it has a handsome cathedral and a law school, and before 1880 was capital of the state. Pop. about 10,000.

**Comb** (O.E. *comb*). This well-known toothed implement has been used in every age and by all peoples for dressing and keeping clean the hair. Combs are also used for fastening the hair when dressed, and as head ornaments. In early times the bodkin (*acus*), equivalent to the modern hair-pin, was employed for the latter purpose, but in medieval times elaborately ornamented combs, sometimes of precious metal, were used for ornamental hair fastening. An allusion to this practice we have in the ancient Scottish ballad of *Sir Patrick Spens*:

O lang, lang may their ladyes sit,  
Wi' their gowd kames in their hair.

Fig. 1 represents an ancient Irish long rack comb in the museum of the Royal Irish Academy.

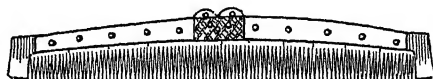

Fig. 1.

Fig. 2 is an example of an ancient Scottish double-edged comb of bone from the Broch of

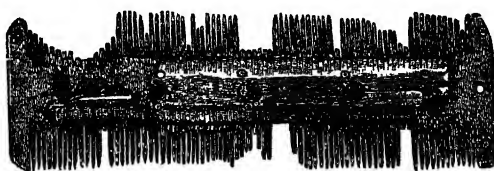

Fig. 2.

Burrian, Orkney, drawn to half the size of the original.

Combs of ivory or of boxwood have been frequently found in early Christian tombs, it being a common practice of antiquity to inclose in the sepulchre objects, especially those of the toilet, that had been used by the deceased. For a late instance, see the article on ST CUTHBERT. Combs also figure commonly in inventories of articles belonging to the medieval churches, and, being made use of by the priests prior to service, that they might approach the altar with the more decency, these instruments became in some sort sanctified by their employment.

Combs are made of horn, tortoiseshell, ivory, wood, bone, metal, india-rubber, and of a com-

position called xylonite (see CELLULOID). In dealing with horn, which is the principal comb-making material, the horns are cut into rectangular pieces in a manner which involves the least possible loss. These segments are damped and heated till they become soft, when they are opened out and pressed quite flat. The plates are next squared, smoothed, and trimmed preparatory to the tooth-cutting, which formerly was done with a *stadda*, or double saw, having two blades of steel set parallel to each other, with a space between them equal to the thickness of the intended tooth. Tooth-cutting is now done by small circular saws to which the plates are automatically applied, the horn moving the space of a tooth after each cut. In this way 70 or 80 teeth may be cut in an inch of ivory for fine-toothed combs. The teeth are then thinned, smoothed, and finished by means of thin wedge-shaped files. Saw-cutting is the only process available for bone, ivory, and wooden combs, and it is used for the finer kinds of horn combs also.

A great economy of material and time, however, is effected by making horn and tortoiseshell combs by the method of 'twinning' or parting. By saw-cutting, the material corresponding to the spaces between the teeth is of course wasted; by the process of parting, this is made available to form

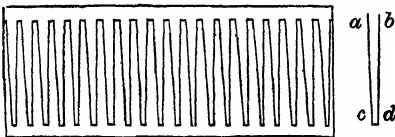

Fig. 3.

the teeth of a second comb. The annexed figure will show how this may be effected. The prepared horny plate is cut through by means of a stamping-cutter, consisting of two thin chisels inclined to each other, as *ac* and *bd*, which represent their edges; between these, and connecting the ends, *c*, *d*, is a small cross-chisel. When this compound cutter descends with sufficient force upon the plate, it will cut one of the teeth shown in the figure. By simple machinery, the table carrying the plate is made to advance a distance equal to the thickness of one tooth while the cutter is rising, and thus the successive cuts are made as represented. A slight pull is now sufficient to part the plate into two combs, the teeth of which only require filing and finishing.

India-rubber combs, now so extensively used, are manufactured by pressing the caoutchouc to the required form in moulds, and 'vulcanising' or combining it with sulphur afterwards. Xylonite combs are similarly made by moulding; but comb teeth of these materials are not so strong and elastic as those of horn and ivory.

**Comb**, a crest of skin, usually brightly coloured, found on the crown of the head in many birds, especially in the males. Like the analogous wattles, combs probably owe the perfecting of their development to Sexual Selection (q.v.).

**Combaconum** (*Kumbhakonam*), one of the oldest and most sacred cities of India, in the centre of the fertile Kaveri delta, 193 miles NE. of Madras, with Hindu temples, a famous *gopuram* or gate pyramid, and a government college. Pop. 65,000.

**Combat**, TRIAL BY. See BATTLE.

**Combatants**, soldiers whose duty it is to fight both in attack and defence, are either cavalry, artillery, engineers, or infantry. Non-combatants, on the other hand, perform administrative duties, and fight only in self-defence, though soldiers and

armed, as in the commissariat, transport, ordnance store, medical, pay, and veterinary departments. See FRANCIS-TIREURS.

In the navy, all seamen are combatants, but engineers, doctors, paymasters, and chaplains are non-combatants.

**Combe, ANDREW, M.D.**, physician and physiologist, was born in Edinburgh, October 27, 1797. He studied medicine there and at Paris, and in 1823 commenced to practise in his native city. In 1836 he received the appointment of physician to the king of the Belgians, but his health failing, he returned to Scotland, where in 1838 he became one of the physicians to Queen Victoria. Mild, benevolent, and wise, Andrew Combe obtained the esteem and admiration of all who could appreciate purity and excellence of character. By patient adherence to physiological principles in the treatment of a delicate constitution, he combated a serious pulmonary disease for nearly thirty years at home and abroad. His death was probably hastened by exposure to the poisonous air of an emigrant ship, in which he made a voyage to America: he wrote to the *Times* on the urgent necessity of a law regulating the sanitary arrangements in emigrant vessels, and in 1849 an act provided a remedy for the evil. He died at Gorgie, near Edinburgh, August 9, 1847. His principal works are: *Observations on Mental Derangement* (1831), *Principles of Physiology* (1834; 15th ed. 1860), *The Physiology of Digestion* (1836; 10th ed. 1860), and *The Management of Infancy* (1840; 10th ed. 1870). See his Life by his brother, George Combe (1850).

**Combe, GEORGE**, phrenologist and moral philosopher, the son of a brewer, was born October 21, 1788, in Edinburgh. He became a Writer to the Signet in 1812, and continued to practise until 1837, when he resolved to devote himself to popularising his views on phrenology and education. As early as 1816, he had made the acquaintance of Spurzheim, and become a convert to his system of phrenology. The result was his *Essays on Phrenology* (1819), and his *Elements of Phrenology* (1824), which reached a ninth edition in 1862. But his most important production is *The Constitution of Man* (1828; 9th ed. 1879), in which he endeavours to demonstrate the essential harmony of the nature of man with the surrounding world, and the necessity of studying the laws of nature. Combe's doctrines were violently opposed, being considered by many as inimical to revealed religion. He numbered amongst his friends Cobden, Robert Chambers, and Miss Evans (George Eliot). Combe contributed largely to the *Phrenological Journal* (20 vols. 1824-47) and to *Chambers's Journal* and the *Scotsman*. He travelled and lectured in the United Kingdom, Germany, and America, and published *Notes on the United States* (1841). He died 14th August 1858. Combe married, in 1833, Cecilia (1794-1868), daughter of the celebrated Mrs Siddons. Besides the works mentioned, he wrote *Lectures on Popular Education* (1833), *Moral Philosophy* (1840), *Principles of Criminal Legislation* (1854), *Phrenology applied to Painting and Sculpture* (1855), *The Currency Question* (1855), *The Relation between Science and Religion* (1857). His writings roused popular interest in the science of healthy living, but the phrenological works are obsolete. Combe's ideas on popular education were put into experimental shape in a secular school which he founded in Edinburgh in 1848, where the sciences were taught, including physiology and phrenology; but it was too much in advance of its time, and after a few years had to be abandoned. All his subjects, save phrenology, are now

taught in every well-appointed school. A physiology lectureship was founded by the trustees of George and Andrew Combe. See the *Life* by C. Gibbon (1878); and Combe's views and articles on *Education*, collected by Jolly (1879).

**Combe, WILLIAM**, author of *Dr Syntax*, was born at Bristol in 1741, and educated at Eton and Oxford, which he quitted without a degree. 'Godson' (or natural son) of a rich London alderman, who died in 1762, leaving him £2150, he led for some years the life of an adventurer, now keeping a princely style at the fashionable watering-places, anon a cook at Douai, and a common soldier. The last forty-three years of his life were passed mostly within the 'rules' of the King's Bench debtors' prison; but he died at Lambeth, 19th June 1823. In the *Dictionary of National Biography* (vol. xi., 1887) Professor Tout enumerates eighty-six works by Combe, published between 1774 and 1824; of these, the *Three Tours of Dr Syntax* (1812-21) alone are remembered, and even they owe much to Rowlandson's illustrations.

**Combermere, VISCOUNT** (Stapleton Stapleton-Cotton), a British field-marshal, son of Sir Robert Salusbury Cotton, Bart., of Combermere Abbey, Cheshire, was born in 1772 at Llewenny Hall, Denbighshire. Educated at Westminster School, he entered the army in 1790, and in 1794 was made lieutenant-colonel of a new regiment of light dragoons, with whom he served in India for several years. In 1808 he proceeded, with the rank of major-general, to the Peninsula; in 1809 he succeeded to the baronetcy; and in 1810 he was appointed to the command of the whole allied cavalry. He was present at the battles of Talavera, Llerena, Salamanca, the Pyrenees, Orthez, and Toulouse, and was raised to the peerage in 1814 as Baron Combermere; although not at Waterloo, he had the command of the cavalry of the army of occupation in France. He was commander of the forces in the West Indies, 1817-20; commander-in-chief in Ireland, 1822-25; and commander of the forces in India, 1825-30, where he captured Bhartpur. Raised to the rank of viscount in 1827, he succeeded Wellington as Constable of the Tower in 1852, and was made a field-marshal in 1855. He died February 21, 1865. See his *Correspondence* (2 vols. 1866).

**Combination.** A combination to commit a crime is, in English law, an indictable Conspiracy (q.v.). Combination, indeed, is the gist of the offence of conspiracy. Unless two or more persons are found to have combined there can be no conviction for conspiracy. Combinations of workmen to raise the rate of wages were formerly unlawful; but the law has been altered in this respect by recent legislation, in particular by the Trade Union Act, 1876, the Conspiracy and Protection of Property Act, 1875, and the Trade Disputes Act, 1906. See CONSPIRACY; TRADE-UNIONS; ASSOCIATIONS, TRUSTS, AND CARTELS.—See also ATOMIC THEORY, CHEMISTRY, PERMUTATIONS.

**Combining.** See COTTON, WOOL, SPINNING.

**Combining Weights.** See ATOMIC THEORY.

**Combretaceæ**, a tropical order of Myrtifloræ, including about 240 species of trees and shrubs, mostly astringent.

**Combustion** is the term commonly applied to those chemical processes which are accompanied in a marked degree by the production of heat and light. The most familiar of such processes are those in which oxygen of the atmosphere combines chemically with the constituents of what are ordinarily spoken of as combustible substances, such as wood, coal, fats, oils, &c. Chemical combination is, as a rule, accompanied by the evolution

of heat and frequently of light (see CHEMISTRY); but every case of chemical combination is not called combustion, because in many cases the quantity of heat evolved is inconsiderable.

When we speak of the combustion of, for instance, coal or wood, we mean the chemical process which consists, in general terms, in the combination of the oxygen of the air with the carbon and hydrogen which constitute the greater part of the combustible portion of either of these substances, and in the production of carbonic acid and water. Many instances are known to chemists in which the oxygen required for a combustion is not derived directly from the atmosphere, but from some oxidising (or oxygen-yielding) agent, and frequently the place of the oxygen may be altogether taken by some other element, as, for instance, when metals, such as antimony in powder, burn in chlorine.

The combustion of every combustible substance is accompanied by the evolution of a quite definite quantity of heat, which is invariable for each substance, whether the combustion takes place rapidly or slowly. A piece of phosphorus, for instance, as is well known, glows in the dark. This is a process of very slow combustion, and is never accompanied by much rise of temperature. When moderately heated in air, a piece of phosphorus bursts into flame, and the combustion is rapid and is accompanied by a considerable rise of temperature; whilst if the phosphorus be burned in pure oxygen, the combustion is an extremely brilliant spectacle, and a high temperature is attained. In each case the actual quantity of heat given out is identical for the same weight of phosphorus, but the time occupied by the combustion varies, and consequently the temperature at any given instant must also vary.

The quantities of heat given out by the combustion of the same weights of *different* substances vary greatly. The measurement of quantities of heat produced by combustion and in other ways is called calorimetry (see HEAT).

The name combustion is applied to a particular process in the Analysis (q.v.) of organic compounds. See also SPONTANEOUS COMBUSTION.

**Comedy.** See DRAMA.

**Comenius, JOHN AMOS** (properly KOMENSKI), a distinguished educational reformer of the 17th century, was born 28th March 1592, in Moravia, either at Comna or at Nivnitz. His parents belonged to the Moravian Brethren. He studied at Herborn (1612), and then at Heidelberg, became rector of the Moravian school of Prerau (1614-16), and minister at Fulnek, but lost all his property and library in 1621, when that town was taken by the Imperialists. He became a wanderer, and settled at Lissa, Poland. Here he worked out his new theory and method of education, wrote his *Didactica Magna*, and was chosen bishop of the Moravian Brethren in 1632. In 1631 he published his *Janua Linguarum Reservata*, which was translated into many European, and even into some oriental languages. There is a trilingual edition, with woodcuts, in the Advocates' Library, Edinburgh. In this work he points out a method of learning languages new at that time, which has been called the intuitive or perceptive system, in which the pupils were taught by a series of lessons on subjects easily understood or appreciable by the senses—such as natural history, the sciences, different trades and professions, &c. The *Vestibulum*, an introduction to the same, appeared in 1633. Comenius also published about the same time the *Ratio Disciplinae Ordinisque*

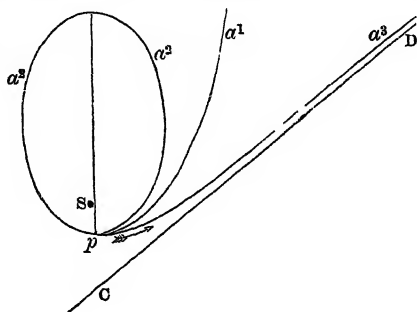

*Ecclesiae in Unstate Fratrum Bohemorum* (1632; republished 1702); and his *Pansophiae Prodomus* (1639), an attempt at a complete statement of the circle of knowledge. In 1641 Comenius was invited to England by parliament, through the philanthropist Hartlieb, to assist in reforming the system of public instruction; but as the breaking out of the Civil War prevented the execution of this design, he went to Sweden (1642). There he was patronised by Oxenstjerna, who gave him a commission to draw up a plan for the organisation of schools in Sweden; and this he completed at Elbing, four years afterwards. He also put to press (1643) a treatise on Pansophia. He returned to his Polish home at Lissa in 1648, and elaborated his work there. He next went (1650) to Sáros-Patak, Hungary, for a similar purpose. Here he composed his celebrated *Orbis Sensualium Pictus*, or *The Visible World* (Nurem. 1658), the first picture-book for children, which has been often reprinted and imitated. Finally, he settled in Amsterdam, where he published several other works. He died at Naarden on the 15th November 1671. Bacon's speculations appear to have stirred the imagination of Comenius to the conception of universal and systematised learning, to which he gave the name of Pansophia or Encyclopædia. His educational and pansophic works were published at Amsterdam (4 vols. 1657), and dedicated to that city in recognition of his hospitable treatment there. In education he was a realist; he was also fervently evangelical, and his whole system was intended to lead up to knowledge, virtue, and piety. Late in life a mystical tendency was apparent in his works. Whatever may be thought of his educational system, he first fully developed method, made important reforms in the teaching of languages, and introduced into schools the study of Nature.

See Laurie's *Comenius, his Life and Work* (1881), a German life by Kvaszala (1892), Keatinge's translation of *The Great Didactic* (1896), and Monroe's *Comenius and the Beginnings of Educational Reform* (1900).

**Comet.** The word comet is derived from the Greek *kómē*, 'hair', a title which had its origin in the hairy appearance often exhibited by the haze or luminous vapour, the presence of which is at first sight the most striking characteristic of the celestial bodies called by the name. The general features of a comet are a definite point or nucleus, a nebulous light surrounding the nucleus, and a luminous train preceding or following the nucleus. When first discovered a comet is usually a hazy, nebulous object without tail. As it approaches the sun it brightens, the nucleus becomes more distinct, and a tail is seen in a direction away from the sun, as if gaseous matter were repelled from the head by some force from the sun. Anciently, when the train preceded the nucleus—as is the case when a comet is receding from the sun—it was called the beard, being only termed the tail when seen following the nucleus as the sun is approached. This distinction has disappeared from all modern astronomical works, and the name tail is given to the appendage, whatever its apparent position. A tail is not, however, always present.

Like the planets, comets move under the influence of the sun's gravitation. They differ from planets in their physical appearance, and also in the character of the orbits they describe. The planets describe elliptic orbits of small eccentricity—i.e. of nearly circular form; but cometary orbits are extremely elongated, and in the neighbourhood of the sun are hardly distinguishable from parabolas. Let  $p$  be the point of perihelion passage of a comet, and let the direction of its motion be in the direction indicated by its arrow. There is a certain velocity of motion at this point which would give the orbit the form of a parabola,  $pa^2$ , the direction of motion always tending to parallelism with the

straight line  $pS$ . Any velocity less than this would cause it to describe a closed curve,  $pa^2$ ; any greater velocity would cause it to describe a hyperbola  $pa^2$ , in which case it would approximate to the direction of a straight line  $CD$ , and would never return. This would be the case if there were no disturbing force to interfere with the sun's attraction; and, conversely, comets approaching the

sun along the various paths above described would pass the perihelion with the various velocities above indicated. But the attraction of an extraneous body of sufficient magnitude interfering with the attraction of the sun might change the orbit from the ellipse to the hyperbola, and *vice versa*. As the parabola is the limiting form between the ellipse and hyperbola, just as the circle is the limiting form of an ellipse with no eccentricity, a parabola is only an approximation to a comet's orbit, as a circle is to that of a planet.

The comets which are *periodic*—i.e. those which describe ellipses, and therefore periodically approach the sun, and thus become visible from the earth—may be divided into three classes: (1) those of short period; (2) those of period about seventy-five years; (3) those of long period. In the first class, with their periods given in years, are Encke, 3·3; Tempel II, 5·1; Swift, 5·5; Winnecke, 5·5; Brorsen, 5·6; Tempel I, 6·0; Finlay, 6·5; Perrine, 6·5; D'Arrest, 6·6; Wolf, 6·8; Holmes, 6·9; Brooks II, 7·1; Faye, 7·4; Tuttle, 13·7. To these may probably be added twelve or thirteen more, recently discovered, which have only been seen once, but whose orbits have been calculated and found to be only moderately elongated ellipses. The greatest distance from the sun these comets reach is near the orbit of Jupiter (with the exception of Tuttle's, which reaches to Saturn), and it is supposed that the attraction of this planet has brought comets which have passed near it into this 'family' of orbits. The comets whose periods approach seventy-five years include the famous comet of Halley, 76·8; Westphal, 67·8; Pons, 70·7; Di Vico, 73·2; Olbers, 74·0; and Brorsen, 75·0. Only two of these comets, besides Halley's, have been seen at two returns as yet. Their greatest distances from the sun extend beyond the orbit of the planet Neptune. The orbits of comets of longer period are somewhat uncertain; it has been maintained by M. Flammarion and Professor Forbes that some of these belong to a family of a hitherto undiscovered trans-Neptunian planet. The periods calculated for some of the long-period comets are many thousands of years; but as the long ellipses are hardly distinguishable from parabolas in the parts of the orbit near the sun, where alone the comets are visible to us, not much reliance can be placed on these figures. Chambers's *Story of the Comets* (1909) states that thirty comets are known to be periodical, and have been seen at more than one apparition; that 341 have been calculated to have elliptic orbits not yet verified, or parabolic orbits, and thirteen hyperbolic orbits.

The very small number of hyperbolic orbits shows that comets rarely have sufficient velocity to carry them right away from the solar system in opposition to the sun's attraction, and thus comets are probably permanent members of the solar system. Another argument in support of this is, that though the sun is moving through space with a velocity of 20 kilometres per second, comets do not approach the sun more frequently from the direction towards which the sun is travelling than from any other direction. Thus comets are probably not bodies which the sun picks up in its journey through interstellar space, but are outlying members of the solar system which accompany it.

The discovery that comets are celestial bodies, extraneous to our atmosphere, is due to Tycho Brahé, who measured the parallax of the comet of 1557. Newton demonstrated that, like the planets, their movements are determined by the gravitation of the sun; and Halley, by determining the parabolic elements of a number of comets from the recorded observations, identified the comet of 1682 with one which had been observed in 1607 by Kepler, and also with a comet observed in 1531 by Apian at Ingoldstadt, and thus confidently predicted its return at the end of 1758 or beginning of 1759. The parabolic elements are elements of a parabola nearly coincident with the elongated elliptic orbit of the comet. They are: (1) The inclination. (2) The longitude of the node. These two determine the plane of the orbit. (3) The longitude of the perihelion, or point of nearest approach to the sun. (4) The perihelion distance, or nearness of approach to the sun. (5) The time of perihelion passage.

To determine these parabolic elements three observations of the comet are sufficient. A simple method due to Olbers enables the elements of cometary orbits to be quickly calculated; and by a table of such elements deduced from the recorded observations, it is possible at once to ascertain whether any newly observed comet is identical with any that have been previously observed. To predict, however, with accuracy the time of the return of a comet, a much more elaborate calculation must be made of the orbit, taking into account the perturbations of the planets to whose influence it is subject. This difficult problem was solved in the case of Halley's comet by the work of Clairaut, who announced in November 1758, just as astronomers began to look out for the return of the comet, that it would take 618 days more to return to the perihelion than in the preceding revolution. The perihelion passage was fixed about the middle of April 1759; but Clairaut distinctly forewarned the world that, being pressed for time, he had neglected small terms, which collectively might amount to about a month in the seventy-six years. The comet passed the perihelion on the 12th March 1759, exactly a month before the time announced, but within the assigned limits of divergence from that date. For the next perihelion passage, the different calculations executed by MM. Damoiseau, Rosenberger, Lehmann, and De Pontécoulant fixed respectively the 4th, the 26th, the 11th, and the 13th November 1835. Subsequently observations indicated the 16th—that is to say, a deviation of only three days from what turned out the most accurate calculation, and a deviation of twelve days from the most remote. The return of the comet to perihelion on 17th April 1910 was predicted by Messrs Cowell and Crommelin with an error of only three days. The early history of this comet is interesting, as calculation shows that it is identical with comets of which records are preserved. In particular, it appeared in 1066 before the battle of Hastings, and a representation of it is given on the Bayeux tapestry. The comet's course has been

traced back by Messrs Cowell and Crommelin, and Halley's comet is identified with one stated in Chinese records to have been seen in 87 B.C., and possibly with a still earlier one in 240 B.C.

*Encke's comet*, which has the shortest period of any comet as yet discovered, has been observed at no less than thirty-one apparitions. Its motion has been carefully studied, and a small acceleration in its periodic times has been taken to indicate the existence of a resisting medium in space. Backlund has shown that the acceleration is by no means regular, and therefore may be due to some other cause than a resisting medium in space.

*Biela's comet* has had a remarkable history which throws light on the structure of comets. It was discovered in 1826, and found to have a period of approximately 6.5 years. In 1846 it was seen to split into two parts, which kept at a distance of about 200,000 miles. In 1852 the two parts were at a distance of 2,000,000 miles. The comet was not seen in 1859 or 1865, but in 1872 its place was taken by a shower of meteors, which moved in the same orbit, radiating from a point in Andromeda. In 1867 it was shown by the researches of Leverrier and Oppolzer that Tempel's comet of 1865 moves in the same orbit as the November meteors. Schiaparelli showed that the Perseid meteors which are seen in August have an orbit identical with that of Tuttle's comet of 1862. We are thus led to regard a comet as made up of a loose collection of meteorites, gathered possibly round a larger central nucleus. When the comet approaches the sun, heat and other radiative influences tend to disintegrate the mass and to drive off gaseous constituents which form the tail. Confirmation of this is found in the fact that several comets are known to follow in the same track. The most remarkable case is that of the three bright comets of 1843, 1880, and 1882, and the fainter comet of 1887. These all move along in the same orbit, an ellipse which approaches to within 300,000 miles of the sun at its nearest point. Another instance is the third comet of 1881, which moves in the same track as that of 1807.

Comets are of great volume but small mass. The head is often 100,000 miles in diameter. Nevertheless, no disturbance in the movement of any of the planets or satellites has been detected in consequence of proximity to a comet. Several have been near the earth and had their movements appreciably modified, but have made no sensible modification on the movement of the earth. Thus their masses are small in comparison with that of the earth, though measured by other standards they may be very great. The most definite information on this point is obtained from Lexell's comet, which in 1770 enveloped the satellites of Jupiter, and remained near them for four months without producing any measurable effect on their movements. From this fact Laplace calculated that the mass of Lexell's comet did not exceed  $\frac{1}{1000}$ th of the mass of the earth. The same comet came to within 1,500,000 miles of the earth on 1st July 1770. If its mass had been equal to that of the earth, the year would have been lengthened by two hours forty-seven minutes. As it is certain that the year was not lengthened by so much as one second, it follows that the mass of the comet was less than  $\frac{1}{1000}$ th of that of the earth.

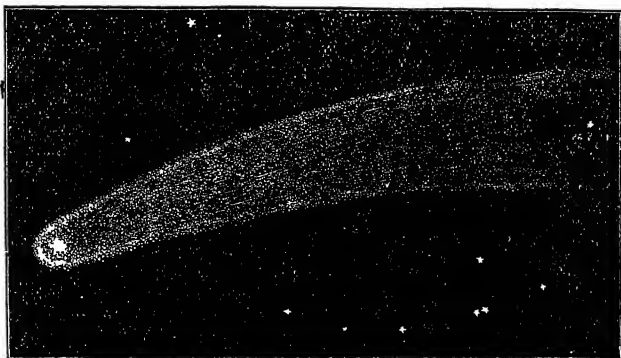

In 1868 Huggins found that the spectrum of the nucleus of the comet of that year showed three bright bands coincident in position with three given by the spectrum of the blue base of a Bunsen flame, and variously interpreted as due to hydrocarbons, carbon, or carbon monoxide. These bands have since been found to be characteristic of comets, though there are several exceptions, such as Brorsen's comet. There is in addition a faint

continuous spectrum, in which the dark Fraunhofer lines are occasionally seen, showing that part of the light is reflected sunlight. In the spectrum of the great comet of 1882, at its very near approach to the sun, Copeland and Lohse discovered a bright line due to sodium, and a number of other metallic lines, especially those due to iron. The sodium and iron lines have been seen in the spectra of other comets which have approached very near the sun. It may be inferred that the nucleus of a comet consists of a collection of solid and metallic bodies surrounded by gaseous hydrocarbons, and that near the sun parts of the solids are converted into luminous gas.

The tails of comets frequently extend over many millions of miles. They are exceedingly tenuous, as is shown by the fact that stars shine through them with light not appreciably dimmed. They are formed by the issue of gaseous matter from the nucleus in the direction of the sun. This matter is then repelled by some force from the sun, and driven backwards so that a tail or tails are produced on the side of the nucleus away from the sun. As the matter driven off shares the orbital motion of the comet round the sun, the tails are curved, as is shown in the illustrations of the comets of 1811 and 1858. From the examination of the tails of a large number of comets, Bredechin, a Russian astronomer, divides them into three types: (1) long tails, showing very slight curvature; (2) plume-like tails, showing slight curvature; and (3) short tails, curving very rapidly. The curvature of the tail offers a means of comparing the repulsive force with solar gravity, and Bredechin finds these to be (1) twelve times as great, (2) equal to, and (3) one-fifth of the sun's gravitational attraction. He considers the tails to consist of (1) hydrogen, (2) hydrocarbons, and (3) iron. The repulsive force may be due to the pressure of light or be of electrical origin, but its essential characteristic is that its amount varies with the area of the surface exposed to it, and not to the mass of the particle. Spectra have been obtained of the tails of Daniel's (1907) and of Morehouse's (1908) comet. They are made up of bright lines and bands, and therefore show that the tails consist of incandescent gas. Spectra which appear to be identical with those of comets' tails have been obtained by Professor Fowler by passing an electric discharge through vacuum tubes in which certain gaseous compounds of carbon are present at a pressure of  $\frac{1}{100,000}$  of atmosphere. One of the lines has been identified by Deslandres with the principal line in the cathode spectrum of nitrogen, and others by Fowler with the cathode spectrum of carbon monoxide.

Since the middle of last century the number of comets discovered annually has averaged from four to five. Most of these are faint and only observable with a telescope. Every few years one is visible to the naked eye, as, for instance, the daylight comet seen in January 1910, and Brooks' comet visible in the autumn of 1911. Comets of remarkable splendour are of still rarer occurrence. In the 19th century the comets of the years 1811, 1843, 1858, 1861, 1874, and 1882 are the most notable. The comet of 1811 was brilliant for many weeks in the northern heavens, being specially conspicuous in autumn, when its tail stretched 25° in length and 6" in breadth at the widest part—indicating a tail 100 million miles long. Argelander

calculated that its orbit is elliptic, but extends to a distance fourteen times as great as that of Neptune, or about 40,000 million miles. The period he assigned for its return is 3065 years. This comet enjoyed the undeserved credit of having contributed to the celebrated port-wine vintage of 1811. The comet of 1843 appeared first in the southern hemisphere, and was extremely brilliant in March. Its tail stretched over an arc of 40° and had a width of 1°; the actual length was no less than 200 million miles. It made a very close approach—less than 500,000 miles—to the sun. The comet of 1858, discovered by Donati at Florence on June 2, when it was very faint, was well placed for observation in September and October, when it displayed a long and beautifully curved tail and a

Comet of 1811.

very bright nucleus. Remarkable features were the changes which took place in the head and the succession of envelopes thrown off. The comet of 1861 was discovered by Tebbutt in New Zealand on May 13. The comet passed its perihelion on June 11, and, travelling north, became visible in Great Britain on June 29. Sir John Herschel held it to be brighter than the comets of 1811 and 1858.

Donati's Comet, 1858.

The tail on June 30 was 30° in length, on July 2 72°, and on July 4 80° and perfectly straight. It is probable that the earth passed through the tail on June 30. The comet of 1874 was discovered by Coggia at Marseilles, and was fairly bright during the summer. It was very near the sun when brightest, and the full extent of the tail was only seen after the head had set. The series of envelopes thrown off from the head were singular features of this comet. The bright comet of 1882, conspicuous to the naked eye during September, passed between earth and sun. Finlay and Elkin at the Cape of Good Hope saw no trace of it while it was in front of the sun, but it became visible soon after it had crossed the disc, and was clearly seen throughout the whole of the next day. The sun was also observed during the transit of Halley's comet across its disc in 1910, but nothing was seen. Hence it

appears that the nuclei of these comets did not contain any masses of more than thirty or forty miles in diameter. The comet of 1882 was followed for a considerable time telescopically, and its orbit well determined. It agrees closely with that of the comet of 1843, and its period appears to be about 700 years. Though it passed very close to the sun, no retardation was detected, and therefore even close to the sun there is no resisting medium of sufficient density to affect the motion of such a body.

Comets are such striking phenomena that it is no wonder they have been regarded with amazement and often with terror. References to their appearances are contained in Chinese, Egyptian, and Chaldean records. Catalogues of comets based on historical allusions were made by Hevelius in 1668, and also by Stanislaus Lubienitzki about the same

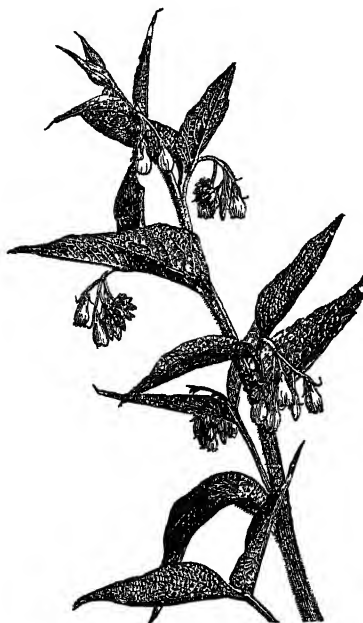

Morehouse's Comet, 29th September 1908; from a Greenwich photograph.

date. A much more critical catalogue, published by Nicolas Struick in 1740, was superseded by the *Cométographie* of Pingré in 1783; supplemented by Biot, especially from Chinese sources. Later cometary histories are very largely based on Pingré. The number of comets recorded before the Christian era is about eighty. Each subsequent century, roughly speaking, twenty to forty have been seen, till we come to the 19th. When telescopes were used and systematic search made for comets the number observed was largely increased. In the 19th century 335 comets were observed, and forty-nine in the first ten years of the 20th century. A list of the elements of the orbits of comets from the earliest times to 1893, as far as they have been computed, is given by Dr Galle. For further information see *The Story of the Comets*, by G. F. Chambers (1909).

**Comfrey** (*Symphytum*), a common palæartic genus of Boraginaceæ, somewhat coarse perennial herbs, although occasionally to be seen in flower-borders. *S. officinale* (purple) and *S. tuberosum* (yellow) are frequent in shady and moist places. *S. officinale* was formerly much esteemed as a vulnerary. Its young leaves and its blanched shoots are still occasionally used as boiled vegetables. The Prickly Comfrey (*S. asperrimum*),

a native of Siberia, 6-10 feet in height, has been recommended for feeding cattle. The stamens are covered in this genus by five awl-shaped processes pushed in from the outside of the corolla, and meeting so as to form a false bottom impassable to ants, flies, and other small honey-thieves, but which can be thrust aside by the

Comfrey (*Symphytum officinale*).

humble-bees which alone fertilise the flower. Many bees, however (especially *B. terrestris* and one or two others), prefer to bite a hole in the side of the corolla below this cover, and the flowers may thus be seen to be visited both in the legitimate and illegitimate way. See the section on Fertilisation in the article FLOWER.

**Comines**, a town on the borders of Belgium and France, 15 miles SW. of Courtrai by rail, divided by the Lys into two parts, of which that on the left (pop. 7000) belongs to Belgium; the other, on the right (pop. 6000), to France. The town has some manufactures, and was the seat of the family of Comines.

**Comines**, PHILIPPE DE, Sieur d'Argenton, a French statesman and historian, who was born about 1445 in the Castle of Comines (q.v.), belonged to a family whose ancestors had been citizens of Ghent. He joined the court of Burgundy, and was sent by Charles the Bold on important missions to France, England, and Spain. In 1472 he forsook Charles and entered the service of Louis XI. of France. He was rewarded with the rich fief of Talmont, and became one of Louis's most trusted advisers. On the accession of Charles VIII. he was deprived of Talmont, and cast into prison for having incurred the displeasure of the regent, Anne of Beaujeu. He accompanied Charles VIII. on his Italian expedition, was present at the battle of Fornovo, and had an interview with Machiavelli in Florence. He held sundry places and pensions under Louis XII., and died in 1509. His *Mémoires* consist of seven books, six of which deal with the reign of Louis XI., while the seventh treats of Charles VIII.'s wars in Italy. They are the earliest example in

French literature of the history as distinguished from the chronicle. Unlike the chroniclers, Comines cares little for the mere spectacle of courtly and military life. His sympathies are with the king against the nobles; his interest is centred in statecraft; his reflections on men and affairs are dispassionate, pregnant, and acute.

His *Lettres et Négotiations* were published in 1867-68. De Mandrot's edition of the *Mémoires* (1903) is from a better MS. than that by Chantelauze (Paris, 1881). The English translation by Danett (1896) was re-edited by Whibley in 1897; and see Whibley's study reprinted in his *Literary Portraits* (1904).

**Comiso**, a town of Sicily, 37 miles WSW. of Syracuse, with manufactures of soap and pottery. Cotton is largely grown here. Pop. 22,000.

**Comitia** were the legal or constitutional meetings of the Roman people, convened by a magistrate, usually for the purpose of putting a question to the vote. According to the constitution of the several gatherings, they were *comitia curiata*, *comitia centuriata*, or *comitia tributa* respectively. See **ROME**.

**Comity of Nations**—more frequently mentioned by its Latin equivalent, *comitas gentium*—is the international courtesy by which effect is given to the laws of one state within the territory and against the citizens of another state. 'In the silence of any positive rule,' says Story, 'affirming, or denying, or restraining the operation of foreign laws, courts of justice presume the tacit adoption of them by their own government, unless they are repugnant to its policy or prejudicial to its interests.' See Story's *Conflict of Laws*; and **INTERNATIONAL LAW**.

**Comma**, in the mathematical study of sound, is a small interval, generally corresponding to the vibration-ratio 81:80, which occurs between the true pitches of two notes, which on the piano, organ, and other tempered instruments, are represented by one only. See **TEMPERAMENT**.

**Commandant** is the officer, of whatever rank, in command of a fortress or military post of any kind—e.g. a station on the lines of communication of an army. The title is also given to an officer commanding a larger body of troops than is proper to his rank, as captain-commandant, lieutenant-commandant, &c., and to the senior lieutenant-colonel of a volunteer battalion in the British army, where there are two or more on its establishment. There are also commandants to most military schools.

**Commander**, in the British navy, is an officer next under a captain in rank, and next above a lieutenant-commander, and serves either as second in command in a large ship, or in independent command of a smaller vessel. In matters of etiquette he ranks with a lieutenant-colonel in the army, but junior of that rank; and he bears the title of captain by courtesy. Retirement is optional at the age of forty-five, and compulsory at fifty, or after five years without employment. In the United States navy, commanders have a rank next below that of captain, and next above that of a lieutenant-commander, and rank with lieutenant-colonels in the army.

**Commander-in-chief**, till 1904 the highest staff-appointment in the British army. On the death of the Duke of Wellington in 1852, this title, borne by him for many years, was allowed to lapse, and the administration of the army was placed under a general on the staff who was styled the general (or field-marshal, if of that rank) commanding in chief. In 1887 the title of commander-in-chief was revived; and in 1895 (on the resignation of the Duke of Cambridge) effect was given to the recommendations of the Hartington Commis-

sion, by a more perfect organisation of our national defences under one supreme authority—though nominally since 1855 the commander-in-chief had been strictly subordinate to the Secretary of State for War. His office, technically called the Horse Guards, was the military department of the War Office (q.v.). In 1904 the title was abolished, the Army Council taking supreme authority (see **ARMY**), with a new officer, the Inspector-general of the Forces, under it, besides the Chief of the General Staff, the Quartermaster-general, and the Master-general of the Ordnance. All promotions and military appointments were recommended by the commander-in-chief, those of great importance being supervised by the war minister, and, if necessary, discussed by the cabinet. He was responsible for recruiting operations, the technical education of officers and men, and everything connected with the efficiency, distribution, and mobilisation of the troops, together with the construction and armament of fortifications; and he exercised an inspectional control over the men under the immediate command of general officers. See **WOLSELEY**, **ROBERTS**.

There is still a local commander-in-chief in India, under whom all the forces there are placed, and in many of the colonies the governor bears this title, which would also be given to the officer in command of any large army engaged in active operations. A naval commander-in-chief is the chief admiral at any port or station. In the United States the president is *ex officio* the commander-in-chief of the army and navy, but many governors of states also bear the military title. By the old German constitution, the emperor was supreme commander-in-chief of army and navy.

**Commander of the Faithful**, a title assumed in 622 by the Khalif Omar (see **KHALIF**).

**Commander's Islands**. See **ALEUTIAN ISLANDS**.

**Commandery**, the district under a *commander*, in connection with the Templars (q.v.), the Hospitallers (q.v.), and other religious orders.

**Commandite**, **SOCIÉTÉ EN**, or **PARTNERSHIP IN**, an expression used for at least two centuries in France, to express a partnership in which one may advance capital without taking part in the management of, or incurring further liability in connection with the business. The term 'sleeping partner' as used in this country till 1907 would have nearly expressed the same idea but for the attendant unlimited liability. The phrase is derived from the old meaning in the commercial nomenclature of France of the word *commande*: the authority given to one person to transact business for another. The working partner had a *commande* from him who merely advanced capital. See **COMPANY**.

**Commedia**, the Italian form of the word comedy, was in the middle ages applied to a narrative with a happy ending. Thus Dante's great work, beginning with hell and ending with paradise, was called *Commedia*. This use, like the corresponding use of tragedy, probably after the example of Italy, was followed in English. David Lyndsay's *Tragedy of the Cardinal*, for example, is a narrative poem; and Lydgate speaks of Chaucer's comedies and tragedies. The Italian word, of course, means also comedy in the ordinary sense. The *Commedia dell'arte*, whose origin has been sought in the Atellan forces (see **ATELLANÆ**) was a dramatic form in which only the general plan was laid down, and the rest left to the improvisation of the actors. It seems to have been brought into favour by Francesco Chereza, actor to Leo X., and was so called because performed by professional actors, members of a craft. For its stock characters, and those of the masked comedy, another popular form, see **PANTOMIME**; also **HAR-**

LEQUIN, PUNCH, SCARAMOUCHE, &c. Comedy on the classical model was *Commedia erudita*.

**Commelinaceæ**, an order of petaloid monocotyledons, all herbaceous, chiefly neotropical, of which a few species are cultivated in herbaceous borders on account of the beauty of their flowers, notably spiderwort, or *Tradescantia* (*Virginica*, and other species), *Commelina caelestis*, &c. Others are grown in hothouses, notably the peculiar *Cochlostemma odoratissima* from Ecuador, in which the stamen filaments expand into large wings.

**Commemoration**, or ENCENIA, the great festival of the Oxford academic year, usually takes place on the third Wednesday after Trinity Sunday. It is of very ancient date, public exercises and recitations having been held from time immemorial in honour of the Act, or period when Masters of Arts and Doctors complete their degrees. The proceedings consist of a Latin oration in honour of founders and benefactors; the presentation of the honorary degree of D.C.L. to strangers eminent in science, politics, &c.; and the recitation of the Newdigate or English prize poem, the Latin prize poem, and the Latin and English prize essays. The more strictly academic and solemn portion of the proceedings was frequently wont to receive scanty attention from a great part of the audience; and the noisy humours of the gallery have often encroached on the stately periods of the public orator. In 1876 the undergraduates were removed from the special gallery they had hitherto occupied, and distributed amongst the general audience, which includes ladies and strangers as well as members of the university. 'Commencement' is the corresponding festival at Cambridge, where, however, it is of less general observance.

**Commendam**, an ancient manner of holding ecclesiastical benefices. When a living fell vacant by the preferment of its holder, it was *commended* by the crown to the care of a clerk, usually a bishop in one of the poorer sees, to hold till a proper pastor was provided for it. Such a living was called an *ecclesia commendata*, and was said to be held *in commendam*. A commendam in ecclesiastical law may be defined as the power of receiving and retaining a benefice contrary to positive law, by supreme authority. Holdings in commendam were abolished in 1836.—**COMMENDATORS**, in Scotland, in Roman Catholic times, were stewards appointed to levy the fruits of a benefice during a vacancy. They were mere trustees; but gradually the pope assumed the power of appointing commendators for life, without any obligation to account. This abuse led in 1466 to a prohibition of all commendams except those granted by bishops for six months and under. See ABBOT.

**Commensalism** (literally, 'at the same table'), the intimate, but never parasitic association of two different kinds of organisms, for the benefit of one, or very often of both. Of such advantageous partnerships there are so many different forms and degrees, that no precise definition of the term can be given. (1) Every one who has looked at shore animals must have observed how often mollusc shells, for instance, are covered with sponges, hydroids, worm-tubes, acorn-shells, and the like. But this is a purely external association, and depends simply on the fact that the shells afford convenient anchorage for the free-swimming embryos. In many cases no great advantage can accrue on either side. The habit is comparable to that of vegetable epiphytes upon trees. This grade might be spoken of as mainly external and unadvantageous association. (2) In other cases, however, the association, though probably accidental, brings its reward. When one sea-mat (Polyzoa) grows entangled with another of greater

vigour, or when different kinds of polyyps are similarly associated, and that is often, there may be distinct advantage to the weaker form, since without becoming a parasite it enjoys the privileges of a messmate. Or the advantage may take another form, when the associate is carried about by its bearer. Thus, Cirripedes are common upon whales, and have evidently an advantage both in security and continual freshness of feeding-ground over those which adhere to fixed objects. This grade might be distinguished as that of fixed external associates with the advantage on one side. (3) It is, however, evident that if a crab be covered with acorn-shells, or polyyps, or sponges, there is no longer a one-sided, but a mutual advantage. It is well for the sedentary growth to be carried about continually to new pastures; but it is well also for the crab to be masked. Covered with a rich growth, either vegetable or animal, the crabs must appear all innocence, and like walking-woods of Birnam, can steal unnoticed upon their victims. A gasteropod may be similarly masked by polyyps, and doubtless gives and reaps similar advantages. This grade may be described as that of fixed associates with mutual advantage, to this extent, at least, that the weaker animals are borne about, and the bearers are masked. (4) But a higher stage of fixed association is sometimes exhibited, that, namely, where the partnership is deliberate, where the masked bearer is not passively benefited, but is an active accomplice. Probably the most striking case of such deliberate partnership is that referred to (and illustrated) under the article ANEMONE—viz. the habit which some hermit crabs have of bearing about sea-anemones on the mollusc shell which they inhabit, or even upon their claws. It would appear that in some cases the crustacean deliberately chooses its ally, induces it to fix itself on the shell or claw, and takes care not to leave it behind at the epochs of shell-changing. When deprived of its commensal, the crab is said to be restlessly ill at ease until another of the same species is forthcoming. Off some parts of the British coast, the beautiful sea-anemone (*Adamsia palliata*) is found enveloping the mollusc home of a hermit crab (*Eupagurus prideauxii*). The use of the sea-anemone as a mask, and also as equivalent to a stinging organ, is obvious enough, while the hermit crab returns the benefit by carrying about the sea-anemone and giving it a share of the spoil. This grade may therefore be described as deliberate partnership with mutual advantage.

So far only fixed commensals have been spoken of, but organisms may be constantly associated without being attached. Sometimes different organisms, both plant and animal, are found in almost constant association without any obvious connection obtaining between them. In many cases this companionship may be simply due to the fact that similar environmental conditions suit both. Small fishes are sometimes found as free commensals within sea-anemones; the Remora (q.v.) attaches itself temporarily to sharks and other fishes; the little crabs (Pinnotheres, &c.) found living freely inside various bivalves are probably true messmates, and similar habitual partnership is very common among crustaceans; a brittle-star is known to live as a free messmate on a crinoid; many worm-types are found in constant though free associations with other animals; and the same habit is exhibited by some Coelenterates and Protozoa. Many of the insects which frequent plants are in strict sense commensals, feeding not on their hosts, but on other visitors, &c. In some cases they form an actual bodyguard.

Commensalism must, of course, be distinguished from parasitism, whether external or internal,

for in parasitism the one organism more or less directly preys upon the other. Yet it is evident that a commensal may readily degenerate into a parasite. Commensalism must also be distinguished from that most intimate kind of partnership known as Symbiosis (q.v.), and illustrated by the union of algoid and fungoid organisms to form a lichen, or by the occurrence of algæ as constant internal associates of Radiolarians, some Cœlenterates, and some worm-types. As part of the animate environment, commensals have influenced one another in very direct ways.

See ENVIRONMENT; Van Beneden's *Animal Parasites* (1876); Semper's *Animal Life* (1881); *Cambridge Natural History* (vol. iii.); E. Step's *Messmates* (1913).

**Commensurable.** Two quantities or numbers are said to be commensurable which are of the same kind, and each of which contains a third quantity or number a certain number of times without remainder; or when both can be measured exactly by the same unit, however small.

**Commeny,** a town in the French department of Allier, 211 miles S. of Paris by rail, is close to a great coal-field, and owes its rise to coal and iron works; pop. 10,000.

**Commerce,** CHAMBER OF. See CHAMBER OF COMMERCE, MERCANTILE LAW.—For the so-called Commercial System, see MERCANTILE SYSTEM.

**Commercial Travellers.** A commercial traveller ('C.T.') is a person whose occupation is to transact business as the accredited travelling representative of a trading house to other trading houses. In the later half of the 18th century in Britain 'many districts remained completely secluded, so that foreign products never reached them at all,' and 'even at the beginning of the 19th century the Yorkshire yeoman was ignorant of sugar, potatoes, and cotton.' It has been the work of the commercial traveller to assist materially in altering this state of things, and to bring about 'equality of distribution of produce, and corresponding equality of prices, and generally to promote that 'facility of exchange which is the very soul of industry.' Commercial travelling in the specific sense is not an old institution. The 'commercial traveller,' 'bagman,' or 'rider' (in the United States, 'drummer') was the successor to the 'chapman' or travelling merchant, who carried with him not samples merely, but stock. Chaucer says—

In Surrye whylom dwelte a companye  
Of chapmen riche, and therto sadde and trewe,  
That wyde-whete senten hir spicerye,  
Clothes of gold, and satyns riche of hewe.

The application of steam to machinery, the consequent rise of the factory system, increased facilities in banking, improved means of locomotion, and the increasing competition for business have made the commercial traveller an important factor in the commercial world. By far the greater portion of the business done in Britain is by commercial travellers. Within recent years a formidable competitor has entered the field in the person of the foreigner, whose superior education and commercial training have hitherto placed the British commercial traveller at a disadvantage; and there is room especially for men possessing a thorough knowledge of foreign and colonial trade, and above all of modern languages. No restrictions are placed on travellers by the British government, and 'the road' is free to all. Travelling is also free in many other countries, though some require an ordinary selling license to be taken out when goods are carried for sale. In other countries, again, a special commercial traveller's license must be obtained, the cost of which may be considerable or but nominal. In some countries British travellers must produce

a certificate from a British chamber of commerce stating that they are legitimately employed. A Blue-book is issued from time to time containing these regulations.

There are several excellent institutions connected with the body, owing largely to the efforts of men like George Moore and George Stockdale. The Commercial Travellers' Schools for destitute orphans and necessitous children were founded in 1845; the school at Pinner accommodates 360 children. The Commercial Travellers' Benevolent Institution was founded in 1849 for the relief of necessitous commercial travellers over the age of fifty-five years, being members, and for their widows. The relief is given in the form of annuities. The Commercial Travellers' Society of Scotland was founded in 1838 for the relief of members incapacitated by disease, accident, or infirmity, and for securing a payment at death. The British Commercial Travellers' Provident Society, like the last named, is based on the Friendly Societies Act. There is also a Commercial Travellers' Christian Association (1882); and the United Kingdom Commercial Travellers' Association (1883) has done good work in pushing forward hotel and railway reforms, and in promoting social intercourse among commercial travellers. A newspaper, *On the Road*, devoted entirely to the interests of commercial travellers, was established in 1883.

In the United States the number of commercial travellers has increased rapidly. They have many wealthy benevolent associations. Their and other commercial interests are greatly promoted by the great Philadelphia Commercial Museum, founded in 1894.

**Commers',** or KOMMERS (Lat. *commercium*), a festive gathering of students of a German university, to celebrate the beginning or end of a semester, or any other academic occasion. Speeches are made, songs sung, and much beer is drunk. The drinking is regulated by a strict ritual, the chairman giving the word of command in Latin. The ceremony of drinking a toast and rubbing the glass on the table is called 'rubbing a salamander'—why, is not known. New-comers are welcomed by a Fuchskomms (*fuchs*, a freshman, literally a fox), and those who are 'fettig' are sped by an Abschiedskomms. A Kommsbuch is a students' song-book. Several characteristic songs form the themes of Brahms's 'Academic Festival' overture.

**Commidendron**, a genus of Compositæ, small trees or shrubs, allied to the daisies and asters. There are three species, confined to St Helena.

**Commination** (Lat., 'threatening'), the 'denouncing of God's anger and judgments against sinners,' read in the Anglican Church on Ash-Wednesday (q.v.). A solemn service, at which penitents were expelled from the church, after instructions and prayers for their amendment, appears to have been held on the first day of Lent from a very early date, perhaps from the beginning of the 6th century; but the commination office used in the Church of England is rather a continuation of the medieval practice of reciting the 'articles of the sentence of cursing,' which were at one time read in the parish churches four times a year; only the opening exhortation to repentance was composed by the English Reformers. The present office is nearly the same as those found in the Sarum and York uses. The curses contained in Deut. xxvii. are read as statements, not as prayers; and the congregation answer 'Amen' to every sentence, as acknowledging the truth of what has been stated, rather than as confirming the curse. The American Prayer-book omits this office, but several prayers taken from it are appointed to be said on Ash-Wednesday, at the end of the litany.

**Commiphora.** See BALSAMODENDRON, BALSAM OF GILEAD, BDELLIUM, MYRRH, BURSERACEÆ.

**Commissariat** is a name for the organised system whereby armies are provided with food, forage, fuel, quarters, and all other necessities except warlike stores. In feudal times soldiers were mainly dependent for food on their lords; but they lived very much by plunder. In the Crusades thousands died of starvation. For centuries contractors not only found the supplies but distributed them, until Frederick the Great, and later Napoleon, began to have a corps of trained men for the duties. Both realised the value of feeding their soldiers well, on the principle that 'an army marches on its stomach.' But Napoleon never reached his ideal through the unpopularity of the expense entailed by a complete system. In Britain the *proviand-master* of Queen Elizabeth was the germ of a supply department. Between that time and the Crimean war (1854) many systems were tried; all were unsatisfactory, and that war proved to all the dire effects of improvidence in this direction. By 1875 some improvements had been made, and the supply of warlike stores had been placed under a separate department, the Ordnance Store. Since 1888 the whole control of transport and supply has been under the charge of the Army Service Corps. The principle on which the British Army Service Corps was organised proved its value in the Great War, when the system was highly tried by the need for a rapid increase that reached eventually to fifty times the previous *personnel*. Some of the belligerents had to recast their systems while fighting. The quartermaster-general, who is the third military member of the Army Council, has under him two directors—of transport and of supply. The *executive* in both cases is in the hands of the Army Service Corps, which is under the disciplinary control of the two directors, whose work, again, is co-ordinated by the quartermaster-general. The officers of the corps work at the provision of transport, food, forage, fuel, light, and supplies for all branches of the army, both in peace and war, as well as the allotment of barracks and quarters and their equipment. The rank and file are in armed companies of trained soldiers, which contain 6 officers (in war) and over 100 rank and file; 71 (before the Great War) were transport companies, 7 mechanical transport companies, 6 supply companies, 4 remount companies. There were about 400 officers from lieutenant-colonel downwards, and 69 quartermasters. In the field the corps provides drivers for all military transport, including that which accompanies the fighting line or carries ammunition, and provides supply columns of various strengths to the cavalry division, to each infantry division, each mounted brigade, and to the extra-divisional (or 'army') troops; also a supply park (final reserve in the field) to each infantry division. The mechanical transport mentioned above is in the park, and is equipped with 3-ton and other motor lorries.

**Commissary**, in general, is any one to whom the power and authority of another is committed. An ecclesiastical commissary is an officer of the bishop, who exercises spiritual jurisdiction in distant parts of the diocese. A military commissary is an officer charged with furnishing provisions and clothes to an army.

When the papal authority was abolished in Scotland, a supreme commissary court was established in Edinburgh in 1563, by a grant of Queen Mary. This court had jurisdiction in actions of divorce, declarators of marriage, nullity of marriage, and all actions which originally belonged to the bishops' ecclesiastical courts. Its powers were gradually conjoined with those of the Court of Session, and

it was finally abolished in 1836, the small remains of its once important jurisdiction being united in the sheriff of Edinburgh. In England the commissary court is the court of the bishop's commissary, exercising spiritual or ecclesiastical jurisdiction of the bishop in parts of his diocese.

**Commission.** As a commercial term, commission is sometimes taken to be synonymous with Brokerage, but there is a distinction. Brokerage is the percentage paid to a passive intermediary in a transaction, who incurs no responsibility; commission is the percentage paid to an active agent in a transaction, who usually does incur some pecuniary and always some moral responsibility.

The practice of secret commissions, which are strictly a species of bribery, caused a considerable amount of interest and discussion in the opening years of the 20th century. They take the form of presents, either of money or in kind, given by traders or contractors to agents or employés outwith the knowledge of their employers. The practice had become so general, extending as it does into every kind of domestic and commercial transaction, as to become a scandal. Lord Russell of Killowen in 1900 was the first to attempt some reform in the matter, and subsequently Lord Halsbury, then Lord Chancellor, introduced a 'Prevention of Corruption' bill in 1903, making the acceptance of a bribe by an agent, and the giving or even offering of one to such a person, a misdemeanour on the part of both giver and receiver, and punishable by fine or imprisonment. The measure passed the House of Lords, but was withdrawn in the House of Commons, as it was again in 1904-5; but it was finally passed by both houses in 1906. See BRIBERY.

A commission as a certificate of rank is granted by the highest authority of a state. All military and naval commissions in Britain must be signed by the sovereign; but in the United States a commission may be issued by a governor of a state as well as by the president of the republic, commissions in the volunteers (or militia) being generally granted by state governors. The appointment of justices of the peace in the United Kingdom is also made by a 'commission of the peace,' issued under the great seal. The great seal itself is in charge of a Lord-keeper, but is put 'into commission' when a change of ministers is taking place. This means that certain persons are appointed to exercise jointly, but without individual powers, the functions of the office. Another instance of the functions of a great public officer being delegated to others 'in commission' is that of the Lord High Admiral, who formerly had control of all naval affairs. This, however, is a permanent commission, although commissioners of Lords of the Admiralty change with every change of the ministry.

An office in commission is an office in suspense. Yet, curiously enough, the phrase has a directly opposite meaning in naval affairs, for when a ship is ordered to be placed 'in commission,' it means that she shall be fully equipped and prepared for active service.

Permanent commissions are also constituted, not merely for the delegation of existing duties, but also for the execution of duties with which no person had been previously charged. As instances we may take the Civil Service Commission in 1855 (see CIVIL SERVICE); the Railway Commission, appointed in 1873 to carry out the act for the better regulation of railways passed in 1854, and to otherwise act as a sort of court of arbitration or appeal in disputes between railway companies; the Irish Land Commission, appointed to carry out the provisions regulating the land laws in Ireland; the Crofters Commission (1886; superseded by the Land Court in 1911) to fix fair rents for the Scottish

crofters. The members of these are nominated in terms of special acts of parliament.

Other permanent commissions are the Charity Commission, created 1853 (of four members, one of whom is unpaid), to examine into all the charities and the management of them, in England and Wales; the Commission for the management of the National Debt; the Ecclesiastical and Church Estates Commission; the Land Commission of England; the Public Works Loan Commission; the Thames Conservancy Commission; that for income-tax cases; the Civil Service Commission; and the Irish Land Commission—bodies more or less administrative, and partaking to some extent of the character of public departments.

In law, a commission may be issued by mandate of a court to take evidence from parties residing abroad or incapacitated from appearing in person. A Commission in Bankruptcy is issued for the purpose of taking charge of the effects of an insolvent for behoof of his creditors. A Commission in Lunacy is appointed by the Court of Chancery to inquire into the mental condition of an alleged lunatic whose property may be in question. There are now permanent commissioners in lunacy whose duties include visitation and supervision of asylums.

In governmental relations, commissions are sometimes constituted where Britain exercises protectorate but has not formed complete colonial establishments, as in Cyprus, Zanzibar, and some islands of the western Pacific, there being in such cases a delegation of the authority of the crown; there is a High Commissioner for South Africa, with resident commissioners under him in such districts as Basutoland and Bechuanaland. In India (q.v.) the administrative head of a province is sometimes called chief-commissioner. Sometimes commissions are international—i.e. composed of representatives of various nations for international purposes. A conspicuous example of such was the commission in 1871 on the Alabama question (see ALABAMA); and under the arbitration treaty of 1911 Britain and the United States appointed a commission composed of three nationals of each of the countries.

Again, a commission may take the form of a temporary embassy for certain specific purposes. The appointments are then made by the Prime Minister and cabinet, as when Mr Gladstone was sent to the Ionian Islands in 1858, or when in 1887 Mr Chamberlain went to America to confer with Canadian and United States delegates in the troublesome fisheries dispute; and in the case of the commission sent to the West Indies to inquire into the effect of sugar bounties on the colonies.

In its parliamentary sense, a commission may be either Special or Royal. In the former case it is appointed usually, and in the latter case invariably, in response to a motion in one or other of the Houses. A royal commission is appointed only by the crown; but a special commission may be appointed by a department of state. The expenses of a commission of this kind are usually defrayed by the parties requiring it, but those of a royal commission are included in the estimates for the current year. The commissioners may be paid by fees regulated by government. When a commission sits in London, it has the power of authorising the payment of witnesses on the scale recognised in courts of law; but when a commission sits in the country, witnesses are not paid.

A royal commission is appointed by motion in parliament, and is issued by a royal warrant nominating certain 'trusty and well-beloved cousins and counsellors' to undertake a specified inquiry. Of such was the royal commission to inquire into the condition of the crofters (1882),

which was a wholly different body from that appointed by act of parliament in 1886 to carry out certain legislative decrees. The former was one of inquiry; the latter, one of administration. The royal commissions appointed to inquire into the causes of the depression of trade (1886-87), into the recent changes in the relative values of the precious metals (1886), and into the coal-supplies of the country (1902) are notable appointments of this kind.

When a royal commission is nominated by royal mandate, a secretary is appointed, and such clerical assistance as may be necessary is provided out of some of the departments. The commissioners are empowered to call and hear evidence (although not on oath), to examine documents, localities, &c. The evidence is reported *in extenso*—question and answer duly numbered—and is submitted, along with the formal report, to the sovereign and to parliament. The whole is then incorporated in a blue-book. The multiplication of royal and special commissions is regarded by many as having become rather a legislative nuisance and a financial burden. Royal commissions always include members of the House of Lords or of the House of Commons, or of both.

Another kind of commission is that sometimes given to two or more judges to inquire into certain alleged crimes, such as the commission (1867-69) to inquire into the Sheffield trade-union outrages; that (1888-90) of three judges appointed by act of parliament to inquire into the 'charges and allegations' brought by the *Times* against Mr Parnell and others. Another important commission was that appointed in 1911 to inquire into the relations between the railway companies and their servants.

It should be added that the sovereign, who nominally presides over the annual deliberations of the General Assembly of the Church of Scotland, delegates the duty to a Scottish peer as Lord High Commissioner, a fresh commission being issued every year. King George V. appointed a commissioner to perform certain functions of the crown during his absence in India in 1911. The Great Seal may be put into commission and entrusted to Lords Commissioners not merely during a change of government, but when the Lord Chancellor has occasion to be out of the country for a brief term—as when in 1913 the Lord Chancellor visited America. The office of the Lord High Treasurer has been in commission since the time of Queen Anne; see TREASURY. For the ecclesiastical court created by Queen Elizabeth, see HIGH COMMISSION; and for army commissions, see below at COMMISSIONS.

**Commission Agent**, or **MERCHANT**, is a person employed to sell goods consigned or delivered to him by another who is called his principal, for a certain percentage, commonly called his commission or factorage. See **BROKER**.

**Commissionaires** is a name given a class of attendants at continental hotels, who perform certain miscellaneous services. Employed to attend at the arrival of railway trains and steamboats to secure customers, they wait to take charge of luggage, see it passed through the hands of the custom-house officers, and send it on to the hotel; for all which service they charge a fee.

In 1859 the *Corps of Commissionaires* was established by Sir Edward Walter in England, with divisions in London, Edinburgh, Glasgow, Leeds, Liverpool, Manchester, and other large cities in the United Kingdom. The corps has recently extended its operations to the principal cities of Australia, and purposes to continue its further development throughout the colonial empire. The corps is composed of picked men from every branch of His

Majesty's naval and military service, and now numbers over 4500. They can be engaged by the day or any other period, and for any duty where honesty, sobriety, and intelligence are required.

**Commission del Crederé.** See DEL CREDERE COMMISSION.

**Commissioner, Lord High.** See ASSEMBLY (GENERAL), COMMISSION.

**Commissioners of Supply.** See SUPPLY.

**Commissions, ARMY,** are warrants from the head of the state for holding various military offices, whether combatant or non-combatant. Officers of Army Service Corps, Royal Army Medical Corps, and Army Veterinary Service have lately been granted commissions as combatants, entering the service as lieutenants. Chaplains, ordnance store officers, army school inspectors, paymasters, and others have commissions as non-combatants, but often have honorary combatant titles as well; some are nominated, some transferred from combatant branches, and some admitted by examination. Similar commissions exist in the Territorial force. The majority of combatant first commissions are gained by competitive examination. They may be gained (1) Through Royal Military College, Sandhurst, for guards, cavalry, infantry, Indian army, West India regiment. (2) Through Royal Military Academy, Woolwich, for artillery and engineers. (3) From Special Reserve (q.v.), for all branches except engineers and Indian army. (4) From universities, including colonial, which have established an approved military class, for all combatant branches except engineers. (5) Through Royal Military College, Kingston, Canada, seven commissions annually, of which one is in engineers. (6) From colonial military forces, for all branches except engineers and Indian army. (7) From the ranks. (8) Through Netley Hospital, for Royal Army Medical Corps, after competitive examination. (9) Through an approved veterinary college, for Army veterinary service, after competitive examination. Subsequent commissions up to that of lieutenant-colonel are given, as vacancies occur, to the senior officer of the next lower rank, provided he has been favourably reported on and has passed the appointed examination, outdoor and indoor, in all the branches of the military art—drill, field-training, military engineering, tactics, topography, law, history of a prescribed campaign, military organisation. The rank of colonel is for the most part conferred by Brevet (q.v.), generally for distinguished service, but also attaches to certain appointments. It is given to a lieutenant-colonel who has completed his five years' term of regimental command and is continued on the active list. The commander of a Regiment (q.v.) is a full colonel. Promotion to major-general, lieutenant-general, and general is by selection as vacancies occur (see GENERAL).

Till 1871 all combatant commissions were purchased, except in the Royal Artillery, Engineers, and Marines, and a few given as prizes to distinguished cadets. In the old Indian Staff Corps first commissions were largely in the gift of the directors; regimental officers then subscribed to a purchase fund which was used to 'buy out' senior officers, whereupon the senior of each rank below obtained his 'step.' In the home army even first commissions could be purchased on passing a very easy qualifying examination, and the man of means could often purchase farther steps over the heads of less opulent comrades by 'buying out' an officer of the next higher rank. The price of a first commission might vary from £450 in the line to £1260 in the Life Guards, and promotion could rarely be obtained without paying for it.

Gladstone's entire abolition of the purchase system by royal warrant in 1871 increased the intrinsic

value of commissions and the number of those who are in a position to compete for them. The competition has in consequence become more severe at the examinations, usually held twice a year, of all the categories of candidates detailed above; before the Great War the flow of candidates was lessening seriously, owing to the pay remaining as a century ago, while the average income of all classes had greatly increased. But the substantial rises of pay granted after the war are expected permanently to obviate any shortage, both in the Home and in the Indian army. The officer has harder work than of yore, and higher professional attainment is called for. Army classes in all the great schools prepare boys for the examinations, and there are many private tutorial establishments. An effort is made so to arrange the syllabus as to encourage boys to compete direct from the schools, and thus avoid the less wholesome life at the 'crammer's' (see CADET). Commissions in the Special Reserve (see MILITIA) are obtained without competition, on recommendation to the War Office by the commander of the unit. In the Territorial force commissions are granted in the same way; but in both cases the officer is under probation for a period. (See a War Office pamphlet, *A Short Guide to the Various Ways of obtaining a Commission.*)

In the United States commissions are granted to suitable military persons by the President, and are published through the adjutant-general's department.

**Commissure,** an anatomical term applied to nervous connections between adjacent parts of the nervous system. Though it is not always used in quite the same way, the general signification of the term, and the physiological import of the structure, is that of a uniting bridge. See BRAIN, NERVOUS SYSTEM.

**Commitment.** See CRIMINAL LAW.

**Committee** (Fr. *comité*), a portion, generally consisting of not less than three members, selected from a more numerous body, to whom some special act to be performed, or investigation to be made, is *committed*. But though a committee usually consists of several members of the body by which it is appointed, it may consist of one member, or, what is more frequent, of the whole of the members acting in a different capacity from that which usually belongs to them. For the committees of parliament, whether 'select,' 'of the whole house,' 'grand,' or 'standing' committees, see PARLIAMENT.

**Commodianus,** the author, probably African, of an accental Latin verse work, *Instructiones adversus Gentium Deos pro Christiana Disciplina* (c. 254-57 A.D.), largely based on Cyprian. See Durel, *Recherches sur Commodien* (1913).

**Commodore,** a rank intermediate between admiral and captain. It is not permanent, but is bestowed for a time on a captain. Usually a commodore commands more ships than one, detached from a fleet on some special service; he hoists at that time a white broad pennant, with a red cross, at the main if a commodore of the first class, at the fore if of the second class; but the rank has also been bestowed on captains holding shore appointments, such as command of R.N. barracks, and on captains holding staff appointments in the Grand Fleet. In etiquette, the commodore ranks with a colonel commandant in the army.

Until 1862 the title of commodore, without any commission as such, was given in the United States navy to such captains as commanded, or had commanded, a squadron. In 1862 the rank of commodore became a commissioned one. His rank is assimilated to that of a brigadier-general in the United States army.

**Commodus**, LUCIUS AURELIUS, a Roman emperor, born at Lanuvium in 161 A.D., was the son of the great Marcus Aurelius and his profligate wife, the younger Faustina. He was carefully educated under his father's care, but lived to become one of the most worthless and bloody wretches that ever disgraced a throne. At his father's death in the spring of 180, he was successfully fighting the Marcomanni and other tribes on the upper Danube, but he at once concluded a treaty with the barbarians, and hastened to Rome to enjoy the pleasures of power. After the discovery of his sister Lucilla's plot against his life in 183, he gave uncontrolled vent to the senseless savagery of his nature. Nearly all who, by virtue, ability, and learning, had risen to honour during his father's lifetime, were sacrificed to appease his savage jealousy of the good and the great. Proud of his own physical strength, he bemeaned himself by exhibiting in gladiatorial combats, and besides used, in public, to sing, dance, play, and act the buffoon. Though a glutton and a shameless debauchee, who wallowed in the most sensual abominations, he yet demanded to be worshipped as a god, and assumed the title of Hercules Romanus. Many unsuccessful plots were devised against the life of this mingled monster and madman, until at length his mistress, Marcia, finding her own name marked down in his tablets for death, in concert with two confederates, tried first to poison him, then caused him to be strangled by Narcissus, a famous athlete, on the 31st of December 192.

**Common Bench.** See BENCH, and COMMON LAW.

**Commoner**, one under the rank of nobility; also a member of the House of Commons. For the *Commoners* at Oxford, as opposed to scholars, see OXFORD.

**Common Forms** are the ordinary clauses which are of frequent occurrence in identical forms in writs and deeds.

**Common Good.** See BOROUGH.

**Common Law**, in England, is the ancient customary law of the land. Before the Norman Conquest, the rights of an Englishman were determined mainly by the customs of the manor, borough, or shire in which he lived. After the Conquest, the king's judges began to go their circuits in every part of the country, doing justice according to the custom of the realm or the common law. In some points they kept to the ancient local customs, in others again they introduced new rules. Primogeniture, e.g., is a rule introduced by the influence of the judges; the ancient English rule of equal division survives only as the 'custom of Kent' under the name of Gavelkind (q.v.). The custom of certain ancient boroughs, which gave the land to the youngest son, survives under the name of Borough English (q.v.). The custom of a place, or of a body of persons, is allowed to supplement or modify the common law if it has been observed from a time 'whereof the memory of man runneth not to the contrary.' Legal memory does not go back beyond the first year of the reign of Richard I., but evidence may be given to impugn the 'immemorial' character of a local custom by showing that it had its origin later than that year.

Even in making new rules, the judges never assumed to legislate; they professed to expound the good customs of the realm, and in applying the rules of common law, each generation of judges was guided by the decisions of its predecessors. Decisions followed in a series of subsequent cases acquired special authority, and were quoted as leading cases. The law fixed by custom and by judicial decision could only be set aside or amended by an act of parliament. But without setting aside

the law, courts of equity, and especially the Court of Chancery (q.v.), framed rules of their own, which enabled them to prevent the stricter rules of common law from being used in defence of injustice. By the Judicature Acts (q.v.), courts of common law and equity were made parts of one supreme court; the two systems are administered concurrently; where there is any conflict between equity and common law, the rules of equity prevail. See EQUITY.

English settlers going to an uncivilised country take with them 'as much of the common law as the nature of things will bear.' In Canada, Australia, &c., and in the United States, the historical basis of the law is the same as in England. In Scotland, and in some other countries, the term common law is used in a sense analogous to its English meaning.

**THE COURTS OF COMMON LAW.**—The superior courts of Common Law in England had their origin in the Curia Regis of the early Norman kings, the chief officers of which were the Chief-justiciar, the Chancellor, and the king's justices. The justices sat in the King's Bench to supervise the proceedings of inferior courts and corporations, and to deal with criminal matters directly concerning the crown. In the Common Bench or Common Pleas they held pleas between subject and subject. In the Exchequer they sat, as Barons of the Exchequer, to decide revenue cases. At first all these courts followed the king, to the great inconvenience of suitors. The Common Pleas were fixed at Westminster by Magna Charta; and in course of time the three superior courts of Common Law were all established on one side of Westminster Hall, each court having its own chief and four (afterwards five) puisne or junior judges, who were called justices in the King's Bench and Common Pleas, and Barons in the Exchequer. On the passing of the Judicature Acts (1873-76), the three courts became divisions of the High Court of Justice. The offices of Chief-justice of the Common Pleas and Chief-baron of the Exchequer are now abolished, and the three divisions are consolidated in the King's Bench Division. The Lord Chief-justice of England is the presiding judge; he is appointed by the crown on the advice of the prime-minister, and his salary is £8000. There are fifteen puisne justices, appointed by the crown on the advice of the Lord Chancellor, each of whom has a salary of £5000. The sittings of the Division are held at the Royal Courts in London; the judges also try cases on their circuits and at the Central Criminal Court. The jurisdiction of the Division includes all special authorities formerly belonging to any of the old Common Law Courts. It takes, e.g., appeals from Revising Barristers (q.v.) which formerly went to the Common Pleas, and revenue cases which belonged to the Exchequer. Appeals from any of the old Common Law Courts went to the judges of the other two courts, sitting in the Exchequer Chamber, and from them to the House of Lords. Appeals from the King's Bench Division now go to the Court of Appeal, and thence to the House of Lords.

Besides the superior courts, there are many inferior courts which exercise a limited common-law jurisdiction. Each manor has its own courts, but except in regard to Copyholds (q.v.), manorial jurisdiction has been superseded by local courts of modern origin. The same remark applies to the Hundred Court and the ancient County Court. The Court of Common Pleas in Lancaster and the Court of Pleas in Durham, now form part of the High Court. The *modern* County Court (which ought more properly to be called a district court) has a common-law jurisdiction; and several statutes contain provisions for remitting the less important

class of common-law actions to the County Court for trial.

Of Borough Courts some (as, e.g., the Court of Hustings in London) are obsolete; others (as, e.g., the Mayor's Court in London and the Court of Passage in Liverpool) are still of importance. The City of London Court is framed on the model of the modern County Courts. The Court of the Cinque Ports is held before the mayor and jurats of each port; from them appeals are taken to the Lord Warden's Court, and thence to the King's Bench Division. Courts of Request for the recovery of small debts existed in several boroughs; they are now obsolete, as also is the Court of Pie Poudre, or dusty foot, held by the steward of a manor to which a market belongs, for the immediate decision of questions arising in the market. There are still courts of some importance, established for the benefit of privileged bodies of persons.

See Martland and Pollock's *Hist. of English Law* (2d ed. 1898); Holdsworth's (1903-9); Pollock's *Expansion of the Common Law* (1904), *Genius of the Common Law* (1912).

**Common Pleas.** See COMMON LAW.

**Common Prayer.** See PRAYER-BOOK.

**Common-riding** is the Scottish equivalent of Beating the Bounds. See BOUNDS.

**Common Room**, an apartment in a monastery in which a fire was constantly kept burning for the use of the monks, and which was presided over by a monk called the master. It was the prototype of the common rooms in the colleges of the English universities, where the dons take their wine after hall.

**Commons**, the dinner provided in English colleges and inns of court for their members. In the inns of court it is provided only during term. Separate tables are appointed for the benchers, for the barristers, and for the students and other members of the inn. See INNS OF COURT.

**Commons, HOUSE OF.** See PARLIAMENT.

**Commons and Enclosures.** This is one of the numerous instances in which a different meaning is attached to the same term in the legal systems of England and Scotland. In England the property in the common land belongs to the lord of the manor; although rights over the common land are possessed by certain persons who hold land in the manor, and are known as commoners. Thus Blackstone defines a common as 'a profit which a man hath in the land of another, as to feed his beasts, to catch fish, to dig turf, to cut wood and the like.' But in Scotland, where the law has adopted the divisions and followed the nomenclature of the civil law and of the legal systems of continental Europe, all these profits, or rights to derive profit, are known as *Servitudes* (q.v.), whereas a common, or commonity, as it is more frequently called, is a common right of property existing in several individuals, frequently the inhabitants of a whole village, in a piece of ground. In each individual the right of course is limited, so as in reality to amount to little more than a servitude; but there is no overlord, the land is not the land of another, but the land of the community as a body.

The nature and origin of rights of common have been the subjects of elaborate investigation, but are still obscure. They are probably derived from the old Germanic rights of common pasture on the *Folkland* (q.v.). In England at present almost the only land subject to common rights is waste land; but formerly rights of joint cultivation extended over a great part of the arable land. These are not yet quite extinct. So long as the lands subject to rights of common were extensive and fertile, their enclosure was a source of wealth

both to lords of manors and to the nation as a whole. Accordingly enclosures began to be frequent in the 16th, and were continued on a great scale to the end of the 18th century. Formerly the enclosure of a common required a private act of parliament. The commoners, who were generally poor and unable properly to represent their case, often suffered by enclosure, obtaining inadequate compensation. By the Act 6 and 7 Will. IV. chap. 115, and subsequent acts, the necessity for a private act of parliament is abolished. By the Act 8 and 9 Vict. chap. 118, which has been often amended, a Board of Commissioners is appointed to inquire into the propriety of any proposed enclosure or partition, and to report to parliament, which may then pass a public act authorising their proceedings. This is the course generally adopted.

In Scotland, commonities or commons were made divisible by an action in the Court of Session, at the instance of any person having an interest by the Stat. 1695, chap. 38.

The lands still subject to rights of common are for the most part such as could not be cultivated with advantage. The increase of population, however, has made them valuable as places of exercise and recreation. This value has been clearly stated by J. S. Mill (*Dissertations and Discussions*, vol. ii. p. 213): 'We must needs think, also, that there is something out of joint, when so much is said of the value of refining and humanising tastes to the labouring-people—when it is proposed to plant parks and lay out gardens for them, that they may enjoy more freely nature's gift alike to rich and poor, of sun, sky, and vegetation; and along with this a counter-progress is constantly going on of stopping up paths and enclosing commons. Is not this another case of giving with one hand and taking back more largely with the other? We look with the utmost jealousy upon any further enclosure of commons. In the greater part of this island, exclusive of the mountain and moor districts, there certainly is not more land remaining in a state of natural wildness than is desirable. Those who would make England resemble many parts of the Continent, where every foot of soil is hemmed in by fences, and covered over with the traces of human labour, should remember that where this is done, it is done for the use and benefit, not of the rich, but of the poor; and that in the countries where there remain no commons, the rich have no parks. The common is the peasant's park. Every argument for ploughing it up to raise more produce applies *a fortiori* to the park, which is generally far more fertile. The effect of either, when done in the manner proposed, is only to make the poor more numerous, not better off. But what ought to be said when, as so often happens, the common is taken from the poor, that the whole or great part of it may be added to the enclosed pleasure-domain of the rich? Is the miserable compensation, and though miserable not always granted, of a small scrap of the land to each of the cottagers who had a goose on the common, any equivalent to the poor generally, to the lovers of nature, or to future generations, for this legalised spoliation?'

Acting upon the principles expressed in this extract, the legislature in the 19th century regulated enclosures with reference to the enjoyment of the general public, as well as to the rights of the lord of the manor and of the commoners. Restraints have been placed on the enclosure of commons in or near towns, and provision has been made for laying them out and maintaining them as places of recreation. Near London especially, many commons have thus been secured to the public. See Miss Octavia Hill, *Our Common Land* (1878); Elton,

*The Law of Commons* (1887); works by Scrutton, Chambers, Cooke, Hall, Williams, Shaw Lefevre, Sir R. Hunter (1897), Gonner (1912); Slater, *The English Peasantry and Enclosure* (1907); J. L. and B. Hammond, *The Village Labourer* (1912).

In the United States 'common' in one sense signifies the common or general fields set apart as pasture-land at the foundation of towns or villages; the idea of such common fields may probably have been suggested by those of semi-feudal England. Common fields also existed in the villages of French and Spanish settlers. The title to these lands was confirmed to the inhabitants by act of congress. Unappropriated lands in Virginia have similarly been confirmed as common lands by statute, and the constitution of Illinois sets apart certain lands as commons. Unless the statute expressly forbids, commons in this sense may be divided at the instance of individuals interested, if they think fit to take legal proceedings for that purpose. In the other sense, the term 'common' is applied to a public park which may belong to the municipality or to the nation—e.g. the Yellowstone Park—respecting which no individual or individuals can claim a division. Such parks are under the direct control of the authorities. As applied to a school, the epithet 'common' means public, supported by taxation, and open to all children of a certain age. It has no reference to the studies of the school.

**Common Sense.** THE PHILOSOPHY OF. There are certain beliefs that have been current among men in all ages, which by some philosophers have been declared to be groundless illusions. Of these, the most remarkable instance is the belief in an external, material world, independent of any mind to perceive it. Berkeley's doctrine (see **BERKELEY**) seemed to his contemporaries to contradict this belief, and affirm that there is no such thing as a material world; and Hume, carrying the same principles to their full length, disintegrated the world of spirits, and left nothing in nature but isolated ideas and impressions.

A dead-lock in philosophy was the result of these doctrines of Berkeley and Hume; and the solution offered by Reid consisted in setting up common sense as an arbiter from which there could be no appeal—that is to say, the universally admitted impressions of mankind were to be taken as corresponding to the fact of things without any further scrutiny. It is only the same view otherwise expressed, when it is declared by other philosophers that the deliverance of consciousness must be presumed true. According to Sir W. Hamilton, in the most elaborate vindication of the common-sense philosophy that has ever been produced (in his edition of Reid's works), consciousness assures us that, in perception, we are immediately cognisant of an external and extended *non-ego* (not-self); and that the testimony of consciousness must be viewed as entitled to prompt and unconditional assent.

The conclusiveness of this reasoning is disputed by many, who say that it is an abnegation of the tasks of philosophy, and may establish mere prejudices as dictates of consciousness. Consciousness (q.v.) is a very wide word, comprising indeed everything that we call mind. Suppose, it is argued, we were to maintain that the veracity of each one's memory was beyond all question or dispute, it would be apparent at once how the case really stands. But there must be a standard truth. Experience is the criterion how far the memory is to be trusted; and possibly the same may be true of the larger fact named consciousness. See **PHILOSOPHY**, **PSYCHOLOGY**.

The truths of common sense, assumed to be those of consciousness, are such as these: the

laws of Identity, Contradiction, and Excluded Middle; the axioms of Mathematics; the law of Causality (see **CAUSE**); the doctrine of an innate moral sense (see **ETHICS**); the doctrine of man's Moral Liberty (see **WILL**); the existence of an external world independent of every perceptive mind. Some of these truths, which however by no means stand all on the same footing, are termed Intuitions, Intuitive Cognition, Instincts, Feelings, Beliefs, Principles, Ultimate or Primordial Elements, Truths *a priori*. Kant's mission was to investigate the origin of such of those truths as might be accounted *a priori*; see **KANT**, **A PRIORI**. The philosophy of common sense, as promulgated by Reid, bore reference especially to the denial by Berkeley of the received view of the material world. See **SCOTTISH PHILOSOPHY**, **RELATIVITY OF KNOWLEDGE**.

**Commonwealth** (practically, a translation of *Lat. respublica*, 'republic') is used in a special sense for the form of government established in England after the execution of Charles I. in January 1649. Usually the Commonwealth is held to extend till the Restoration in 1660; and in the *Calendar of State Papers* this is the usage of the word. But the Commonwealth is sometimes limited to the period 1649–53, ending with the establishment of Cromwell's Protectorate. See **CROMWELL**, **ENGLAND**. Several states of the American Union are officially called commonwealths, as is also the 'Commonwealth of Australia.'

**Commune** is the unit or lowest division in the administration of France, corresponding in the rural districts to the English parish or township, and in towns to the English municipality. In France there are over 36,000 communes, with a considerable measure of self-government, with the power of holding property, &c. Each commune has a council elected by universal suffrage, and the council is presided over by a *maire* and one or more *adjoints* or assistants. In the larger communes the *maire* is selected by the central government out of the members of the council; in others he is appointed by the prefect of the department. The central government through its officials exercises generally a very large control over the affairs of the commune. For other communes, see **BOROUGH**, **CITY**, **MIR**, **RUSSIA**, **VILLAGE COMMUNITIES**.

The rising of the commune of Paris in 1871 should not be confounded with Communism (q.v.). It was a revolutionary assertion of the autonomy of Paris, that is, of the right of self-government through its commune or municipality. The theory of the rising was that every commune should have a real autonomy, the central government being merely a federation of communes. The movement was based on discontent at Paris, where the people found themselves in possession of arms after the siege by the Germans. The rising began on the 18th March 1871, and was only suppressed ten weeks later after long and bloody fighting between the forces of the commune and a large army of the central government, 6500 Communards having fallen during 20–30th May, and 38,578 been taken prisoners. See **FRANCE**; and see histories of the Paris commune by Lissagaray (trans. 1886) and Thomas March (1896).

**Communism** signifies, in ecclesiastical language, that relation, involving mutual claims and duties, in which those stand who are united by uniformity of belief in one religious body or church. To exclude from this relation and its involved rights is to *excommunicate*. The most visible symbol of this relation being the partaking together of the Lord's Supper, that rite is often called the Communion. See **LORD'S SUPPER**, **PRAYER-BOOK**, **LITURGY**; and for Communion Table, see **ALTAR**.

**Communism** is a system of society in which common property is the recognised form. In later times it is an attempt to prevent or remedy the evils arising out of the inequalities of private property by holding property in common. But in primitive societies, in the hunting and pastoral stages of civilisation, communism was universal. It was only when the transition was made to a settled life and to agriculture that private ownership in land began to appear, and even then it was slowly introduced. Long after the private use of land had been established, the common ownership of it by the tribe or clan was still recognised and enforced, and the arable land of the community was subject to periodical redistribution with the view to cultivation. Survivals of this system still exist in various countries of the world, notably in Russia under the Mir.

In the ancient world a partial communism prevailed in Crete and Sparta. Towards the decline of Greece more systematic speculations and experiments in communism appeared. The most eminent example of the former was the republic of Plato, in which a community of goods and also of wives was taught, as the form of society among the ruling and military class. These were to be supported by the industrial classes, whose form of life is not indicated. In Palestine, about the Christian era, the Essenes were a society of recluses with celibacy and the community of goods.

A most remarkable instance of community of goods is that of the early Christians at Jerusalem, recorded in Acts, iv. 32. Under the influence of Christianity the rigorous and often merciless ideas and rights of private property developed in the ancient world, especially among the Romans, were greatly modified. Denunciations of wealth tending to communism are not infrequent in the church fathers. Not to mention the corporate property of the church itself, which in medieval times embraced about one-third of the land in the countries where it was established, many of the monastic institutions were based on the community of goods. During the middle ages, sects holding the community both of goods and women appeared, like the sect of the Giovannali in Corsica.

At times of social and spiritual change or fermentation communistic ideas usually grow up with special vigour. Such was the case at the Reformation, when the anabaptists Munzer and Bockholt set up communism in Germany, and similar notions had a wide diffusion in other countries (see ANABAPTISTS). The most eminent literary form of it, combined with the noblest humanitarian ideals and practical suggestions for reform, which even yet have not been realised, was the Utopia of Sir Thomas More (1516). In that great work, besides the institution of common property, we have the most advanced views on toleration, universal education, a mild criminal code, sanitation, and a working-day of six hours. Campanella's *Civitas Solis* (1623) has a similar community of goods under the despotic rule of the wise men, with a working-day of four hours.

At the discovery of America the Spanish conquerors found a system of agricultural communism under a central despotism both in Mexico and Peru. Like the partial communism of Crete and Sparta it may have been a survival or continuation of the primitive communism. In the earliest English settlements in America, both Virginia and New England, a system of common property was attempted, but soon abandoned. During the fermentation which preceded and accompanied the French Revolution communistic ideas again emerged in the writings of Morely and Mably. They are also found vaguely expressed in the works of Rousseau, and through him they to some

degree affected the principles of Robespierre and St Just; but the general tendency of the Revolution was to consolidate individual rights and private property. The conspiracy of Babeuf was intended to establish a systematic communism by revolution.

Socialism (q.v.) must not be identified with communism. Yet it is largely coloured with communistic conceptions, and in some of its schools a thoroughgoing communism is taught. About 1920 a quite fresh meaning of the word, imported from the continent of Europe, became widely current in England. In 1847 Marx used the word as equivalent to socialism in the important *Manifesto of the Communist Party* written by him and Engels, and constantly reprinted and circulated ever since. The Russian Bolsheviks call themselves Communists (Bolshevist is a nickname like Tory or Quaker), and their followers in England, Germany, and elsewhere have adopted the same name. Russian bolshevism is Marxian socialism, with stress laid on some special doctrines, and the word communist, as now most commonly used by and of certain groups of extreme socialists, simply means socialists who approve of the teachings and policy of the Russian Bolsheviks. Different are the communistic societies of the United States. These are mainly efforts to realise for their members a happier state of things by community of property, without a revolutionary propaganda; see BROOK FARM, FOURIER, OWEN (R.), PERFECTIONISTS, RAPP, SHAKERS.

**Commutation.** See ANNUITY, TITHES, PENSIONS.

**Commutator**, an apparatus attached to many electric machines for reversing the currents. See ELECTRICITY, DYNAMO-ELECTRIC MACHINES.

**Comnenus**, a family, originally Italian, of which many members occupied the throne of the Byzantine Empire (q.v.) from 1057 to 1204, and that of Trebizond (q.v.) from 1204 to 1461. See ALEXIUS, ISAAC.—ANNA COMNENA (q.v.), who lived in the first half of the 12th century, was a high literary as well as historical celebrity.—DAVID COMNENUS, the last representative of the imperial race in Trebizond, was executed at Adrianople in 1462, with all his family, by command of Mohammed II.

**Como**, a city of Lombardy, Northern Italy, beautifully situated at the south-west extremity of the Lake of Como, 30 miles N. of Milan by rail. It lies in a valley, surrounded by hills, clad with luxuriant gardens, olive plantations, and orange groves, with here and there an old ruin cropping out. The city is surrounded by old walls flanked with towers, the gateways by which the walls are pierced being fine specimens of medieval military architecture. Among the principal buildings of Como are the cathedral (1396-1732), and the town-hall, built of marble, dating from the beginning of the 13th century. The chief articles of manufacture are silk, satin, gloves, and soap. By means of its port, Como carries on extensive trade in the produce of the district with Switzerland. Population with suburbs, 50,000. Como, the ancient *Comum*, was the birthplace of Cæcilius Statius, the two Plinys, of several popes, and of the physicist Volta. In 1107 it began to war with Milan, and in the course of twenty years was utterly destroyed by its antagonist. As an important headquarters of the Ghibelline party, it was rebuilt in 1158 by Frederick Barbarossa, and remained a republic for two centuries, when it fell into the hands of the Viscontis, its history since that time being bound up with that of Milan.

**Como**, LAKE OF (Ital. *Lago di Como*, or *Il Lario*, ancient *Larius Lacus*), a sheet of water, in Northern Italy, lying at the foot of the Bernine Alps. It is chiefly formed by the river Adda, which enters it at its north, and issues at its south-eastern

extremity. The total length of the lake from Como to Riva is about 30 miles. Fifteen miles from its northern extremity, the promontory of Bellaggio divides it into two branches, the shorter of which is called the Lago di Lecco. The greatest breadth of the lake is  $2\frac{1}{2}$  miles, but throughout the greatest part of its length it is much less. It is 663 feet above sea-level, has a mean depth of 870 feet, and a maximum of 1352 feet. The beauty of the scenery and the salubrity of the climate have made the Lake of Como the most celebrated in Italy, its shores being everywhere studded with noble villas.

**Comodoro Rivadavia**, an Argentine oil-field and port on the Golfo de San Jorge (Chubut).

**Comorin**, CAPE (*Kumdré*), the most southerly extremity of the peninsula of India, being, in fact, a sandy accretion to the termination of the Western Ghats. The low headland is in the state of Travancore, and its lat. and long. are  $8^{\circ} 4' 20''$  N., and  $77^{\circ} 35' 35''$  E.

**Comoro Isles**, four islands belonging to France, in the Mozambique Channel, since 1908 part of the colony of Madagascar. Vanilla is the chief article of export. The islands, which are of volcanic origin, are mountainous, and have an extremely fertile soil, are called Angaziya or Great Comoro, Anjouan or Johanna, Mohilla, and Mayotta. Great Comoro is 35 miles long; its highest point is 8500 feet. Johanna is next in size. Mohilla, the smallest, is 15 miles long. These became French in 1886. Total pop. 100,000. Mayotta or Mayotte, 21 miles long, and with a population of 15,000, has been a French possession since 1841. At the capital, Dsaoudi or Nzaondzi, are government buildings, a few hundred French soldiers, and numerous officials. In all the islands the blood of the natives is partially Arab, partially Malagasy, the Sakalavas having occupied part of Mayotte after the conquest of Madagascar by the Hovas. See MADAGASCAR.

**Company.** The term, though it may be applied to any partnership, is now generally used to denote an incorporated company. Such a company differs from a Partnership (q.v.) chiefly in these respects: A partner cannot transfer his share in the firm without the consent of the other partners; the shares in an incorporated company are, as a general rule, freely transferable. A contract made, or act done, by any partner in relation to the business of the partnership is binding on all the partners; the management of the affairs of a company is vested in directors and other officials, and a shareholder is not an agent for the company. Again, the liability of each partner for the debts of the firm is unlimited, except in case of a limited partnership under the act of 1907; in a company the liability of each shareholder may be, and usually is, limited either by shares or by guarantee. So distinct is the law as to companies from the law as to partnership that the Partnership Act, 1890, which codifies the law on that subject, expressly excludes from the definition of partnership any company or association which is registered as a company under the Companies Acts, or is incorporated by act of parliament or letters patent or royal charter. Large partnerships or 'unincorporated companies' were formerly not uncommon. They were regulated by the law of partnership, modified and adapted to the needs of a large and fluctuating number of members, and the liability of the members was unlimited. Now, however, the Companies Consolidation Act, 1908, sec. 1, re-enacting a provision in the act of 1862, prohibits the formation of any company, association, or partnership consisting of more than twenty persons for the purposes of carrying on any business that has for its object the acquisition of gain (or, in the case of associations formed for the business of banking, of more than ten persons) unless

it is registered as a company under the act, or is formed in pursuance of some other act of parliament (such as railway companies formed under private acts) or of letters patent, or is a mining company subject to the jurisdiction of the Stannaries Court.

Incorporated companies may be classed under three heads: (1) Those created by royal charter or by special acts of parliament which completely define their powers (see CORPORATION and Chartered Companies *infra*). (2) Those created by special acts which adopt by reference the provisions of one or more general statutes. The general statutes so adopted, in the ordinary case, are the Companies Clauses Acts, 1845-89, and, it may be, other statutes, such as the Railway Clauses Act, 1845, or the Waterworks Clauses Acts, 1847 and 1863, appropriate to the objects of the particular company. These statutes contain general clauses regulating the constitution, management, and powers of companies whose business cannot be carried out without the exercise of compulsory powers, privileges, and monopolies; and these clauses, when included in the special act of a company, are applicable to that company as if they were part of its special act. This class includes most companies formed for the purpose of carrying out large enterprises of a public nature—e.g. railway companies, harbour companies, canal companies, and companies for the supply of water or gas or electricity. (3) Those created under the Companies (Consolidation) Act, 1908, or under the earlier Companies Acts, which have been consolidated by that act. The vast majority of ordinary trading joint-stock companies in the United Kingdom belong to this class; i.e. they owe their incorporation not to royal charter or to a special act of parliament, but to registration under the Companies Acts.

Prior to 1908 the principal act relating to the formation and registration of joint-stock companies was the Companies Act of 1862. That act, however, had been amended by many later statutes; and in 1908 it and all the amending statutes were repealed and re-enacted in the Consolidation Act. The Consolidation Act of 1908 has itself been amended in some details by more recent statutes—e.g. the Companies Act, 1913.

Companies formed under these Companies Acts are of three kinds: (1) companies limited by shares, in which the capital of the company is divided into shares and the liability of every member is limited to the amount unpaid on his shares; (2) companies limited by guarantee, in which each member undertakes to contribute a certain sum in the event of the company being wound up, and his liability is limited to that sum; (3) unlimited companies, in which the liability of every member is unlimited, as it is in the case of an ordinary partnership. The act also recognises 'private companies,' in which the right of the members to transfer shares is restricted, the number of members (exclusive of persons who are in the employment of the company) is limited to fifty, and any invitation to the public to subscribe for shares or debentures is prohibited. A private company—which may consist of two members only, and usually is formed to carry on a family business—is exempt from certain provisions of the Companies Act of 1908; but certain additional requirements have been imposed on such companies by the Companies Act, 1913.

To form a company, seven or more persons—or, in the case of a private company, two or more persons—must execute a *Memorandum of Association*, which sets out the name of the company, the place where its registered office is to be situated, its objects or powers, the amount of its capital, and, if the liability of the members is to be limited, the extent to which their liability is limited. Each

of the signatories of the memorandum must agree to take at least one share in the company. The memorandum is stamped and lodged with the registrar of joint-stock companies, who issues a certificate of incorporation, which is conclusive evidence that all the requisites to registration have been duly complied with, and that the company is duly registered. The memorandum corresponds to the charter of a company created by charter. The company has no powers other than those set out in its memorandum, and any act done by the company or its agents outside the scope of these powers is *ultra vires* and void.

The memorandum of association may in the case of a company limited by shares, and must in the case of a company limited by guarantee or unlimited, be accompanied by *Articles of Association*. Model articles, which may or may not be adopted, are furnished in Table A, Schedule I., appended to the act of 1908. The function of the articles is to regulate the management of the company. Thus they usually contain regulations as to the division of the capital into shares, the transfer and forfeiture of shares, the holding of meetings, the votes of members, and the appointment and powers of the directors. These regulations form a binding contract between all the members and the company. The articles must be signed by the same persons as signed the memorandum, and are filed with the registrar at the same time as the memorandum.

Upon due registration the persons who subscribed the memorandum and the articles, and such other persons as may from time to time become members of the company, become a body corporate, having perpetual succession and a common seal, with power to hold lands. Every company is bound to keep a *register of members*. In an ordinary company, the capital of which is in shares, every shareholder is, so long as he is a shareholder, a member of the body corporate. The register of members contains the name and address of each member, the amount and numbers of his shares, the date of acquiring them, and the amount paid up. It is open to the inspection of any member gratis, and of any other person on payment of one shilling. The register is *prima facie*, but not conclusive, evidence of membership. In the case of companies registered in England, no notice of any trust is entered on the register; but in the case of Scottish companies, the practice is to enter shares as held by trustees, though this does not affect the personal liability of the trustees as members of the company. The company may issue *certificates* to holders of shares or stock; and these certificates are *prima facie* evidence of the title of the member to the shares or stock. Shares in a company are personal estate, transferable in the manner provided by the articles of the company. The ordinary form of transfer is executed by the transferor, and handed to the transferee with the share certificate. The transferee then executes it, and sends it to the company for registration. The articles of a company, however, not infrequently give the directors power to refuse a transferee.

If the public are invited to subscribe for shares, the company must either issue a *prospectus*, which is filed with the registrar, or else file a statement in lieu of prospectus. In order to secure a full disclosure of the position, and to enable the public to form an intelligent opinion on that position, the prospectus, or the statement in lieu of it, must set forth certain particulars. It must state, *inter alia*, the *minimum subscription* on which the directors may proceed to allotment. No shares offered to the public can be allotted until the fixed minimum number of shares has been subscribed, and the amount due on allotment has been paid in cash. If no such minimum is fixed, or if none is stated in

the prospectus, the whole issue must be subscribed before any shares are allotted. Moreover, the company cannot commence business until the amount of the minimum subscription has been subscribed.

A company must hold a general meeting, known as the 'statutory meeting,' within not less than one month, and not more than three months, after the date at which it is entitled to commence business. At least once in every year there must be held an annual general meeting. Extraordinary general meetings may be called at other times, and the holders of not less than one-tenth of the issued shares may require such a meeting to be called. The articles usually provide for every member having a vote in respect of each share held by him; but if the articles contain no provision on the subject, each shareholder has one vote. The articles also commonly provide for shareholders who are absent from the meeting voting by proxy, and for a poll being taken. There is no power to vote by proxy unless it is expressly provided for by the articles. Resolutions by a general meeting are of three kinds: (1) ordinary resolutions, which may be passed by a majority of members present; (2) special resolutions, which are necessary to effect certain vital alterations, and require two meetings—the resolution being passed at the first of these meetings by a three-quarters majority of those present, and being confirmed at the second meeting, held within a definite period after the first, by a simple majority; and (3) extraordinary resolutions, which must be passed by a three-quarters majority at a general meeting, but need not be confirmed by a second meeting. An extraordinary resolution may be passed to wind up a company voluntarily on the ground that it cannot continue its business by reason of its liabilities, and that it is advisable to wind it up. A copy of every special resolution and of every extraordinary resolution must be sent to the registrar.

The general management of the company is usually deputed to Directors (q.v.), who are the agents of the company in carrying on its business. The number, powers, necessary qualification, and method of election of the directors are regulated by the articles. The first directors, too, are, as a rule, named in the articles. The shareholders, by resolutions, may enlarge the powers conferred on the directors by the articles, and enable them to do anything that it is competent for the company itself to do.

There are three ways in which a company may be wound up. (1) It may be wound up compulsorily by the court. A compulsory winding up by the court is commenced by a petition to the court, and, generally speaking, is equivalent to proceedings in Bankruptcy (q.v.). The petition may be presented by the company itself, or by a creditor or creditors, or by a contributory or contributories. The circumstances in which a company may be wound up by the court are various; but the most frequent ground is that the company is unable to pay its debts. (2) A voluntary winding up takes place when the period fixed for the duration of the company has come to an end, and the company has passed an ordinary resolution to wind up; or when, for any cause, the company has passed a special resolution to wind up voluntarily; or when the company has passed an extraordinary resolution that it cannot by reason of its liabilities carry on its business, and that it is expedient that the company be wound up. From the date of the passing of the prescribed resolution, the company must cease to carry on business, except so far as may be required for the beneficial winding up. (3) When a company has resolved to wind up voluntarily, the court may order that the winding up shall proceed under the supervision of the court. The granting

of such an order, called a 'supervision order,' is in the discretion of the court, and the application is generally made by the company itself or by creditors.

In whatever manner a company is wound up, the duties of the *liquidator*, who is appointed to carry out the winding up, are very similar. These duties are to take possession of, and realise, the assets, to call upon the members to contribute according to the extent of their liability, to pay the company's debts and the costs of the winding up out of the funds so raised, and to distribute the surplus, if any, among the shareholders. In a winding up, every present and past member of the company is, in proportion to his capital, liable to contribute to the assets to an amount sufficient for the payment of the company's debts, the expenses of the winding up, and the adjustment of the rights of the contributories among themselves. While liability to contribute may thus attach to persons who have ceased to be members of the company, no past member will be liable if he has ceased to be a member for one year or upwards prior to the commencement of the winding up; or in respect of any debt or liability incurred after he ceased to be a member; or unless the existing members are unable to satisfy the contributions requiring to be made by them. The liquidator may thus require to make up two lists of contributories, called the A and B lists respectively, the one of present and the other of past members. In the case of a company limited by shares, the contributions required from any member, present or past, cannot exceed the amount unpaid on the shares held, or formerly held, by him. In the case of a company limited by guarantee no member can be made liable beyond the sum he has undertaken to contribute. In the case of an 'unlimited' company, no limit is set to the contributions which may be required from each member.

**CHARTERED COMPANIES** are corporations trading under a charter granted by a sovereign power, and having certain privileges, rights, and obligations, therein defined. Such companies have undoubtedly constituted the foundation of the colonial empire of Britain, although in most instances the profits of trade and not the formation of colonies was their primary object. The history of some of the earliest trading companies in Britain will be found described at **HANSEATIC LEAGUE**. Chartered companies, as now understood, may be said to date from the time of Elizabeth, and many were formed for trading purposes with the New World and the Indies. The Company of Merchant Adventurers of England, which originated in 1359, received a charter from Elizabeth about 200 years later. The Russia Company (first chartered in 1554) set the example of annexing territory in 1613 by setting up King James's arms at Spitsbergen. Many companies were organised in the 17th century for the further exploiting of America and the East. The most famous were the East India Company (q.v.), chartered by Elizabeth in 1600, and the Hudson Bay Company (q.v.), chartered in 1670. The Darien Scheme (q.v.) was a Scottish company, sanctioned by royal authority in 1695. Nearly all the original British colonies in North America were first formed by chartered companies, of which the Virginia Company (1609) and the Massachusetts Bay Company (1629) were most prominent (see **UNITED STATES**). Other European countries, particularly Holland and France, were at this time actively promoting trading companies. Of the old companies, the Hudson Bay Company still exists, though shorn of many of its original privileges. In the last quarter of the 19th century a fresh development in chartered companies took place, nearly all of them in Africa. The principal among

these are the British North Borneo Company (see **BORNEO**), chartered in 1881; the Royal Niger Company (see **NIGERIA**), chartered in 1886, bought by government in 1900 and its territories formed into the protectorate of Nigeria; the Imperial British East Africa Company (see **ZANZIBAR**), chartered in 1888, its territories taken over by government in 1896, and now the Kenya Colony and Protectorate; and the British South Africa Company (see **RHODESIA**). These companies have not the same unlimited powers as the old companies; they have no monopoly of trade, and their sovereignty rights are limited. The state exercises control over all political matters, and the rights of natives are strictly protected; the government also retains the right to forfeit the charters if it considers their purposes are not being properly carried out.

**Company**, in Military Organisation, is a captain's command. In the British infantry there are now 4 companies in a Battalion (q.v.), each consisting of 6 officers, 10 sergeants, 5 corporals, 4 drummers and buglers, 207 rank and file, including signallers, stretcher-bearers, drivers of pack-cobs, and batmen. Garrison artillery, Engineers, and Army Service Corps are also in companies, with no higher units in war. There is a specially trained signal company with each infantry Division (q.v.). A company is divided into 4 platoons, with a lieutenant in command of each, and each section into 2 squads under a sergeant. The platoon is the 'fire-unit.'

**Comparative Anatomy** is the science which examines and compares the structure of two or more different kinds of animal, so as to discover their points of resemblance and unlikeness. See **ANATOMY**, **ANTHROPOID APES**, **BIOLOGY**, **BIRD**, **FISHES**, **MAMMALS**, **REPTILES**, &c.; also **CUVIER**, **HUXLEY**, **OWEN** (SIR RICHARD), &c.

**Comparetti**, DOMENICO, born at Rome in 1835, taught Greek at Pisa, Florence, and Rome, and has written on South Italian dialects, Virgil the Magician, Sindbad, and Italian folklore.

**Compass**, or MARINER'S COMPASS, a magnetic instrument used to indicate the direction of a ship with respect to the magnetic north and south line.

The directive property of the magnet seems to

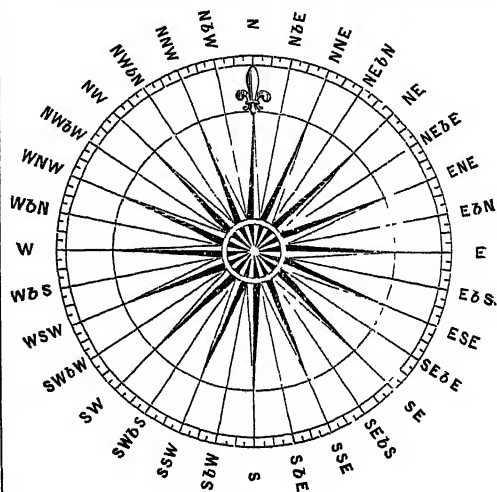

Fig. 1.

have been unknown in Europe till the 12th century. It appears, however, on very good authority that it was known in China and throughout the East

generally at a very remote period. The Chinese annals assign its discovery to the year 2634 B.C., when they say an instrument for indicating the south was constructed by the Emperor Ho-ang-ti. The earliest reference to the making of magnets is in a Chinese dictionary of 121 A.D., where lodestone

centre piece of sapphire poised on an iridium point (fig. 3). Instead of a single needle there are eight thin strips of steel fastened to the silk threads as shown in the figure. The thin paper rim bearing the points is divided at intervals so that the contractions and expansions due to change of

temperature may not produce warping of the aluminium. The whole arrangement weighs only 200 grains or so, and thus there is very little tendency to flatten the point of the supporting needle. Hence the 'friction error' can be made very small; in fact, if it is found that a card can be made to rest even half a degree out of the magnetic meridian, the supporting point is rejected for a sharper one. The weight, such as it is, being mostly in the rim, the period of vibration of the card is long (40 seconds or so), which makes the card very steady. The bowl is saved from violent oscillation by having in the bottom a quantity of castor-oil. The gimbals are supported on knife-edges, and their being made of brass wire-rope dispenses with the not very durable india-rubber pads otherwise used. A simple device prevents the card from jumping off the pivot when heavy guns are fired—a matter of some importance in an engagement. The binnacle has complete provision for stowing away the magnets, soft iron bars, and spheres used to counteract the magnetism of the iron of the ship.

Along with Kelvin's compass is supplied a piece of apparatus for converting it into an azimuth compass, which is a compass for finding the angle subtended

at the observer's eye by the projections of two objects on the horizontal plane.

The gyroscopic compass utilises the principle of the Gyroscope (q.v.). Its axis is thereby kept parallel to that of the earth, so that a reading gives not merely directions but latitude.

Modified forms of the compass are in use on land by surveyors, miners, and travellers, and need not be further alluded to here.

For the earth's action on a magnetised needle suspended free to move horizontally and vertically, see the articles MAGNETISM, DECLINATION.

The great difficulty connected with the use of the compass arises from the disturbing influence of the ship's magnetism, of which part is considered permanent, and part—due to the soft iron—is temporary, and varies with the position of the ship. Various methods are in use to regulate this difficulty, which in iron vessels is sometimes so great as to make an ordinary compass almost useless. The principal are (1) counteracting the permanent induced magnetism by properly placed permanent bar magnets; and (2) supplying about the compass soft iron masses in such a way that, however the ship turns, the transient induced magnetism on the left of the compass shall be

exactly equivalent to that on the right. Many of the best ships carry a standard compass placed as far as possible from the iron of the ship, especially from vertical masses like iron masts and funnels.

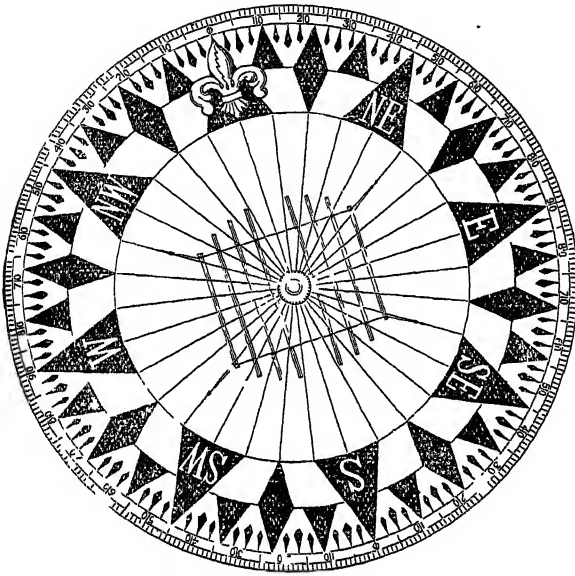

Fig. 2.

is defined as 'a stone with which an attraction can be given to the needle;' but this property of the lodestone could not fail to have been observed at a very much earlier time. At first the Chinese would appear to have used the compass exclusively for guidance in travelling by land, and we hear of their using it by sea only somewhere about 300 A.D.

The ordinary mariner's compass is made up as follows: The needle is a magnetised strip of steel, or in the better compasses a number of thin strips magnetised separately and then bound together. This is balanced so as to swing horizontally on a fine pivot. Fastened to the upper surface of the needle and swinging with it is a circular card marked with the thirty-two 'points, and having the point marked N immediately over the end of the needle that is attracted to the north. The pivot on which the needle swings stands up from the bottom of a copper bowl, which has a glass covering to protect the contents from wind and weather. The compass-bowl is made of copper (a good conductor of electricity) in order to damp the vibrations of the needle. For the needle in moving induces currents of electricity in the copper bowl, the electro-magnetic forces of which tend (according to Lenz's Law) to oppose the motion producing them. For the same purpose also the compass-bowl is sometimes filled with spirit, but the additional friction of the liquid interferes with the sensitiveness of the needle. The bowl is supported in Gimbals (q.v.) so as to remain horizontal in all positions of the ship. The whole arrangement is placed in the binnacle, situated when possible in the fore and aft line, and having provision for the placing of lamps to illuminate the compass-card by night.

The compass-card is represented in fig. 1. In Lord Kelvin's compass a thin aluminium ring (fig. 2) is connected by silk threads with an aluminium boss, which rests on an aluminium cup having a

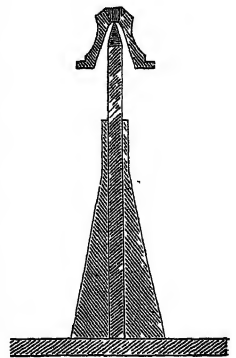

Fig. 3.

When it is mentioned that an error of one point ( $11\frac{1}{2}^\circ$ ) in steering means an error of about one mile in five, the necessity for the various precautions will be readily recognised. For details on this subject, see the *Admiralty Manual on the Deviations of the Compass*, and the references there given.

**Compass-plants** are those which, when unduly exposed to the sun, place their leaves in a north-and-south direction, as *Silphium* and the prickly lettuce (*Lactuca Scariola*).

**Compensation** is the term used in law to denote the statutory right of an outgoing tenant in respect of certain classes of unexhausted improvements specified in the Agricultural Holdings Acts; see LANDLORD AND TENANT. The word is loosely applied to any claim of damages arising in respect of injury. Thus where a workman is injured by accident arising out of, and in the course of, his employment, the right given, under the Workmen's Compensation Act, 1906, to him, or, in the event of his death, to his dependants, is termed a right of compensation; see MASTER AND SERVANT, WORKMEN'S COMPENSATION. In Scots law its proper meaning is that mutual creditors and debtors may set off one debt against another. This applies, as it did in the civil law, where each of the parties is at the same time debtor and creditor in clearly ascertained debts. In order that one debt may extinguish another, compensation must be pleaded.—For compensation of errors in physics, as illustrated in the compensation pendulum, see PENDULUM.

**Competition** (Lat., 'a seeking together') has been well defined by Dr Johnson as 'the act of endeavouring to gain what another endeavours to gain at the same time.' In political economy it is simply the form taken by the struggle for existence as applied to industry. Formerly prices and generally the economic relations of men to each other were regulated by custom or authority. The growth of freedom has now brought it about that these relations are determined by individual effort. The general rule is that each man must be responsible for his own economic well-being. The workman brings his labour to the market and gets what he can for it. The capitalist engages labour on the terms most favourable to himself, and sells his produce at such price as it can bring. The owner of land generally takes the highest rent he can obtain. In short, the industrial world is a world of conflicting or competing interests.

As we have said, this system of competition is an outcome of modern freedom, and the rise of it may be historically traced. In mediæval times the relations of men were fixed by custom or authority. But the restraints of custom and authority were felt to be vexatious, oppressive, and injurious, and in the various spheres of human activity, in religion, politics, and economics, the free individuality of men sought and found wider room to develop itself. This great movement began with the revival of learning, the discovery of America, and the Protestant Reformation, and has been continued through the revolutions of the 17th, 18th, 19th, and 20th centuries. In the industrial sphere it means that, whereas in former times a man's calling, place of residence, and the remuneration of his industry were fixed for him, he is now at liberty to decide them for himself as best he can. Each man is free to do the best he can for himself, but as he finds numerous individuals who exercise the same freedom within a limited field, there arises the prevailing system of competition.

No one conversant with the facts will deny that the system of free competition has been attended with enormous progress, and that it has acted as a powerful stimulus to human energy and the spirit of improvement. But the development of the

system has brought with it most important limitations, some of which may be noted. While such a system must always be limited by law and justice, and the necessities of political union, legislation has been obliged to provide special safeguards against the evils of competition, notably in the English Factory Acts. Trade-unions are an attempt to regulate competition in the interest of labour. Employers' combinations have a like object in the interest of the capitalist. In America especially the development of 'trusts' tends to make competition a dead-letter. These trusts are combinations of capitalists with a view to regulating prices. The protective system of many countries is intended to maintain native industries against foreign competition. It should be noted also that even yet custom is largely influential in many spheres, and that not a few of the evils of competition are mitigated by the kindly feeling which prevails in all the relations of life. Employers do not generally bring wages down to the lowest level attainable by competition. In actual experience the competitive system is modified by a great variety of influences. Thus, the Trade Boards Acts (1909 and 1918) were designed for the protection of unorganised and 'sweated' labour by the establishment of legal minimum wage-rates in selected trades.

**Compiègne**, a quiet and old-fashioned but picturesque town in the French department of Oise, on the river Oise, a little below its junction with the Aisne, 52 miles NNE. of Paris by rail. Of its churches three deserve notice, St Germain (15th century), St Antoine (12th century), and St Jacques (13th century). The hôtel-de-ville is a late Gothic edifice with a fine central belfry. But the chief pride of Compiègne is its palace, built anew by Louis XV., and splendidly fitted up by Napoleon, who often occupied it. It was during part of the Great War the seat of the General Headquarters. From the gardens an arbour walk, 1600 yards long, leads towards the beautiful forest of Compiègne, which was a favourite hunting-ground of many of the kings of France. The inhabitants of Compiègne manufacture canvas, cordage, and sugar. The population is about 16,000. Compiègne is mentioned in the times of Clovis under the name of *Compendium*. It was at the siege of this town, in 1430, that the Maid of Orleans was captured; and here, in 1810, Napoleon first met Maria Louisa of Austria, on occasion of their marriage.

**Complement** of an angle is what it lacks to make up  $90^\circ$ ; of an arc, to make up a quadrant; and hence, in Astronomy, the complement of a star in its zenith-distance. In Music, two intervals, which together make up an octave, are called complementary (see INVERSION). In Arithmetic, if any number is subtracted from the next higher power of ten, the result is its complement. Thus 7 and 3 are complementary; so are 63 and 37; 881 and 119; and  $1\cdot4384386$  is the complement to  $8\cdot5615614$ . In Chromatics, red is the complement of green, orange of blue, and yellow of violet—these colours in combination producing white.

**Complexion**. See SKIN; also TEMPERAMENT, HIPPOCRATES.

**Compline**. See BREVIARY.

**Complutensian Bible**. See ALCALÁ DE HENARES and XIMENES.

**Compony**, or GOBONY. See BORDURE.

**Compositæ**, an order of sympetalous dicotyledons, the richest of all in species, these numbering above 11,000; it is also the most widely distributed through all regions of the globe, although most abundant in temperate and subtropical climates.

and, furthermore, the richest in individuals, it having been reckoned that about every tenth flowering plant on the earth is a composite. The rationale of this may be broadly seen (at least if we grant an individual constitution and structure especially well adapted to both vegetation and reproduction), for we can see that the consequent great number of healthy individuals must be associated with active local competition and survival of the fittest, and with distribution of these over a wide area; while this again is at least one condition of considerable differentiation of varieties, and so ultimately of species.

While popularly a daisy or dandelion is regarded as a simple flower, the roughest examination suffices to analyse this into an orderly assemblage, technically a *capitulum* of small but distinct florets; hence the beginner is apt, without more ado, to refer all similar aggregates, say a head of Scabious (Dipsacaceæ) or Seapink (Plumbaginaceæ) to the Compositæ. We find, however, such aggregates arising in all alliances, and naturally so; racemes, spikes, or umbels of flowers wholly distinct in structure may all be shortened down into heads or capitula, since reproductive development is tending everywhere to check vegetative growth. We are thus led to inquire of what forms are the composites to be regarded as the reduced members, and the evidence of comparative anatomy goes to prove their relationship to Campanulaceæ and their irregular forms the Lobeliaceæ; in a word, to view the yellow 'tubular' florets of our daisy as a head of tiny bells, while the white strap-shaped or 'ligulate' ones of its ray, like all those of a dandelion, resemble the flowers of lobelia.

In shortening down, or arresting the inflorescence into a head, the bract of each separate flower remains in place; and in a *Zinnia*, or sunflower, we find each floret with its separate bract throughout the whole capitulum; in most cases these disappear. Those of the outermost florets, however, together with the immediately lower leaves of the flower-axis (which bear no florets, and are thus in strictness not entitled to their common name of bracts), become usually crowded into an *involucre*. This subserves in bud the protective purposes of a calyx to the whole inflorescence at once, and thus the calyx of the separate florets becomes unnecessary. In its place we find at most a circle of fine downy hairs, which may be characteristically serrated or feathered, and which only reach full development and usefulness when the fruit has to be distributed. On account of its merely epidermic nature and late appearance, its calycine nature has been denied, and the term *pappus* substituted. The evolutionist need, however, feel little hesitation in regarding the pappus as simply representing the epidermic fringe of a reduced calyx; nor is verifactory evidence wanting. The stamens grow upon the united corolla and themselves unite by the anthers, thus forming a ring, or rather pollen-bearing tube, up through which the style grows, all much as in bell-flowers. The style bears two stigmas, indicating an originally two-carpeled arrangement, but the ovary is one-celled, and contains only a single ascending ovule. The ovary hardens as a nutlet, which is commonly floated away upon the wind when ripe by help of its pappus; it may be anchored where it descends by its minute grappling-hooks or serrations. In this way it is conveyed to new soil, it may be at a great distance—an obvious advantage, alike to the species or the individual, when germination takes place.

The classification is difficult. The order may be divided into Tubulifloræ, in which the disc-flowers are not ligulate, and Ligulifloræ, in which all are ligulate.

Although many composites are cultivated and useful plants, none attain the highest economic importance; yet the artichoke, and Jerusalem artichoke, salsafy, lettuce, endive, &c., are familiar inmates of the kitchen-garden, while chicory is extensively cultivated as a substitute for coffee, and even sometimes, as well as Jerusalem artichoke, for the purpose of feeding domestic animals. A very few, like safflower and saw-wort, yield dyestuffs; from the seed of others—e.g. sunflower—a bland oil is expressed; while many are of time-honoured repute for their medicinal properties—e.g. chamomile, arnica, wormwood, elecampane, &c. A still greater number—e.g. dahlias and sunflowers, asters and chrysanthemums—are esteemed ornaments of our flower-gardens, particularly in the latter part of summer and in autumn. Being mostly herbs, or rarely shrubs, the order is quite unimportant as regards timber; the Striehout (*Tarchonanthus camphoratus*), a small tree of the Cape of Good Hope, is, however, close-grained and beautiful. See Small, *Origin and Development of the Compositæ* (1919).

**Composite Order.** See COLUMN.

**Composition.** Under the title Composition and Resolution of Velocity and Forces, we deal with one of the fundamental problems in mechanics—viz. to compound two velocities (or forces) into a single velocity (or force) which shall be their equivalent. We shall consider it as applied to velocities in the first place.

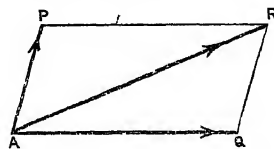

If a point is moving with two independent velocities, it moves in some one definite *direction* with a definite *speed*. This single velocity (for the term includes the idea of direction as well as speed) is equivalent to the two *component* velocities, and is termed their *resultant*. A good example is afforded by a ball thrown up in a moving railway carriage; it partakes of the train's motion horizontally, while it also simultaneously moves vertically upwards.

When the two components are in the same straight line, their resultant is in all cases equal to their algebraic sum. In the case of velocities in different directions, the magnitude and direction of their resultant is obtained by the following theorem, known as the *Parallelogram of Velocities*. If a point A move with two velocities, represented in magnitude and direction by AP and AQ respectively, their resultant will be similarly represented by AR, the diagonal of the parallelogram of which AP and AQ are continuous sides.

For, let the point move along AQ with velocity AQ, and let the page be in motion in the direction AP with velocity AP. After a unit of time has elapsed, the point will have moved from A to Q along AQ, but, owing to the motion of the page, the line AQ will have moved into the position PR, so that the point will really be at R; hence its motion has been in the direction AR, with a velocity whose magnitude is represented by AR.

Similarly, we may compound any number of velocities in one plane into a single resultant. In the case where three components are not coplanar, a corresponding theorem, the *Parallelepiped of Velocities*, is used to find the resultant.

The resolution of velocities is exactly the converse problem; for where a directed length such as AR can be made the diagonal of a parallelogram, then the continuous sides are the components. Of course, in this manner, an infinite number of pairs of components can be obtained, each having the given velocity as their resultant. But the

resolutions usually required are those in which the components are in given directions at right angles.

Since forces can be graphically represented in the same manner as velocities, all that has been said of velocities applies equally well to forces; and obvious changes in the terminology at once give the means of compounding and resolving forces. See DYNAMICS, KINEMATICS, STATICS.

**Composition**, in Bankruptcy, a certain percentage which creditors agree to receive from a bankrupt in lieu of full payment of his debts, and the acceptance of which operates as a discharge to the bankrupt. See BANKRUPTCY.

**Compos Mentis**. See INSANITY.

**Compostella**. See SANTIAGO DE COMPOSTELLA.

**Composts** are a kind of Manure (q.v.), consisting of mixtures of substances adapted to the fertilisation of the soil, which being allowed to ferment, and undergo chemical changes for a considerable time in heaps, become more valuable than they were at first, or ever could have been if applied separately. Composts were formerly made of farm-yard manure, and earth or lime in addition. Road-scrappings, peat-moss, leaves, and clearings of ditches also formed materials for the purpose. By allowing these to lie for six months in heaps of from three to four feet in depth, food was prepared for plants. The mass was usually applied to the turnip-crop, and when artificial manures were unknown, considerable benefit arose from such dressings. The use of guano and other light manures has superseded in a great measure the necessity of this laborious process, and composts for the turnips or barley-crops are now little used. The wonderful effects that have resulted from the application of small doses of artificial manures have impressed farmers in general with the truth that the most energetic elements bear a small proportion in weight to the whole mass of farm-yard dung or composts, and that the mixing of manure in heaps with earth does not so much add to its virtues as to repay the labour expended in the process. More care is now rightly bestowed in preserving manure from washings by rain. Composts formed of leaves, ditch-scurings, road-scrappings, or any earthy substance containing a large percentage of vegetable matter, with the addition of lime, may still be used with benefit for pastures that are deteriorating, or where the soil is stiff. Indeed, there should still be a compost-heap at every farm. Wherever tidy and careful management prevails, there is a good deal of road-scrappings, ditch-scurings, and other rubbish to be disposed of, and the compost-heap is a handy and useful receptacle for all such matter. The value of well-made compost for the top-dressing of pasture-land is greater than is generally understood or acknowledged, and it can be carted out and spread at old times when there is a lull in the more urgent farm-work. Where moss prevails, lime should enter largely as a component. On the other hand, where the soil is of a strong and clayey nature, earthy substances containing vegetable matter in larger proportions should be used. Vegetable matter has the effect of imparting a softness to the surface that is particularly conducive to the free growth of pastures. Compost made of turf, leaves, earth, and bone-dust is used with great benefit by gardeners, for vines and fruit-trees which are injured by too concentrated manures.

**Compound** (corruption of Portuguese *campanha*, 'yard or court') is the usual name in India for the enclosure in which a house stands, with its out-houses, yard, and garden.

**Compound Animals**. See COLONIAL ANIMALS.

**Compounding of Felony**, in England, is the offence of entering into an agreement for valuable consideration not to prosecute a felony, and is punishable with fine and imprisonment. Any member of the community who enters into such a bargain is guilty of this offence, even though he suffered no injury from the felony. Compounding of informations upon penal statutes, or of misdemeanours, is punishable in grave cases. But in less serious cases an agreement to abstain from prosecuting the offender is not unlawful, and in misdemeanours affecting some private rights the court will often permit the prosecutor to accept pecuniary amends, and withdraw the prosecution. Advertising a reward for stolen property, coupled with words implying that no questions will be asked, or that no prosecution will be instituted, or that a pawnbroker returning the property will be paid what he has advanced on it, is punishable by a fine of £50 each on the advertiser, publisher, and printer.

**Compound Interest**. See INTEREST.

**Comprador** (Portug., 'buyer'), a Chinese employed by Europeans as intermediary in business dealings in China, and as head of their native staff.

**Compressed-air Bath**, a strong chamber of riveted iron plates in which two or more persons can sit, and into which air is driven to any required pressure. The inflow of fresh and the escape of foul air are regulated by valves. Another appliance for using either compressed or rarefied air consists of a mask tightly covering mouth and nose, and connected by a tube and suitable valves with some form of air-cistern in which the pressure can be varied as desired. By this appliance patients can inspire either compressed or rarefied air, or can breathe out into either of these. Treatment by *Aerotherapeutics* has long been a favourite study, but the results have varied much, and have lacked exactness. The general effects of compressed air are to lessen the frequency of the movements of the chest, and of the heart or pulse beats, while allowing the absorption of more oxygen, and increasing the blood-tension. Rarefied air produces the opposite effects. Many diseased conditions, therefore, should benefit by this treatment, especially asthma, chronic bronchitis, and catarrh under compressed air; while in the treatment generally we have a useful system of lung gymnastics, which increases the power of the respiratory muscles and the vital capacity of the lungs.

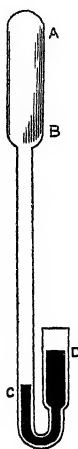

**Compressed-air Motors**. One mode of employing air as a motive power has been described under AIR-ENGINE (q.v.). Another obvious way is to compress the air and then apply it in the manner of high-pressure steam. But the great loss of power, due principally to the dissipation of the heat which results from the high compression of the air, will always render the employment of such a motive power very wasteful. There are, however, many conditions under which the use of compressed air is convenient and advantageous. The air-gun, although more a toy than a useful weapon, is one of the oldest examples of a compressed-air motor. Partly by compression and partly by exhaustion of air, pneumatic tubes are worked in connection with central post-offices for the transmission of letters and messages to and from various districts in large cities. In boring in mines, and in blasting and tunnelling operations, compressed air is an exceedingly useful agent, the power being easily carried by tubes into confined areas where the air when liberated, after it performs its primary duty, is of great value for aiding the ventilation of the spaces (see BORING). In the application of automatic brakes to passenger trains.

compressed air has also been found to be the most convenient power (see BRAKES). Air compressed and stored in a reservoir under the vehicle has also been employed as a motive-power for tiamway-cars. In a different direction the agency of compressed air is important in the artificial production of cold for chilling-houses for meat-preservation on land, and for frozen-meat chambers for preserving fresh meat on board vessels (see REFRIGERATION).

**Compression and Compressibility.** When a body is subjected to the action of any force which causes it to occupy less volume, it is said to be compressed, and the diminution of volume is termed *compression*. The term *compressibility* is frequently used to signify that property of bodies whereby they yield to that particular form of stress known as pressure; but more strictly it is employed to denote the measure of this property as possessed by different substances. Under the same pressure it is obvious that the same volume of various substances will diminish by different amounts; and, to measure this change, the *compressibility* is defined to be the ratio of the amount of compression per unit volume to the compressing force applied. It thus may be determined by measuring the amount of compression of a known volume when under a certain pressure; dividing this by the product of the original volume and the pressure gives the average compressibility (per unit pressure) of the substance throughout the range of pressure employed. The unit of pressure generally used is *one atmosphere*, which is defined in this country as being the weight of a column of mercury, one square inch in section, 29·905 inches in height, at the temperature of 0° C., and weighed at sea-level in the latitude of London. Its actual value in pounds-weight per square inch is nearly 14·7; so that 152·3 atmospheres of pressure is equivalent to a pressure of one ton per square inch.

In gases the relation between pressure and volume is given by Boyle's Law (see GASES)—viz. the volume of a given mass of gas is inversely proportional to its pressure. From this it follows that the compressibility is inversely proportional to the pressure—i.e. the diminution of volume due to a given increment of pressure is correspondingly small as the pressure is great. The behaviour of a gas under pressure is closely related to the proximity of its temperature to the critical point (see CRITICAL TEMPERATURE); for if below this temperature the gas can, and if above it, cannot be liquefied by pressure alone. It is only since 1877 that liquefaction has been effected in those gases formerly termed permanent.

From the first attempts to compress liquids it was concluded that they were incompressible, but Canton in 1762, by a comparatively simple experiment, showed that the compressibility of water though small is quite appreciable, and that it is less at higher than at lower temperatures. The measurement of the compressibility of liquids is usually made in a glass vessel (see fig.) termed a piezometer. A tube, ABCD, open at one end, D, is bent upon itself between C and D, widened at one end into a cylindrical bulb, AB, and at the other into a cistern, D. The liquid experimented on fills the bulb and stem to C, from which point to D, mercury fills the tube. On the surface of the mercury at C an index floats. The instrument is placed in a larger and much stronger vessel containing water to which pressure (measured by an attached gauge) is applied. The contents of the piezometer being

thus compressed, the mercury column ascends in the stem, and when the pressure is relieved the index is left at that point to which the mercury rose under the highest pressure applied. The actual amount of compression, and the original volume, as well as the pressure, being known, the compressibility can be thereby calculated, a correction being finally added for the compression of the glass piezometer itself. From experiments made with such apparatus, the following conclusions (see *Report on some of the Physical Properties of Fresh Water and Sea-water*, by Professor P. G. Tait; *Challenger Expedition Commission Reports*, Physics and Chemistry, part iv.) seem now to be well established regarding the compressibility of liquids, more especially of water. The compressibility of water decreases as both the temperature and pressure are raised; under moderate pressures (e.g. one or two atmospheres) it has a point of minimum value about 60° C., while its actual value at 10° C. and at a pressure of one ton per square inch is very nearly  $\frac{1}{100000}$ . Sea-water is less compressible than fresh water; the ratio of the compressibility of the former to the latter being ·915. Solutions of common salt are less compressible as they are stronger; the compressibility falling off uniformly with increased strength. Both sea-water and salt solutions diminish in compressibility with temperature and pressure in the same manner as fresh water. It has also been proved that the maximum-density point of water is lowered by pressure; the actual amount of this lowering being 3°·1 C. per ton—i.e. water under a pressure of one ton per sq. in. has its maximum density point at 0° 9, instead of at 4°, as under ordinary atmospheric pressure.

The compressibility of solids is generally very much smaller than that of either liquids or gases. It is best measured by noting the shortening of a rod or fibre of the material tested while subjected to hydrostatic pressure; the linear compressibility thus obtained is, approximately, one-third the cubical compressibility. For glass it is ·00000265 per atmosphere.

**Comptometer.** See CALCULATING MACHINE.

**Compulsion.** The effect of compulsion on the validity of obligations and payments, and on criminal responsibility, is noticed under CONTRACT, CRIME, FORCE AND FEAR, and DURESS.

**Compurgators** were twelve persons whom Anglo-Saxon law permitted the accused to call in proof of his innocence, and who joined their oaths to his. They were persons taken from the neighbourhood, or otherwise known to the accused. It was rather in the character of witnesses than of jurymen that they acted, though the institution has been spoken of as the Anglo-Saxon jury; what they swore to was not so much their knowledge, as their belief. The number of compurgators varied with the rank of the parties and the nature of the accusation, but was usually twelve. The system of compurgators was adopted even in civil actions for debt. Compurgation, which was a custom common to most of the Teutonic races, fell into disuse after the Conquest; but the ceremony of what was called canonical purgation of clerks—convict was not abolished in England till the reign of Elizabeth. See JURY.

**Comrie**, a pleasant and sheltered village of Perthshire, on the Earn, 7 miles W. of Crieff. It has often been visited by earthquakes, notably in October 1839, January 1876, and April 1921. These are apparently due to its geological position on the great line of fault between the Highlands and the Lowlands. Here George Gilfillan was born in 1813.

**Comstock Lodge**, a lode of silver and gold to

which Virginia City (q.v.), Nevada, owed its prosperity. Discovered in 1859, the lode, with its rich pockets or bonanzas, yielded at times over \$10,000,000 annually, and as much as \$38,000,000 in 1877. Its yield from the beginning to 1890 was \$340,000,000, but since then it has fallen off, and with it the population of Virginia City. The shaft is 3500 feet deep, but work is now confined to the upper levels, the workmen having been driven from the depths by an influx of hot water (170° F.).

**Comte**, AUGUSTE, the founder of Positivism (q.v.), was born 19th January 1798, at Montpellier, where his father was treasurer of taxes. At the Lycée of his native place he was distinguished equally for his aptitude for mathematics and his resistance to official authority, characteristics which did not desert him on his entering the École Polytechnique at Paris in his seventeenth year. Here he took the lead in a protest of the students against the manners of one of the tutors, and was expelled, after a residence of two years had obtained recognition of his abilities from the professors. A few months were spent with his parents, and then Comte returned to Paris, where for a time he made a scanty living by teaching mathematics. It would seem that, some years before, he had completely freed himself from the influence of all existing social and religious theories, and a reforming zeal was beginning to possess his mind, when in 1818 he came into contact with St Simon, by whom his inclination towards the reconstruction of thought and life was confirmed and strengthened. A definite relation was established between them, by which Comte remained for six years the disciple and collaborator of the older thinker; but there gradually became apparent a disagreement of aim and method, and the necessity felt by Comte of asserting the independence of his own conceptions led to a violent rupture. In 1825 Comte married, but the union proved unhappy, and after seventeen years of intermittent discord, ended in a separation. In the following year Comte began a course of lectures in exposition of his system of philosophy, which was attended by several eminent men of science, but the course was soon interrupted by an attack of insanity, which disabled the lecturer for a few months. His labours were afterwards resumed, and the six volumes of his *Philosophie Positive* was published at intervals between 1830 and 1842, during which period his livelihood was chiefly obtained from the offices of examiner and tutor in the École Polytechnique. After these positions were taken from him, owing to the prejudices of his colleagues, he resumed the private teaching of mathematics, but in his later years he was supported entirely by a 'subsidy' from his friends and admirers. In 1845 Comte became acquainted with Clothilde de Vaux, and until her death within a year afterwards, a close intimacy was maintained between them. On Comte's side it was a passionate attachment, the purity of which was happily preserved, and its influence is clearly shown in his later works, especially in the *Politique Positive*. Comte died in his sixtieth year on 5th September 1857, and was buried in the cemetery of Père-la-Chaise. His system is expounded in the article POSITIVISM.

Comte's principal works were *Cours de Philosophie Positive* (6 vols. Paris, 1830-42; freely translated into English, and condensed by Harriet Martineau, 2 vols. 1853), *Traité Élémentaire de Géométrie Analytique* (1843), *Traité d'Astronomie Populaire* (1845), *Discours sur l'Ensemble du Positivisme* (1848), *Système de Politique Positive* (4 vols. 1851-54; trans. 1875), and *Catholicisme Positiviste, ou Sommaire Exposition de la Religion Universelle* (1852; trans. 1858). Comte's *Testament* was published in 1884, his *Correspondance Inédite* in 1903-4. See books by Dr J. K. Ingram, H. D. Hutton, H. Gruber, G. Deherme (1909), and W. Ostwald (1914); and works cited at POSITIVISM.

**Comus**, in later antiquity, a divinity of festive mirth and joy, represented as a winged youth, sometimes drunk and languid as after a debauch, or slumbering in a standing posture with legs crossed. Comus thus became the representative deity of riotous merry-making, of tipsy dance and jollity, and as such figures in Milton's noble poetic tribute to chastity, the mask of *Comus*; though here the poet, as elsewhere, has devised his own mythology, and made him the child of Bacchus and of Circe, 'much like his father, but his mother more.'

**Comyn**, CUMMING, or CUMYN, a family which rose to great power and eminence in England and Scotland. It took its name from the town of Comines, near Lille, on the frontier between France and Belgium. While one branch remained there, and in 1445 gave birth to the historian Philippe de Comines (q.v.), another followed the banners of William of Normandy to the conquest of England. In 1069 the Conqueror sent Robert of Comines, or Comyn, whom he created Earl of Northumberland, with 700 horse to reduce the yet unsubdued provinces of the north. He seized Durham, but had not held it for 48 hours when the people suddenly rose against him, and he perished in the flames of the bishop's palace, leaving two infant sons. The younger, William, became Chancellor of Scotland about 1133, and nine years later all but possessed himself of the see of Durham. The chancellor's grandnephew, Richard, inherited the English possessions of his family, and acquired lands in Scotland. By his marriage with Hexilda, the granddaughter of Donald Bane, king of the Scots, he had a son William, who was Great Justiciary of Scotland, and about 1210 became Earl of Buchan by marrying Marjory, daughter and heiress of Fergus, the last Celtic Earl of Buchan. Their son, Alexander, Earl of Buchan, married Isabella or Elizabeth, second daughter of Roger de Quenci, Earl of Winchester, and with her acquired the high office of Constable of Scotland, with great estates in Galloway, Fife, and the Lothians. By a previous marriage with a wife whose name has not been ascertained, William Comyn was father of Richard—whose son John (Red John Comyn) became Lord of Badenoch—and of Walter, who by marriage became Earl of Menteith, and was one of the guardians or regents of Scotland during the minority of Alexander III. Through other marriages the family obtained, for a time, the earldoms of Angus and Athole, so that, by the middle of the 13th century, there were in Scotland 4 earls, 1 lord, and 32 belted knights of the name of Comyn. Within seventy years afterwards this great house was so utterly overthrown that, in the words of a contemporary chronicle, 'there was no memorial left of it in the land, save the orisons of the monks of Deer' (founded as a Cistercian monastery by William Comyn, Earl of Buchan, in 1219). The Comyns perished in the memorable revolution which placed Bruce on the throne of Scotland. Their chief, Black John Comyn, Lord of Badenoch, great-grandson of William, Earl of Buchan, had, in 1291, been an unsuccessful competitor for the crown, as a descendant of the old Celtic dynasty through the granddaughter of King Donald Bane. His son, also called Red John Comyn, was one of the wardens of Scotland, and distinguished himself by his gallant resistance to the English. Suspected by Bruce of betraying him to Edward, Comyn fell under Bruce's dagger, before the altar of the Franciscan friars at Dumfries in 1306; and his kindred went down, one after another, in the struggle to avenge him. John Comyn, Earl of Buchan, the son of Alexander and Isabella de Quenci, was defeated by Bruce in a pitched battle, near Inverury, in 1308, when his earldom was wasted with such relentless severity, that—we are told by the poet

who sang the victories of Bruce—for sixty years afterwards men mourned the desolation of Buchan. Such of the Comyns as escaped the sword found refuge, with their wives and children, in England, where, although they were so poor as to be dependants on the bounty of the English court, they married into the best families, so that, in the words of Mr Riddell, 'their blood at this day circulates through all that is noble in the sister kingdom.' See M. E. Cumming-Bruce, *Family Records of the Bruces and the Comyns* (Edin. 1870).

**Conacre** is the custom of letting land in Ireland in small portions for a single crop, the rent being paid either in money or in labour.

**Conant**, THOMAS JEFFERSON, D.D., American biblical scholar, born in Brandon, Vermont, in 1802, graduated at Middlebury in 1823, and filled chairs of Languages in various colleges, dying on the 30th April 1891. In 1856 he published a translation of the book of Job, and in 1857 he was appointed by the American Bible Union to revise the Scriptures. On this work he was engaged until 1875, and he was also a member of the American committee of the Old Testament Company who prepared the revised version. His translations of Gesenius' Hebrew grammar have been standard text-books, and his other works include critical English versions of both Old and New Testament books.

**Concan.** See KONKAN.

**Concarneau**, a village of Brittany, on the east coast of Finistère, 15 miles by rail SE. of Quimper. Its inhabitants are largely engaged in the sardine-fisheries and in pisciculture.

**Concealment** is a technical expression in the criminal law of both England and Scotland; as in concealment of pregnancy and birth, concealing treasure-trove, concealing ore from a mine, concealment by a seller from a purchaser of any instrument material to the title with intent to defraud, &c. The concealment of another's crime may expose to a charge of misprision, or it may amount to a charge of accessions after the fact—e.g. where the body of a murdered person is concealed. In bankruptcy, concealment of debtor's property is a serious offence. In civil transactions, but especially in particular contracts, such as insurance and suretyship, where a high measure of good faith is expected, the concealment of a material fact may often invalidate an obligation.

**Concealment of Birth.** See BIRTH.

**Concepción**, (1) a province of Chile, stretching from the Andes to the coast north of Arauco. It is an important agricultural and cattle-raising district, and has valuable coal-mines. Area, 3500 sq. m.; population, 250,000.—CONCEPCIÓN, the capital, near the mouth of the Biobío (crossed by a viaduct 5700 feet long), is a regular and handsome town, although it has suffered severely from earthquakes. Its cathedral, Palace of Justice, and hospital are noteworthy; and its port, Talcahuano, on Concepción Bay, is the safest and best harbour in all Chile, and ranks next to Valparaíso as a mart of foreign trade. Pop. 66,000.—(2) CONCEPCIÓN DEL URUGUAY, the former capital of the Argentine province of Entre Ríos, on the Uruguay, 180 miles SE. of Paraná by the Entre Ríos Railway, with large slaughter-houses and active river-trade; pop. 10,000.—(3) CONCEPCIÓN, a town of Paraguay, on the Paraguay River, about 260 miles above Asunción, with trade in *maté*. The population, officially returned for 1917 as 15,000, includes the surrounding districts; the town itself has less than 4000 inhabitants.—(4) The name of several places in Bolivia, the largest being CONCEPCIÓN DE APOLOBAMBA, capital of Caupolicán, in the province of Beni, formerly a Franciscan mission. Its Indian popula-

tion cultivate coca and cacao, and collect medicinal barks from the surrounding forests.—(5) CONCEPCIÓN, a town of Mexico, 50 miles W. of Chihuahua, in the upper Yaqui valley, famous for its apples.—(6) CONCEPCIÓN DE LA VEGA, a town of San Domingo, 5 miles SE. of Santiago; pop. 9000.

**Concept.** See PSYCHOLOGY, IDEA.

**Conception.** See PREGNANCY, REPRODUCTION. The Immaculate Conception is the subject of a separate article. A special order of nuns, called 'Sisters of the Conception of Our Lady,' was founded in Portugal in 1484 by Beatrix de Sylva, in honour of the immaculate conception. It was confirmed in 1489 by Pope Innocent VIII. In 1489 Cardinal Ximenes put the nuns under the direction of the Franciscans, and imposed on them the rule of St Clara. The order subsequently spread into Italy and France.

**Conceptualism.** See NOMINALISM.

**Concert-pitch.** See PITCH.

**Concertina**, a musical instrument invented in 1829 by Sir Charles Wheatstone, the sounds of which are produced by free vibrating reeds of metal, as in the accordion. The scale of the concertina is very complete and extensive, beginning with the lowest note of the violin, G, and ascending chromatically for four octaves. Violin, flute, and oboe music can be performed on the concertina with good effect, and it has an extensive repertoire of music specially written for itself. Every sound in the scale is double, and can be produced either by pulling the bellows open, or by pressing them together. Concertinas are now made in Germany, but not so perfectly as in England. The keys in the German concertina are constructed on the same principle as those in the accordion, which play one note when the bellows are expanded, and another when contracted.

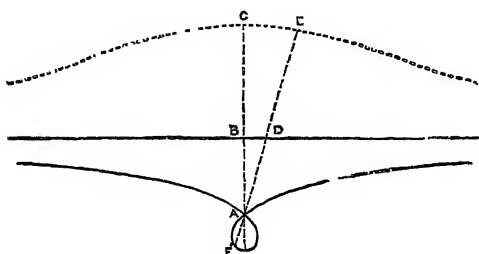

**Concerto**, a musical composition for a solo instrument, with orchestral accompaniments, calculated to give the performer an opportunity to display the highest mechanical skill, as well as intellectual cultivation in the art. The concerto consists of three movements, each of which, like the whole, has a certain character, and like the symphony or the sonata, to which it approximates in form, requires a clear development and treatment of the motives, and a strict adherence to the rules of form. A peculiar feature, usually introduced in the first movement, but frequently also in the last, is the Cadenza (q.v.). When the form is in any way abridged, it is then called a concertino. From the beginning of the last century to the present time, the pianoforte and the violin are the solo instruments mostly used for the concerto. The oldest violin concertos are those by Torelli, the first being published in 1686. The form was developed by Corelli, Tartini, Bach, and Handel, and reached its modern shape under Mozart, though some important modifications were introduced by Beethoven, whose violin concerto and pianoforte concertos are regarded as the highest achievements in this form. Concertos for wind-instruments have been less regarded, and are generally written by the performers themselves, and seldom deserve to be called classical works. Weber's clarinet concerto may be mentioned as one of the few exceptions. There are also concertos for various combinations of solo instruments, such as Bach's for two or more pianofortes, or Beethoven's for piano, violin, and violoncello.

**Conch** (Gr. *konchê*, 'a shell'), a marine shell, especially of the *Strombus gigas* (see STROMBUS); and, in art, a spiral shell used by the Tritons as a trumpet, and still used by some African peoples in war. The native whites of the Bahamas are called

'Conchs' from the commonness of the shells on their coasts. For the Indian conch, see CHANK-SHELL.

**Conchifera** (Lat., 'shell-bearing'), a term applied by Lamarck to bivalve molluscs and the very different Brachiopods (q.v.), but now rarely used.

**Conchoid** (Gr., 'shell-like,' from the shape), a plane curve invented to solve the problem of trisecting a plane angle, doubling the cube, &c. Given any straight line and a point without it, we can describe two companion curves which are dissimilar, but have the straight line as their common Asymptote (q.v.) between them. Thus both branches extend in either direction to infinity, and can never meet though continually approaching each other. The conchoid is obviously symmetrical with respect to the straight line drawn perpendicular to the given line from the given point. This curve has been utilised in architecture to give a waving outline to tapering columns. Through A the fixed

point draw any line ADE, measure DE and DE' each = BC, then E and E' trace the two branches of the conchoid. When BC = BA, there is a cusp at A; when BC is greater than BA, the inferior branch has a loop as in the figure.

**Conchology**, that branch of natural history which deals with the shells of molluscs. From the time of Aristotle the beauty and variety of these structures have made them favourite objects of study, and few zoological subjects have excited so much popular enthusiasm. The study often became unscientific, and sometimes a craze, as when extravagant sums were paid for rare forms of no particular beauty or interest. Since the shells are only external coverings, and were seldom considered in relation to their tenants, or in connection with the internal and external influences to which they owe their shapes, conchology has been somewhat barren of scientific results. It is, however, possible that with the accumulation of knowledge in regard to the constitution and conditions of molluscs, the study of their shells may come to have fresh scientific interest and dignity. See BIVALVES, MOLLUSCA, SHELLS, &c.

**Concierge** is the French name for a janitor of a house, hotel, or public buildings, who in many Continental towns where the people live largely in flats exercises important supervision over all who pass his *conciergerie*. The famous Paris prison so called is part of the Palais de Justice. See PARIS.

**Conciliation Boards** for the settlement of trade disputes consisted till 1896, whether permanent or for a special purpose, of representatives of employers and of workmen. The passing of the Conciliation Act of 1896 empowered the Board of Trade to make inquiries, promote arrangements, and, if desired, appoint an arbitrator to act with representatives of the two parties. See ARBITRATION, TRADE UNIONS.

**Conclave.** See POPE.

**Concord**, capital of New Hampshire, U.S., on the Merrimac River, 73 miles NNW. of Boston by

rail. It extends two miles along the river, with wide streets, and contains a fine granite state-house and other public buildings. Its quarries of white granite are celebrated; and with abundant water-power, it has manufactures of cotton, woollen, leather, and wooden goods, machinery, carriages, organs, &c. Pop. 22,000.

**Concord**, a town of Massachusetts, in the county of Middlesex, 23 miles by rail NW. of Boston. It is the seat of a large prison and reformatory. As early as 1767 the people of Concord opposed the measures of the British government, and in the revolutionary war a skirmish took place here, 19th April 1775. The place is notable as having been the home of Emerson, Hawthorne, Thoreau, and other men of letters. Pop. 6500.

**Concord**, a city and capital of Cabarrus county, North Carolina, 21 miles NE. of Charlotte. It has foundries and extensive manufactures of cotton. Pop. 10,000.

**Concord**, in Music. See MUSIC.

**Concordance** (Low Lat. *concordantia*), originally a system of harmonising things that differ or appear to differ. Thus there is a concordance of the Gregorian and Julian calendars, and of passages in the Bible that do not seem to agree. Subsequently it came to be used for a book arranged so as to form an alphabetical index of all passages, or at least of all the more important words in any work. For writings of universal import, from which passages are continually being adduced to prove or support principles affecting our daily life and action, such a handbook is indispensable. The necessity of a concordance for the Bible seems to have been felt at an early period. The first regular concordance of the Vulgate was made about 1244 by Hugo de Sancto Caro, with the assistance of many other Dominican monks. This work was frequently printed (e.g. Lyons, 1540, 1531), and led to Hugo's division of the Bible into chapters being universally adopted. Amended editions were prepared by Arlotto de Prato (about 1290), and (in the 14th century) by Konrad of Halberstadt. Concordances to the Vulgate were published at Basel in 1521 and 1561, by Rob. Stephanus (Paris, 1555), by Fr. Lucas (Antwerp, 1617), and by the Abbé F. P. Dutripon (Paris, 1838). A Greek concordance of the New Testament and Septuagint was prepared by Euthalius of Rhodes about the year 1300, but has been lost. Concordances of the Septuagint were compiled by Conrad Kircher (Frankfort, 2 vols. 1607), by Abraham Fromm (2 vols. Amsterdam, 1718) and by Dr Hatch (6 parts, 1889-92). Xystus Betuleius published in 1546 the first printed concordance of the Greek New Testament, which was republished and amended by Stephens (Paris, 1594; Geneva, 1600). A better concordance was compiled by Erasmus Schmidt (1638), whose work, as revised and enlarged by Bruder (1842; new ed. 1880), is now of standard value. An abridgment was issued by Schmoller (1869). The first Hebrew concordance was drawn up by Rabbi Isaac Nathan about 1438, and by Johann Buxtorf (edited by his son Johann Buxtorf, Basel, 1632). On the work of Buxtorf the later concordances of J. Fürst (1840), Bernhard Bar (1861 et seq.), and Davidson (Lond. 1876) are based. The chief concordances for Luther's Bible are those of Lankisch (1718), Büchner (1740; 17th ed. 1885), Beck (1770), Wichmann (1782), Schott (1827), Hauff (1828), Bernhard (1850). The first concordance of the New Testament in English was by Thomas Gybson (Lond. 1835), and of the whole Bible in English by John Marbeck (1550). The best known of the numerous concordances for the authorised English version of the Bible was compiled by Alexander Cruden, and first published in 1737 (3d ed. with his

corrections, 1769); Dr R. Young's (1864) and Rev. J. B. R. Walker's (1894) are more recent. The *Englishman's Hebrew and Greek Concordances* (1860) deserve mention. The first Concordance of the Koran appeared at Calcutta in 1811, but was superseded by that of Flügel (1842). The *Complete Concordance to Shakespeare*, compiled by Mrs Cowden Clarke (1845; new ed. Lond. 1881), and that by John Bartlett (1894) are admirable. More or less complete concordances have also been prepared to some of the classical authors, to Dante, Petrarch, Chaucer, Pope, Milton, Gray, Cowper, Burns, Shelley, Wordsworth, Tennyson, and other poets.

**Concordat**, usually an agreement made between the pope, as the head of the Roman Catholic Church, and a secular government, on matters which concern the interests of its Roman Catholic subjects. Such concordats may take either of two forms. The pope may, after consultation with the government in question, issue a bull regulating the affairs of the Roman Catholic Church in the country, the contents of the said bull being afterwards ratified by the government and incorporated in the law of the land. Or again, a formal treaty may be drawn up and signed by plenipotentiaries on both sides. Various theories have been held on the obligation of such contracts. Secular jurists have denied that they impose any real obligation on the state, which may annul them at pleasure. Extreme Ultramontanes, on the other hand, have regarded concordats as privileges which the pope grants for the time without entering into any contract properly so called, while the more moderate of Roman canonists recognise a contract binding both sides. As a matter of fact, no modern government can engage that its stipulations with the pope will be respected by its successors in office. Thus the Austrian concordat was secured by the clerical party in 1855 and swept away by their opponents in 1870. The concordat re-establishing the church in France after the Revolution was concluded by Napoleon (as first consul) and Pius VII. in 1801, and was in force till the separation of church and state in 1905.

**Concordia**, a town of the Argentine state of Entre Ríos, on the Uruguay, 302 miles N. of Buenos Aires by river. It has a custom-house, and a river-trade exceeded only by that of Buenos Aires and Rosario, exporting salted meat and Paraguay tea. It has railway connection with Paraná, Uruguay, and South Brazil. Pop. 20,000.

**Concordiæ Formula.** See AUGSBURG CONFESSION, CONFESSIONS, CHEMNITZ (MARTIN).

**Concrete.** There is but little difference between concrete and coarse mortar. The mortar used in the masonry of castles and churches erected during the middle ages is in fact a concrete with small pebbles instead of the larger ones used in modern concrete. Any mixture of lime, sand, and water, with broken stones or bricks, bits of slag, gravel, or other hard material, is called a concrete. The hard lumps are termed the *aggregate*, and the mortar in which they are embedded is called the *matrix*. The mixture varies with the nature and quality of the materials, but it often consists of 1 part of quicklime, 2 of sand, and 5 of gravel. It is better to use such a material as broken stone rather than water-rolled gravel, which has often too smooth a surface. Lime concrete, as the kind above described may be termed, is used principally for foundations, that is, a thick bed of it is formed below the lowest course of stones or bricks in walls, in cases where the ground itself is not sufficiently firm and solid.

The Hennebique and other methods of 'reinforced concrete' for building purposes are very extensively used in America, and are rapidly growing in favour

in Britain. A framework of steel bars arranged to give strength where most required is embedded in concrete, and the whole building forms one complete solid mass. The steel gives the concrete the tensile strength which it does not itself possess, while the concrete provides the other elements of strength wherein the steel is lacking.

Portland cement concrete is made either by mixing it with gravel alone, or more generally by using the cement along with sand and broken stones, as in the very similar concretes used at Portland Breakwater Fort and at Cork Harbour (cement, 5 cubic ft.; sand, 10 ft.; broken stones, 28 ft.; water, 23½ gallons); but considerably different proportions are also employed. Portland cement being the binding material in this concrete, the question arises whether there is sufficient experience of its durability, especially where it is exposed to the action of sea-water, to warrant its employment in structural works of great or even of moderate size. See CEMENT.

Concrete made of the hydraulic lime from Teil in France, which contains 66 per cent. of silicate of lime, has been employed in the construction of breakwaters and similar works at Cherbourg, Marseilles, and other places. The Teil hydraulic lime is one of the strongest known, and the concrete made with it has resisted the action of sea-water for many years. Ordinary lime concrete does not set under water.

A concrete is made of broken stones and tar, or, better, bitumen or asphalt; and either may be hardened by the introduction of dried and pounded lime, clay, or brick-dust. The solid materials should be heated. For backing armour-plates in forts a concrete of cast-iron turnings, asphalt, and pitch has been used; and for piers, gravel mixed with a thirtieth part of iron borings.

Of late, reinforced concrete has been used as a material for building ships. At first small craft only were made of it, but sizes have increased with growth of experience and confidence.

**Concrete**, a term in logic opposed to *abstract*. A *concrete* notion is the notion of an object as it exists in nature, invested with all its qualities, as any particular flower, leaf, or tree; an *abstract* notion is the notion of any attribute of that flower, leaf, or tree, such as its colour, form, or height; qualities which may be thought of independently of the objects in which they inhere, though they cannot so exist.—The abstract method of handling a subject is adapted to speculation and reasoning; the concrete, to poetic effect and impressive illustration.

**Concretion**, in Medicine, a formation of solid unorganised masses within the body, either by chemical precipitation from the fluids, or by the accidental aggregation of solids introduced into the system from without. In the former case, a concretion is termed a Calculus (q.v.); in the latter, the concretion may be either wholly composed of solids foreign to the body, or these may be mingled with the elements of the secretions, as with mucus, or calculeous matter. Thus beans, peas, needles, &c., introduced into the cavities of the body, have become the nuclei of concretions, by attracting around them mucus, or crystalline deposits from the urine. The most remarkable forms of concretion, however, are perhaps those formed in the stomach and intestines of man and the lower animals, from the more solid and indigestible parts of the food, or of substances improperly swallowed. Thus, young women have been known to acquire the habit of swallowing their own hair to a great extent; and very large concretions have been thus formed, which have proved fatal, by obstructing the passage of food. The

use of oatmeal in large amount has also been found to lead to concretions, especially when eaten coarsely ground and unboiled; such concretions have commonly been found in the intestines. The excessive domestic use of magnesia in the solid form as a laxative has been known to have a similar effect. In certain animals, intestinal concretions are not uncommon, and grow to an immense size; they used to be greatly prized as antidotes, and were used in medicine under the name of Bezoars (q.v.). In certain forms of morbid deposits, such as fibrous tumours (see TUMOUR), and in Tubercle (q.v.), concretions not unfrequently form; they are for the most part composed of phosphate and carbonate of lime.

**Concretionary Structure** is a condition in rocks produced by molecular aggregation subsequent to the deposition of the strata, whereby the material of the rock is formed into spherules or balls, as in the concretions of magnesian limestone and the somewhat similar structures occasionally seen in certain tuffs and crystalline igneous rocks. *Concretions* are nodules, balls, or irregular masses of various kinds which occur scattered through the body of a rock, and consist of mineral matter which was formerly diffused through the material of the rock. Some of these concretions are crystalline, as gypsum in clay; others may be spherical, and have an internal radiating structure, as iron-pyrite in shale. Fantastically shaped concretions are not uncommon in certain fine clays; such are the 'fairy-stones' of the country people here, and the 'loss-puppen' of Germany.

**Concubinage**, the state of cohabitation of a man and woman without the sanction of a formally legal marriage. We find examples in the Old Testament, showing that it was permissible as a relief from a childless marriage. The Roman *concubinatus* was a permanent relation affording freedom from many of the severe marriage restrictions of the civil law. It was a perfectly respectable arrangement, and the woman had a footing in law, although a less dignified position socially than a wife. The offspring, called natural children, came to have limited rights of succession, and could be completely legitimated by subsequent marriage. Augustus, with a view to promote regular marriages, and check the growing licentiousness, enacted a comprehensive marriage-law (*Lex Julia et Papia Poppæa*), which confined concubinage to women of low rank and those who had lost their station. Christianity required the complete sanctity of marriage, although the civil law long continued to tolerate separation at pleasure. In the Eastern empire concubinage was entirely prohibited by the Emperor Leo. The ancient laws of the Germans recognised, along with regular marriage, a similar informal connection of the sexes still not unknown as Morganatic Marriage (q.v.). The *barragania* of medieval Spain and the *hand-fasting* of our own ancestors were merely forms of concubinage. See CELIBACY and MARRIAGE.

**Concurrent** is a technical term for the person who accompanies a sheriff's officer as witness or assistant.

**Concussion of the Brain**, in Medicine, is one form of Shock (q.v.)—that, namely, where the symptoms are due to an injury which has shaken or jarred the brain, and stunned the patient, without producing any mechanical injury, so far as can be ascertained, to the brain or skull. It is generally believed that concussion alone can produce severe symptoms and even death, though conclusive proof of this has not yet been given. It is apt to occur from a severe blow or fall on the head, from railway accidents, from the bursting

of a shell, &c. The symptoms are those which characterise shock—pale and cold skin, feeble pulse and respiration, with the addition of unconsciousness. This condition may last a few minutes, or it may in severe cases be prolonged for hours or days. But in most cases it is succeeded by a period of reaction after an hour or more (often ushered in by vomiting, which is thus a favourable symptom), when the skin becomes warmer, the pulse stronger, and consciousness gradually returns. Recovery is usually complete; but sometimes loss of memory, weakening of mental power, undue excitability, or some other sign of impairment of the nervous mechanism, such as dumbness or paralysis of a limb, remains for a long time. In these cases particularly, when a patient is in receipt of compensation or pension, the mere thought that he will lose this if he gets better is a deterrent to recovery.

In regard to treatment, the patient should as quickly as possible be put to bed in a well-aired room, with warm bottles or blankets applied to the body and limbs, and should have injuries to other parts attended to; but beyond this, the less he is interfered with the better. In particular, brandy and other stimulants should on no account be given, except by medical direction, for, though occasionally necessary, they do much more harm than good in the great majority of cases. During the period of reaction the patient must be kept very quiet; and for a long time after apparent recovery he must abstain from alcohol and from excessive mental exertion.

**CONCUSSION OF THE SPINAL CORD** is due to similar causes acting upon the vertebral column instead of the head. The symptoms vary much with the site and severity of the injury. In many cases they are altogether absent or quite trivial at first, and only attract attention after some hours or days have elapsed; yet serious after-effects are rather more common than in cases of concussion of the brain. Here also, however, complete recovery is the rule. The treatment must be in the first instance the same as in concussion of the brain.

Concussion of the spinal cord has attracted special attention in recent times owing to its frequent occurrence as a result of railway accidents. The slow and insidious nature of the symptoms presented by many such cases, and the difficulty of deciding whether those symptoms are real, and whether they have resulted from the alleged injury, have given rise to much litigation with respect to damages. The subject is very fully treated by Erichsen, *Concussion of the Spine, &c.* (1875; 2d ed. 1882). See also SHOCK.

**Condé**, in the French department of Nord, situated at the confluence of the Haine and Scheldt, 7 miles NNE. of Valenciennes by rail, is a fortress of the third rank, and gives name to the famous family; pop. 6000.—CONDÉ-SUR-NOIREAU, a town in the department of Calvados, 23 miles SSW. of Caen by rail, has cotton-mills; pop. 6000.

**Condé**, LOUIS I. DE BOURBON, PRINCE DE, younger brother of Antony of Bourbon, king of Navarre, was born 7th May 1530, representative of an ancient and famous race taking their name from the town of Condé. During the wars between Henry II. and Spain, Condé distinguished himself by his gallantry, winning especial honour at the siege of Metz, the battle of St Quentin, and the capture of Calais from the English—the chief military events of the time. On the accession of Francis II. (1559), the family of the Guises became all-powerful in the state, and Condé and his brother Antony, partly from jealousy of the Guises, and partly from sincere religious conviction, joined the Huguenots, who were now

struggling for legal recognition. To destroy the power of the Guises, and further the interests of the Huguenots, Condé was induced to join the Conspiracy of Amboise (1560). The plot miscarried, and Condé escaped execution only by the death of the king, which by necessitating the regency of the queen-mother, Catharine de Medicis, the bitter enemy of the Guises, changed the policy of the country. Concessions were now granted to the Huguenots, and Condé was made governor of Picardy. The massacre of Huguenots at Vassy by Guise (1562), however, led to the first civil war, and Condé and Coligny gathered an army of Huguenots. At the battle of Dreux, Condé was defeated and taken prisoner, but the assassination of Guise soon afterwards made possible the Pacification of Amboise (1563), by which Condé was released, and the Huguenots were granted liberty of worship. This concession being gradually withdrawn by Catharine de Medicis, the second Huguenot war broke out in 1567. In the south of France Condé had coins struck with the inscription: 'Louis XIII., first Christian king of France.' But at the battle of Jarnac (1569) Condé was defeated and taken prisoner, and immediately after his surrender, shot dead by his bitterest enemy, the Baron de Montesquieu. Condé was a brave leader, and exceedingly popular with his soldiers, but he had neither the lofty character nor the genius of Coligny.—His great grandson,

**Condé, LOUIS II. DE BOURBON, PRINCE OF**, known as 'the Great Condé,' was born September 8, 1621. Carefully educated by the Jesuits in their college at Bourges, Condé acquired a taste for literature, which he retained all through his life. In his seventeenth year he was introduced at court, and the year following was intrusted by his father with his government of Burgundy. By his marriage, much against his will, to the niece of Richelieu, he gained the support of that minister, and for a time of Richelieu's successor, Mazarin. At this period the Thirty Years' War was still raging, and since 1635 France had been engaged in a protracted struggle with Spain. In 1643, when he was only twenty-two, Condé was appointed to the chief command of the French forces, and in his first campaign defeated the Spaniards at Rocroi in the most brilliant of all his victories. As for more than a century the Spanish armies had been deemed all but invincible, this victory placed Condé at once in the first rank of commanders. In 1644, with his great rival Turenne as his subordinate, in a series of engagements he inflicted at Freiburg a severe check on the Bavarian general, Mercy; and in the following year again defeated the same general at Nordlingen. These successes were gained at an immense cost of life, and in the matter of strategical skill have been disapproved by subsequent military authorities. By the death of his father in 1646, Condé, who had hitherto been known as the Duc d'Enghien, became the head of the house, and was thenceforth addressed as *Monsieur le Prince*. The capture of Dunkirk in 1646, and a great victory at Lens in 1648, in which the famous Spanish infantry were again completely beaten, were the other achievements of Condé during this the first period of his career. The war of the Fronde, occasioned by the quarrels of the court and the parliament, had now broken out, and Condé was required to support the power of the queen and Mazarin. With the aid of Condé the court party came to terms with the Fronde; but Condé himself, who after this service expected to be chief in the state, gave such offence to the queen and Mazarin by his arrogant conduct, that they had himself and his brothers arrested and imprisoned for a year at Vincennes, a proceeding approved alike by the Fronde and the people of Paris. Popular feeling,

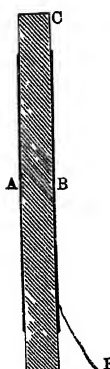

however, soon changed in his favour, and grew so strong against Mazarin that he was forced to leave Paris and set Condé at liberty. But Mazarin's power over the queen was still absolute, and Condé, disappointed once more in his ambition, and finding the queen, Fronde, and people once more all against him, retired to Guienne, and raised an army on the plea of rescuing the young king, Louis XIV., from bad advisers. Thus began what is known as the third war of the Fronde. At Bleneau he defeated the royal troops, but was at length forced by Turenne to make for Paris. Here in the Faubourg St Antoine he sustained a defeat which deprived him of all hope of ultimate success, and a peace was concluded in 1653. The terms of this peace, however, were such as Condé would not accept, and deprived of all support in France, he went over to Spain, and for six years served in all the campaigns against his country. Hampered in his action by the Spanish generals, he could effect little against the strategy of Turenne. The battle of the Dunes, near Dunkirk, where Turenne, aided by 6000 of Cromwell's Ironsides, inflicted a severe defeat on the Spaniards, put an end to the war. At the peace of the Pyrenees (1659) which followed, it was said that the affairs of Condé were more difficult to settle than those of Europe. So formidable was he deemed, that the young king found it advisable to restore him to all his honours and estates, and even to his government of Burgundy. Retiring to his estate at Chantilly, Condé remained here till his services were required in another war between France and Spain, when at his suggestion and by his action, Franche Comté was overrun and conquered (1668). The next year, on the resignation of Casimir, king of Poland, Condé would probably have been chosen his successor but for the jealousy of Louis. In 1674 he fought his last battle. This was at Seneffe in Belgium, where he had for his opponent William, Prince of Orange. The battle lasted seventeen hours, and both sides claimed the victory. On the death of Turenne in 1675, Condé succeeded him in the command of the army on the Rhine, but his health was now such as to render him unfit for active service. Retiring again to Chantilly, he lived there till his death on 11th December 1686, associating much with the great men of letters of the period, Molière, Racine, Boileau, and La Bruyère. Condé had all his life been noted as a scoffer at religion, but the year before his death he publicly announced his conversion. He took especial pleasure in the society of Bossuet, whose oration on his death, regarded as one of the masterpieces of French literature, has served ever since to throw a deceptive lustre round the name of Condé. He had no political genius, and even as a commander he owed his successes more to the fiery energy of his character than to sheer military talent. There is no ground to suppose that in his public career he was influenced by any other motive than selfish ambition; and in his private character, though he could on occasion display a certain magnanimity, he was in intense degree self-willed and overbearing. When all deductions have been made, however, Condé still remains in the first rank of the Frenchmen of his century.

See Mahon's *Life of Condé*, Fitzpatrick's *The Great Condé and the Period of the Fronde*; *Histoire des Princes de Condé*, by the Duc d'Aumale (7 vols. 1862-95); Miss E. Godley, *The Great Condé* (1915); and the *Mémoires* of Cardinal de Retz, Madame de Motteville, &c.

**Condenser** is an apparatus in which aqueous or other vapour is condensed into a liquid form either by the introduction of cold water, as in the condensing Steam-engine (q.v.), or as in distillation, by placing the condenser in another vessel, through which a current of cold water passes. When the water-supply is deficient at sea or on the

coast, salt water may be distilled and condensed. See DISTILLATION, GAS, WATER, RETORT.

The ELECTRIC CONDENSER is an apparatus consisting essentially of two parallel conducting plates, separated by a layer of non-conducting material or dielectric, employed to receive and retain quantities of electricity greater than either or both of the plates would do alone. The simplest and typical form of condenser is that which was first used by Franklin. It is simply a sheet of glass, C (see fig.), both sides of which, excepting a margin at

the edges, are covered with tinfoil, A and B. To charge such a condenser, one of the sheets of tinfoil, say B, is connected with the ground, E (either by some metallic connection or by being placed on the hand of the experimenter), while the sheet, A, remains insulated. If A be now charged with electricity, positive for example, a negative charge is induced on that side of B nearer A, while an equal quantity passes to the ground. Increasing the charge in A induces a corresponding increase in B. This process, although by means of it large quantities of electricity may be accumulated, cannot go on indefinitely; for on reaching a certain limit, depending on the dimension,

&c. of the apparatus, the nature of the dielectric used, and the difference of potential of the two conducting plates, either a *disruptive discharge* (see ELECTRICITY) takes place, or the charge passes off through the insulating supports of the condenser.

All the various forms of condensers satisfy the definition given above. One useful form is that in which the two conducting plates are fixed on the ends of brass rods which pass through brass knobs on the tops of two glass pillars, the dielectric in this case being air. The more common form, however, is the Leyden Jar (q.v.). Another is made up of sheets of tinfoil and paraffined paper, placed alternately in layers; the first, third, fifth, &c. sheets of tinfoil are connected to one terminal, and the second, fourth, sixth, &c. to another.

The *capacity* of a condenser is defined to be that quantity of electricity with which one plate must be charged in order to raise its potential by one unit. It can be shown that, in the case of condensers of the Leyden jar form, the capacity is numerically equal to the product of the outer and inner radii of the coating, divided by the difference of the radii—i.e. is greater as that difference is less. Hence the thinner (within certain limits) the glass between the two coatings of such a condenser, the greater is its capacity.

**Condescendence**, in the judicial procedure of Scotland, is an articulate statement annexed to a summons, setting forth the allegations in fact upon which an action is founded.

**Condillac**, ÉTIENNE BONNOT DE MABLY DE, philosopher, was born of a noble family at Grenoble, 30th September 1715. His life was uneventful. As a child his delicate health delayed his progress in education; but in youth he numbered among his friends Rousseau, Diderot, Duclos, &c. Many of his works were composed for his pupil, the Duke of Parma, grandson of Louis XIV.; and he was titular Abbé de Mureau. He was chosen a member of the French Academy in 1768. He died on his estate of Flux, near Beaugency, on 3d August 1780.

A great part of the *Essai sur l'Origine des Connaissances Humaines* (1746), and nearly all the *Traité des Systèmes* (1749), are occupied with a

polemic against innate ideas and abstract systems. He expounds his analytic method in the *Logique* (1780) and the *Art de Raisonner* (part of the *Cours d'Etudes*, in 13 vols. 1755). The *Langue des Calculs* appeared in 1798.

In the *Traité des Sensations*, Condillac uses his analytic method to solve the problem of the origin of our ideas and the formation of the mental faculties. He divided philosophical systems into three classes—(1) Abstract systems, (2) hypothesis, (3) the 'true' system of Locke, which rests on the facts of experience. But in confounding sensation and perception, and endeavouring to base all thought on sensation, he departed from Locke, and became the founder of Sensationalism. To Condillac all reasoning is only a variation of the form of expression. He held that all ideas and mental operations are only transformations of sensation. So he was compelled to put into the primary sensation all that he sought to develop out of it. His curious device of the statue, gradually endowed with the various senses and mental faculties, was for the purpose of isolating sensations. He substituted for the Cartesian test of truth his own criterion of identity. He recognised three kinds of evidence—of fact, of feeling, and of reason; and he affirmed that the same method of analysis is common to all the sciences. Unlike his scholars and followers, the encyclopædists Diderot, D'Alembert, Holbach, Condillac was not a materialist. He was a strong believer in Free Trade. *Le Commerce et le Gouvernement*, published in 1776, treats economy as the science of exchanges, and has exercised much influence upon later economists.

The first of several editions of his *Œuvres Complètes* appeared in 1798. See monographs by Robert (1869), Dewaule (1891), Saltykow (1901), Lebeau (1903), and Baguenault de Puchesse (1910).

**Condiments**, or seasoning agents, include saline substances, such as common salt; acidulous bodies, such as acetic acid or vinegar; oily condiments, such as butter and olive-oil; saccharine substances, such as sugar and honey; and aromatic and pungent condiments, such as mustard, ginger, pepper, and pickles. See DIET.

**Condition** means in law a declaration or provision that upon the occurrence of an uncertain event a right shall arise or cease to exist. A condition on the occurrence of which a right is to arise is a condition precedent or suspensive. A condition on the occurrence of which a right is to cease to exist is a condition subsequent or resolutive. In the English law of contract a condition is to be distinguished from a warranty. A condition is a term in a contract, the breach of which gives the other party a right to treat the contract as at an end; a warranty, on the other hand, is a collateral agreement, breach of which merely entitles the other party to damages. Physically impossible and unlawful conditions in matters of contract annul the obligation to which they are annexed, but in questions under settlements and wills the opposite rule holds, and such conditions are ignored. Conditions in restraint of marriage are considered unlawful where they are absolute; but where, for example, a legacy is given on the condition that the legatee shall not marry a particular person or a person of a particular class, the condition is effectual. A potestative condition is the technical name for a condition in the power of one of the parties. It is an important doctrine of contract law that if a debtor does anything to prevent the accomplishment of such a condition, he becomes liable as if the condition had occurred. Many most important conditions are implied—e.g. in a marine policy that the ship is seaworthy. Similarly in contracts of sale, of lease, of employment, many

conditions are implied by law. Thus in a contract of sale it is an implied condition that the seller has a right to sell; in a sale of goods by description, that the goods shall correspond with the description; and in a sale by sample, that the bulk shall correspond with the sample in quality. Many questions have arisen as to the effect of conditions expressed, or referred to, on tickets issued by railway companies and other carriers. These questions for the most part turn on whether the party issuing the ticket has sufficiently brought its conditions to the knowledge of the person who took the ticket. In bankruptcy, dividends are set aside to meet conditional obligations.

Conditions of sale is the name used in England for what are called articles of roup in Scotland. These are generally printed along with the particulars of sale. Similarly, conditions are prefixed to catalogues of sales of furniture, books, or other articles.

**Condition**, in Logic, denotes that which must precede the operation of a cause. It is not regarded as that which produces an effect, but as that which renders the production of one possible—to some logicians, however, a distinction without a difference. For instance, when an impression is made on wax by a seal, the seal is said to be the *cause*; the softness or fluidity of the wax, a *condition*.

*The Philosophy of the Conditioned* was a phrase brought into use by Sir W. Hamilton to express the inability of the human mind to conceive or reason respecting the Absolute and the Infinite. Our thought, according to him, can only be of the *relative* and the *finite*, of which these terms are but the negations; relativity and finitude are the conditions under which the human intelligence operates. In one of his dissertations on this, he criticised and endeavoured to refute the opposite position as maintained by Cousin—a modification of the previous doctrine of Schelling—that 'the Unconditioned, the Absolute, the Infinite, is immediately known in consciousness, and this by difference, plurality, and relation.' Dean Mansel, in his Bampton Lectures (1858), brought Hamilton's doctrine into special prominence, and dwelt on the Relativity of Knowledge (q.v.) as a great fundamental law of the human mind.

**Conditional Immortality** is a tenet held by a theological school which denies the inherent immortality of the soul, and the consequent doctrines both of eternal misery and of Universalism (q.v.), as contrary to the teachings both of nature and revelation. Its advocates maintain that the Bible sets immortality before men as something to be sought after (Rom. ii. 7), as a divine gift offered on certain conditions (Rom. vi. 23; John, iii. 15, 16), and as a matter of hope and promise in the present life (Titus, i. 2); that this immortality is not a present possession (Mark, x. 30), and is to be realised by the assumption of a spiritual body at the resurrection of regenerate men from the dead (Luke, xx. 35, 36), an event synchronous with the second coming of Christ (1 Cor. xv. 51, 52). Divine testimony, no less than experience, they say, declares unequivocally that man has the same natural life as all other animals (Eccles. iii. 19), and only those who by faith and obedience are united to Christ have the promise of immortality. The Calvinistic doctrine of eternal misery is untenable, the punishment of sin being death or everlasting destruction, to be inflicted subsequent to a judgment after the Lord returns (2 Thess. i. 9, 10). The dogma of Universalism, the only alternative to endless torment if the soul *must* live for ever, is also, they maintain, unfounded, since the punishment of sin (death) is said to be everlasting, like the life which is the reward of the righteous (Matt. xxv. 46). It

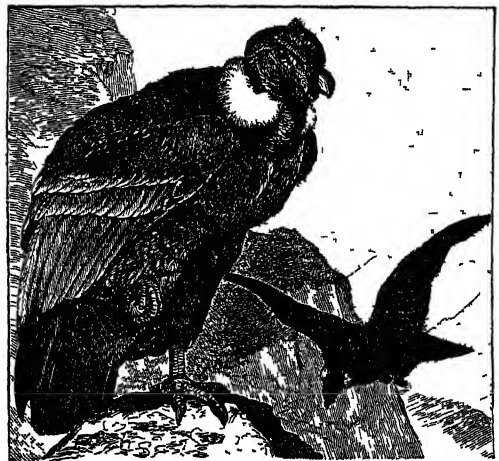

is claimed that a succession of eminent and pious men have upheld this doctrine from apostolic times, among whom may be mentioned Justin Martyr, Clement of Alexandria, Irenæus, &c.

Conditional immortality has received considerable impulse in recent years from many able and zealous advocates, notably the late William Leask, D.D., editor of the *Rainbow*, and Rev. Edward White. The Conditional Immortality Mission started in Britain in 1878 did much for the cause by means of lectures, publications, annual conferences, and a monthly organ. Many churches have been organised in Great Britain and America having conditional immortality as part of their doctrinal basis. Works on the doctrine—known also, especially in America, as annihilationism—are *Life in Christ* (1875), by Edward White; *The Life Everlasting and The Unspeakable Gift*, by J. H. Pettingell; *Hades and The Duration and Nature of Future Punishment*, by Henry Constable; *The Evolution of Immortality*, by S. D. McConnell (New York, 1901), expounds a cognate theory.

**Condom**, a town in the French department of Gers, pleasantly situated on a height above the confluence of the Baise and the Gèle, 20 miles SW. of Agen by rail. It has one fine church, once a cathedral; and was formerly the capital of the extensive Gascon district of *Condomois*, now included in the departments of Landes and Lot-et-Garonne. Bossuet was Bishop of Condom for a year (1669). Pop. 6000.

**Condonation**, in the legal phraseology both of Great Britain and the United States, means forgiveness granted by the injured party, and may be urged by the guilty party as a defence against an action of divorce on the ground of adultery. See DIVORCE.

**Condor** (*Sarcorhamphus condor* or *gryphus*), the great vulture of the Andes, one of the largest and most remarkable birds. Among the wide order of Accipitres, or Birds of Prey, the condor is the grandest representative of the family Cathartidæ,

Condor.

or New-World Vultures. These may be at once distinguished from Old-World forms by the incompleteness of the partition between the nostrils, by having, to put it more plainly, 'a hole through their nose.' The beak is also constricted at the end of the 'cere,' and the feathers have no 'after-shaft.'

Among these New-World vultures, the condor is chief. Though its size and strength have been often exaggerated, this magnificent bird is probably

the largest of the vultures. The only rival which could dispute this claim is the famous Lämmergeiger (*Gypactus barbatus*) of the Alps. The male condor may measure about 3½ feet in length; the female is slightly smaller. The expanse of each wing (said to be 15 feet from tip to tip) is more than twice the length. The general colour is black with a steel-blue sheen, and some of the feathers verge into gray; there is a downy white ruff round the dull-red naked neck. The young birds are covered with whitish down. The beak is long, hooked at the apex, black at the root, yellow at the point and on the sides. The head is naked, and in the male bird bears a large fleshy comb. The eyes look sideways; the 'perforated' nose is characteristic of the family. The voice is limited to a weak sort of snorting. The feet are not well suited for grasping, the hind-toe being very small and hardly reaching the ground. The stories about condors lifting their prey in their feet from the ground are mythical. These birds have their central home in the Andes, but extend to some other mountainous parts of South America. They breed on the heights, laying their two eggs on bare ledges in the months of November and December; the young are unable to fly for a whole year. They descend to the plains to feed on carrion, tearing carcasses with their strong bills; they may also attack lambs and calves, or several together may venture on an adult animal. Their boldness and voracity seem to have been exaggerated. Their voracity is, however, great: Tschudi mentions one in confinement at Valparaiso, which ate 18 lb. of meat in a single day, and seemed on the morrow to have as good an appetite as usual. The condors have great powers of flight, and can soar to immense heights, till, in fact, they are lost in or far above the clouds. They are readily kept in confinement, and may be seen in many zoological gardens.

In the same genus is the rarer King of the Vultures (*S. papa*), inhabiting the wooded plains of South and Central America. It is a smaller bird, reddish-yellow above, white beneath, with bluish-gray ruff, black quills and tail. Its head and neck are covered with variously coloured roughnesses. It owes its name to the way in which it bullies other vultures. Closely allied is the Turkey Vulture (*Cathartes aura*) of North America. This bird, useful as a carrion destroyer, is about 2½ feet in length, black in colour with a purplish sheen, well marked by its carmine and bluish-red head, fleshy neck, and white feet. *C. atratus* is another species from South America.

**Condorcet**, JEAN ANTOINE NICOLAS DE CARITAT, MARQUIS DE, an eminent French author, was born, the son of a cavalry officer, in Ribemont, near St Quentin, in the department of Aisne, on 17th September 1743. In childhood he breathed the closest atmosphere of clerical and aristocratic exclusiveness, with the result of making him in after-years the enemy of all privilege and a thoroughgoing sceptic. Condorcet, after distinguishing himself in the Jesuit school at Reims, began his mathematical studies at the age of thirteen, at the College of Navarre in Paris. His success was rapid and brilliant, and the high approval of Clairaut and D'Alembert determined his future. His *Essai sur le Calcul Intégral* (1765) won him a seat in the Académie des Sciences; he entered the French Academy in 1781. He took an active part in the work of the *Encyclopédie*. On the outbreak of the Revolution he made eloquent speeches and wrote famous pamphlets on the popular side, was sent by Paris to the Legislative Assembly in 1791, and in 1792 became president of the Assembly. He voted that the king should receive the most severe punishment except death, and as deputy for Aisne in the National Con-

vention, he voted usually with the Girondists. Accused and condemned by the extreme party, he found refuge in the house of a generous lady, Madame Vernet, for eight months; but driven to change his place of concealment, he was recognised and arrested. Imprisoned in the gaol of Bourg-la-Reine on the 7th April 1794, he was found dead the next morning, whether by disease or poison was never known.

His profession of faith, in a letter to 'Turgot, which was written when he left college at seventeen years of age, lays stress on moral sympathy as the source of all virtue. His constancy in moral principle was fitly associated with perfect consistency in politics. He raised a great commotion by his attempt to apply the calculus of probabilities in the domain of jurisprudence, and of the moral and political sciences. In his *Progrès de l'Esprit Humain*, written in hiding, he insisted on the justice and necessity of establishing a perfect equality of civil and political rights between the individuals of both sexes, and proclaimed the indefinite perfectibility of the human race.

See the biography by Arago prefixed to the complete edition of his works (1847-49, 12 vols.), books on him by Robinet (1895) and Cahen (1904), Morley's *Critical Miscellanies*, Comte's *Philosophie Positive*, Flint's *History of the Philosophy of History*.

**Condottieri** (Lat. *conducti*, 'hired'), the name given in the 14th and 15th centuries to the leaders of certain bands of 'free lances' or military adventurers who, for booty, offered their services to any party in any contest, and often practised warfare on their own account purely for the sake of plunder. These mercenaries were called into action by the endless feuds of the Italian states during the middle ages. Among the most celebrated of their leaders were Sir John Hawkwood at Florence (1390, originally an Essex tailor); Francis of Carmagnola (about 1412); and Francis Sforza, who in 1450 became Duke of Milan. The *Compagnies Grandes* in France, during the 14th century, resembled the bands led by the Italian condottieri. They originated in the long bloody wars between France and England, did enormous mischief, and became powerful enough to rout the king's forces in 1361; but ultimately Du Guesclin persuaded them to seek their fortune in the Spanish service. See O. Browning, *The Age of the Condottieri* (1895).

**Conductivity**. See HEAT, ELECTRICITY.

**Conductor**, the director of the modern orchestra. Though from the earliest days of the orchestra abroad he has always performed his duty by beating time with the baton, the practice was unknown in this country till introduced by Spohr in 1820, at a concert of the Philharmonic Society of London. Previously the orchestra was kept together by the leader of the violins, the conductor simply sitting at the harpsichord or piano with the score before him, occasionally putting in a few chords, or accompanying; but the result was clearly unsatisfactory, and the conducting stick had only to be introduced to gain general acceptance at once. The art of conducting as now practised requires so many qualifications that it may be considered rather as a special gift than an acquirement to be learnt. But few eminent composers have also distinguished themselves as conductors. Great recent conductors are Costa, Von Bülow, Richter, and Nikisch.

**Conductors and Non-conductors of Electricity**. When an electrified body is placed upon a metallic stand, so that it is in metallic connection with the earth, all traces of electrification disappear; but if placed upon supports of glass or ebonite, its charge is still retained, the body then being said to be *insulated*. In the former case, the electric charge having passed to the ground through

the metallic support, the metal is termed a *conductor* of electricity; in the latter, the glass or ebonite is termed a *non-conductor* or *insulator*, since by its means the charge is prevented from leaving the body. This distinction is somewhat artificial, since no substance is known to be either a perfect conductor or an absolute insulator. The substances in frequent use as conductors and non-conductors may be arranged in the following order of their conductivity, beginning with the best: Silver, copper, gold, brass, zinc, platinum, iron, tin, lead, mercury, German-silver, graphite, red phosphorus, mineral acids, saline solutions, seawater, pure water, alcohol, wood, ice, vegetable oils, lime, chalk, camphor, porcelain, wool, hair, silk, glass, wax, sulphur, resin, amber, gutta-percha, shellac, paraffin, ebonite, air and other gases.

It is found that the efficiency of a non-conductor, when used as an insulator in electrostatic experiments, depends very largely on the state of its surface. In a damp atmosphere, glass becomes coated with a thin film of moisture which considerably lessens its insulating power. Hence these experiments succeed better in dry weather; otherwise the apparatus requires to be heated, or the glass insulators employed to be coated with shellac varnish, upon which moisture does not so readily deposit. In metals, conducting power decreases when the temperature is raised; on the other hand, glass, wax, sulphur, and some other bodies which are extremely bad conductors at ordinary temperatures, conduct very much better when raised to a sufficiently high temperature. It has been observed that a series of metals arranged in order of their electrical conducting powers, exhibits the same order as when similarly arranged for their thermal conducting powers; in other words, metals which conduct electricity well, conduct heat well. Also, that when two specimens of the same metal differ in electric conductivity, they differ in thermal conductivity, and in the same way. See **LIGHTNING CONDUCTOR, ELECTRICITY.**

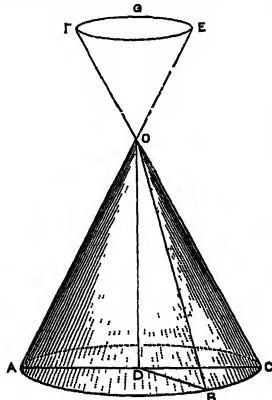

**Condurango** is the name of several South American *Asclepiadaceæ* (q.v.), whose bark affords a drug used as a remedy for venomous bites.

**Condyle**, a protuberance on the end of a bone, serving for articulation with another bone; especially that by which the occipital bone of the skull is articulated to the spine.

**Condy's Fluid.** See **MANGANESE.**

**Cone.** In general, the term *cone* is applied to any surface described by the motion of a straight line which always passes through a fixed point and

also intersects some curve in space. But more particularly, the word is used to denote a *right circular cone*—i.e. the solid produced by the revolution of a right-angled triangle round one of the sides containing the right angle. Thus (see fig.), let ODC be a triangle with a right angle at D; if it revolve round OD, then in moving through successive positions, OC will trace out the cone, OABC. The point,

O, is termed the *vertex*; the height, OD, the *altitude*; the line, OD, the *axis*; and the circle, ABC, the *base* of the cone. The line, OC, by whose

motion the cone is produced, is termed a *generating line*, or *generator*. In the *oblique* cone, the axis is inclined to the base at an angle other than a right angle. A *truncated* cone is the lower part of a cone cut by a plane parallel to the base.

The lateral surface of a right circular cone is obtained by multiplying half the circumference of the base into the slant height of the cone; the solid content, or volume, is equal to one-third of the area of the base multiplied by the altitude.

In considering the different possible sections of a cone by a plane, it is necessary to remember (as is indicated in the figure) that a cone is really produced in duplicate; that the generators, after passing through the fixed point, O, form another cone, such as OEGF. Different positions of the sectional plane produce different curves, according as it is parallel to the base, a generator, the axis, or parallel to none of these; so, consequently, we have a circle, parabola, hyperbola or ellipse, respectively. For the conic sections, see **CIRCLE, ELLIPSE, HYPERBOLA, PARABOLA.**

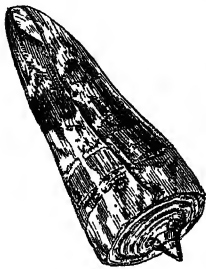

**Cone** is a term used in Botany, with considerable latitude and variety of application. The growing point or bud of any ordinary higher plant is of more or less acutely conical shape, and the young leaves at first arise in close succession upon it. But while in vegetative growth the axis usually lengthens and the leaves develop and expand, the onset of reproductive functions may check these changes. In the simplest cases the leaves may become partially modified for pollen or ovule bearing, as stamens or carpels, while the leaf apices do not wholly lose their leafy character and arrangement; thus we have the cone-like male and female flowers of Cycads (q.v.). In the allied conifers, which include the most characteristic cone-bearing trees, the leafy character of the crowded stamens composing the male flower may be almost entirely lost; but in the female the structure of the familiar cones (e.g. Scots pine, spruce, larch) has been the subject of enormous controversy; since from one point of view it is regarded as a single flower composed of many carpellary leaves (each bearing a biovular placenta on its upper surface); while from the other it must be viewed as an inflorescence of which the crowded bracts bear axillary biovular branches (see **GYMNOSPERMS**). The cones of Coniferæ may vary greatly from their typical shape, witness the almost spheroidal cones of *Araucarias*; while the number and crowded succession of the leaves may be much reduced and simplified, as in cypress. The apparent cones which occur in some orders of dicotyledonous plants are always due to a crowding of the inflorescence.

**Conecte**, THOMAS, a Carmelite friar born in Rennes, who both in France and Italy anticipated Savonarola by preaching a crusade in favour of reforms and against vanities, and at Rome in 1434 was condemned for heresy and burnt.

**Coneglia'no**, a town (pop. 6000) of northern Italy, 31 miles N.E. of Venice, the birthplace of the painter Giambattista Cima, called often Conegliano (1460?-1518), a pupil of Gian Bellini, whom he resembles in serenity of religious feeling. See the book on him by Burckhardt (1905).

**Cone-shell** (*Conidae*), a family of Gasteropod molluscs, with substantial conical shells. The last whorl of the spiral is much larger than those which precede it and simply form the apex of the cone. The aperture is long and narrow, with a sharp-edged outer lip. The head of the animal has a long proboscis; the 'foot' is long and narrow as the aperture suggests; the respiratory siphon is short and thick. In the living state the shell is covered by a yellowish epidermis, and it is only when this is rubbed off that the great beauty

of the colour and marking is disclosed. During life the inner layer of the shell and the internal partition of the second last whorl undergo more or less absorption. The principal genus, *Conus*, includes some 500 living species, ranging from the

Cone-shell.

Mediterranean to the Cape, but especially at home in the eastern equatorial seas. They creep in relatively shallow water among the rocks and coral reefs, and prey upon other molluscs. Among the numerous species, some are rare, and have been favourite objects of collectors' mania. Many pounds have been paid for single specimens, and *Conus gloria-maris* is said to be 'worth ten times its weight in gold'. *C. cedo nulli* is in its finer varieties a much prized treasure, and *C. ammiratus* is another favourite, though much commoner form. Numerous fossil species are known from the chalk onwards. Some of the animals are eaten, and the shells often form ornaments, or are worn down into rings and the like. The augur-shell (*Terebra*), the latticed shell (*Cancellaria*), the tower-shell (*Pleurotoma*) are nearly allied genera, often regarded as types of separate families.

**Coney.** See FURS, HYRAX, RABBIT.

**Coney Island,** part of New York City, barely separated from the south-west angle of Long Island, is a strip of sand, 5 miles by  $\frac{1}{2}$  mile, with a fine beach; a crowded summer resort.

**Confarreation,** a peculiar mode of marriage in use among the Romans, which consisted in the employment of certain words in the presence of ten witnesses, and in the performance of a religious ceremony in which *panis farreus* ('bread made of spelt') was partaken. Various priestly offices, such as that of the *Flamen Dialis*, were open only to those who were born of parents thus married.

**Confederate States,** the name adopted by the confederacy formed by the eleven southern and slave-holding states which seceded from the American Union in 1860-61, and established a government which lasted till the close of the great civil war in 1865. See UNITED STATES. The Confederate States were South Carolina, Alabama, Florida, Mississippi, Georgia, Louisiana, Texas, Virginia (without West Virginia), Arkansas, Tennessee, and North Carolina.

**Confederation.** See FEDERATIONS AND UNIONS; also UNITED STATES, GERMANY, AUSTRIA, SWITZERLAND, &c.

**Confederation of the Rhine** dates from the war of 1805, so disastrous for Austria, when several minor German princes were forced to ally themselves with France. The first to do so were the Electors of Bavaria and Württemberg, who, in recompense of their services, were elevated to the dignity of kings by the peace of Presburg, 26th December 1805. Finally, at Paris, on the 12th July 1806, 16 German princes formally signed an act of confederation, dissolving their connection with the Germanic empire, and allying themselves with France, under the protectorate of Napoleon. The more important of these 16 princes were the kings of Bavaria and Württemberg, the arch-chancellor, the Elector of Baden, the new Duke of Cleves and Berg (Joachim Murat), and the Landgraf of Hesse-Darmstadt; later other princes followed their example, including the king of Saxony, the new king of Westphalia, and the Elector of Würzburg. In 1811 the unpatriotic confederation comprised

4 kingdoms, 5 grand-duchies, 11 duchies, and 16 principalities, covering an area of 125,000 sq. m., with a population of 14,608,877, and an army of 119,180 men. The utter ruin which overtook the French army in the Russian campaign acted like a solvent on the confederation, and the year 1813 saw it vanish like mist in the sudden outburst of German patriotism. See GERMANY.

**Conference,** a meeting of the representatives of a number of states for political or diplomatic purposes, usually distinguished from a Congress (q.v.) as having only power to discuss and prepare arrangements, not to decide and conclude. But the distinction is not consistently observed. —Conference is also the name of the supreme synod of the Methodists (q.v.).

**Conference, IMPERIAL,** a meeting of premiers and other representatives of the United Kingdom and the British self-governing dominions, to discuss matters of joint interest. Colonial Conferences were held in 1887, when colonial premiers were in London for Queen Victoria's jubilee celebrations, in 1902 and in 1907, when the name Imperial Conference was adopted, and a period (subject to variations) of four years. None was held in 1915; but an 'Imperial War Conference' met in 1917 and in 1918. India has been represented since 1917. The British prime-minister presides, or in his absence the colonial secretary.

**Conferva,** a genus of fresh-water Algae (q.v.), forming slimy masses or tufts in ponds and stagnant pools, easily recognised by their unbranched filaments, each consisting of a simple row of cells, destitute of spiral bands or the like. The filaments do not conjugate; multiplication is by swarm-spores, or by thick-walled aplanospores.

**Confession, in Roman Catholic theology,** means a declaration of sins to a priest in order to obtain absolution. The word, however, has borne very different meanings at different times, and the changes in sense mark important stages in the development of discipline and doctrine. St James (v. 16) speaks of that spontaneous confession which Christians make 'one to another' out of humility and brotherly love; and, much in the same spirit, Origen (Hom. in Ps. xxxvii.) recommends the sinner to seek out a physician 'learned and merciful,' to whom he may disclose his wounds, and from whom he may get advice. In all this there is no question of strict obligation on the one hand, or of priestly power upon the other. Still, even before Origen's time, the word had acquired a new signification. From the close of the 2d century at latest the church marked out for special reprobation those sins which were called 'mortal'—viz. murder, idolatry, and adultery. The guilty person was required to make public confession, he was subjected to penitential exercises, and was either excluded during life from the communion of the church, or readmitted, after long discipline, by the bishop, who imposed his hands upon him. The list of 'mortal offences' was extended during the 5th and the following centuries to all crimes which the Roman law punished with death, exile, or grave corporal penalty, and Leo I. (440-461 A.D.), in a famous letter to the Bishops of Apulia (Ep. 168), substituted private confession to the priest for public confession to the congregation. But the essential points of difference between ancient and modern or sacramental confession remained. In the former, the church only required confession to man of certain enormous offences, and left the mass of sins which are now called mortal to the judgment of God; and she exercised the power of 'binding and loosing' by excluding sinners from, and readmitting them to, her communion. Such power is really inherent in every society, though

of course the church claimed to hold it by divine commission (Matt. xvi. 19, xviii. 18; John, xx. 22, 23), and insisted on the serious consequences which it involved. We can trace the faint beginnings of the modern system in the practice which prevailed in monasteries and nunneries of confessing breaches of the rule to the superiors (Jerome, *De Reg. Monachorum*, Basil, *Reg. Brev.*), and in the growing habit of seeking advice from priests by secret confession. The thirty-third canon of the Council of Châlons, which was held 813 A.D., throws great light on the state of things then existing. Some, the council says, maintain that 'sins should be confessed to God alone,' others to God and to the priest. The council finds no fault with either view, and remarks that confession to God purges the conscience from sin, while confession to the priest teaches the penitent 'how his sins are to be purged.' Even Peter Lombard, the great theological authority of the 12th century (*In Sentent. lib. iv.*), occupies the same ground as the Council of Châlons; and Aquinas (*Supplement to the Summa*) admits that in Lombard's time the necessity of confessing all mortal sins to the priest was an open question. Meantime, the fourth Lateran Council in 1215 (can. xxi.) had required all the faithful who have come to the years of discretion to confess their sins at least once a year to their parish priest, or with his leave to another priest. The doctrine received its final form in the Council of Trent (Sess. xiv.). The council explains 'mortal sins' to mean all sins, 'even sins of thought', which separate the soul from God. It declares that for mortal sin after baptism, confession to an approved priest, in act if possible, in desire if a priest cannot be had, is by divine institution the one and only remedy. This confession must embrace every mortal sin which can be recalled after careful self-examination. Further, it declares that the secret confession of mortal sins has always been practised in the church, and whereas in Peter Lombard's time Roman Catholics were free to hold that absolution was no more than a declaration of forgiveness by God, the council condemns this opinion under anathema. But it is careful to add that confession and absolution, in order to avail, must be accompanied by sincere sorrow before God for sin past, and a firm purpose of amendment. By the present canon law, Roman Catholics living in the world may choose any priest approved by the bishop as their confessor. The confession of slight or venial sins remains a matter of counsel and not of precept.

Confession to a priest is prescribed by the Greek and most of the Oriental churches, and the Church of England recommends private confession in the case of the sick, though it has never enforced the use of it. In 1873, 483 Anglican clergymen presented a petition to Convocation for the education, selection, and licensing of duly qualified confessors. That petition fell flat; but confession is regularly practised among a considerable section of the English communion. The Lutherans at first were inclined to retain some sort of private confession, but they were content with confession of a general kind, and have allowed it to fall into disuse. It is entirely rejected by Presbyterians, Methodists, Congregationalists, Baptists, &c.

The 'seal of confession' is the obligation which binds the priest to make no use whatever outside of the confessional of the knowledge acquired there. It is imposed under severe penalties by the fourth Lateran Council. See CONFIDENTIALITY, and Lea's *History of Auricular Confession* (3 vols. 1896).

**Confession**, in civil procedure by English law, is a formal admission or avowal of a fact, as when a defendant alleges a ground of defence which has arisen since the commencement of an action, and the plaintiff confesses the defence—i.e. admits the

truth of the defendant's allegation. In Scotland, a party to an ordinary civil action may be called on to confess or deny any relevant matter of fact, and if he refuse, he will be held as confessed. Where a statement within the opposite party's knowledge is averred upon one side, it is held as confessed by the other unless specifically denied. In criminal law, a confession is an admission of guilt. In England, a confession by a criminal made in the course of a judicial proceeding is sufficient, if plenary, to found a conviction, as where a prisoner pleads guilty. An extra-judicial confession, if freely made, may be admitted as evidence. In Scotland, a confession made by a criminal in presence of a judge will be admitted as evidence; but is not held as equivalent to a confession by the panel in presence of a jury, which is conclusive evidence against him. In the United States also confession is evidence, if voluntary and made without promise of reward or threat of punishment, and that whether made before or after apprehension and commitment; generally confession without corroboration is insufficient, but in one or two states the jury may convict without corroboration. As to confession on trial, see CRIMINAL LAW; as to confession before the examining magistrate, see DECLARATION; and for Judgment by Confession, see COGNOVIT.

CONFESSION AND AVOIDANCE, in pleading at common law, in England, is the admission of the allegation of the opposite party, but with the addition of some circumstance which deprives it of legal effect, as, for instance, the admitting that an assault was committed in self-defence. Since the passing of the Judicature Acts of 1873 and 1875, pleas in confession and avoidance have technically fallen into desuetude.

**Confessional**, the seat or recess in which the priest sits to hear confession in a Roman Catholic church. It is probable that the confessionals in English churches, previous to the Reformation, like those still often found in Catholic use, were slight wooden erections, because they have so entirely disappeared that their form is a matter of dispute among ecclesiologists. It would seem that confessionals were not always used, as in an old painting on the walls of St Mary's Chapel, Winchester, a woman is represented kneeling to a priest, who is seated in his stall. The confessional commonly has a door in front for the priest to enter by, and an opening on one or both sides, like a small window, with a grating of wire or zinc, for the penitents to speak through.

**Confessions of Faith** are generically identical with Creeds (q.v.). If any distinction be made, it is the merely accidental differentiation that creeds are shorter, and that confessions of faith are generally polemical as well as didactic in their character and aim. Such a distinction, it is found, actually obtains in practice, and confessions of faith, as thus distinguished from creeds, are so numerous and varied as to call for separate attention.

Confessions of faith may be defined as authorised summaries of a church's belief, and standards of its faith and doctrine. In all Protestant churches, however, they are regarded as subordinate standards, ranking under the Scriptures, which are recognised as the only supreme 'rule of faith and life.' Their object is to present the cardinal truths of revelation in a connected and logical form, especially if these be controverted; while at the same time they afford a basis of association and a bond of unity for Christians. As they are the result of the conflicts of a church with error, confessions of faith vary in their doctrinal comprehensiveness, are more or less gradual in their

growth, and are significant and important features in its history.

Prior to the era of the Reformation in Europe, the public formularies of the Christian church were generally termed creeds. It was the rise of Protestantism that evoked confessions of faith as we now understand the name. Among the first to formulate these were the Swiss at Zurich, where, in 1523, Zwingli wrote his *Sixty-seven Articles or Conclusions*. To Luther and Philip Melancthon, however, is due the honour of drawing up the first authoritative evangelical formulary, the *Augsburg Confession* (q.v.), by the adoption of which the Lutheran princes, with their states, in 1530, finally broke with Rome. It was followed by the *Apology of the Augsburg Confession*, drawn up by Melancthon, and recognised as a confession in 1532. Later confessions of that church are the *Articles of Smalcald*, prepared in 1537, the *Saxon Confession*, and the *Wurtemberg Confession*, both published in 1551. But these were superseded in 1580 on the adoption of the *Form of Concord* (*Formula Concordiæ*), which is the most representative symbol of the Lutheran Church.

The German Reformed Church, which sprang up side by side with the Lutheran, and stood midway between it and the Calvinistic bodies, issued in 1530 the *Tetrapolitan Confession*, so called because sent forth in name of the four cities of Strasburg, Constance, Memmingen, and Lindau. It was written chiefly by Bucer. Among other confessions officially recognised by this church, or local portions of it, were the Confession of Anhalt (1581); the Confession of Nassau (1578); the *Consensus of the Ministry of Bremen* (1598); the *Hessian and Heidelberg Confessions* (1607); and the *Declaration of Thorn* (1645).

In Switzerland, the labours of Zwingli were followed by the publication in 1534 of the *First Confession of Basel*, prepared by Ecclampadius and Myconius. To it succeeded in 1536 the *Second Confession of Basel*, better known as the *First Helvetic Confession*. It was superseded in 1566 by the more comprehensive *Second Helvetic Confession*, which was written by Bullinger, and obtained official sanction in Scotland, Hungary, France, and Poland. Calvin left his mark on confessional literature in, among others, the *Consensus of Zurich* (1549); in the *Consensus of Geneva* (1552), which is a treatise written mainly in defence of the doctrine of predestination; and in the *Gallican Confession*, which he prepared in conjunction with his pupil, Antoine de la Roche Chandieu (Sadeel). The latest Swiss confession is the *Helvetic Consensus Formula*, written in 1675, by Heidegger of Zurich. It is thoroughly Calvinistic, and was drawn up in defence of the conclusions of the Synod of Dort.

The *Gallican Confession*, was adopted by the French Reformed Church in 1559, and after revision was ratified at the Synod of Rochelle in 1571, whence it is sometimes called the *Confession of Rochelle*.

The *Belgic Confession*, drawn up principally by Guido de Brès in 1561, has since then been, and still is, the authoritative standard of the Dutch and Belgian Reformed churches. The Arminian controversy occasioned the meeting of the Synod of Dort in 1618, and the issuing of the *Canons of Dort* in the following year. These canons were adopted as symbolical by the Dutch and French Reformed churches.

But confessions have not been peculiar to the Protestant Church. Influenced by the Reformation, the Greek Church adopted the *Orthodox Confession of Mogilas*, the metropolitan of Kiev (died 1647), who drew it up in a catechetical form as a protective measure against both Protestant and Roman Catholic churches. Recast by Syriga, the

metropolitan of Nicæa, it became in 1672 the confession of the whole Greek Church. At the same time the anti-Calvinistic *Confession of Dosithæus* was promulgated by the Synod of Jerusalem. Similarly, the Roman Catholic Church published the *Canons and Decrees of the Council of Trent* in 1564, to which were added in 1854 the decree of Pius IX. on the Immaculate Conception, and in 1870 the Vatican Decrees. See ROMAN CATHOLIC CHURCH.

In Britain the chief confessions are the *Scots Confession*, consisting of twenty-five articles, drawn up by John Knox in 1560, and adopted by the Church and kingdom of Scotland; the *Thirty-nine Articles of the Church of England*, adopted in 1562; the Irish Articles, one hundred and four in number, prepared by Archbishop Usher, and adopted by the Irish Church in convocation at Dublin in 1615, but superseded by the *Thirty-nine Articles of the Church of England* in 1635 (see ARTICLES); and the *Westminster Confession of Faith*, emitted in 1647 by the Westminster Assembly of Divines (see WESTMINSTER). This confession has become identified with Presbyterianism among all the English-speaking populations of the globe. Its theology was also adopted with some modifications by the Congregationalists and a section of the Baptists. It was ratified by the English parliament in 1647, but in England its influence waned with the decline of Presbyterianism during the Commonwealth and the reign of Charles II. By Scotland, in furtherance of the uniformity agreed upon in the Solemn League and Covenant, the Westminster Confession was cordially received and adopted in place of that of 1560. It was approved by the General Assembly in 1647, with the modification of but one section regarding the magistrate's power *circa sacra*, was ratified by parliament in 1649 and again in 1690, and continues to be the common symbol of the Church of Scotland and most of the churches which have seceded from her communion, save in so far as the two churches now forming the United Free Church modified their acceptance of the Confession by a Declaratory Statement on certain doctrines.

The Westminster Confession consists of thirty-three chapters, is thoroughly Calvinistic in its teaching, and is in many parts stated in terms designed to counteract the principal errors of the time. Beginning with the canon of Scripture, it surveys the entire field of theology, deals also with the relations of the state to the church, the constitution of the church itself, and concludes with the topics of death, the resurrection, and the last judgment. Its precise logic, its clear, dignified and powerful diction, and its constant reference to Scripture in proof of its statements, tended greatly to beget that influence to which it attained.

See CREEDS; also two works by Philip Schaff (1877, 1878), and *A History of Creeds and Confessions of Faith* by Dr William A. Curtis (1912), based on his article in the *Encyclopedia of Religion and Ethics*.

**Confessor.** See CANONISATION.

**Confidentiality**, in Law. The most common instance of confidentiality is in the case of communications between a client and his legal adviser. A client cannot be compelled, and a legal adviser (whether barrister or solicitor) is not allowed, without the express consent of his client, to disclose communications, or to produce documents, passing between them in the ordinary course of professional employment. In England the rule is not qualified by reference to impending litigation; but the privilege does not extend to communications passing before the professional employment commenced or after it ceased. A communication or document when 'once privileged is always

privileged.' Thus it does not cease to be privileged on the death of the client or on the client changing his solicitor. The privilege may be waived by the client, but cannot be waived by the solicitor. On the same principle, in the law of libel and slander, communications between solicitor and client and communications made by a solicitor in defence of his client's rights, although they are defamatory of a third person, are *prima facie* privileged; so that no action of damages lies in respect of the defamatory words, except on proof of malice.

The old rules of evidence, which excluded persons from giving evidence on the ground of near relationship or of personal interest in the case, have been removed by a series of statutes culminating in the Evidence Act, 1898. In civil cases all persons, including the parties to the case, are now competent witnesses, provided they are able to understand the nature of an oath and to give rational testimony. In criminal proceedings, the accused and the wife or husband of the accused (except in certain cases where she or he is the person injured by the crime) are incompetent as witnesses for the prosecution; but the accused, and the wife or husband of the accused, are competent as witnesses for the defence. On the ground of confidentiality, however, certain matters are protected from disclosure, and a witness is legally entitled to refuse to answer questions on these matters. In particular, owing to the importance of preserving the confidences of married life, a husband or wife cannot be compelled to disclose any communications made to him or her, during the marriage, by his or her wife or husband. Again, a witness, if he is not himself a party to the litigation, cannot be compelled to produce the title-deeds of his property for inspection. It is also a recognised privilege that a witness cannot be compelled to answer any question, or produce any document, which tends to expose the witness, or the wife or husband of the witness, to a criminal charge. An exception to this rule is made in the case of an accused person giving evidence, for, under the Criminal Evidence Act, 1898, he may in cross-examination be asked questions tending to criminate him of the offence wherewith he is then charged.

From the 4th and 5th centuries the 'Seal of Confession' was held to be inviolable, and no priest could be called upon, under any circumstances, to reveal facts which had been confided to him under its sanction. To this the case of treason was an exception in England, even in Roman Catholic times. The capitularies of the French kings and some other continental codes of the middle ages prohibited the attendance of clergy as witnesses in court. In Roman Catholic countries the privileges of the confessional remain unaltered, although a priest may state that the accused has submitted to penance. The duty of disclosure, however, is enforced in all cases in which the confession has reference to a future crime. In England no special privilege whatever is extended to the Roman Catholic confessional; and the question as to how far a confession made to a clergyman for the purpose of obtaining spiritual comfort and consolation is protected was long considered doubtful. The rule has, however, been settled for some time that clergymen are not entitled to the same privilege as legal advisers; though it has often been advocated as advisable to extend the rule to clergymen, including Roman Catholic priests. In Scotland the point has never been decided, evidence of the kind in question, when not indispensable for the ends of justice, being generally either withheld or withdrawn. It has been decided in England that communications to a medical man,

even in the strictest professional confidence, are not protected from disclosure; and the same is the case in Scotland. Factors, bankers, and intimate friends are certainly not within the protection of the rule. Confidentiality exists as to official reports and state papers, the disclosure of which would be contrary to public policy.

In the United States members of the legal profession are privileged, and, as a rule, what a client says to them cannot be disclosed except the right of confidentiality be waived. Interpreters stand in the same relation as attorneys. The privilege of confidentiality does not at common law extend to confessions made to priests or clergymen; but in several states confessions to them in their professional character are privileged by statute. Communications made to a physician are not as a rule privileged, but in some states confidentiality is recognised by statute. Communications between a husband and wife are privileged from disclosure, on the grounds of public policy and the good order of society. See **LIBEL**.

**Confirmation**, a Latin word which signifies 'strengthening.' In the ancient church, the rite so named was administered immediately after baptism, if the bishop happened to be present at the solemnity; and in the Greek Church it is still made part of the baptismal rite, being administered then by the priest by means of unction with chrism pre consecrated by a bishop. In the Roman Catholic Church, for the last 300 or 400 years, the bishops have interposed a delay of seven years after infant baptism; in the Lutheran Church, the rite is usually delayed for from thirteen to sixteen years; and in the English Church, from fourteen to eighteen years. There is, however, in the latter church no limitation of age, other than such as is indirectly implied by the exaction of a specified amount of religious knowledge as a qualification for the rite. Confirmation may be administered at an earlier period, if a family is about to emigrate; and persons are confirmed up to sixty or seventy, if they choose. The ceremony consists in the imposition of hands by the bishop, accompanied by an invocation of the Holy Ghost as the comforter and strengthener. But both in the Lutheran and in the English Church, the ceremony is made the occasion of requiring from those who have been baptised in infancy, a renewal in their own persons of the baptismal vow made for them by their godfathers and godmothers, who are thereby released from their responsibility. Properly, none can partake of the Lord's Supper, in these churches, unless they have been confirmed. In the Roman Catholic Church, confirmation is held to be one of the seven sacraments, and in its administration chrism and the sign of the cross are used; and instead of the imposition of hands, the person confirmed receives a slight blow on the cheek, to remind him that he must in future suffer affronts for the name of Christ. Catholics usually take a new name at confirmation, which should be the name of some saint whom they choose for their special patron. In the Thirty-nine Articles of the Church of England, confirmation is declared not to be one of the sacraments, and the above ceremonies have been discontinued since the Reformation.

**Confiscation**, in Scottish law, has been applied to the forfeiture of lands or goods to the crown, as part of the punishment for certain crimes, such as murder and treason. But more commonly the word is used in international law to signify the appropriation of goods or ships belonging to a hostile state, or its subjects, generally as a punishment for an attempted breach of blockade. See **ESCHEAT**.

**Conflict of Laws.** On the breaking up of the Roman empire into separate kingdoms, many systems of jurisprudence, more or less dissimilar, arose, and were administered side by side. In these new kingdoms the system of law under which an individual lived depended on his nationality, the Roman and the Goth, though living in the same territory, each being governed by his own system of law. This system of 'personal laws,' as distinguished from territorial laws, held sway till a comparatively late period in European history. When the parties to a case or in any legal relation lived under different personal laws, there arose what was called a 'conflict of laws,' and a body of rules was developed to determine such conflicts. Later, when the basis of jurisdiction in European states became territorial, the elaboration of these rules constituted a new branch of jurisprudence, to which the title of Private International Law has been given. Many of the classical treatises on the subject—e.g. Huber, Story, and Dicey—are entitled the *Conflict of Laws*. Other writers, such as Savigny, Bar, and Foelix, use the term 'Private International Law.' The two terms are now synonymous, both meaning that department of law—rendered necessary by the fact that there are different territorial jurisdictions possessing different laws—which determines in what national jurisdiction an action ought to be brought and by what national law it ought to be decided. See INTERNATIONAL LAW.

**Conformable Strata** are beds which lie parallel to each other, the accumulation of the upper strata having followed the deposition of the underlying beds without any break or prolonged interruption. Conformity thus points to a continuity of the same physical conditions.

**Confraternities.** See BROTHERHOODS and GUILDS.

**Confronté**, in Heraldry, is a term applied to two animals facing or fronting one another.

**Confucius**, the name by which the great Chinese sage is known, is a Latinised form of the Chinese *K'ung Fū-tszé* (孔夫子) or 'the Master K'ung,' K'ung being his clan or family name, and Fū-tszé the denomination applied to him by his disciples after he had become a teacher, and gathered around him a school of ardent and inquiring spirits, to whom he communicated his views on the ancient literature and history of their country, and on the principles of human duty. As a child, he received the *postnomen* Ch'ü, and when grown up he was called *Chung-ni*, marking his place in the household. His birth took place, according to the most authoritative account, in 551 B.C., in the village of Ch'ieh, in the state of Lû, a part of the present province of Shantung.

The K'ung family had migrated to Lû from the dukedom of Sung, and were a branch of the ruling house of Sung. The lineage of Confucius is thus traced through the dukes of Sung to the kings of the Shang or Yin dynasty, and through them again, up among the mists of antiquity, to the sovereign Hwang Ti, whose reign is said to have commenced in 2697 B.C. His father, known to us by the name of Shü Liang-heh, was commandant of Tsâu, and a soldier distinguished for his strength and daring. In his old age he contracted a second marriage with a young lady of the Yen family, and of her was born the sage in 551.

Liang-heh died in the child's third year, leaving his mother and him in straitened circumstances. He has described his own mental growth till he was seventy, when he 'could do whatever his

heart prompted, without transgressing what was right,' and tells us that 'at fifteen his mind was set on learning, and at thirty he stood firm in his convictions.'

At nineteen he married, going for his wife to the Chien-kwan family in his ancestral state of Sung, and in the year after, his son Lî was born. Besides this son Lî, Confucius had two daughters.

Confucius.

(Reduced fac-simile of a rubbing from a marble slab behind his temple at Kio-foo-hien).

About the time of his marriage we find him in humble offices, in charge of the public stores of grain, and of the public herds, performing efficiently his functions, and allowing nothing beyond or higher than them to occupy his attention. In 531 B.C., when he was in his twenty-second year, he commenced in Ch'ueh-lî his career as a teacher. He continued in his native state till 517 B.C., with the exception of a short visit to the capital at Loh, where he is said to have met with Láo-tsze (q.v.). In 517 Lû fell into great disorder. The Duke Cháu being worsted in the struggle, fled to the neighbouring state of Ch'í, and thither Confucius also for a time repaired.

Returning to Lû, he remained there for sixteen more years without being called to any official employment. Duke Cháu died in exile in 510 B.C.; and his younger brother and successor, Duke Ting, in 501 B.C. appointed Confucius governor of the town of Chung-tú, where a marvellous reformation in the manners of the people speedily took place. The next year saw him first minister of works for the state, and next minister of crime. The government was now conducted for three years according to his counsel. 'He strengthened,' we are told, 'the ruling house, and weakened the ministers and chiefs. A transforming government went abroad. Dishonesty and dissoluteness were ashamed, and hid their heads. Loyalty and good faith became the characteristics of the men, and chastity and docility those of the women. Strangers flocked to Lû from other states.' Confucius was the idol of the people.

But this success did not last long. The prosperity of the state awakened the jealousy and fears of its neighbours. The marquis of Ch'í cunningly sent to Duke Ting a present of beautiful courtesans and fine horses, and a breach was made between Confucius and his ruler. His counsels were no longer sought. He determined to leave Lû and visit other states. Accordingly in 497 B.C., when he was now

in his fifty-fifth year, he went forth from Lû, nor did he return to it till 485 or 484 B.C.

During this long period he visited many states, attended always by a company of his disciples. His fame had gone before him, and many of the princes would have received and supported him, but he would not settle where he could not obtain free course in carrying out his principles. Repeatedly he and his companions were in straits, and even in peril of their lives. Once they were assailed by a mob, who mistook him for an officer by whom they had been oppressed. But while the others were alarmed, he calmly said: 'After the death of king Wân, was not the cause of the right way lodged in me? While Heaven does not wish this cause to perish, what can the people of K'wang do for me?' Another time, in somewhat similar circumstances, he said: 'Heaven has produced the virtue that is in me; what can any man do to me?' Such was his belief concerning himself and his mission. He never pretended to be anything more than man, but *he knew the right way*, the way for the individual to perfect himself, and the way for the highest ruler to rule, so as to make men happy and good. One of the princelets through whose territory they passed asked his disciple Tsze-lû how he would describe the Master, and the disciple gave him no reply. When he told the Master of the question, Confucius said: 'Why did you not tell him that I am a man who in his eager pursuit of knowledge forgets his food, and in the joy of its attainment forgets his sorrows, and who does not perceive that old age is coming on!' He was then probably in his sixty-fifth year.

Duke Ting of Lû died in 495 B.C., and was succeeded by his son Duke Ai, who in his tenth year sent a message of recall to the sage in Wei. The ruler and his ministers received him respectfully, but he can hardly be said to have re-entered political life. Only a few more years remained to him, during which he is said to have put the finishing hand to his labours on the ancient writings, and been specially assiduous in the study of the *Yi-king*. He tells us himself that he reformed the music to which the ancient odes were sung, and digested the odes themselves, giving to the pieces in the principal parts of the collection their proper places. He must have occupied himself also with the composition of the only classical work which is assigned to his own pencil—the *Ch'un Ch'ü*, embracing the events in the history of Lû from 722–481 B.C. The latest entry in the work is that in Duke Ai's fourteenth year (481 B.C.). He died on the 11th day of the 4th month in 479 B.C.

In the *Confucian Analects*, or memorabilia compiled soon after his death from the reminiscences of his disciples, we have abundant information of the Master's Sayings and Doings, and they can be added to from the supplements to the *Ch'un Ch'ü*, the *Narratives of the School*, portions of the *Books of Ritual Usages*, and the memoir by Sze-ma Ch'ien. There are other works about him, but all containing more or less of the legendary element, evidently introduced after the Buddhistic literature became known to the Chinese. Of no ancient personage do we have fuller information than we possess of Confucius, and no other can we fashion more completely to ourselves. One whole book of the *Analects* is occupied with his personal characteristics, his deportment, his eating, his dress. It shows him to us at his ruler's court, in his intercourse with his disciples, in his carriage, at his table, in his bed. The disciples tell us that there were four things from which he was free—foregone conclusions, arbitrary determinations, obstinacy, and egoism; that there were four subjects which he avoided in talking with them—extraordinary things, feats of strength, rebellious

disorder, and spirits; that there were four things which he taught them—letters, ethics, leal-heartedness, and truthfulness; that there were three things of which he seldom spoke—profitableness, the appointments (of Heaven), and perfect virtue; and that there were three things in regard to which he thought the greatest caution should be exercised—fasting (as preliminary to sacrifice), (going to) war, and (the treatment of) disease.

It is often said that Confucianism is a system of morality without religion. That he was emphatically a moral teacher is indeed true; and his greatest achievement as such was his formulating the golden rule, 'What you do not wish done to yourself, do not do to others.' He acknowledges in one passage that he himself failed in taking the initiative in obeying it. But this high morality was not without a religious sanction. If it be the requirement of man's nature on a correct analysis, yet that nature is the distinguishing endowment conferred on man by Heaven or God, and obedience to its requirements is obedience to the will of God. The first sentence of the *Chung Yung*, the treatise written by Confucius' grandson, is this: 'What Heaven has conferred is *the Nature*; an accordance with this nature is what is called *the Path*; the regulation of this path is what is called *the Teaching*.'

But how is it that we do not find in the utterances of Confucius the expressions of a fervent piety, and that in his many exhibitions of the character of the *Chun-tsz*, his superior, model, or ideal man, he does not show him to us communing with God, confessing his own unworthiness, and imploring his forgiveness? These defects in his teaching we must admit. The explanation of them lies probably in this, that the direct worship of God was confined in the ancient religion of China, as it still is, to the sovereign as the parent and priest of the people. Speaking of the greatest religious services of the ancient sovereigns, Confucius, as is recorded also by his grandson, delivered the important judgment that in those services, 'in the ceremonies of the sacrifices to heaven and earth, they served God.' He probably thought that it was not for him as a subject to be taking on his lips the Great Name; he was, as he said, merely a 'transmitter and not a maker.'

It has been said that Confucius discountenanced prayer; but the passage referred to in support of the charge is not sufficient to bear it out. Equally reticent and enigmatic were his replies to the well-known question of the same disciple about the services offered to the spirits of the departed, and about death itself. He did not rise to the acknowledgment of the principle enunciated by Lâo-tsz, that kindness is to be returned for injury, and evil overcome with good, but laid down to his disciples the dictum that they should 'recompense injury with justice, and return good for good.' And his own special work, the *Ch'un Ch'ü*, is evasive and deceptive; according to Kung-yang it often 'conceals (the true nature of events) out of regard to the high in rank, to kinship, and to men of worth.' The person in the past to whom he looked back with the greatest reverence was the Duke of Chän, the legislator and consolidator of the dynasty of Chau (died 1105 B.C.).

He died lamenting the failure of his life; but he was hardly gone when his merit began to be acknowledged. Duke Ai, who had been unable to follow his counsels, caused a temple to be built, where sacrifices, or offerings, should be presented to the sage from generation to generation. In one aspect of it, the brief reign of Shih Hwang-ti, the first imperial sovereign of China, was a contest between him and Confucius, in which the latter prevailed. The first emperor of the Han dynasty,

in 197 B.C., in passing through Lû presented to him 'a great offering.' Succeeding dynasties did honour to him by titles and offerings; and by none was this done so much as by the Manchû-Tatar dynasty, intending thereby, it is believed, to reconcile the Chinese people to their sway. The Khang-hsi emperor, the greatest of its monarchs, after visiting his temple, and presenting the offerings, prostrated himself three times before the sage's image, bowing his head each time thrice to the ground. The law requires that there shall be a temple to Confucius in every prefecture, sub-prefecture, district, and market-town in the empire. These temples are not to Confucius alone. They are not *pantheons*, for he has never been deified; but the worship paid to him in them is extended to several of his disciples and a crowd of his most distinguished followers, amounting to more than one hundred and fifty names in all, selected from the literati and officers in all the course of time.

Twice a year, on a certain fixed day, the emperor went to the imperial college in Peking, and did homage to Confucius. The words of the principal prayer or address on the occasion were the following: 'On this month of this year, I, the emperor, offer sacrifice to the philosopher K'ung, the ancient Teacher, the Perfect Sage, and say, O Teacher, in virtue equal to heaven and earth, whose doctrines embrace both time past and present, thou didst digest and transmit the six classics, and didst hand down lessons for all generations! Now in the second month of spring (or autumn), in reverent observance of the old statutes, with victims, silks, spirits, and fruits, I offer sacrifice to thee. With thee are associated the philosopher Yen, Continuator of thee; the philosopher Ts'ang, Exhibitor of thy fundamental principles; the philosopher Tsze-sze, Transmitter of thee; and the philosopher M'ang, second to thee. Mayest thou enjoy the offerings!' Confucius' descendants are many. His lineal representative has the title of *k'ung* or duke, and large landed property. Under the republic it was decided that Confucianism should be the basis of national ethical teaching.

See *Mémoires concernant l'Histoire et les Sciences des Chinois* (Paris, 1776-1814); Legge's *Chinese Classics*, vol. i. (1861), and *Confucius' Life and Teaching* (6th ed. 1887); Plath's *Confucius und seine Schüler* (1867); Alexander's *Confucius the Great Teacher* (1891); and Giles's *Confucianism and its Rivals* (1915).

**Congé d'élire** (Norman-French), the name given in England to the king's warrant or permission to a dean and chapter to proceed to the election of a bishop to a vacant see. Since the act of Henry VIII. in 1534, the *congé d'élire* has always been accompanied by a letter-missive from the sovereign, mentioning the person to be elected by name, so that in reality it is a nomination by the crown. If the dean and chapter delay the election beyond twelve days, the nomination is effected by letters-patent from the crown; if they delay beyond twenty days, or elect another than the person named, they incur the penalties of a *Præmunare* (q.v.). See BISHOP.

**Conger**, or CONGER-EEL, a marine bony fish in the eel family (Murænidæ). The body is eel-like, without pelvic fins, with a continuous dorsal fin beginning very far forward, and without scales. The length varies from 3 to 6 feet, or even more; the colour is dark gray or bluish above, whitish below; the mouth is wide; the tongue free; the teeth in rows, one closely packed series forming a sharp edge. Four species occur widely distributed in temperate and tropical seas. *Conger vulgaris* is common on the British coasts, especially off Cornwall. Giant specimens, 10 feet in length, 18 inches in girth, over 100 lb. in weight, are recorded; and

even ordinary specimens left aground among the rocks, or landed unexpectedly on board a boat, are awkward customers to deal with. They are very muscular and voracious fishes, feeding on comparatively large prey, and have remarkably strong biting powers. They often rotate rapidly on their

Conger-eel.

own axis, and have a certain degree of grasping power with their tails. The colour seems to vary with habitat, since those from rocks are blacker than those from sand-banks. They occur from the shore down to about 50 fathoms, and are extremely prolific. The flesh is coarse, but is often enough eaten. What is called turtle soup is believed to be often made mainly of conger-eel.

**Congested Districts Board.** See CROFTER.

**Congestion** may be defined to be excess of blood in the vessels of a part, and is to be regarded not as an independent disease, except in a very small proportion of cases, but as one stage or one manifestation of some other disease. It is, however, of such importance and of so frequent occurrence as to require a separate notice. Congestions are divided into two groups—viz. *active*, due to dilatation of the arteries of the affected part; and *passive*, due to some cause interfering with the return of blood by the veins. In active congestion the flow of blood is usually increased, and the excess is chiefly in the arteries. Familiar instances are the phenomenon of Blushing (q.v.) and the effect of heat, especially moist heat, in increasing the redness of any part to which it may be applied. But the most important active congestions are those which occur in connection with Inflammation (q.v.), of which they constitute the first stage. In passive congestion the flow of blood is always diminished, and the excess is chiefly in the veins. It may be due either to direct obstruction to the return of blood through the veins, or to general enfeeblement of the circulation.

*Congestion from venous obstruction* is easily illustrated by tying up the arm, as is done before opening a vein, when the veins are compressed more than the arteries. If the ligature is kept on for a sufficient time, the veins swell, the fingers become red, and then livid, and the whole limb is swollen. Cold applied to the surface of the body acts similarly on it, and contracts the veins more rapidly than the arteries, which lie deeper; and the purple colour of the hands and face after exposure to cold shows the congested state of the capillaries. Congestions, with stagnation of the blood, are caused in internal organs by an obstruction of the veins leading from them. Thus, congestion of the brain may be produced by a tight cravat or by a tumour pressing on the jugular veins. Efforts of straining, coughing, holding the breath, and asthmatic paroxysms which impede the flow of

blood through the lungs, cause congestion in various parts. Tubercles in the lungs cause congestion of that organ. Obstruction to the transit of blood through the liver causes congestion in the abdomen, hemorrhoids, &c.

*Congestion from weakness of the circulation* includes a numerous class of cases. Here gravitation comes into play very much more forcibly than in the healthy body in determining the distribution of the blood to different parts and organs, though it always produces some effect. Diseases of the valves of the heart are almost always accompanied by congestion of other internal organs at some stage of their progress. In extreme debility, certain fevers, &c., there is general congestion of the parenchymatous organs—the lungs, liver, &c.—and the blood gravitates to the lowest parts, giving rise to what is termed *hypostatic* congestion of the posterior parts of the lungs, the skin of the back, &c. In other cases the effect is more local, as when the feet swell after long standing, in consequence of over-distension of the veins. Congestive affections of this kind are often mistaken for inflammation.

Active congestion, when it requires treatment, must be dealt with in the same manner as inflammation. With regard to passive congestion, the end to which treatment must be directed is the removal of its cause. This can be effected in some cases by measures having a local effect, either completely, as by the loosening of a ligature, the disuse of too tight articles of clothing, or by the removal of a tumour compressing veins, or partially, as by elevation of the head in affected brain, and the recumbent position in congestion of the hemorrhoidal or uterine vessels. Uniform gentle pressure, by supporting the weak vessels, and friction, by increasing the onward movement of the blood in the veins, are often of great use in superficial parts. Similarly the application of astringents, such as adrenal extract, greatly diminishes congestion in parts for which it can be used. Where the heart-power is at fault, strengthening remedies must be given—ammonia, strychnine, digitalis, &c. The American Witch-hazel (q.v.) when administered internally seems to have the power of diminishing the size of dilated veins, and is sometimes useful in varicose veins, hemorrhoids, &c. Various remedies are supposed to have a special power of removing the congestion of certain organs; thus, mercurials are recommended for congestion of the liver; digitalis for congestion of the kidneys; menthol, benzoin, and the balsams for bronchial congestion.

**Congleton**, an ancient municipal borough in the east of Cheshire, picturesquely situated in a deep valley on the banks of the Dane, an affluent of the Weaver, 26 miles S of Manchester. It has a handsome town-hall (1864), manufactures of silk, and neighbouring coal-mines. Pop. 13,000. See book by R. Head (1887).

**Conglomerate**, or **PLUMPUDDING-STONE**, a rock consisting of various-sized, round, water-worn stones cemented together, the binding material being generally of a calcareous, siliceous, or ferruginous character. Now and again the stones are held together by simple compression without any cement. Conglomerate is evidently gravel compacted into a more or less coherent mass. Like coarse gravel and shingle, some conglomerates are very tumultuous in appearance, and show no lines or planes of deposition. Generally, however, rocks of this kind exhibit rudely alternating layers of finer and coarser materials. The included stones may consist of any kind of rock or mineral, but the harder species, such as quartz-rock and quartz, are apt to preponderate. Conglomerates are generally

beach-deposits, either marine or lacustrine; sometimes they are of fluvial origin.

**Congo**, the great equatorial river of Central Africa, has its reservoir in Lake Bangweolo, of which the Chambezi is the largest feeder. From Bangweolo the great river issues under the name of the Luapula; and turning in a northerly direction, it expands into Lake Moero, on leaving which it is called, as far as Nyangwe, the Lualaba. Its length has been calculated variously at a little under and a little over 3000 miles, it drains an area of more than 1,300,000 sq. m., and it discharges a body of water into the ocean second only to the Amazon. The two largest tributaries of the Congo are the Kasai S., and the Mobangi N. The lower river extends from the Banana mouth to the first rapids, 110 miles, navigable for steamers drawing 18 feet. The middle or cataract region extends from Vivi to Stanley Pool, 235 miles. The upper river from Stanley Pool to Stanley Falls, 1068 miles, is navigable for steamers drawing 4 feet, besides over 3000 miles of navigable tributaries. A railway of 250 miles, running some 20 miles south of the river, connects Matadi with Stanley Pool. The river, whose mouth was discovered in 1482 by Diogo Cam, was known to the Portuguese as the Zaïre. In 1818 Tuckey explored 118 miles. In 1867-71 Livingstone discovered the Luapula and Lualaba, which he supposed to be the head-waters of the Nile, but which, by following the course to the sea in 1876-77, Stanley proved to be the upper Congo.

**FRENCH CONGO**, officially French Equatorial Africa, lies between Cameroon and Belgian Congo, the Congo and the Ubangi being the south-eastern boundary, and to the N., beyond Lake Chad and the Bahr-el-Ghazal, includes Kanem, Tibbu, Borku, Ennedi, and Tibesti. It falls into four 'colonies': Gabun, capital Libreville; Middle-Congo, capital Brazzaville; Ubangi-Shari, capital Bangui; and Chad. Area (with territories ceded to Germany in 1911, recovered 1919), 1,000,000 sq. m.; pop. 3,000,000.

**BELGIAN CONGO**, from being a trading association founded by Stanley and Leopold II. of Belgium, was recognised as the Congo Free State by the European powers in conference at Berlin in 1885. It contains an area estimated at 900,000 sq. m., and lies between French Congo (NW.), Portuguese West Africa (SW.), Rhodesia (S. and SE.), Tanganyika territory and Uganda (E.), Anglo-Egyptian Sudan (NE.). It has a coast-line of only about 35 miles north of the mouth of the Congo River. The country is drained almost exclusively by the Congo and its many tributaries. In the east it touches Lakes Bangweolo, Moero, Tanganyika, and Edward; while wholly within its borders are Kivu, as well as Lake Leopold II. discharging into the Mfiri, numerous lakes connected with the river Lualaba, and others. On the whole, the country is not mountainous, but forms a depressed and inclined plateau, rising round its rim to heights of about 6000 feet, and on its eastern border touching much higher elevations on the flanks of the Ruwenzori and Mfumbiro ranges. In the west, where the Congo escapes from the depression, the escarpment of the plateau is cut back to Livingstone Falls. Much of the surface of Belgian Congo is composed of savannas and arable lands, but more is under dense and dark forest, in which rubber-trees are abundant, and many strange forms of animal life are found. Gold, diamonds, copper, tin, and other minerals occur. The people are varied in race, but (except in the NE.) are generally Bantu in speech. In several regions pygmy tribes inhabit the forests. The government is centred at Brussels, and a governor-general administers the territories. Kinshasa was selected in 1921 to supersede Boma as capital. Ruanda and Urundi, from German

East Africa, are held by League of Nations mandate. The chief products are rubber, palm-nuts and oils, copal, cocoa, ivory, coffee, gold, copper, diamonds, and tobacco, while the country is the world's chief source of radium and cobalt. The bulk of the trade is with Belgium. The ports are Banana, at the mouth of the Congo; and Boma, 60 miles up. Where the navigation of the Congo is stopped by falls and rapids, railways have been built. Thus the line from Kabalo on the Congo to Albertville on Lake Tanganyika (1915) and the Ujiji-Dar-es-Salaam line enable one to cross Africa by rail and steamer. The Cape to Cairo line enters Katanga province from the south, and reaches the Congo at Bukama (1918); its northward continuation is probable. Lines connecting Katanga with Boma and with Lobito Bay (Portuguese West Africa) are under construction. Pop. about 8,500,000 (8000 Europeans).

**THE CONGO QUESTION.**—In 1885, before the signature of the Berlin Act, a treaty had been concluded between King Leopold and the United States, in which the flag of the Congo State was recognised, though no boundaries were named. But the American Government was not a signatory of the Berlin Act itself. The British treaty, also signed before the United Kingdom joined in the collective action of the Powers, was couched in somewhat similar terms. Great Britain and the United States were specially responsible for the conversion of a private philanthropic enterprise into that which was intended by Europe to form a model tropical State. While King Leopold was wont to point to American action as first in date, Great Britain made possible the foundation of the Leopoldian dominion by waiving her own earlier treaties with the native chiefs of the upper valley, and using her influence to obtain the renunciation by Portugal of the sovereignty of those coast territories to which a Portuguese claim had been recognised.

When, about 1890, secrecy succeeded publicity in Congolese affairs, the writings of some Englishmen who accompanied the Congo troops in war, as well as of Swedish, American, and British missionaries labouring in the Congo region, caused much alarm among the earlier friends of King Leopold's enterprise. Those originally associated by the King of the Belgians with his Committee of Exploration had included representatives of English commercial and missionary bodies. Sir John Kennaway, for example, had been present at the first meeting of the Comité d'Études du Haut Congo, and he lived to express, as father of the House of Commons, the consternation with which the history of the Congo filled those who had placed in it their hopes for the future of the African native races. For many years, however, while decrees confiscating the natural products of the soil, and giving official sanction to forced labour, were concealed, the reports of atrocious cruelty were fiercely contradicted by the rulers of the State.

Since 1909 there has been little difference of opinion as to the character of the late King Leopold's system. Those among his co-religionists who at one time were inclined to ascribe to Protestant prejudice accounts of cruelties thought to be exaggerated, yielded, in 1910, to the general view. Under acceptance of responsibility by the Belgian Parliament, it is not necessary to reopen the closed pages of Congo history, except for the purpose of noting the fatal blot in the economic system established by decrees, leading as it did to the reversal of the conditions laid down in the treaties and in the Berlin Act, and making reform difficult. The State was founded in the name of God for the regeneration of the native races inhabiting the largest river system of Central Africa.

The contention of Congo reformers, afterwards accepted by Belgian statesmen long at variance with them, was that there could be no future for a rule based on the forcible collection, under rigid monopoly, of the whole produce of the soil.

The Belgian decree which formed the basis for improved government in the Congo Colony bore date 22d March 1910. Nominally accepting the substance of the demand of the British Government and of Belgian reformers representing nearly half of the Belgian Chambers, by reversing the State monopoly on which the Leopoldian system had been based, the decree admitted the right to trade in the natural products of the soil, including rubber. The exceptions and the reservations were considerable, and it was first doubtful whether much had been gained. Pressure of opinion was continued and the position of the Belgian ministry, attacked by M. Vandervelde, with the support of most Belgian Liberals, forced further concession from their moral weakness. The companies with whom King Leopold had financial arrangements ousting the native inhabitants of all the rights, had in some cases exhausted the territories they misgoverned, and in others could look forward only to a few years of continued profitable exaction. As a consequence the Colonial Minister announced that the territory of the Congo would be thrown open to European competition in steps extending over a few years from the date of commencement in July 1910.

Both as to the political and economic situation, the prospect had by the end of the year become more favourable than it had been before or immediately after the issue of the 1910 decree. The harm, however, that had been wrought by the hostage and sentry system involved in the collection of rubber for the State could not be easily undone. To the remonstrances of Great Britain and of the United States the Belgian Colonial Office had replied by a partial repudiation of responsibility, expressed in Brussels by language in the nature of 'hands off.' Recognition, too lightly given to Belgian annexation of the new colony by Germany and France, was long delayed by the British and American Governments on the ground that treaty obligations, although not denounced, were far from having been fulfilled. Apart from general sympathy with the oppressed, the definite responsibilities incurred by the two Governments, and in a less degree by all the Powers, in 1885, justified, as they had inevitably produced, this diplomatic pressure.

In the decree of 1910 there had been no security against the grant of fresh monopoly and no guarantee for the distant future. While the treaty of transfer remained in force and bound Belgium to continue the agreements of King Leopold with his *compagnies concessionnaires*, yet, by her treaty with Great Britain, Belgium had no right to close any part of Congo territory for a single day. However grudging the admission of previous breach of treaty and of the Berlin Act, the announcement that the whole country was to be thrown open disposed opinion in America and England to hope for the continuation of improvement. After a period of incredible horror, the promise of the abolition of forced labour for revenue purposes, and ultimate restoration of freedom of commerce, was widely accepted as a declaration of intention to mitigate abuse as rapidly as possible.

In 1910 the railway from South Africa crossed the Congo frontier and reached the heart of the newly discovered mining territory of the Katanga Province. The inflow of white settlers proclaimed the end of monopoly in the south-western portions of the Congo territory; and the Union Government of South Africa came upon the scene as assailants of monopoly, though not as champions of the native. It was soon the accepted belief abroad that

the opening of the sealed State was likely to aid the restoration to the native population of its economic rights, while the high pay necessarily given to attract labour to the less populous districts seemed certain further to discourage the old methods of oppression in those provinces from which labour would be drawn. In large parts of the territory, well watched by the consular representatives of Great Britain and the United States, pressure upon the natives was relaxed; and favourable reports reconciled many of the severest critics.

See Fox-Bourne, *Civilisation in CongoLand* (1903); several works by Mr E. D. Morel, such as *Red Rubber*; *Great Britain and the Congo* (1909); A. B. Keith, *The Belgian Congo and the Berlin Act* (1919); publications of the Congo Reform Association, which contain an important despatch from the Government of the United States, the famous Report to the British Government by their agent Roger Casement, and the more important Belgian official papers; and Blue-books.

**Congregation** (Lat. *con*, 'together'; *grex*, 'a flock'), an assembly, generally a religious assembly; in its most ordinary use, an assembly of Christians met in one place for worship (see CHURCH).—In the Roman Catholic Church, it often designates a sort of board of cardinals, prelates, and divines, to which is intrusted the management of some important branch of the affairs of the church. Thus the *Congregation of the Index* examines books and decides on their fitness for general perusal (see INDEX). The *Congregation de Propaganda Fide* is instituted for the propagation of the Roman Catholic faith and the government of the church in non-Catholic countries (see PROPAGANDA). The *Congregation of Relics* inquires into the genuineness of supposed relics. The *Congregation of the Holy Office* takes cognisance of heresies, &c. (see INQUISITION). The *Congregation of Rites* regulates the festivals and offices of new saints. There are numerous other congregations. The word is also used in the Church of Rome to describe communities of ecclesiastics who live together under rule, but without being bound by vow, or at least by solemn vow. Such are the *Congregation of the Oratory*, the *Congregation of the most Holy Redeemer*, usually called Redemptorists, &c.

**Congregationalists.** See INDEPENDENTS.

**Congress**, an assembly either of sovereign princes, or of the delegated representatives of sovereign states, for the purpose of considering matters of international interest. Even in America, though the term has now a different meaning, it had a similar origin, the first congress being that of the delegates from the various British colonies, who met on the 7th October 1765, for the purpose of considering their grievances. Previous to signing a treaty of peace, a meeting of plenipotentiaries usually takes place, to which the name of a congress is sometimes applied, though it seems more properly to be reserved for those more important meetings at which extensive schemes of future policy are determined on, and the balance of power amongst the various European states readjusted. To this class belonged the famous Congress of Vienna in 1815; that of Carlsbad in 1819, for regulating the affairs of Germany; that of Paris at the end of the Russian war of 1854-56; that at Berlin after the Russo-Turkish war of 1877-78; and the conference on Morocco at Algeiras in 1906. There is scarcely any difference between a congress and a diplomatic Conference (q.v.).

**Congress of the United States.** The legislative body of the United States is called the Congress of the United States, and consists of a senate, elected by the legislatures of the several states, and a House of Representatives, elected by the

direct votes of the people. It is supreme within its constitutional limits, deriving its powers directly from the people. By constitutional provision congress has certain direct, express powers, and such implied powers as are necessary to carry these into effect. It convenes at least once in each year (on the first Monday in December), and receives the president's annual message, giving information of the state of the Union, and suggesting desirable legislation. The president may call it into extra session at other dates for special legislation.

**Express Powers.**—Congress has power to impose and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defence and general welfare of the United States. This grant of sovereign power is independent of state control, and is limited only by the provision in the constitution that the duties, imposts, and excises shall be uniform throughout. See INCOME-TAX.

Congress has power to borrow money on the credit of the United States, to regulate commerce with foreign nations, and among the several states and with the Indian tribes. It has the exclusive power to establish a uniform rule of naturalisation, and uniform laws on the subject of bankruptcies throughout the United States; to coin money, regulate the value thereof and of foreign coin, and fix the standard of weights and measures; to provide for the punishment of counterfeiting the securities and current coin of the United States; and to establish post-offices and post-roads. Congress has power to promote the progress of science and useful arts, by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries; to constitute tribunals inferior to the Supreme Court; to define and punish piracies and felonies committed on the high seas, and offences against the law of nations.

Congress alone has power to declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water. It can raise and support armies, may provide and maintain a navy, and make rules for the government of the land and naval forces. Congress has power to provide for calling forth the militia of the several states for the purpose of executing the United States laws, to suppress insurrections, and repel invasions, and to provide for organising, arming, and disciplining the militia, and for governing such part of them as may be employed in the service of the United States; reserving to the states respectively the appointment of the officers, and the authority of training the militia, according to the discipline prescribed by congress.

Congress exercises exclusive legislative control in all cases whatsoever over the District of Columbia (the seat of government of the United States), and over all places purchased for the erection of forts, magazines, arsenals, dockyards, and other needful buildings. Congress has power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States, and to make all laws which shall be necessary and proper for carrying into execution all powers vested by the constitution in the government of the United States, or in any department or offices thereof.

**Constitutional Limitations.**—Congress cannot pass a bill of attainder or any *ex post facto* law. Neither can it lay any tax or duty upon articles exported from any state, or give preference to the ports of one state over those of another, by any regulation of commerce or revenue; nor can it compel vessels bound to or from one state to enter, clear, or pay duties in another. It cannot enact a law taking from the citizen his private property for public use without compensation therefor.

Congress cannot make any law respecting an

establishment of religion, or prohibiting the free exercise thereof, or abridging the freedom of speech or of the press, or denying the right of the people peaceably to assemble, and to petition the government for a redress of grievances. Congress cannot enact any law that will render the people insecure in their persons, houses, papers, and effects from unreasonable searches and seizures; or authorise any warrants to issue but upon probable cause supported by oath or affirmation, particularly describing the place to be searched, and the persons or things to be seized. Congress has no power to take from a person accused of crime his right to a speedy and public trial, by an impartial jury of the state or district wherein the crime was committed; or his right to be informed of the nature and cause of the accusation, to be confronted with the witnesses against him, and to have compulsory process for obtaining witnesses in his favour; or his right to be defended by counsel. It cannot enact a law requiring excessive bail, imposing excessive fines, or inflicting cruel and unusual punishments.

*Senate.*—The senate is composed of two senators from each state, formerly chosen by the legislature thereof, but since 1913 by direct popular vote, for a term of six years, so arranged that one-third of all the senators shall go out every two years. No person is eligible for the office of senator unless he is thirty years of age, has been a citizen of the United States nine years, and is an inhabitant of the state for which he is chosen. The senate is presided over by the vice-president of the United States, but in case that officer is acting president of the United States, or is unable to preside, the senate elects a presiding officer *pro tempore*. It chooses all its other officers. The senate has the sole power to try impeachments presented by the House of Representatives, and when sitting in that capacity the senators are sworn or affirmed. Should the president of the United States be on trial, the chief-justice of the Supreme Court of the United States presides. For conviction in impeachments concurrence of two-thirds of the senate is necessary; and judgment cannot extend beyond removal from office and disqualification to hold any office of honour, trust, or profit under the United States.

*House of Representatives.*—The House of Representatives is composed of members chosen every second year by the people of the several states. It elects a Speaker to preside over its deliberations, and all its other officers. No person can be a representative in congress who has not attained the age of twenty-five years and been seven years a citizen of the United States, and he must be an inhabitant of the state in which he is chosen.

The representatives are apportioned among the several states according to the number of their inhabitants respectively, counting the whole number of persons in each state, excluding Indians not taxed. But when the right to vote at any election for the choice of electors for president and vice-president of the United States, representatives in congress, the executive and judicial officers of a state, or the members of the legislature thereof, is denied to citizens of the United States, being twenty-one years of age, or is in any way abridged, except for participation in rebellion or other crime, by constitutional provision the basis of representation is proportionally reduced. The first article of the United States Constitution provides that there shall not be more than one representative to every 30,000 inhabitants, but the increase of population necessitated an increase in the unit of representation, to prevent the house becoming unwieldy, and the apportionment after the census of 1910 gave 210,415 inhabitants as the unit, or 435 members in all. Each organised territory sends one delegate to the House of Representatives, who may debate,

but cannot vote. The nineteenth amendment to the Constitution (1920) admitted women to the national franchise on the same terms as men. Already in some states the right had been conceded for presidential and vice-presidential elections.

The House of Representatives has the sole power of impeachment of the executive and judicial officers of the United States, and must present the charges on which it rests to the senate for trial. Each house is judge of the elections, returns, and qualifications of its own members, and a majority constitute a quorum; but a less number may adjourn from day to day, and may be authorised to compel the attendance of absent members.

Each house determines the rules of its own procedure, and may punish its members for disorderly behaviour, and also may compel the attendance of witnesses before its committees, and inflict punishment for contempt of its authority.

Each house must keep a journal of its proceedings, and must publish the same (excepting such parts as may in their judgment require secrecy), and at the desire of one-fifth of the members present, the yeas and nays of the members voting on any question must be entered on the journal. But neither house, during the session of congress, without the consent of the other, can adjourn for more than three days, nor to any other place than that in which the two houses shall be sitting.

No senator or representative may be appointed to any civil office under the authority of the United States which shall have been created during the time for which he was elected, and no person holding any office under the United States can, during his continuance in office, be a member of either house of congress.

Members of congress are privileged from arrest, except for treason, felony, and breach of the peace, during their attendance upon their public duties.

Two-thirds of the senators present must concur in any treaty which may be made, and in all appointments by the president of ambassadors, or other public ministers and consuls, judges of the Supreme Court of the United States, and such other officers whose appointments are not otherwise provided for.

By the amendments to the Constitution abolishing slavery, guaranteeing civil rights, asserting the validity of the public debt, forbidding the denial or abridgment of the United States citizen's right to vote on account of race, colour, previous condition of servitude, or sex, and prohibiting the manufacture, sale, import, or export of intoxicating liquors, congress is empowered to enforce these provisions by legislation.

When any person, having taken an oath to support the constitution of the United States, as an executive or judicial officer of the United States or of any state, or as a member of congress or state legislature, is, by article xiv. of the United States constitution, ineligible to the position of senator or representative, or elector of president and vice-president of the United States, or to any office, civil or military, under the government of the United States, from having engaged in insurrection or rebellion against the same, congress is empowered to remove this disability by a two-thirds vote of both houses.

ACTS OF CONGRESS are the legislative enactments of the two houses of congress. Bills may originate in either house (except bills for raising revenue, which must originate in the House of Representatives), and be introduced by any member, and may be amended in either house. They are usually referred to the appropriate standing committee for examination and report; and are read a first, second, and third time before being put upon their final passage, being subject to modification or amendment and discussion, according to the rules in each house.

After a bill has been passed by both houses, it is presented to the president of the United States for his approval and signature. If he approves and signs it, it becomes a law. If he does not approve it, the president returns it, with his objections, to the house in which it originated; and that house must enter his objections at large upon its journal, and proceed to reconsider it. If after reconsideration it is passed by a two-thirds vote, it is sent to the other house with the president's objections, by which it shall likewise be reconsidered, and if approved by two-thirds of that house, it becomes a law; the vote in both houses must be taken by yeas and nays, and the names of the voters for or against are entered upon the journal of each house respectively. If the bill is not returned by the president within ten days (Sundays excepted), it becomes a law in the same manner as if he had signed it, unless congress by adjournment prevents its return, in which case it does not become a law.

Every order, resolution, or vote to which the concurrence of both houses is necessary (except adjournment) must likewise be presented to the president after passage, and in case of his disapproval (or veto) must be repassed by a two-thirds vote in the same manner as bills, in order to become a law notwithstanding his objections.

The sessions of congress usually continue during several months, but congress can adjourn at any time by the concurrence of a majority of both houses. If, however, congress adjourns without passing the appropriation bills necessary for the expenses of government, a special session of congress may be called by the president of the United States. Each congress ends on 4th March, every second year, at noon. See books by Moore (1895), Bryce (1910), and President Wilson (1914).

**Congreve, RICHARD**, Positivist, born at Leamington, Sept. 4, 1818, and educated under Arnold at Rugby, became a scholar, fellow, and tutor of Wadham College, Oxford, but resigned after having become definitively a disciple of Comte. He died 5th July 1899. In 1855 he published a good edition of Aristotle's *Politics*. Later works are *Lectures on the Roman Empire of the West* (1855); *Elizabeth of England* (1862); *The Catechism of Positivist Religion* (1858); *Essays: Political, Social, and Religious* (1874); besides many propagandist sermons and addresses. He died 5th July 1899.

**Congreve, WILLIAM**, the greatest master of the English comedy of repartee, as distinguished from the humoristic or Jonsonian comedy which it replaced, was born at Bardsey, near Leeds, and baptised on February 10, 1669 (1670). As a school-boy he was educated at Kilkenny, and as an undergraduate at Trinity College, Dublin. And if this does really make an English gentleman an Irish one, as certain writers learned in 'racial mixings' have generously assumed, Congreve's genius may be taken as another proof that English wit, like English poetry, is the outcome of that mysterious 'Celtic element,' or breath of the 'Celtic Titan' discovered by Matthew Arnold. After the completion of his education, Congreve returned to England, and began life in London, where, like Wycherley, and, indeed, like many another man of letters, he entered upon the study of the law—an arid study, as is generally supposed, for a wit, and yet one which (being the study of the practical logic of life) does more than any other, it has been said, to solidify and strengthen the disparate forces of the intellect in whatsoever field those forces may afterwards come to be exercised. Entered at the Middle Temple, but finding, as Leigh Hunt says, that 'having family as well as wit and scholarship,' he could 'make way in life without a profession,' Congreve invaded very early the literary arena

where 'family and wit and scholarship' were in those old days of more account than would now seem possible. His first publication was *Incognita, or Love and Duty Reconciled*, a novel of cross-purposes and disguises, based partly on reminiscences of the method of Shakespeare's fancy-plays, and partly on reminiscences of a very different dramatic method, that of the new prose comedy which, invented by Etherege, had been very greatly strengthened by Wycherley. When Dr Johnson said of this novel that he 'would rather praise it than read it,' he spoke with his usual sagacity—indeed, he may be said to have marked out a course of criticism which has found high favour among succeeding critics of fiction—a course which is, no doubt, as wise as amiable in regard to nine novels out of any given ten. But whether the tenth, the novel to be read as well as praised, should properly be *Rasselas* or *Incognita* seems to depend, now as then, on the temper and the constitution of the praiser. If *Rasselas* is the more instructive, *Incognita* is the more amusing. For though to laugh with the author is difficult, to laugh at him is easy enough, and laughter is certainly good. Congreve's novel is rich in 'cultismo' of that highly ornate kind which has at intervals illuminated modern literature from Góngora to Dr Chivers. Such a passage as that in which Congreve talks about his heroine's employing one of Cupid's pen-feathers 'to pick her teeth' would have satisfied even such masters of style as the author of *Polyphemus* and the author of *Eonuchs of Ruby*.

That a story so full of that silly mock-sentiment then in vogue—stuff which would now make even school-girls laugh—should have been written by the great wit and humorist of *Love for Love*—that the story should have had a very great success among those same cynical beaux and brazen belles who were in the habit of sitting out *She Would if She Could* and the *Country Wife*—would be incredible did we not remember the still more astonishing fact that the love-passion—the passion which Shakespeare and Ford and the rest of the Shakespearians had delineated so powerfully—was, judging from the literature of Congreve's time, wiped out as by a sponge from the English character. It is not enough to say that as soon as the wits of the coffee-houses attempted to touch the love-passion their sense of humour straightway fled: their common sense fled too; they became idiots, positive idiots. As far as date of publication goes, Congreve's novel was followed by his translation of the eleventh satire of Juvenal. This appeared in Dryden's *Juvenal and Persius*, dated 1693, but actually published in 1692. From Dryden, to whom he had been introduced it is said by Southerne, Congreve received unvarying kindness—kindness which was answered by unvarying gratitude, or rather by that generosity of recognition among fine spirits—the sublimation of gratitude—which is said to be undreamed of by smaller souls. In January 1693 appeared Congreve's comedy the *Old Bachelor*, under the auspices of Dryden—'then as now a living and immortal witness to the falsehood of the vulgar charge which taxes the greater among the poets with jealousy or envy, the natural badge and brand of the smallest that would claim a place among their kind.' But if Dryden was free from envy, the disease which, according to the above skilful diagnosis by Swinburne, afflicts poetasters and criticasters alone, not less free from this literary leprosy was Congreve himself. This is what makes him, notwithstanding his rank-worship, so interesting as a personality; this is what also makes the other comic dramatists Etherege and Vanbrugh interesting, so interesting, that we would fain, if we dared, condone even such sins against the sanctities of art as theirs; they

were free from the disease which it seems feeds the lower slopes of Parnassus with poisonous air. No three writers were ever more generally beloved—none were ever beloved more deservedly than these. And even Wycherley—he whose literary sins were the most grievous of all—was, on account of his fine social qualities, called ‘Manly Wycherley.’ That a corrupt court should have spoiled such men as these is, among all the heavy impeachments of the Restoration, the heaviest.

Congreve's freedom from the fussy egotism of the literator served him in good stead in regard to the *Old Bachelor*. Dryden, while declaring that he ‘never saw such a first play in his life,’ hinted at the same time that a great deal of skilful manipulation was required before it could be safely placed upon the boards. And he and Southerne and Maynwaring, who set about manipulating it, seem to have had from Congreve *carte blanche* to do with it as they liked. The brilliant success of the *Old Bachelor*—a play whose merits were of entirely a literary kind—is evidence of the enormous change that has come over play-goers since those days. Congreve's second comedy, the *Double Dealer*, which appeared in the November of 1693, was more firmly knit, and in every way stronger than the *Old Bachelor*, but the satire on the morals of the time—especially on the meanness and heartless treachery in sexual relations which had become the fashion of the court, was administered in too serious a temper to please an audience composed largely of the very people satirised. The empty-headed beaux and callous women who went to the theatre went there to be amused, not to be sermonised. But besides this repellent quality, the play suffered from a want of dramatic illusion greater in a certain sense than even the *Old Bachelor* had displayed. An audience can scarcely be interested in the doings of a villain who every few minutes comes to the footlights in order to assure them what a consummate villain he is, and on what admirable psychological principles his creator has fashioned him, nor yet in a hero who lets a villain do what he will in order that the dramatist's plot may be conveniently worked out. In stage-craft Congreve was always weaker than Vanbrugh and Wycherley, but the weakness made itself specially conspicuous here.

It was to this play that was prefixed Dryden's famous verses ‘To my dear friend, Mr Congreve,’ verses whose generosity passes into pathos. Congreve's next publication was the *Mourning Muse of Alexis*, a poetic dialogue upon the subject of Queen Mary's death, as full of artificial conceits as his novel. *Love for Love*, the finest prose comedy in the English language, finished in 1694, was produced at the ‘theatre in Little Lincolns Inn Fields’ in 1695. It has an abandonment of humour, an irresistible rush of sparkling merriment, such as Congreve's previous plays had not promised. In judging of its qualities we must not forget that in comedy as in tragedy—in prose as in verse—nothing is really informed by artistic vitality which lacks the rhythmic rush born of creative enjoyment. To him who is really and truly organised to write, whether in verse or in prose, there is always in the genuine exercise of his faculty a sense of sport as delightful as it is deep, an exhilaration that cannot be simulated and that cannot be supplied to the nervous system of the true writing man by any other stimulant. Not all the *Paradis artificiels* summoned up by the geni of Opium, Hashish, or Alcohol, can compete with the true paradise which the Genius of the Inkhorn throws open to the born literator when the impulse is really upon him. And as surely as the hilarity of artistic creation is seen in Aristophanes, in Lucian, in Rabelais, in Shakespeare, in Swift, in Dickens, is it seen in Congreve's *Love for Love*. No wonder then that of

all his plays it was the last to be banished from the stage. So late as 1842 Macready revived it (modified of course) at Drury Lane, and this was followed by still later revivals, the last of all being a version of the play in three acts, compressed by Mr John Hollingshead at the Gaiety Theatre in November 1871, with Miss Cavendish in Angelica and Miss Farren in Prue. In *Love for Love* culminated the prose comedy of England. Abundant and brilliant as is the wit, the coruscations do not, as in Congreve's other plays, outdazzle the sweeter and softer light of the humour. The characterisation is true, true under the conditions which, as he himself admirably said in his letter to Dennis, the comedian must always work under. ‘The distance of the stage,’ says he, ‘requires the figure represented to be something better than the life; and, sure, a picture may have features larger in proportion and yet be very like the original. If this exactness of quantity were to be observed in wit, as some would have it in humour, what would become of those characters that are designed for men of wit? I believe, if a poet should steal a dialogue of any length from the extempore discourse of the two wittiest men upon earth, he would find the scene but coldly received by the town.’

Some of the characterisation, such as that of Angelica, is really beautiful, while some, like that of Sir Sampson Legend, in its genial breadth passes from the comedy of artifice into absolute comedy, and is almost Shakespearian. In 1697 Congreve's one tragedy, the *Mourning Bride*, appeared. The honours it received in the 18th century were as excessive as the contempt it met with in the next. No doubt it is full of improbabilities, but it shows a considerable power of invention of melodramatic if not of tragic incident. The purely theatric and scenic qualities of the second act are of a most original, if not of high order, and with the scenic appliances of our own day might be made theatrically effective. Of course, however, it is cold—cold as those ‘monumental caves of death’ which ‘shot a chillness’ to the ‘trembling hearts’ of Drs Johnson and Blackmore—and nothing could really warm it.

Between the date of the *Mourning Bride* and that of Congreve's last comedy, the *Way of the World*, he was busily occupied, in company with several others, in the famous Jeremy Collier controversy, defending the morality of the new stage. The great mistake of Congreve's life was this—of defending his plays on moral grounds. To ‘let well alone’ is wise: to let ill alone is perhaps wiser still. Of all sins, that of producing harmful literature is the blackest. It is the peculiar glory of letters that stronger than king or kaiser is he who writes strongly. It is so to-day: it was so when the warrior kings of Nineveh went out to reap glory—i.e., to slay and flay—in order to furnish the scribe with subjects—in order that the scribe should, in bas-relief and cuneiform character, record their doings. Hence, in the truest and deepest sense, to write is, as Bishop Butler has said, to act; and if, as he declares, ‘endeavouring to force upon our minds a practical sense of virtue, or to beget in others that practical sense of it which a man really has himself, is a virtuous act,’ what, on the other hand, was the act of him who wrote certain scenes in the *Double Dealer* and *Love for Love*?

And yet even this new stage was not without one saving grace till Congreve defended it; it had a frankness in sin: that was something at least. Its place was not alongside those filthy French fictions of our own time which, while pandering to the bestial side of man, set up an impudent pretence of doing so for the good of his soul. But Congreve in his lame defence condescended to

the part of the hypocrite—condescended to exploit Aristotle's paradox about comedy being an imitation of bad characters—an imitation with an ethical end; as if such comedy as his had anything to do with ethical ends! Notwithstanding the conventional tags at the end of Congreve's plays—tags which had no serious meaning, and were meant to have none—the 'Seventh Hell' of the Hypocrite could never claim the author of *Love for Love* until he set about defending that play. Better to leave ill alone, we say.

Congreve's last play, the *Way of the World*, was produced in 1700. Though quite as full of intellectual brilliance as *Love for Love*, and evidently written with more care, not to say labour, it lacks the humorous impulse which we have seen in Congreve's masterpiece. The glitter is that of icicles in the sunlight. The wit of the dialogue is not sufficiently held in hand to work out the characters and the plot. In a word, it comes more completely than does any other of Congreve's plays within the scope of the Duke of Buckinghamshire's strictures upon the comedy of repartee:

Another fault, which often does befall,  
Is when the wit of some great poet shall  
So overflow, that is, be none at all,  
That ev'n his fools speak sense, as if posset,  
And each by inspiration breaks his jest,  
If once the justness of each part be lost,  
Well may we laugh, but at the poet's cost.

This play was received with comparative coldness, and Congreve wrote no more for the stage; but he lived till January 1729. Socially his life was one unbroken success. Physical suffering he had, but most of it was the result perhaps of his own youthful indiscretions. Kneller's portrait shows him to have been a handsome man with dark eyes. His career shows him to have been a man of fine genius who, smitten with the English canker of rank-worship, succeeded in half-misprising his endowments and living and dying genteel. He amassed a fortune, and left it not to his greatest friend Mrs Bracegirdle, a woman of genius, of surpassing beauty, and most lovable nature, who had sacrificed everything for him, but to the Duchess of Marlborough, who, after his death, had a waxen statue of him made—a statue which sat at her table in his very clothes, and nodded mechanically over the dinner at Her Grace's smallest joke, even as he had used to nod in the flesh.

See the *Works*, ed. Summers (1923); *Comedies*, ed. W. E. Henley (1895); the edition by Knight; the short *Life* by Gosse (1888; rev. and enl. 1924); essays by Hazlitt and Swinburne; also A. Nicoll, *Restoration Drama* (1923); Bonamy Dobrée, *Restoration Comedy* (1924).

**Congreve**, SIR WILLIAM, was born 20th May 1772, the son of William Congreve, Comptroller of Woolwich Royal Laboratory. Passing through the Royal Academy at Woolwich in 1808, after many experiments he contrived the Congreve rocket. It was tried in the Basque roads in 1809, and at Leipzig in 1813, not too successfully. Honours were heaped on Congreve; he was elected F.R.S., M.P. in 1812, and in 1814 he succeeded to the baronetcy and his father's place. He died at Toulouse, 16th May 1828. See ROCKET.

**Coni**, or CUNEO, capital of an Italian province, stands in a fruitful district, 48 miles SW. of Turin by rail. It has a fine cathedral, lately restored. It was once strongly fortified, and a place of great strategic importance. Its chief manufactures are silk, cotton, and paper. Pop. 30,000.

**Conic Sections**. See CONE, CIRCLE, ELLIPSE, PARABOLA, and HYPERBOLA.

**Coniferæ**. This important and interesting class of gymnosperms attained its maximum importance during past geological periods; its world-wide

geographical distribution and strongly marked family and generic differences being in this way explained—i.e. when we regard the existing forms as the survivors of a larger and once predominant coniferous flora, which has been in good part displaced by the more recent and higher monocotyledonous and dicotyledonous (angiospermous) forms. About 350 species, included in about 33 genera, now remain. Leaving the questions of floral morphology and minute structure which separate the conifers (along with Cycads and Gnetaceæ) from the remaining phanerogams or 'angiosperms' to the article GYMNOSPERMS, it may be most profitable here to make a rapid survey of the most important groups of the class, with their principal types. Various systems of classification have been propounded; an old and widely adopted one recognises three orders, the pines (Abietinæ), cypresses (Cupressinæ), and yews (Taxinæ). Since, however, the first two of these are much less widely separated from each other than from the third, later systematists are returning to the classification of Lindley, and regard these as making up a single order (Pinoideæ) equivalent to the yew order (Taxoideæ). On account of the exceptional importance of this class, alike in forestry and horticulture, a brief enumeration of the families of these orders, with mention of their most important species, may now be given.

Commencing with the Abietinæ division of Pinoideæ, we find three families, the pines proper (*Abietinæ*), Araucarias (*Araucariinæ*), and Taxodiaceæ (*Taxodiinæ*). The genera *Abies*, *Picea*, *Tsuga*, consist of evergreen trees, or sometimes shrubs, in which the linear and always more or less completely needle-shaped leaves arise singly, and are never clustered in branchlets, while the scales of the cones are not thickened at the tip. The list may be headed by the Spruce Fir, or Norway Spruce (*Picea excelsa*), one of our commonest trees, while *Tsuga Douglasii*, *Abies nobilis*, and other Californian species are of special beauty as trees and value as timber, with other species too numerous to mention. The old Linnean genus *Pinus* (from which the firs, larches, and cedars have been separated off as *Abies*, *Larix*, and *Cedrus* respectively) still includes about 100 species, easily distinguished from *Abies* by the grouping of the leaves upon arrested branchlets, the thickening of the tips of the cone-scales, and other characters. Among the more important species, *P. sylvestris* (the Scots pine), *P. austriaca* (the Austrian pine), *P. Laricio* (the Corsican pine), *P. Pinaster* (the cluster pine), and *P. Pinea* (the stone pine of southern Europe), may be first mentioned, alike on account of their frequency of occurrence in forests and plantations in Europe, and as agreeing in having usually only two leaves on each branchlet. A large and chiefly Californian series agrees in having three leaves on each sheath. Of these, *P. insignis* (the Oregon pitch pine), *P. Benthamiana*, and *P. radiata* may be mentioned; finally a series, usually five-leaved, includes the Weymouth Pine and White Pine of North-east America (*P. Strobus*), the Siberian Stone Pine (*P. Cembra*), &c. Of the allied genus *Larix* (see LARCH) only *L. europæa* (*decidua*) need here be mentioned, while of *Cedrus* (see CEDAR) *C. Libanus* and *C. Deodara* are of special importance. The Araucariaceæ are familiarly represented by the *A. imbricata* of Chile, so common in suburban gardens (see ARAUCARIA), and other more graceful but usually less hardy species; as also by the important Kauri pine and other species of *Dammara*. See DAMMARA.

The Taxodiaceæ include a number of very important trees, notably the curious umbrella pine (*Sciadopitys*) of Japan, *Cunninghamia sinensis* of China, and the colossal *Wellingtonia* (*Sequoiia gigantea*)

of California, with its allied species (see *SEQUOIA*). In addition to these we may mention also the Japanese Cedar (*Cryptomeria japonica*, the Virginian Bald Cypress (*Taxodium distichum*).

Among the Cupressineæ we have first the cypresses proper, which include, besides the well-known genus *Cupressus* (see *CYPRESS*), *Chamaecyparis* of North America and Japan. *Juniperus* (see *JUNIPER*) alone forms another family; while *Thuja* (see *ARBOR VITÆ*) with its immediate allies *Thujopsis* and *Libocedrus* constitute a third; and *Callitris* with *Actinostrobus* and *Fitzroya* make up the fourth. *Callitris* is the Australian cypress pine, whose great virtue is its resistance to the white ant.

Passing now to the sub-order of yews (*Taxoideæ*) we have again two main divisions, the yews proper, or *Taxeæ*, and the *Podocarpeæ*. Among the latter we shall only mention the oriental genus *Podocarpus*, and the beautiful *Dacrydium cupressinum* of New Zealand; but the former are of much greater variety and importance (see *YEW*). Besides *Taxus*, we have the Chinese and Japanese *Cephalotaxus*, and the Chinese and Californian *Torreya*.

The sacred Chinese maiden-hair tree (*Ginkgo biloba*), formerly placed here, is now regarded as forming a genus, a family, and a class by itself.

See *GYMNOSPERMS*, and articles on particular genera; also Engler's *Pflanzenfamilien*, and Dallimore and Jackson's *Handbook of Conifere* (1923). For the purposes of the English horticulturist Veitch's *Manual of Conifere* is most exhaustive, while Gordon's *Pinetum*, Hemsley's *Handbook of Hardy Trees*, &c. (1877), and Webster's *Coniferous Trees* (1918) are of service to the amateur.

**Conington**, JOHN, a great classical scholar, was born at Boston, 10th August 1825. He was educated at Beverley, and for five years at Rugby, obtained a demysip at Magdalen College, Oxford, in 1843, and next year carried off, in the same term, the Hatford and Ireland scholarships. In 1846 he betook himself to University College, where he was elected to a fellowship two years later. Other distinctions he won were the chancellor's prize for Latin verse, for an English essay, and for a Latin essay. Determining not to take orders, he tried the study of law, but soon abandoned it in disgust. In 1854 he was appointed to the newly-founded chair of Latin Language and Literature at Oxford, which he filled until his untimely death at his native place, October 23, 1869. The impulse that Conington's lofty and contagious enthusiasm gave to classical scholarship and real culture in England was far more considerable than anything he was able to effect in the way of performance. His unique personality and the singular charm of his simple but serious nature made a profound and permanent impression upon his friends and pupils. His greatest work is his edition of *Virgil* (3 vols. 1861-68), with its singularly subtle and suggestive essays. His edition of the *Agamemnon* (1848) and *Choephori* (1857) of *Æschylus* are of less moment, though indeed the latter is admirable. In his last years he gave himself much to translation, the results of which were his metrical version of the *Odes* of Horace (1863); the *Æneid* (1866), in Scott's ballad-metre; the *Iliad* (1868), in the Spenserian stanza; and the *Satires* and *Epistles* of Horace (1869), in the couplet of Pope. Of these the last is without doubt the most valuable. His edition of *Persius* was published in 1872, and in the same year his *Miscellaneous Writings* (2 vols.), with a short Life by Professor H. J. S. Smith.

**Conirostres**, a term often applied to a section of Passerine birds, characterised by a strong conical beak. It includes numerous families, and such types as weaver-birds, finches, sparrows, and larks.

The character referred to is too external and adaptive to be of much importance, and the term is too wide in its application to be of much use. It is better disused.

**Coniston Grits and Flags**, a series of siliceous sandstones, grits, flags, and conglomerates, belonging to the Silurian system of Cumberland, &c. They take their name from Coniston in Lancashire, and attain a maximum thickness of probably not less than 7000 feet. They are characterised—the finer grained beds (flags) especially—by the presence of many species of graptolites and other fossils. They are believed to be on the same geological horizon as the Denbighshire grits and flags of Wales. See *SILURIAN SYSTEM*.

**Coniston Water**, in the English Lake District, lies in North Lancashire, at the east foot of the Coniston Fells, 9 miles W. of Bowness on Windermere, and 10 by rail NNE. of Foxfield Junction. It is 5 miles long,  $\frac{1}{2}$  mile broad, 143 feet above the sea, and its greatest depth is 184 feet. Its waters abound with trout and perch. On the east shore stand Brantwood, once Ruskin's home, and Tent House, once Tennyson's. The Old Man of Coniston, to the NW., is 2633 feet high. See *LAKE DISTRICT*.

**Conium**. See *HEMLOCK*.

**Conjeveram** (*Kanchivaram*), 'the Benares of South India,' 45 miles SW. of Madras by rail, with three old pagodas, ancient tanks, and United Free Church missions. Here Hyder Ali defeated the British in 1780. Pop. 54,000.

**Conjugal Rights**. See *MARRIAGE*.

**Conjugation of Cells**, a mode of reproduction in which two apparently similar cells unite, as in *Amœba*, *Diatoms*, *Spirogyra*, &c. See *ALGÆ*, *DESMIDS*, *DIATOMS*, and *REPRODUCTION*.

**Conjunction**, in Astronomy, is one of the Aspects (q.v.) of the planets. Two heavenly bodies are in conjunction when they have the same longitude—that is, when the same perpendicular to the ecliptic passes through both. If they have, at the same time, the same latitude—that is, if they are both equally far north or south of the ecliptic—they appear from the earth to be in the same spot of the heavens, and to cover one another. The sun and moon are in conjunction at the period of new moon. In the case of the inferior planets Mercury and Venus, there is an inferior conjunction when the planet is between the earth and the sun, and a superior when the sun is between the earth and the planet. In general, a heavenly body is in conjunction with the sun when it is on the same side of the earth, and in a line with him; and it is in *opposition* to the sun when it is on the opposite side of the earth, the earth being in a line between it and the sun. Planets are invisible when in conjunction with the sun, except in rare cases when an inferior planet passes over the sun's disc, and may be seen as a speck on his surface. Conjunctions are either *geocentric* or *heliocentric*, according as they are actually witnessed from the earth, or as they would be witnessed if observed from the sun. In observing a conjunction from the earth's surface it is usual to reduce the observation to what it would be if made from the earth's centre; by this means the exact times of conjunction are more accurately fixed, and the observations of one astronomer made available to every other, wherever he may be on the earth's surface. *Grand conjunctions* are those where several stars or planets are found together. Chinese history records one in the reign of the Emperor Tehuen-hiu (2514-2436 B.C.), which astronomers calculate to have actually taken place.

**Conjuring**, as understood at the present day, signifies the production of effects apparently miraculous by natural means.

The art of producing apparently supernatural phenomena has been cultivated from remote antiquity. The earlier professors of the art claimed *bona-fide* supernatural powers; and in ages when the most elementary principles of physical science were unknown beyond a very limited circle, it was not difficult to gain credence for such a pretension. The modern conjurer makes no such claim, but tells the public frankly that his marvels are illusory, and rest either on personal dexterity or on some ingenious application of natural principles. Of the conjurers of remote antiquity we have few reliable records; though it is a tolerably safe conjecture that the prestige of the ancient mysteries rested in no small degree upon effects of natural magic. It may also be gathered that the conjurers of old were familiar with certain forms of optical illusion, in which the use of plane and concave mirrors, and a partial anticipation of the principle of the magic-lantern, played prominent parts. Chaucer mentions illusions of his own day of which the above seems the most probable solution. In the accounts of very early writers, however, large deductions must be made for the comparative ignorance of the observer, and the desire, common to all narrators of extraordinary occurrences, to make the marvel as marvellous as possible. Perhaps the earliest really trustworthy authority is Reginald Scot, who in his *Discoverie of Witchcraft* (1584) has enumerated the stock feats of the conjurers of his day. The list includes swallowing a knife; burning a card and reproducing it from the pocket of a spectator; passing a coin from one pocket to another; converting money into counters, or counters into money; conveying money into the hand of another person; making a coin pass through a table, or vanish from a handkerchief; tying a knot, and undoing it 'by the power of words'; taking beads from a string, the ends of which are held fast by another person; making corn to pass from one box to another; turning wheat into flour 'by the power of words'; burning a thread and making it whole again; pulling ribbons from the mouth; thrusting a knife into the head or arm; putting a ring through the cheek; and cutting off a person's head and restoring it to its former position. Strange to say, many of these feats, which were doubtless already old in the time of Scot, are still performed, with more or less variation of detail, by conjurers at the present day.

The conjurers of Scot's time, and even of much later date, were accustomed, in order to facilitate the substitutions on which a great part of their tricks depended, to wear an apron with pockets, known (from its resemblance to a game-bag) as the *gibécère*. A later school suppressed this tell-tale article of costume, and used instead a table, with cover reaching nearly or quite to the ground. This table concealed an assistant, who worked most of the required transformations, &c., either handing the needful articles to the conjurer as he passed behind the table, or pushing them up through traps in the table-top. Conus the elder, a French conjurer who flourished at the close of the 18th century, made a further improvement by discarding the concealed assistant, and using an undraped table with a secret shelf (now known as the *servante*) behind it, on which his substitutions were made. His immediate competitors did not follow his example, a whole generation of later conjurers, including Comte, Bosco, and Philippe, retaining the suggestive draped table. Its death-blow, however, was struck by Robert Houdin (1805-71), with whom about 1844 a new era began. His miniature theatre in the *Palais Royal* was remarkable for the elegant simplicity of its stage arrangements, and in particular for the complete suppression of the *boîte à compère* ('wooden confederate'), as Robert Houdin

sarcastically terms it. The new style took with the public, and by degrees Robert Houdin's contemporaries found themselves compelled to follow his example.

To Robert Houdin belongs the credit of devising some of the best-known and most ingenious pieces of magical apparatus, as also that of the application of electro-magnetism, then little understood, to the production of magical effects. The well-known magic drum, that beats without visible drumsticks, the magic clock and bell, and the chest, light or heavy at command, are all fruits of his inventive genius.

The most modern school of conjurers, following the lead of Wiljalba Frikell, and subsequently represented by Hartz, Hermann, Buatier de Kolta, Verbeck, Lynn, Bertiam, &c., generally aim at producing their magical results with the minimum of visible apparatus. There has been, however, some reaction in favour of more spectacular illusions, such as those of Maskelyne, in which the resources of optical and acoustic as well as mechanical science are laid under contribution in aid of conjuring proper.

See works by Hoffmann—*Modern Magic* (6th ed. 1886), *More Magic* (1890), *Later Magic* (1904), and other volumes; Maskelyne and Devant, *Our Magic* (1911); *Sleight of Hand*, by Edwin Sachs (2d ed. 1885); Robert Houdin's *Secrets de la Prestidigitation et de la Magie* (1868; reprinted in 1878 under the title of *Comment on devient Sorcier*) and *Magie et Physique Amusante* (1877); and an anonymous work, *Recueil de Tours de Physique Amusante* (published by De La Rue of Paris). The three last-named works have been translated into English by Hoffmann, under the titles of *The Secrets of Conjuring and Magic*, *The Secrets of Stage Conjuring*, and *Drawing-room Conjuring* respectively.

**Conkling**, ROSCOE, American politician, born in Albany, New York, 30th October 1829, was admitted to the bar in 1850, sat in congress as a Republican in 1858-62 and 1864-66, and was elected to the United States senate in 1867, 1873, and 1879. He was now an influential member of his party; in 1876 he received ninety-three votes for the presidential nomination, and, in 1880, by his support of Grant, and his personal opposition to Blaine, divided the Republicans into two sections. In 1881 he and his colleague suddenly resigned from the senate, owing to a dispute with President Garfield on a question of patronage, and sought re-election; but after a warm canvass, both were rejected, though vigorously supported by Vice-president Arthur. Conkling afterwards practised law in New York city. He died 18th April 1888.

**Conn**, LOUGH, a picturesque Irish lake in the north of County Mayo, together with Lough Cullin (from which it is separated by a narrow neck of land), 13 miles long, and 1 to 3 broad. It lies in a wild romantic region of hills, glens, rocky slopes, precipices, broken ground, and bogs, contains many islets, and has bold shores.

**Connara'cea**, an order allied to Leguminosæ, including about 160 species, all tropical, of which the most important is *Connarus guianensis* (or *Omphalobium Lambertii*) of Guiana, the source of the zebra-wood of cabinet-makers.

**Connaught**, the most westerly and the smallest, both in extent and population, of the four provinces of Ireland. It is bounded N. and W. by the Atlantic; E. by Ulster and Leinster, from the latter of which it is separated by the Shannon; and S. by Munster. It contains the counties of Galway, Leitrim, Mayo, Roscommon, and Sligo. Greatest length from north to south, 105 miles; greatest breadth, not including Achil Island, 92 miles. Area, 6863 sq. m. The west coast has many fine bays and harbours, and the surface, especially in the western half, is mountainous and

rugged, forming remarkably grand and picturesque scenery. The people are still almost purely Celtic. In ancient times the O'Connors were kings of Connaught. In 1590 the province was divided by the English into six counties, its present five, with Clare, afterwards joined to Munster. The Duke of Connaught and Strathearn, third son of Queen Victoria (b 1850), was in 1902 made Field-marshal, in 1904 Inspector-general of the Forces, and in 1907 Commander-in-chief in the Mediterranean, and in 1911-14 was Governor-general of Canada. The Connaught Rangers, once the 88th foot, now comprise the old 88th and 94th Regiments. Pop. (1841) 1,420,705; (1891) 724,772; (1911) 610,984.

**Connecticut** (*kon-net'-e-kut*), one of the six New England states of the American Union, and one of the original thirteen federal states, is bounded by Massachusetts, Rhode Island, Long Island Sound, and the state of New York. It is the smallest in area (5000 sq. m.) of all the states, excepting Rhode Island and Delaware, but in 1920 ranked twenty-ninth (of the forty-eight) in respect of population. It is one of the most densely peopled states of the Union. A great part of the surface is rocky and uneven, and the Green and Taconic Mountains of the Appalachian system occupy a considerable part of the western extremity of the state; but the mountains here are all insignificant in respect of height. Much of the surface is not easily cultivated, and rather unfertile; but a considerable part of the valley of the Connecticut River is very productive, tobacco being a leading product of this section. Hay, potatoes, maize, oats, and rye are the principal crops. Grazing and milk farms, orchards and market-gardens, are profitably sustained in all parts of the state.

The Connecticut River, which, rising in New Hampshire, forms the boundary between that state and Vermont, and flows south through Massachusetts, crosses Connecticut also, and after a course of about 450 miles enters Long Island Sound, 30 miles east of New Haven. It is navigable for vessels of light draught as high as Hartford. In the east part is the River Thames, and in the west the Housatonic, both of which afford some navigation. But the greatest value of the very numerous streams is as a source of water-power. The surface-rocks are mostly Azoic, with the principal exception of a strip of Triassic sandstone or psammite running along the Connecticut River. This brown sandstone is largely quarried at Portland and East Haven, as are excellent red and plain granites and gneissoid building-stones at many points; valuable serpentine and verdantique exist near New Haven. Some quarries yield excellent flagstones of gneissoid character; the so-called 'trap' rock, which is a diabase of Triassic date, is also wrought; and in the north-west good limestones of Lower Silurian age are quarried. Brown hematites are extensively wrought in the north-west section, and yield excellent iron. Lead, copper, cobalt, and tungsten have been locally mined. Useful mineral-waters occur at various points. The climate is very changeable, and is rather severe in winter, but generally healthful. Nearly the whole surface was once richly forested; but no very extensive areas are now covered by large timber; still the aggregate production of wood for building purposes and for fuel is very considerable. The sea-coast affords a number of good harbours. Most of the maritime enterprise is now directed to the coastwise trade, the whale and seal fisheries having declined. Oyster-fishing is engaged in largely and very systematically, as is the taking of fish for oil and fish-guano. The manufactures of Connecticut are carried on upon

a very extensive scale, and are of exceedingly varied character; and notwithstanding its small area, the state stands in the first rank as respects the amount and aggregate value of manufactured goods. Copper, brass, and silver goods, machinery, clocks, hardware, india-rubber goods, firearms, textiles, and smallwares in great variety, are produced on a large scale. Life, fire, and accident insurance, and the publication of subscription books, receive great attention. The state is well supplied with railways. In very few parts of the world has more been done for popular education than in this state. Private schools of every grade supplement the work of this public-school system. The latter dates from 1644. Yale University at New Haven comprises collegiate and post-graduate courses, besides medical, theological, scientific, law, and art schools, and takes a very high place among the seats of learning in the country. Mention should be made of Trinity College, Hartford, and of the Wesleyan University at Middletown. There are also divinity schools at Hartford (Congregationalist) and Middletown (Episcopalian), an agricultural college at Storrs. The state supports a full complement of institutions for correction and charity. Among the principal cities and towns are New Haven, Bridgeport, Hartford (the capital), Waterbury, New Britain, Stamford, Meriden, New London, Norwalk, and Norwich.

The old stock of inhabitants were of English Puritan origin, but of later years there has been a large immigration of Irish, German, English, and others. The colony of Connecticut may be said to date from 1634, when the movement began in which Hartford, Wethersfield, and Windsor were settled by persons removing from Massachusetts, and displacing a slender colony of the Dutch. This movement was in reality the secession of the more democratic element from Massachusetts. Saybrook, named in honour of Lord Say-and-Sele and Lord Brooke, was the nucleus of a separate colony which in 1644 was united to Connecticut, as was in 1662 the New Haven colony, founded in 1638. The Connecticut colony adopted a constitution in 1639, 'the first written democratic constitution on record.' The royal charter of 1662 was exceedingly liberal, it being essentially a confirmation of the older constitution; and it continued in force even after the independence of the American states, but in 1818 was replaced by the present state constitution. A large part of Long Island was for a considerable period under the government of the colony. Prominent events in Connecticut history have been the bloody war with the Pequot Indians, 1637; the governorship of Sir Edmund Andros, during a part of which (1687-88) the colonial charter was in abeyance, and according to the very doubtful but commonly received account was only saved from destruction by being hidden for a time in a hollow tree, the Charter Oak at Hartford. Slavery was abolished in 1818. Pop. (1870) 537,454; (1880) 622,700; (1890) 746,258; (1900) 908,420; (1910) 1,114,756; (1920) 1,380,631. See Johnston's *Connecticut* (1887); G. L. Clark's *History of Connecticut* (1915).

**Connellsville**, a borough of Pennsylvania, 35 miles SSE. of Pittsburgh, has a very great coke industry, and manufactures automobiles and machinery; pop. 13,500.

**Connemara**, a wild and picturesque district, the westernmost division of Co. Galway. Its scenery, lakes, streams, and inlets attract many fishers and tourists. Connemara is also called Ballynahinch.

**Connoisseur**, a term borrowed from the French, to designate persons who, without being themselves artists, are competent to pass a critical

judgment upon the merits of works of art, especially in painting and sculpture. The Italian equivalent for connoisseurs is *Cognoscenti*.

**Conodonts**, minute fossils met with in Paleozoic strata. They are variable in form, and look very like the teeth of different kinds of fishes, some being simple slender pointed sharp-edged cones, while others are more complex, resembling in form the teeth of certain sharks. Their affinities are very uncertain—some maintaining that they are really the minute teeth of fishes allied to the living hag-fishes and lampreys—others suggesting that they have more analogy with the hooklets or denticles of annelids and naked molluscs.

**Conoid**, a solid formed by the revolution of a conic section round its axis; such are the sphere, paraboloid, ellipsoid, and hyperboloid.

**Conolly**, JOHN, physician, born at Market Rasen, Lincolnshire, in 1794, graduated at Edinburgh in 1821, and in 1827 settled in London, where he was for two years professor of the Practice of Medicine in University College. In 1839 he was appointed resident physician to the Asylum for the Insane at Hanwell; this post he held till 1844, and afterwards he was retained as visiting physician. Here, under Conolly, all forms of mechanical restraint were from the first entirely discontinued; and although his views were admittedly not original, it is mainly to his earnestness and eloquence that the revolution in asylum management in England is due. His best works are those on the *Construction and Government of Lunatic Asylums* (1847), and kindred subjects. He died 5th March 1866. See the Memoir by Sir James Clark (1869).

**Conquest**. In the law of succession in Scotland heritable property acquired during the lifetime of the deceased, by purchase, donation, or excambion, was called Conquest, in opposition to that to which he has succeeded, which is called Heritage. The distinction was abolished by the Conveyancing Act, 1874. Conquest, in a marriage-contract, is property acquired by the husband during the marriage as distinguished from what he possessed before the marriage. Such property was frequently but is now rarely settled either on the heir or on the issue of the marriage.

**Conquistado'res** (Span., 'conquerors') is a collective term for the Spanish conquerors of America, such as Cortes, Balboa, Pizarro. See the articles under their names; as also MEXICO, PERU, &c.

**Conrad**, or KONRAD I., king of the Germans, was the son of the Count of Franconia, and the nephew of the Emperor Arnulf. He was elected king (practically emperor of Germany) on the extinction of the direct line of the Carolingians in 911 A.D. He gradually re-established the imperial authority over most of the German princes, carried on an unsuccessful war with France, and at last fell mortally wounded at Quedlinburg (918), in a battle with the Hungarians, who had repeatedly invaded his dominions. See GERMANY.

**Conrad II.**, king of the Germans, and Roman emperor, was elected after the extinction of the Saxon imperial family in 1024. He was the son of Henry, Duke of Franconia, and is by many considered as the founder of the Franconian dynasty. Immediately after his election he commenced a tour through Germany to administer justice. In 1026 he crossed the Alps, chastised the rebellious Italians, was crowned at Milan as king of Italy, and he and his wife Gisela were anointed emperor and empress of the Romans by the pope. He was soon recalled to Germany to put down four formidable revolts, in which he succeeded so well that by 1033 peace was restored. In 1032 he

had succeeded to the kingdom of Burgundy, which he annexed to the empire. In 1036 a rebellion in Italy again compelled him to cross the Alps; but his efforts to restore his authority were this time unsuccessful, and he was forced to grant various privileges to his Italian subjects. Shortly after his return he died at Utrecht, 4th June 1039. Conrad was one of the most remarkable of the earlier monarchs of Germany. He reduced the dangerous power of the great dukes of the empire, and defended the rights of the humbler people against oppression by the nobility.

**Conrad III.**, king of the Germans, the founder of the Hohenstaufen (q.v.) dynasty, was the son of Frederick of Swabia, and was born in 1093. While under twenty years of age, Conrad, with his elder brother Frederick, had bravely supported Henry V. against his numerous enemies, and in return that monarch granted Conrad the investiture of the duchy of Franconia. He subsequently contested the crown of Italy with the Emperor Lothar of Saxony, but was compelled to resign his pretensions. On the death of Lothar, the prince of Germany, fearing the increasing preponderance of the Guelph party, and attracted by his brilliant courage, moderation, and goodness, offered Conrad the crown, and he was accordingly crowned at Aix-la-Chapelle, 21st February 1138. He was immediately involved in a quarrel with Henry the Proud, Duke of Bavaria and Saxony, and head of the Guelph party in Germany; and the struggle was continued under Henry's son and successor, Henry the Lion (q.v., and see GUELPHS AND Ghibellines). While Germany was thus convulsed, the state of Italy was not a whit more peaceable. The several belligerents besought Conrad's assistance, but he well knew the natural inconstancy of the Italians, and determined to stand aloof. Soon after this St Bernard of Clairvaux commenced to preach a new crusade, and Conrad, seized with the general infatuation, set out for Palestine at the head of a large army (see CRUSADES). A new attempt by the Duke of Bavaria to regain his dukedom was defeated by the nephew of Conrad, whose health had broken during the crusade. Conrad died at Bamberg in 1152. See GERMANY.

**Conrad**, JOSEPH (FEODOR JOSEF CONRAD KORNIEWSKI, 1857-1924), novelist, born—of Polish parents—in the Ukraine, was educated at Cracow, and went to sea in 1874. He was naturalised in England in 1884, and took his master's certificate, but ten years later gave up the sea for literature. *Almayer's Folly* (1895) was followed by *An Outcast of the Islands*, *The Nigger of the Narcissus*, *Tales of Unrest*, and *Lord Jim* (1900)—all brimming with sea reminiscences. *Youth* (1902) and *Typhoon* (1903) proved him a master of the short story. In *The Inheritors* (1901) and *Romance* (1903) he collaborated with Ford Madox Hueffer. *Nostromo* (1904), the story of a South American revolution, well illustrates his faculty for making his characters tell their own tale. The novelist's Slavonic origin shows itself in *The Secret Agent* (1907) and *Under Western Eyes* (1911). Since *Chance* (1914) he has had an ever-widening audience. Later novels are *Victory* (1915)—like many of his stories, a South Sea yarn—*The Arrow of Gold* (1919), *Rescue* (1920), *The Rover* (1923). *A Set of Six*, like *Twist Land and Sea* and *Within the Tides*, is a volume of short stories. *The Mirror of the Sea* (1906) and *Some Reminiscences* (1912) are autobiographical; and *Notes on Life and Letters* (1921) also helps 'towards a better vision of the man.' By his transfusion of realism with romance, his blending of rich experience with a vivid imagination, his surprising command of English (an

unknown tongue to him till 1878), his masterly—if sometimes laborious—unfolding of plot, his psychological insight, his creation of atmosphere, his ironic power, sombre humour, artistic and lyric zest, Conrad is established securely in the very front rank of modern English fiction. See a memoir by his widow (1926).

**Conradin** OF SWABIA, last of the Hohenstaufens, the son of Conrad IV. (1237–54), was born in 1252, two years before his father's death. His uncle Manfred (q.v.) had assumed the crown of Sicily on a rumour of Conradin's death, though he declared himself ready to give it up. But Pope Clement VI.'s hatred of the Hohenstaufens led him to offer the crown of the Two Sicilies to Charles of Anjou, a consummate warrior and able politician. Charles immediately invaded Italy, and met his antagonist at Benevento, where the defeat and death of Manfred, in 1266, gave him undisturbed possession of the kingdom. But the Neapolitans, detesting their new master, sent deputies to Bavaria to invite Conradin, then in his sixteenth year, to come and push his claim. Conradin accordingly made his appearance in Italy at the head of 10,000 men, and being joined by the Neapolitans in large numbers, gained several victories over the French, but was finally defeated near Tagliacozzo, 22d August 1268, and taken prisoner along with Frederick of Baden and other comrades. The two unfortunate princes were, with the consent of the pope, executed in the market-place of Naples on the 20th October. A few minutes before his execution, Conradin, on the scaffold, took off his glove, and threw it into the midst of the crowd as a gage of vengeance, requesting that it might be carried to his heir, Peter of Aragon. The tragic tale has furnished materials for many poets. See SICILIAN VESPER.

**Consanguinity**, the relationship which subsists between persons who are of the same blood, is either *direct*, which is the relationship between ascendants and descendants, or *collateral*, between persons sprung from a common ancestor. In the direct line, a son is said to stand in the first degree to his father; a grandson, in the second degree to his grandfather; and so on.—*Affinity* (q.v.) is the relationship brought about by marriage between a husband and the blood-relations of his wife, or between a wife and the blood-relations of her husband.

Consanguinity and affinity have been in all parts of the world more or less looked on as impediments to marriage between the parties related. Among the ancient Persians and Egyptians, marriages were sometimes sanctioned between brother and sister, and even father and daughter; and in the book of Genesis we read of Abraham marrying his half-sister.

The Roman law prohibited marriage between ascendants and descendants, a prohibition extended to relations by adoption. In the collateral line, the prohibited degrees included brother and sister, and all cases where one party stood *in loco parentis* to the other, as uncle and niece. Marriage between cousins-german, at one time prohibited, was declared lawful by Arcadius and Honorius. The degrees prohibited in consanguinity were by Constantine also prohibited in affinity.

By the old canon law and early decretals, marriages were prohibited between persons as far removed as the seventh degree of consanguinity or affinity. The fourth council of Lateran, 1215 A.D., narrowed the prohibition from the seventh to the fourth degree; i.e. the grandchildren of cousins-german. A marriage between persons related in any of these ways was accounted incestuous, and the children bastards. The pope assumed the right of granting dispensations from impediments to

marriage arising from consanguinity and affinity, a power which seems to have been first exercised in the 12th century.

In the countries which embraced the Reformation, a general relaxation took place in the prohibitions to marriage from consanguinity and affinity. In England, an act of 1547 allowed all persons to marry who were not prohibited by the Levitical law; and according to the interpretation put on this statute, the prohibitions included all relations in the direct line, brother and sister, and collaterals, when one party is brother or sister to the direct ascendant or descendant of the other; the degrees prohibited in consanguinity being equally prohibited in affinity. In Scotland, acts of 1567, professing to take the Levitical law as the standard, assimilated the prohibitions from consanguinity and affinity to those of England. In France, the Code Napoléon prohibits marriage between ascendants and descendants lawful or natural, and persons similarly connected by affinity; and in the collateral line between brothers and sisters lawful or natural, and persons similarly connected by affinity. Marriage between uncle and niece, and aunt and nephew, is also prohibited. In various countries of Europe, as Denmark, no prohibitions from affinity, except in the direct line, are recognised. In most of the United States of America, marriage is allowed between uncle and niece. See AFFINITY, DECEASED WIFE'S SISTER, INCEST, KIN; and for exogamy and curious savage methods of counting relationship, MARRIAGE.

The much-vexed question how far the marriage of relations tends to injure the constitution of their offspring, either by the intensification of hereditary taint or more directly, is complicated by considerations introduced by Mendelian researches. The effects of inbreeding seem not to be purely evil; a certain amount of inbreeding may be necessary in order to start a new breed. See BREED, CATTLE.

**Conscience.** See ETHICS.

**Conscience**, HENDRIK, a popular Flemish novelist, was born 3d December 1812, at Antwerp. His father, who bought and broke up old ships, was a native of Besançon, but his mother was of Flemish birth. At fifteen the boy had to shift for his living as an under-master in a school, but at the outbreak of the revolution in 1830 he joined the Belgian ranks, and served till 1836. Patriotism and poverty together impelled him to write, and between them produced in 1837 his first volume in Flemish, *In't Wonderjaar, 1566*. Wappers the painter finally got him appointed in 1841 to an office in the Antwerp Academy, which he continued to fill until 1854. Three years later he received a place in the local administration of Courtrai, and became in 1866 director of the Wiertz Museum at Brussels. Here he died, September 10, 1883. His *Phantazy* (1837), a fine collection of tales, and his most popular romance, *De Leeuw van Vlaenderen* (1838), early made his name dear to his fellow-countrymen; but it was his series of charming pictures of Flemish life, beginning with the little book, *Hoe men schilder wordt* (1843), that, through French, German, and English translations, carried his fame over Europe. Amongst those translated into English, besides the *Lion of Flanders*, are *Blind Rosa*, *Ricketicketack*, *The Poor Gentleman*, *The Miser*, and *The Demon of Gold*. The historical accuracy of his *Geschiedenis van België* (1845) was somewhat impaired by his Catholic predilections. The vast popularity of Conscience's novels depended mainly on the unflagging vigour and interest of the incidents in which they abounded, although these often enough defied all historical consistency and verisimilitude alike. It should be remembered to his credit, as, indeed, it

was his own proudest boast, that in his hundred volumes he had never painted vice in seductive colours. A complete collection of his works appeared in 1867-80; another in 1912; and a German translation at Munster in 75 small volumes, 1846-84. See his *Life*, in French, by Eekhoud (Brussels, 1881).

**Conscience, COURTS OF, IN ENGLAND.** These were courts for the recovery of small debts, constituted by special local acts of parliament in London, Westminster, and other trading districts. The county courts have superseded them. See **COUNTY**.

**Conscience Money**, money paid to relieve the conscience, is a not inapt term for money sent to the Chancellor of the Exchequer in payment of a tax that had previously been evaded, and in regard to which a tender conscience feels that something remained to be done. The conscience money is often sent anonymously.

**Consciousness.** This is the most comprehensive term employed in designating the mind. In the widest and most unexceptionable meaning, consciousness is a term which includes all mental states, operations, or processes, and, as has been truly said, it is not strictly susceptible of definition, seeing that we can have no experience of the unconscious. We may specify different modes or varieties of consciousness, such as thoughts, feelings, and volitions; but the quality in which they all agree, and which constitutes them mental facts or states of consciousness, cannot be otherwise explained than by a mere reference to the constant experience of every human being. Consciousness, in this its strict sense, thus embraces the whole field of mental experience, and the expression 'facts of consciousness' is frequently used as synonymous with psychical facts or facts of mind to designate the subject-matter of psychology.

Popularly, therefore, when we are mentally alive, or performing any of the recognised functions of the mind, we are said to be conscious; while the total cessation of every mental energy is described by the term 'unconsciousness,' among other phrases. In dreamless sleep, in stupor, fainting, and under the influence of the anæsthetic drugs, we are unconscious; in waking, or rallying into renewed mental activity, we are said to become conscious.

The difficulties of the subject, however, have prevented a perfectly definite and uniform usage from being adhered to. As the mind in its waking or active condition may be more or less excited, or vary in the intensity of its manifestations, there are degrees of consciousness; and, accordingly, the name is apt to be applied to denote the higher degrees in opposition to the lower. Thus, in first learning to write, to cast up sums, to play on an instrument, or to ride a bicycle, our mind is put very much on the stretch; in other words, we are very much excited or highly conscious. But when years of incessant practice have consummated the process into a full-formed habit, a very small amount of mental attention is involved; and we may then be said to perform the work all but unconsciously. Such habitual actions are frequently designated secondarily automatic, and Sir W. Hamilton, for example, speaks in this connection of 'unconscious mental modifications.' But as he has previously defined consciousness as co-extensive with all mental phenomena, such a phrase evidently involves a contradiction in terms, being equivalent to unconscious consciousness. It is explained, though not justified, by the (unavowed) double use of the term consciousness just adverted to. Later writers have sought to escape from this inconvenient terminology by speaking of the more obscure mental processes as 'sub-conscious.' Stress is laid by

them upon the infinite gradations of consciousness, and some amount of consciousness, however infinitesimal, is postulated so long as we can speak with propriety of mental phenomena at all. This sub-conscious region is understood to include not only the phenomena of habit referred to above, but the mass of organic or bodily feelings which, though intellectually unanalysed, are constantly present as a kind of background to our more distinct consciousness, and mainly determine both our habitual temperament and our varying moods. The hypothesis is also employed to explain the phenomena of memory as well as that instinctive basis of human life to which, under the name of the Unconscious, Hartmann (q.v.) assigned such important philosophical functions.

Consciousness is sometimes used in a special sense to denote the mind's cognisance of itself, as opposed to the cognisance or examination of the outer world. Hence, in studying our own minds, we are said to be using consciousness as the instrument; but in studying minerals or plants, we resort to external observation by the senses. A contrast is thus instituted between consciousness and observation, which contrast gives to the former word a peculiarly contracted meaning; for in the wide sense above described, observation is truly an act of consciousness. But such a usage is confusing and undesirable, and has been generally abandoned by accurate writers. The study of our own mind may be more appropriately expressed by such phrases as 'self-consciousness,' 'reflection,' or 'introspection.'

Important philosophical points are involved in the determination of the *conditions* of consciousness, or the circumstances attendant on the manifestation of mental energy. The most general and fundamental condition of our becoming conscious is difference or *change*. The even continuance of one impression tends to unconsciousness; and there are a number of facts that show that if an influence were present in one unvarying degree from the first moment of life to the last, that influence would be to our feeling and knowledge as if it did not exist at all. This was formulated by Bain as the Law of Relativity. See also **DREAMS, PERSONALITY, PSYCHOLOGY**.

**Conscription.** A government, failing to obtain under voluntarism the number of recruits it needs for its war forces, resorts to the method of calling up by law the required number. If all the youths of military age are not needed, exemptions are first granted on certain accounts, as to an eldest male orphan, pupils of certain colleges, &c.; if there is still a superfluity, lot-drawing is resorted to. Conscription proper thus differs from universal military service. Before the Great War France, owing to stationary population and the German danger, had nearly reached the universal; Germany, great and growing, was still able to allow exemptions freely. Great Britain, her dependencies, the United States, and China were the only important peoples that had not adopted conscription, but the war forced it upon us and the United States. In peace-time the usual age for calling up was twenty years, but the strain of the war reduced this as low as to eighteen.

As an example of the working of the system, France was able to have about 300,000 recruits annually (before the war) out of 40 millions of a population. These served three years in the active army, eleven in army reserve, seven in territorial army, seven in its reserve, the men being thus liable to the age of forty-eight. Germany drew more than 300,000 annually with great ease out of her population of 65 millions, kept them for two years in the active army, and let them go at forty-five years of age. By the peace treaties of 1918-20

compulsory recruiting was forbidden in the defeated countries. The British Empire and the United States also abandoned conscription, but the latter at least tends towards universal military training.

Felons, being called up, are usually disposed of into 'penal battalions,' the French, for instance, sending them to Africa and Madagascar. In the Great War most of the active belligerents swept away all exemption rules, allowing to remain in civil life only those between eighteen and fifty who were reckoned indispensable for national work.

In the United Kingdom a form of conscription was created by the Ballot Act of 1860, which provides for all males over 5 feet 2 inches between the ages of eighteen and thirty being called upon to serve in the militia, but is held in abeyance by an annual act of parliament. In the Channel Islands, service in the militia is compulsory for the physically fit, from sixteen to forty-five years of age. Breaches of discipline are punished by the civil magistrate by fine or imprisonment.

**Consecration** is the act of solemnly dedicating a person or thing to the service of God. In the Jewish law, rites of this nature are frequently enjoined, the Levites and priests, the tabernacle and altar, &c. being specially dedicated or consecrated to God; and analogous forms occur in most pagan nations. Among Christians the word consecration describes—(1) the ordination of bishops. The Nicene Council (can. 4) requires the ceremony to be performed by not less than three bishops. This rule is maintained by the Church of England. Among Roman Catholics the pope may permit consecration by one bishop and two priests. (2) The hallowing of the elements in the eucharist, by the words of institution according to Roman Catholics and Anglicans; by the invocation of the Holy Spirit according to the Greeks. (3) The dedication of churches; first mentioned by Eusebius, *Hist. Eccles.* x. 3. The rites, originally very simple, have become long and elaborate in the Church of Rome, though the present form is in substance as old as the Sacramentary of St Gregory. In the English Church the bishop chooses his own form. That most generally used was drawn up by the Anglican episcopate in 1712. In the American Episcopal Church a form was appointed in 1799. (4) The benediction of abbots and abbesses according to forms prescribed in the Roman Pontifical. It is usually performed by a bishop. (5) The consecration of altars, chalices, and patens by the bishop with the chrism or hallowed oil. The consecration of altars is mentioned by councils of the 6th century, that of chalices and patens in the Gregorian Sacramentary.

**Consecutive**, a term in Music. The rules of harmony forbid consecutive octaves or fifths in part-writing, though there are exceptions in modern music.

**Consent** is the foundation of all contracts and legal obligations. The doctrine that the free consent of the parties bound, and not the will of any earthly legislator, or the form in which that will is expressed, constitutes the binding element in contracts, flows as an inevitable logical consequence from the doctrines of personal and political freedom. All that either civil or ecclesiastical authority can do is to ascertain, at the instance of one or other of the parties, whether consent has or has not been given.—For consent in a girl, under the Criminal Law Amendment Acts, see ABDUCTION.

**Conservation of Energy.** See ENERGY.

**Conservative**, as applied to one of the two great parties in English politics, was first used by J. W. Croker in an article in the *Quarterly* for January 1830, and was by Macaulay in the *Edinburgh* for 1832 referred to as a 'new cant word.'

*Conservative* accordingly began to supplant *Tory* about the time of the Reform Bill struggle. See *TORY*, and Lord Hugh Cecil's *Conservatism* (1912).

**Conservatoire**, or CONSERVATORIUM (Ital. *conservatorio*), a name given by Italians and others to schools instituted for the purpose of advancing the study of music and maintaining its purity. In the earliest times these schools were partly attached to benevolent institutions and hospitals; others, again, were supported by opulent private individuals. They were originally intended for foundlings, orphans, and the children of poor parents. Some trace their origin to St Ambrose, Bishop of Milan, in the 4th century, or St Leo, who flourished in the 5th. They were largely developed by Gregory the Great. The scholars, male and female, all received free board, lodging, and clothing, and were taught to sing and play. Extra boarders were also admitted on paying a fee. In Naples there were at one time four such schools, while in Venice there were four expressly for females. In 1808 the Neapolitan conservatoires were reduced to one, under the name of Reale Collegio di Musica. The Venetian conservatoires shared in the downfall of the Venetian republic. A new grand conservatoire was founded at Milan in 1808, which still exists. In France the necessity of a school for educating singers gave rise to the *École Royale de Chant et de Déclamation* in 1784. During the French Revolution, in consequence of the scarcity of instrumental musicians for the army, the government decreed the erection of an Institut National de Musique in 1793, which was changed into the present establishment in 1795 under the name of the Conservatoire de Musique. The yearly expenses of this conservatoire were fixed at 240,000 francs, the number of masters was 125, and the pupils of both sexes amounted to 600. The professors are about 100 in number. The tuition is divided over more than seventy different classes. The elementary works published by this conservatoire for all instruments are known over the whole world, and it possesses a library and museum of the first importance. The post of director has been held by Cherubini, 1822-42; Auber, 1842-71; Ambroise Thomas, 1871-96; Théodore Dubois, 1896-1905; Gabriel Fauré. Other important conservatoires are those of Brussels (founded 1833), Prague, Vienna (1816), and the great conservatorium of Leipzig, established in 1842 under the auspices of Mendelssohn; also those of Cologne, Munich, Stuttgart, Berlin, &c. The Royal College of Music in London, which received a charter in 1882, is designed to rival the conservatoires of the Continent. There are several of note in the United States, especially the National Conservatory of Music of America in the city of New York, the New England Conservatory of Music (1870) in Boston, the Peabody Institute, Baltimore, and the Cincinnati College of Music; and there are reputable schools of music, termed conservatories, in almost all the principal cities. The name conservatoire is used for other than musical schools in France. There is thus a *Conservatoire des Arts et Métiers* at Paris.

**Conservators of the Peace**, a title usually applied to knights elected in each shire from the 12th century onwards for the conservation of the peace. They were in fact the predecessors of the Justices of the Peace (q.v.), by whom they were superseded.

**Conservatory.** See PLANT-HOUSE.

**Conserve.** See PRESERVED PROVISIONS.

**Considérant**, VICTOR-PROSPER, French Socialist, was born in 1808 at Salins, in the department of Jura. After being educated at the Polytechnic School of Paris, he entered the army, which,

however, he soon left to promulgate the doctrines of the socialist Fourier. On the death of his master (1837), Considérant became the head of his school, and undertook the management of the *Phalange*, a review devoted to the spread of their opinions. Having gained the support of a young Englishman, Mr Young, who advanced the required sum of money, Considérant established, on a large estate in the department of Eure et Loire, a socialist colony or *Phalanstère*; but the experiment failed, and the *Phalange* fell to the ground. Thereafter he continued to promote his views in the *Démocratie Pacifique*. Among his numerous writings, the chief is the *Destinée Sociale*, dedicated to Louis-Philippe. In 1849 Considérant was accused of high treason, and fled from France. In Texas he founded a socialist community, *La Réunion*, which flourished for a time, but has since come to nothing. He returned to France in 1869, wrote occasional political pamphlets, and died 27th December 1893. See *Life* by Coignet (1895).

**Consideration**, in Law. In the law of contract a party to an agreement is said to receive 'consideration' for his promise when the other party, to whom the promise is made, does or abstains from doing something, or promises to do or abstain from doing something, in return for the promise.

In the law of England, a contract not under seal—i.e. not embodied in a Deed (q.v.)—is not legally binding unless it is based on 'valuable consideration.' A valuable consideration, in the sense of the law, may, according to a well-known definition, 'consist either in some right, interest, profit, or benefit accruing to one party, or some forbearance, detriment, loss, or responsibility given, suffered, or undertaken by the other.' Consideration, as is evident from this definition, may take the most various forms. Thus the abandonment of a right, or the compromise of a *bond fide* claim, or any labour or trouble undertaken may be a valid consideration for a promise. While consideration must be of some value in the eye of the law, it need not be adequate; nor will a court of law, in ordinary circumstances, inquire into its actual value. Where, however, the consideration is flagrantly inadequate, the fact may, in some cases, be evidence of fraud. The consideration may be either present or future; but it must not be something already past. A past consideration—e.g. something done by the other party before the promise was made—is, in effect, no consideration at all; for the promisor, in return for his promise, gets nothing which he has not got already. Similarly, if the person to whom the promise is made merely does, or promises to do, something which he is already bound to do under a general rule of law or under an existing contract, there is no consideration. Again, the consideration must not be illegal or immoral; for any contract which contemplates an illegal or immoral object is invalid. Consideration may be either 'executed' or 'executory.' Executed consideration is an act done or value given at the time of making the contract. An executory consideration is a promise to do something at a future time. Mutual promises made at the same time are concurrent considerations—the promise of one party being an executory consideration for the promise of the other party. It is now settled that a mere moral obligation is not a sufficient consideration for a promise. Thus the existence of a moral duty arising from blood relationship between the parties—though important in other branches of law—is not recognised in the law of contract as a 'valuable' consideration. While a person who promises to perform a service for another without valuable consideration is not legally bound to perform it, yet, if he does perform it, he is bound to exercise reasonable care in its performance, and is

liable for damage caused by his negligence in the performance.

In the United States the doctrine of consideration is substantially the same as exists in England.

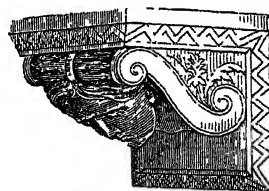

In Scotland, and in the legal systems of the Continent, the doctrine of consideration in contract is not recognised. Thus in Scotland a promise, though gratuitous, is binding in law if it is undertaken as a final engagement, and is not merely an expression of an intention; but, as a general rule, a gratuitous promise can be proved only by the writ or oath of the promisor.

**Consignment**, in Mercantile Law, is the term applied to goods which are placed in the hands of an agent or factor for sale, or for some other specified purpose. If the consigner fails, the consignee has generally a lien on the unsold goods for advances; if the consigner has to pay bills granted by consignee for advances, he may generally get back his consignment so far as unsold.

**Consistory** (Lat. *consistorium*), properly a place of assembly, but in the later Latinity the word came to signify the particular place where the privy-council or cabinet of the Roman emperor met, and after the time of Diocletian and Constantine, the council itself. The name passed over into the early Christian church. The bishops established their consistories; and the highest ecclesiastical court of the Roman Church, composed only of cardinals, still bears this name, as do also the pope's private councils. In the Lutheran Church the powers of the bishops passed largely into the hands of the princes, and consistorial courts took over the supervision of religion, public worship, the clergy, and theological training. Calvin's consistorial court was famous; and 'the consistorial system' of church government is practically presbyterianism, though the governing bodies are not called presbyteries. In England the bishops have consistorial courts for ecclesiastical causes, the chancellor of the diocese being generally the judge. In Scotland, where before the Reformation the land business of the country (as well as all matters matrimonial, which were specially consistorial business) was largely transacted in the bishops' consistorial courts, the courts survived the Reformation, but lapsed into commissary courts, as they again did into the general court system. See COMMISSARY.

**Consolato del Mare.** See CONSULATE OF THE SEA.

**Console** (Fr.), in Architecture, a projection resembling a bracket, frequently in the form of the letter S, used to support cornices, or for placing busts, vases, or figures on. Consols were often richly ornamented in the under part. The illustration, from Parker's *Glossary*, is from the palace of Diocletian at Spalato.

Console.

**Consolidation Acts**, acts of parliament which combine or consolidate into one general statute the enactments of several special measures, such as the Railway Clauses Consolidation Act, 1845, the Titles to Land Consolidation Act, 1868, &c.

**Consols**, a contraction of Consolidated Annuities. In incurring the national debt, government borrowed money at different periods on special conditions, being generally the payment of an annuity of so much per cent. on the sum borrowed. Great confusion arose from the variety of stocks thus created, and it was thought expedient to consolidate

them into one fund, kept in one account at the Bank of England. The Consolidated Annuities Act was passed in 1749-50, consolidation being completed in 1757. For consolidation of the Funded Debt subsequent to that period, see NATIONAL DEBT.

**Consonance** is a combination of notes which can sound together without the harshness produced by beats. See SOUND, MUSIC.

**Consonant.** See PHONETICS.

**Consort,** literally, one who throws in his lot with another. In English constitutional law, the term is applied to the husband or wife of the reigning sovereign, viewed not in a private but in a public capacity, as participating to a certain limited extent in the prerogatives of sovereignty. A queen-consort is specially so named in distinction from a queen-regnant, who holds the crown in her own right, as Queen Elizabeth and Queen Victoria, and from a queen-dowager, the widow of a king. A queen-consort is in all legal proceedings looked upon as a *feme-sole*, independent of her husband's control, as if she were a single woman. Coke gives as the reason for this that the common law would not have the king, whose care is for public affairs, troubled with the domestic concerns of his wife. The queen-consort has also a particular revenue and peculiar exemptions and privileges. One curious and ancient perquisite is that, when a whale, which is a royal fish, is taken upon the coast, it by right should be divided between the king and the queen, the head only being the king's property, and the tail the queen's. The consort is in all respects a subject of the sovereign; accordingly the husband of a queen-regnant is her subject, and may be guilty of treason against her. Up to the year 1857 the husband of Queen Victoria possessed no distinctive English title, and no place in court ceremonial except such as was conceded to him by courtesy. In that year the title of Prince-Consort was conferred upon him by letters-patent.

**Conspiracy,** a combination between two or more persons to perpetrate an unlawful act, or to do a lawful act by unlawful means. In criminal law, conspiracy is an indictable misdemeanour. The most important classes of conspiracy are conspiracy to commit a crime, conspiracy to cheat and defraud or to injure a man in his civil rights otherwise than by fraud, and conspiracy to obstruct or defeat the course of public justice. Formerly combinations by workmen to raise the rate of wages were conspiracy, but this is no longer so. By the Trade Union Act, 1871, the purposes of a trade union are not, by reason merely that they are in restraint of trade, to be deemed unlawful, so as to render the members liable to criminal prosecution for conspiracy or otherwise. By the Conspiracy and Protection of Property Act, 1875, no agreement or combination of two or more persons to do, or procure to be done, any act in contemplation or furtherance of a trade dispute is indictable as a conspiracy, if such act committed by one person would not be punishable as a crime. It is perfectly legal, under the existing law, for workmen to protect their interests by combining together, or forming unions, in order to stipulate with their employers the terms on which they will agree to work. But the right to combine must not interfere with the right of any workmen, who desire to keep aloof from the combination, to dispose of their labour as they think fit, or with the right of the masters to have contracts of service duly carried out. The Conspiracy and Protection of Property Act, 1875, renders liable to penalties any person who, with a view to compel any other person to abstain from doing, or to do, any act which such other person

has a legal right to do or abstain from doing, wrongfully and without legal authority uses violence to or intimidates such other person, or injures his property, or persistently follows him about, or watches or besets his house or other place where he resides or works or carries on business (commonly known as 'picketing'). Under the Trade Disputes Act, 1906, what is commonly called 'peaceful picketing' is now lawful; that is to say, it is now lawful for one or more persons, in contemplation or furtherance of a trade dispute, to picket a place 'if they so attend merely for the purpose of peaceably obtaining or communicating information, or of peaceably persuading any person to work or abstain from working.' See PLOT, SEDITION.

**Conspiracy Bill.** See POLITICAL OFFENCES.

**Constable** (Lat. *constabulus*), the title of an ancient officer, originally of high military rank, but now generally an officer of the peace. The older writers, as Coke and Selden, fancifully derive the word from *koning-stapel*, 'staff and stay of the king.' It represents, however, the Latin *comes stabuli*, 'count of the stable,' an officer who in the later Roman empire was at first charged with the care of the stables, and afterwards became captain of a military force, and chief officer of the army. The title was borrowed from the Romans by the Franks. The Constable of France rose gradually in importance from the comparatively modest position of an officer of the household, till at last he became *ex officio* the commander-in-chief of the army in the absence of the monarch, the highest judge in military offences and in all questions of chivalry and honour, and the supreme regulator and arbitrator in all matters connected with tilts, tournaments, and all martial displays. The office was suppressed by Louis XIII. in 1626. Under Napoleon, the constable was the fifth of the great dignitaries of the empire. The office was again abolished on the restoration of the Bourbons. But besides the Constable of France, almost all the great vassals of the crown had constables who filled analogous offices at their minor courts.

The Lord High Constable of England appears shortly after the Conquest as the seventh great officer of the crown, and formerly a judge in the Court of Chivalry. The office went by inheritance to the Earls of Hereford and Essex, and afterwards in the line of Stafford. When Edward Stafford, Duke of Buckingham, was attainted in 1521, the office became forfeit, and has never since been granted except for a special ceremony of state, as when it was conferred on the Duke of Wellington for the coronation of Queen Victoria. The High Constable of Scotland was an officer very similar to the Constable of France and England. The office, now purely honorary, in 1314 was made hereditary in the noble family of Erroll, and is reserved both in the Treaty of Union and in the statute of George II. abolishing hereditary jurisdictions. The High Constable is by birth the first subject in Scotland after the blood-royal.

The governor of a royal castle was often called Constable; see the article LONDON. The Constables of the Hundred, and of the Vill, were the predecessors of the high and petty constables of later times. The statute of Winchester (1285) ordains that in every hundred or franchise there shall be chosen two constables, to make the view of armour, and to see to the conservation of the peace. The petty constable exercised similar functions within the narrower limits of the township or parish, and was subordinate to the high constable of the hundred. The high constables were formerly appointed by the courts leet of the franchise or hundred over which they presided; or, in default of such appointment,

by the justices at their special sessions. An act of 1869 made provision for the abolition of the office of high constable throughout England and Wales. The appointment of petty constables was made by the justices, who were directed annually to require from the overseers of parishes a list of those within the parish qualified and liable to serve as constables. When not specially exempted, every able-bodied man, between twenty-five and fifty-five, resident in the parish, and rated to the poor, or a tenant to the value of £4 per annum, was to be included in this list.—SPECIAL CONSTABLES are persons sworn in by the justices to preserve the peace, or to execute warrants on special occasions, as in 1848 (the Chartists), in 1887 (the 'unemployed' riots in Trafalgar Square, London), and in 1914 (the Great War). Any two justices of the peace who shall learn that a tumult, riot, or felony has taken place, or is apprehended, may swear in as many householders or others as they may think fit, to act as special constables. The lord-lieutenant may also, by direction of one of the principal secretaries of state, cause special constables to be appointed for the whole county, or any part of it. By the Special Constables Act, 1923, amending and making perpetual those of 1914, regulations may be made by Order in Council providing for appointments being made though no riot or felony has taken place or is apprehended; and special constables may be substituted for metropolitan police at armament depots, &c. Special constables in Scotland are appointed by the burgh magistrates or the standing joint committee of the county. In the United States they are generally elected by the people, but special constables may be appointed by the authorities in emergencies. The title of High Constable is in some American cities given to the principal police officers. For county constabulary, see POLICE, and for the Irish constabulary, IRELAND.

**Constable, ARCHIBALD**, publisher, was born at Carnbee, Fife, 24th February 1774, and became a bookseller's apprentice in Edinburgh (1788-95). He then started as a bookseller at the Cross of Edinburgh, and speedily gathered round him the chief book-collectors of the time. He gradually drifted into the publishing business, secured the copyright of the *Scots Magazine* in 1801, and was chosen as the publisher of the afterwards famous *Edinburgh Review*. He published for all the leading men of the time, and his quick appreciation of the merits of the works of Sir Walter Scott became the envy and wonder of the book-trade. There were several business partners in the career of Constable & Co., but Archibald Constable was from first to last the mainspring of the concern. Had painstaking business qualities kept pace with his shrewdness and large-minded literary transactions, business calamities might have been averted. 'Among all his myriad of undertakings, I question,' says Lockhart, 'if any one that really originated with himself, and continued to be superintended by his own care, ever did fail.' In 1812 he purchased for between £13,000 and £14,000 the copyright of the *Encyclopædia Britannica*. In the commercial crisis of 1826 Constable & Co. failed, the liabilities amounting to upwards of a quarter of a million. The only noteworthy publishing scheme of Constable after this failure was the issue of his celebrated *Miscellany*. He died July 21, 1827. See *Archibald Constable and his Literary Correspondents*, by his son, Thomas Constable (1873).

**Constable, HENRY**, poet, was born in 1562, son of Sir Robert Constable of Newark, a soldier who was knighted by Essex in 1570. At sixteen Henry entered St John's College, Cambridge, early turned Roman Catholic, and betook himself to

Paris. He was pensioned by the French king, and seems to have been often employed in confidential missions to England and to Scotland. He died at Liège, 9th October 1613. In 1592 was published his *Diana*, a collection of twenty-three sonnets; two years later, the second edition, containing seventy-six, but some of these by his devoted friend, Sir Philip Sidney, and other poets. Constable's sonnets are quaint, and sometimes laboured, but they are instinct with fancy and the tremor of genuine poetic feeling. Constable contributed to *England's Helicon* (1600), and sixteen 'spiritual sonnets' to Park's *Heliconia*. See editions by W. C. Hazlitt (1859) and John Gray (1897).

**Constable, JOHN, R.A.**, landscape-painter, was born at East Bergholt, Suffolk, where his father was a well-to-do landowner and miller, 11th June 1776. At the age of eighteen he assisted his father for about a year in the mill; but his love of art was irrepressible, and it was encouraged by Sir George Beaumont, who prevailed upon his family to send him to London. Here he arrived in 1795; and, after an interval of a year spent in his old employment, he returned in 1799, and entered the schools of the Royal Academy, to whose exhibition he sent a work in 1802. Hitherto he had been carefully studying the methods of other painters, poring over Sir George's great Claude, and copying Ruysdael, seeking, as he says, 'truth at second-hand.' He now turned exclusively to nature, resolving to free himself from conventionality, to paint the very fact, to 'adopt a pure and unaffected manner of representing the scenes that may employ me.' But the public, trained to admire an artificial and pseudo-classical adaptation of nature, cared little for his simple renderings of common subjects, and he was nearly forty before he sold a single landscape beyond the circle of his relatives and personal friends. Meanwhile he supported himself by painting likenesses; he copied portraits by Reynolds for the Earl of Dysart, and executed altar-pieces for the churches of Brantham and Nayland in Suffolk.

In 1816 he married Mary Bicknell; and in 1828, on the death of her father, solicitor to the Admiralty, an inheritance of £20,000 placed the family in easy circumstances, and enabled Constable to devote himself quite exclusively to his beloved but unremunerative landscape work. In 1821 he had won the best artistic triumph of his life, in the applause which greeted the appearance of his 'Hay-wain' (then titled 'A Landscape—Noon'), when it was exhibited in the Paris Salon by a French purchaser. Not less marked was the impression produced by his 'White Horse,' at the Lille Exhibition in 1825. Each work gained a gold medal, and the former in particular won the warmest enthusiasm of Delacroix and the other leaders of the romantic school, and exercised a definite and powerful influence upon the future of landscape art in France. Appreciation of this sort was more precious to a true artist than such formal academic honours as Constable won in England, than his election as Associate in 1819, and his tardy and ungraciously awarded promotion to membership in 1829. His later years were saddened by the deaths of his wife and his friend Archdeacon Fisher, by ill-health, and by great depression of spirits; but he worked steadily at his art, though his landscapes still were frequently unsold, producing 'Salisbury Cathedral from the Meadows' (1831); 'Waterloo Bridge,' then titled 'Whitehall Stairs' (1832); and 'The Valley Farm' (1835). He was engaged upon 'Arundel Mill and Castle' at the time of his death, which occurred suddenly, on the 31st of March 1837.

The art of Constable marks the first definite departure in the history of English landscape from the conventional treatment of our earlier painters,

the breaking away from the traditions of Claude and the Dutch masters, the return to direct and personal impressions of nature. With a broad and rapid touch he renders all the force and variety of colouring that full-leaved English landscape presents; catches, with singular skill, her passing effects of rain-cloud and sunlight; suggests, with swift and unsurpassable power, her sense of glitter and motion. Mr Ruskin's criticism has, alike in its general scope and in most of its specific references, done much to disparage Constable's art in the estimation of the public of the time that is just passing; but already there is a recoil on the part of both painters and critics from the detailed intricacy of pre-Raphaelite methods; Constable's works are assuming their true place in the sequence of our national art; and their painter is being recognised as one of the very foremost figures of English landscape painters.

The most important of the engravings after Constable are the mezzotint plates by David Lucas. See his *Life* by C. R. Leslie (1843; new ed. 1896; French trans. 1905), and E. V. Lucas, *John Constable the Painter* (1924); also shorter works by C. J. Holmes (1902), Lord Windsor (1903), M. S. Henderson (1905), and F. Rutter (1924).

**Constable, SIR MARMADUKE** (1455?-1518), of Flamborough, served in France in 1475 and 1492, executed diplomatic commissions in Scotland, and fought at Flodden. Four scholarships were founded in his name at St John's College, Cambridge (1522).

**Constance**, or **KONSTANZ**, sometimes **KOSTNITZ**, a city of Baden, once a free imperial city, on both sides of the Rhine, at its exit from the Lake of Constance, 73 miles E. of Basel. One of the most ancient towns of Germany, Constance owed its prosperity to its linen industry, for which it was already famous in the 12th century; but five centuries later this had sunk greatly, and it has only been partially revived since the establishment of railways. Its manufactures include linen, cotton, jute, and waterproof fabrics, canvas, carpets, and chemicals; and other industries are bell-founding, printing, and publishing. Beside the picture-gallery, library, and town-hall, with a valuable collection of archives, the most noteworthy buildings are the cathedral (part of which dates from the 11th century), the old Dominican convent (now an hotel), and the present market-hall, in which three places the sessions of the great council were held. Population, 30,000.—The most notable event in the history of Constance is the meeting of the ecclesiastical council here in 1414-18 with a view to put an end to the disorders in the papedom and in the election of popes, and also to prevent the spread of the doctrines of Huss. There assembled with the Emperor Sigismund and Pope John XXIII. 3 patriarchs, 33 cardinals, 47 archbishops, 145 bishops, 124 abbots, 750 doctors, and about 18,000 priests and monks, besides numerous princes and counts of the empire, and representatives from all the monarchs of Catholic Christendom; and the retinues of these members of council swelled the number of strangers resident in the town to over 50,000. The three rival popes, John XXIII., Gregory XII., and Benedict XIII., were deposed, and Martin V. was elected. Huss (q.v.) and Jerome of Prague (q.v.) were condemned and burned. The emperor was, however, disappointed in his hope of a thorough reform of the church (*causa reformationis*), in spite of the efforts of such advocates of reform as Peter d'Ailly and Gerson (q.v.); and the Council of Basel (q.v.) was afterwards called to carry on the work which the Council of Constance had failed to accomplish.

**Constance, LAKE OF** (called by the Germans *Bodensee* or *Bodmansee*—the *Lacus Brigantinus*

of the Romans), lies between Switzerland and Germany, and on the north side of the Alps of Switzerland, and forms a meeting-point of the five territories—Baden, Württemberg, Bavaria, Vorarlberg, and Switzerland. It has an elevation of 1309 feet above the sea. The Lake of Constance is traversed by the Rhine from east to west; its greatest length is about 46½ miles, and utmost breadth 10½ miles, the area being 204½ sq. miles; the mean depth is 490 feet, while the greatest depth is 827 feet. The southernmost of the two western extremities is called the lower lake, and is separated from the main lake by a narrow channel two miles long, and lies full a yard below the level of the lake. The shores are formed by hilly lands, with low tracts at the mouths of the Rhine and smaller rivers. Cornfields, vineyards, pastures, orchards, and wooded declivities, with here and there the ruins of old castles interspersed, surround the lake. The water has a dark-green hue, often rises suddenly some ten or twelve feet during a thaw, and rolls in high waves during the prevalence of a strong south, north-west, or east wind. Without visible cause it sometimes rises and falls to a considerable degree. Usually the level rises from June onwards to August, when it sinks again. It is seldom frozen, except in very severe winters. The fisheries of this lake are important. Since 1824 steam-navigation has added to the facilities of commerce across the lake, and its commercial importance has been greatly increased by the connection of the chief towns on its shores with the railways of South Germany and Switzerland. The chief towns are Constance, Bregenz, Lindau, and Friedrichshafen. See Capper's *Shores and Cities of the Bodensee* (1881).

**Constans**, youngest of the three sons of Constantine the Great, received Illyricum, Italy, and Africa as his share of the empire. After the defeat and death of his elder brother Constantine, in 340 A.D., Constans became sole ruler of the West till his death in 350.

**Constant, BENJAMIN**, subject-painter, was born in Paris, 10th June 1845. He studied in the Ecole des Beaux-Arts and under Cabanel, and began to exhibit at the Salon in 1869, with his 'Hamlet and the King,' a work purchased by the French government. He soon turned to those Eastern subjects for the treatment of which he is best known, producing 'Prisoners in Morocco' (1875); 'Mahomet II.' (1876); 'The Harem' (1878); 'The Favourite of the Emir' (1879); 'The Day after a Victory in the Alhambra' (1882); and 'The Vengeance of the Chérif' (1885). His works are characterised by direct and powerful but frequently most repulsive realism, melodramatic feeling, bold portrayal of the nude, and vivid colouring; and he received medals in 1875 and 1876, and the decoration of the Legion of Honour in 1878. He died 26th May 1902.

**Constant de Rebecque, HENRI BENJAMIN**, author and politician, was born of French Huguenot ancestry at Lausanne, 23d October 1767. He was educated at Oxford, Erlangen, and Edinburgh, where he became acquainted with Mackintosh and Erskine. In 1795, settling in Paris, he quickly gained reputation as a publicist. He entered the Tribunat in 1799, but was banished from France in 1802, for having denounced the despotic acts of Napoleon. After travelling over Germany and Italy, in company with Madame de Staël, he lived for a number of years in Göttingen. On Napoleon's fall in 1814 he returned to Paris, and issued several pamphlets advocating constitutional liberty; during the Hundred Days he became one of Napoleon's Councillors of State, though previously he had styled Napoleon a Genghis Khan, and his government a government of Mamelukes. After

the second restoration of the Bourbons, Constant wrote and spoke consistently in favour of constitutional freedom. He was returned to the Chamber of Deputies in 1819, and became the leader of the Opposition. He was the ablest controversialist among the *Doctrinaires*, the French Whigs. The greater number of his very able political pamphlets were collected under the title of *Cours de Politique Constitutionnelle* (4 vols. 1817-20); his *Discours* were published in 1828. He died 8th December 1830. His powerful intellect had many sides. In *De la Religion* (5 vols. 1824-31) he maintained that the spirit of religion, as it grows loftier and purer, casts off the various forms in which it has been embodied, and which obstruct its expansion. He was likewise the author of a remarkable novel, *Adolphe* (1816), a short story of love and disillusion, in which Constant forestalls the method of the analytic novelists. His Correspondence appeared in 1844, his *Œuvres Politiques* in 1875, his Letters to Madame Récamier and his family in 1882-88, and his *Journal Intime* in 1894. See Life by Elizabeth Schermerhoin (1924).

**Constantia**, a district on the slopes of Table Mountain, about 10 miles south of Cape Town, between Wynberg and Hout Bay. The governor, Simon van der Stel, laid out a farm here in 1684, which became famed for the quality of the sweet wines it produced. Groot Constantia is still a government experimental wine farm. The district also produces fine fruit. For wine-growing at the Cape, see CAPE OF GOOD HOPE.

**Constantina**, a town of Spain, in Andalusia, situated in a mountainous district, 40 miles NNE. of Seville, with silver-mines, and a trade in wine and vinegar; pop. 13,500.

**Constantine**, capital of the easternmost department of Algeria, is very picturesquely situated on a nearly isolated chalk rock with flat summit, three sides of which are washed by a small stream, flowing through a deep and narrow ravine, and the fourth is connected by a narrow ridge with the adjoining mountains. It is 830 feet above the river, and 2160 feet above the sea; it is connected by rail with its port Philippeville, 40 miles NE., as also with Algiers and with Tunis. It is surrounded by walls constructed by the Arabs out of Roman sculptured stones. There are practically two cities, the French and the Arab, though the running of wide streets through the Arab town has taken away much of its primitive oriental look. Constantine was anciently the capital of Numidia, called *Carta* by the Carthaginians, *Cirta* by the Romans; and near it many notable events occurred in the wars with Jugurtha. It was destroyed about 311 A.D., but was soon rebuilt by Constantine the Great, from whom it derives its present name. It held out against the Vandals and other besiegers, but was taken by the Arabs in 710. Subsequently, it shared in general the fortunes of Algeria (q.v.). Constantine manufactures woollen cloths, saddlery, leather goods, and carpets; it is a great trade centre, being the chief grain market of Algeria, and exports oil and wool. Pop. 78,000, of whom about half are French, with many Jews.

**Constantine I.**, Roman emperor, 306-337 A.D. FLAVIUS VALERIUS AURELIUS CONSTANTINUS, surnamed 'the Great,' was born c. 274, at Naissus, in Upper Moesia. He was the eldest son of Constantius Chlorus and Helena, and first distinguished himself as a soldier in Diocletian's famous Egyptian expedition (296), next under Galerius in the Persian war. In 305, the two emperors, Diocletian and Maximian, abdicated, and were succeeded in the supreme rank of Augustus by the two Cæsars, Constantius Chlorus and Galerius. Galerius, envious of young Constantine's

brilliant genius and popularity among the soldiers, took every means of exposing him to danger, and it was now that he acquired that mixture of reserve, cunning, and wisdom which was so conspicuous in his conduct in after-years. At last, extorting a reluctant consent from the jealous Galerius, he made his way hastily to his father, who ruled in the West, and joined him at Boulogne just as he was setting out on an expedition against the Picts in North Britain (306). Constantius died at York in the same year, having proclaimed his son Constantine his successor. The latter now wrote a conciliatory letter to Galerius, and requested to be acknowledged as Augustus. Galerius did not dare to quarrel with Constantine, yet he granted him the title of Cæsar only. Political complications now increased, until in 308 there were actually no less than six emperors at once—Galerius, Licinius, and Maximin in the East; and Maximian, Maxentius his son, and Constantine in the West. Maxentius having quarrelled with his father, forced him to flee from Rome; he took refuge with Constantine, who had married his daughter Fausta at Arles in 307, but was ungrateful enough to plot the destruction of his benefactor. This being discovered, he fled to Marseilles, the inhabitants of which were just about to give him up to the conqueror, when he anticipated his fate by suicide (309). Maxentius professed great anger at the death of his father, and assembled a large army, with which he threatened Gaul. Constantine anticipated his movements by crossing the Alps by Mont Cenis, and invading Italy. Already twice he had defeated Maxentius, when he finally crushed his power by the great victory of the Milvian Bridge, near Rome, 28th October 312. Maxentius himself was pressed by the thronging crowd of fugitives over the bridge into the river, and drowned. Constantine now entered the capital, disbanded the Pretorian guards, and destroyed their camp. During his short stay in Rome he assumed the title of *Pontifex Maximus*. It was during his final struggle with Maxentius that the famous incident occurred that is said to have caused Constantine's conversion, and which Eusebius gives us an account of from the lips of the emperor himself. At noon there appeared in the sky a flaming cross inscribed 'Εν τούτῳ νικά' ('By this, conquer'). Again, the night before the final battle, a vision appeared to Constantine in his sleep, bidding him inscribe the shields of his soldiers with the sacred monogram of the name of Christ. Hence the well-known *Labarum* (q.v.) or standard of the Cross (q.v.), which Constantine, however, did not give his army, according to Gibbon, till 323. Whatever the story of the conversion be worth, one satisfactory consequence was the edict of Milan (March 313), issued conjointly with Licinius, giving civil rights and toleration to Christians throughout the empire.

Constantine was now sole emperor of the West. Similarly, by the death of Galerius in 311, and of Maximin in 313, Licinius became sole emperor of the East. In 314 a war broke out between the two rulers, in which Licinius had the worst, and was fain to conclude a peace by the cession of Illyricum, Pannonia, and Greece. Constantine gave Licinius his sister Constantia in marriage, and for the next nine years devoted himself vigorously to the correction of abuses in the administration of the laws, to the strengthening of the frontiers of his empire, and to chastising the barbarians, who learned to fear and respect his power. In 323 he renewed the war with Licinius, whom he defeated, and ultimately put to death. Constantine was now at the summit of his ambition, the sole governor of the Roman world. He chose Byzantium for his capital, and in 330 solemnly inaugurated it as the seat of

government, under the name of Constantinople or City of Constantine. Two deeds of Constantine have thrown a dark shade over his memory. In 326 his eldest son (by his first wife), Crispus, a gallant and accomplished prince, who was very popular, he put to death on a charge of treason; and next year his own second wife, Fausta, mother of the three sons, Constantius, Constantine II., and Constans, amongst whom he divided his empire. In 325 was held the great Council of Nicæa, in which he opposed the Arians on political grounds, as the weaker party; but not being theologically interested in the dissensions, he refrained from active persecution. In 324 Christianity became the state religion. Yet it was only a short time before Constantine's death, which occurred 22d May 337, that he would allow himself to be baptised by the Arian bishop, Eusebius of Nicomedia. The story of his baptism at Rome by Pope Sylvester in 326, and of the so-called *Donation of Constantine* thereafter, alluded to in Dante's *Inferno*, and often cited in support of the temporal power of the papacy, may safely be dismissed (see CANON LAW). See books on him by Cutts (1881), J. B. Firth (1905), and Coleman (1915); and for other Constantines, see BYZANTINE EMPIRE.

**Constantine**, king of Greece, was born at Athens, 2d August 1868. Of Orthodox faith, and the first prince of a Greek reigning dynasty born in modern times on Greek soil, he embodied from the first the national aspirations of the Greeks. He studied under private tutors at Athens, and, while receiving his military education in Germany, attended also some courses at the university of Leipzig. By marrying in 1889 Sophia Dorothea of Hohenzollern, sister of Kaiser William II. of Germany, he became, in popular belief, that Constantine of ancient prophecy who, wedded to a Sophia, was to restore the empire of Byzantium to the Greeks. He commanded in 1897 the Greek forces in the disastrous war with Turkey, and, as the result of the rising of the garrison of Athens in 1909, suffered with his brothers removal from military command, and virtual exile for a time. But in 1913 he succeeded to the throne at a moment when his successes in the Balkan wars had removed the obloquy into which his military reputation had fallen. During the Great War Constantine strove for the maintenance of Greek neutrality, in direct defiance even of popular will as constitutionally expressed. The belief that Constantine was covertly, and even openly, hostile to the Entente led in 1917 to an allied demand for the abdication of himself and his eldest son, whereupon he withdrew to Switzerland, and was succeeded by Alexander, his second son. But on the untimely death of the latter in 1920, the ex-king was triumphantly recalled by plebiscite to the throne. In the following year he led Greece to war with Turkey, but revolution at home followed the overwhelming defeat of his arms in Anatolia; and in 1922 he was obliged for the second time to abdicate. Retiring to Palermo, he died there, 11th January 1923, and was succeeded by George, his eldest son.

**Constantine Nikolaevitch**, Grand-duke of Russia, the second son of the emperor Nicholas I., and the brother of Alexander II., was born 21st September 1827. During the Crimean war he commanded the Russian fleet in the Baltic, and directed the defensive preparations which held the English and French armaments in check before Cronstadt. The leader of the Muscovite or national party, he strenuously opposed the concessions made to the western powers, but throughout gave, though contrary to expectation, steady allegiance to his elder brother from his accession to his unhappy death. On the outbreak of the

Polish insurrection in 1862, he held the office of viceroy of Poland for three months, was appointed in January 1865 and reappointed in 1878 president of the council of the empire. After the accession of his nephew, Alexander III., in 1881, he was deprived of his offices on suspicion of having intrigued with the revolutionary party, and retired from public life, dying in 1892.

**Constantinople**, 41° N. lat., 28° 59' E. long., long capital of Turkey, stands on a site partly occupied by the ancient Byzantium. The Turks call it Istambul or Stambol. The original Byzantium was a colony (about 658 B.C.) from Megara, with an Aigive mixture. It was built on the apex of the triangular peninsula which juts out towards Asia on the southern side of the Golden Horn, where the present Eski Serai or 'Old Seraglio' stands, and its commanding position made it an object of strife among the nations—Persians, Gauls, and Greeks. In the middle of the 4th century B.C., the Athenians under Demosthenes, coming to the assistance of the Byzantines, repelled the siege of Philip of Macedon, aided, according to the legend, by the supernatural appearance of a crescent in the sky, which revealed the advance of the invaders, and was forthwith adopted as the badge or crest of the city, as it is to this day. After its submission, the Roman emperors long recognised its virtual independence, and in 328 A.D. Constantine the Great founded in the place of Byzantium a new metropolis on the Bosphorus, which he called New Rome, and which also received in his honour the name of Constantinopolis. The place was inaugurated in 330 as a new seat of Roman government, and for eleven centuries remained the capital of the Eastern Roman empire, giving its laws, its architecture, and its creed to the other countries. Its walls were enlarged by Anthemius under Theodosius II., and its public buildings were enriched by Justinian in 527-65. Since then it has undergone many sieges by Sassanians, Persians, Avais, Saracens (six times), Russians (in 9th to 11th century), Latins, and Turks; and of its twenty-six sieges and eight captures, that of the Latins under Baldwin and Dandolo in 1204 was by far the most disastrous, barbarous, and spoliating. In comparison, the Turkish sieges were humane and chivalrous: the first took place in 1356; Murâd II. made the attempt again in 1422; and Mohammed II. carried the city against the resolute resistance of Constantine Palæologus and Giustiniani in 1453. Since then, such has been the renown of the Turks or the jealousy of the powers that the imperial city has witnessed no fresh siege by foreigners, though the Bulgars came dangerously near in 1912. After the Great War Constantinople was left to the Turks, but was superseded by Angora as capital.

Constantinople consists of two distinct parts, besides more distant suburbs—Constantinople proper or Stambol, and what may be termed Christian Constantinople, where the Christian colonies chiefly congregate. The two are separated by the Golden Horn, a creek about 5 miles long and half a mile wide at the entrance, so called probably from its famous fisheries, a veritable horn of plenty to the ancient inhabitants; in the present day a safe, deep, and capacious harbour. Stambol or Turkish Constantinople lies on the southern side of the Golden Horn, and Christian Constantinople lies on the north side; the two are connected by a couple of rude but convenient bridges. Stambol is on the site of Byzantium, and the old walls of Constantine show that the modern Turkish city occupies much the same area as the capital of the first Christian emperor. The walls run a circuit of 14 miles from the grim but now ruined and disused castle of the Seven Towers—where many sultans met their deaths at the hands of

their mutinous soldiery, and where foreign ambassadors were imprisoned upon declaration of war—to the Golden Horn, then along its southern shore to Seraglio Point, and so back to the Seven Towers close along the margin of the Propontis. Within these walls the city rises, like Rome, upon seven low hills, crowned by noble mosques, with a wilderness of picturesque, tumble-down, filthy, wooden houses, and lane upon lane of even more picturesque and scarcely less dirty bazaars, climbing up their sides from the Golden Horn to the Hippodrome. Years ago Stambol was more beautiful and more filthy, but fire has so repeatedly laid it low that the old streets are becoming few, and their place is being taken by more sanitary but not equally pleasing thoroughfares and brick or stone houses. In the bazaars and some of the less reformed byways there is left quite enough of the old Mussulman leaven to make one aware of the charms and the drawbacks of an oriental city. Very few of the goods, however, which the admiring tourist carries away from the bazaars are made there; many come from Vienna, and not a few from Manchester.

In Stambol are nearly all the monuments. In the row of some half-dozen mosques, whose conglomeration of domes and semi-domes, like a clustered jelly-mould, contrasting with the numerous tall and exceedingly slender minarets, crown the summits of the hills, we see some of the most famous and magnificent monuments of Christian and Turkish art. First, next the Seraglio, stands Agia Sophia, Saint Sophia, the church dedicated by Constantine to 'Holy Wisdom,' and rebuilt with added splendour by Theodosius (415) and by Justinian (533-563), and now converted into a cathedral mosque. Outside it is not worth a second glance; but within, the airy grace of its stupendous dome, and the beauty of its marbles and mosaics, despite all the ravages of Moslem and, worse than Moslem, tourists' desecrations, fascinate and amaze the vision (see *BYZANTINE ARCHITECTURE*). Next, but not less beautiful, is the Suleymaniya, the mosque which the Great Suleyman and his architect Sinan erected in 1550-55 on the model of St Sophia, but with Saracenic ornament and a loftier though not quite so expansive dome. Some of the monolithic columns are remarkable for their size and beauty, and the general effect is even more imposing than that of St Sophia. Scarcely less stately is the mosque of Ahmed I. (1610), in the Hippodrome, distinguished without by its six minarets (instead of the usual four), and within by the four gigantic columns, 36 yards round, which support the dome; here the official celebrations and formal processions take place at the great festivals. The mosque of the conqueror Mohammed II. was unfortunately altered in the rebuilding of 1768. There are some beautiful royal mausoleums, and over three hundred other mosques in Constantinople, and an even larger number of chapels, but very few of them present features of special interest, except sometimes in the beauty of their wall-tiles, of the Rhodian style, for the manufacture of which the suburb of Eyvâb was famous.

The remains of the Greek churches are more interesting, and the Fanar, or Greek quarter of Stambol, recalls the memories of many distinguished Fanariote statesmen; but among the relics of ancient Constantinople none is more striking than the Hippodrome (now called At-Meydan, or 'Horse Manège'), originally a circus surrounded by marble seats, long since removed, but still showing remains of antiquity, such as the famous column of the Three Serpents which once stood at the Temple of Delphi, and supported a gold tripod made out of the spoils taken by the Greeks at the battle of Plataea, but was removed to his new capital by Constantine.

The serpents' heads are broken off; one was said to have been struck off by the scimitar of Mohammed the Conqueror, and one is still preserved in the museum of antiquities. In the Hippodrome also stands an obelisk brought from On (Heliopolis) in Egypt, and re-erected by Proclus the Pætor in the reign of Theodosius; hard by are the Burnt Column, the column of Theodosius, and the Seraskier's Tower, whence watchmen survey the city and give warning of conflagrations. Among the remains of Mohammedan splendour the Old Seraglio (Eski Serai) is the most important, though it has not been a royal residence since the days of Mahmûd II. Its first gate, Bab-i-Humayûn or 'Sublime Porte,' has given its name to the Turkish government in its foreign relations. Within its three spacious courts, full of beautiful trees and picturesque in their gray decay, are various stables and former offices of the court, the old council chamber, the armoury (once the Church of St Irene), the museum, mint, and the celebrated treasury, where uncut jewels, gold-embroidered vestments, and gorgeously mounted arms are preserved in fabulous value. The museum contains the famous Sidon sarcophagi and the products of many excavations, and a school of art is now attached. In the neglected gardens overlooking Seraglio Point are various kiosks, one of which, called that of Baghdad or Murâd IV., is lined with exquisite tiles, another contains the library of the sultans, and a third is the ominous Kafes or 'cage' where the unhappy princes who menaced the peace of sultans were immured for life. There are in Constantinople hundreds of *medreses* or mosque colleges, and *mektebs* or elementary schools; a university (re-organised since 1918) was founded in 1900, with faculties of arts, theology, law, medicine, and science.

Christian Constantinople comprises Galata, Pera, and Top-hâna. Galata is pre-eminently the merchant quarter, the seat of customs, and the steam companies' agencies; it was granted to a colony of Genoese merchants in 1265, and originally was enclosed by walls of 4 miles circuit, now destroyed. Traces of Genoese architecture may still be found in the narrow, dirty streets, and in the Tower of Galata, once the citadel, which serves the same purpose as the Seraskier's Tower on the opposite side in giving alarms of fires. Galata has been considerably improved; stone and brick houses have superseded the dangerous wooden constructions of the past; a good thoroughfare with a tramway extends to Beshiktash; a fine quay has been built on the shore of the Golden Horn, corresponding to a similar quay on the Stambol side (opened in 1900); and a tunnelled railway drags passengers up the steep ascent to Pera. Pera is the fashionable quarter; here are all the embassies and legations and consulates, and here every one of position has his town-house. Two-thirds of this quarter were burned down in 1870. The result was a considerable improvement in the architecture and ventilation of Pera. The steep and badly paved Grande Rue, which traverses the whole quarter, and is continued along the shore of the Bosphorus for many miles, is, however, still in parts little better than a lane; but it is lined with fair if expensive shops, and boasts an opera-house, and many cafés and restaurants, besides most of the principal hotels, and nearly the worst morals in Europe. In Pera is the English Memorial Church, erected in honour of those who fell in the Crimean war. Turks preponderate at Top-hâna, so named from its cannon-foundry. Close by is the magnificent palace of Dolmabahçhé, on the brink of the Bosphorus.

Among the other suburbs may be mentioned Kâsim Pasha, extending beyond Galata, along the north shore of the Golden Horn, the seat of

the admiralty; continued by Haskoi, inhabited by a Jewish and Armenian colony; and at the head of the Golden Horn the picturesque village of Eyyûb, a green medley of gardens and graveyards surrounding the celebrated mosque where every sultan had formerly to be girt with the sword of Osman before he ascended the throne. No Christian is allowed to approach the holy place. Along the European shore of the Bosphorus are many summer-resorts, Therapia, the chief summer residence of the ambassadors, and Biyukderé being the most important. The Asiatic shore is also lined with settlements, from Scutari (where is the chief Turkish burial-place, as well as the great Crimean cemetery, and admirable hospitals and schools) to Kandili, with its large European population, chiefly of the trading classes, and Beikos (see BOSPORUS). Numerous palaces of past sultans and ministers line both shores, Dolmabahçé on the European and Beglerbeg on the Asiatic being the largest; but the sultan latterly resided in a new palace called Yildiz Kiosk, at the top of the hill of Besiktâsh, beyond Pera. Famous among pleasure-resorts are the Sweet Waters of Europe, at the head of the Golden Horn; Kiahat-hâna, near the Castle of Asia; the forest of Belgrade; and the Princes' Islands in the Sea of Marmora, not far from Kadiköi, the ancient Chalcedon. The population of Constantinople is variously estimated, there being no satisfactory official figures. It amounts probably to 1,125,000, including 500,000 Turks, 200,000 Greeks, 180,000 Armenians, 65,000 Jews, and 70,000 Europeans, the city being essentially cosmopolitan. Its industries are of no great importance. There are glass, soap, tobacco, and cotton works, and works for the preparation of skins and other by-products of the slaughter-house, while small craftsmen work in leather (boots and saddlery), silk, brass, and copper. The naval and military arsenals and the railway repairing-shops are of considerable extent. Once the meeting-point of the trade routes of the world, Constantinople cannot now be counted a great commercial centre. Its trade is chiefly in the hands of Greeks, Armenians, and Jews. Grain from the interior is the principal export, but opium, mohair, tobacco, carpets, hides, silk, and oil are also important. The police administration of the city is divided into circles and wards, all under a prefect, subject to the Minister of the Interior. The first through train from Paris reached Constantinople in 1889; there are also railways to Salonika, Bourgas, and Angora. Within the city electric tramways are in operation.

Young, *Constantinople* (1926); and the works of Mordtmann, Paspates, Salzenberg, and Labarte. For the Councils of Constantinople, see COUNCIL.

**Constantius**, called CHLORUS, nephew of the emperor Claudius II., became Cæsar in 292 A.D., received Britain, Gaul, and Spain as his government, and after re-establishing Roman power in Britain and defeating the Alemanni, became one of the two Augustuses in 305, but died at York in 306. Constantine the Great was his son.—(2) **CONSTANTIUS**, third son of Constantine, was Roman emperor, 337–361 A.D. He fought with the Persians; and after the death in 350 of his brother Constans (who in 340 had defeated their

elder brother Constantine), became sole emperor till his death in 361.

**Constantza**, formerly KUSTENDJI, a seaport in the Dobruja, Rumania, stands on the Black Sea, at the end of Trajan's wall and of the railway to Tchernavoda, on the Danube. The harbour has been improved, and it is growing in commercial importance, especially for petroleum. Pop. 27,600. Tomi, the place of Ovid's banishment, was near.

**Constellation** (Lat. *con*, 'together,' and *stella*, 'a star'), a group of stars. The stars which stud the firmament have, from a time earlier than authentic records can trace, been formed into artificial groups, which have received names borrowed from fancy or fable, mainly from Greek mythology. These groups are called constellations. Though quite devoid of anything like systematic arrangement, this traditional grouping is found a sufficiently convenient classification, and still remains the basis of nomenclature for the stars among astronomers. They are divided into northern, southern, and zodiacal constellations. In old authors, 'constellation' is used to signify the relative positions of the planets (see ASPECTS) at a given moment. See STAR, ORION, URSA MAJOR, ZODIAC.

**Constipation**, or irregular and insufficient action of the bowels, is one of the most common of ailments; there are few persons in fact who have not at some time or other suffered from it. It may be due either to deficient secretion of fluids in the digestive organs, or to imperfect muscular action of the bowels (see DIGESTION), or most often to both these causes combined. The retention within the organism of matters which should be regularly evacuated as they are formed, and their consequent absorption into the blood and tissues of the body, often leads to a whole train of unpleasant symptoms: headache, or pain in other regions, irritability, lassitude, and debility, and many other discomforts may be due to this cause. In severe cases of constipation, partial obstruction of the bowels may be the cause, and may become complete; and often the bowel becomes so distended and its muscular power so enfeebled that the restoration of a healthy condition is impossible.

Constipation is especially apt to occur in those who lead sedentary lives, or whose diet consists too exclusively of animal food and starchy substances. It may often be avoided by judicious regulation of habits and diet; and the hygienic treatment is of far more importance than the medicinal.

In perfect health, the lower bowel should be evacuated every day, or at the furthest every second day. This process, like many others in the body, tends to recur at the same period every day, and every one should do all he can to acquire a habit of regularity in this respect. Moderate regular exercise, especially in the open air, is often of great importance; where the liver is at fault, riding is specially useful. A daily cold bath, or in the case of those with whom this does not agree, brisk rubbing with a rough towel, may be helpful. A favourite remedy with some is the use of a cloth wrung out of cold or tepid water and applied to the abdomen; this, as used at hydropathic establishments, is called an 'abdominal compress,' and is worn under a bandage of macintosh cloth, to keep the moisture from escaping, during the earlier part of the day.

Attention to diet is of prime importance. In Britain very many persons live almost entirely on animal food, white bread, and potatoes, a diet extremely apt to lead to constipation. There are many easily obtainable foods the habitual use of which would in many cases correct this tendency. Oatmeal, especially in the form of porridge, brown

or 'whole-meal' bread, or gingerbread; almost all vegetables (except potatoes), either cooked or uncooked; olive-oil, which may be used in salads; treacle, eaten with bread or made into puddings; fruit of all kinds, particularly prunes and figs, which can be obtained all the year round—all tend to increase the activity of the bowels. If such forms of food were more generally used, the rest of the community would gain even more than the many vendors of 'liver pills,' and other quack medicines would lose.

The amount of fluid taken in the day is also of importance. Many persons, especially those in whom much fluid taken with meals interferes with comfortable digestion, do not imbibe enough for the needs of the body. In such cases a stated amount of fluid should be taken at other times. A tumbler of water, either cold or hot, slowly sipped during the process of dressing in the morning, is sometimes efficient in relieving constipation.

Lastly, the use of medicinal remedies must be shortly considered. Compared with the measures already noticed, they must be regarded as an evil, though often a necessary one. Constipation may be seriously aggravated by their injudicious employment. Often a large dose of some purgative is taken and produces very free action of the bowels with temporary relief; but increased constipation is almost sure to follow. The condition to be remedied is a chronic and habitual one, and must be combated by patient and persevering treatment. The medicine selected should be taken every day, but the dose must be the very smallest which will produce the desired effect.

It is impossible to enumerate all the drugs which may be used, or to define the conditions in which each is most likely to be beneficial. A few of those in most general use only must be enumerated. Natural mineral waters and natural salts are in much repute at present: a dose should be taken on rising in the morning. Epsom or Glauber's salt, if dissolved in plenty of water, is much cheaper and almost as satisfactory. Effervescent salines (seidlitz powder, magnesia, and many much-advertised patent medicines) are more pleasant to take, and have a similar action. Many persons take one of these habitually over many years without any ill effect. Compound colocynth pills, or colocynth and hyoscyamus pills; compound liquorice powder (containing senna and sulphur, one of the best preparations); Gregory's powder (containing rhubarb and magnesia); podophyllin, euonymin, and other drugs from America, are all useful aperients, and should be taken at bedtime. Nux vomica is a useful addition to other aperients, as it acts specially upon the muscles of the intestines, increasing their activity. A word of caution is necessary regarding mercurial preparations, which are most valuable in certain cases, but most dangerous if used habitually. The indiscriminate use of calomel and gray powder in the nursery, where they are very popular owing to their tastelessness, cannot too strongly be condemned. The most generally useful of all aperients at present in use is *Cascara Sagrada*, the bark of a North American species of buckthorn (*Rhamnus Purshiana*). The liquid extract is the preparation in most general use, of which from 15 to 60 drops taken daily, either in one dose at bedtime or still better in several doses after meals, is generally sufficient. It increases the secretions, but especially the muscular power of the intestine; and in very many cases can be given up altogether after being used for a few weeks (see also **APERIENTS**). In some cases Clysters (q.v.) are the most satisfactory means of procuring an evacuation.

*Constipation in the lower animals* often depends, as in man, on imperfect secretion from, or motion of, the intestinal walls. But it also occurs as a

symptom in many diseases, as rinderpest, red-water, milk fever, paralysis, &c. In the horse it is usually accompanied by Colic (q.v.), and when long continued leads to Enteritis (q.v.). The treatment will depend largely on the cause, but amongst appropriate remedies are soap-and-water clysters given every two hours; smart friction and cloths wrung out of hot water applied to the abdomen, with aloes and calomel in suitable doses given in gruel, and repeated in sixteen hours, if necessary. Give, besides, walking exercise; restrict the amount of dry solid food, but allow plenty of thin gruel or other fluids, which may be rendered more laxative by admixture with treacle or a little salt. Similar treatment is called for in dogs, cats, and pigs.

In cattle and sheep, digestion principally takes place in the large and quadrisepted stomach; the bowels, accordingly, are little liable to derangement; and constipation, when occurring in these animals, generally depends upon impaction of dry hard food between the leaves of the third stomach, fardel-bag, or moniplies. The complaint is hence called *fardel-bound*. It results from the eating of tough and indigestible food, such as ripe vetches, rye-grass, or clover; it prevails in dry seasons, and on pastures where the herbage is coarse and the water scarce. It occurs amongst cattle eating freely of hedge-cuttings or shoots of oak-trees; hence its synonym *wood-evil*. From the drying-up of the natural secretions, it accompanies most febrile and inflammatory diseases. The milder cases constitute the ordinary form of indigestion in ruminants, are accompanied by what the cow-man terms *loss of cud*, and usually yield to a dose of salts given with an ounce or two of ginger. In more protracted cases rumination is suspended, appetite gone, and fever is present. There is a grunt noticeable, especially when the animal is moved, different from that accompanying chest complaints, by its occurrence at the commencement of expiration. By pressing the closed fist upwards and forwards beneath the short ribs on the right side, the round, hard, distended stomach may be felt. This state of matters may continue for ten days or a fortnight, when the animal, if unrelieved, becomes nauseated, and sinks. Stupor sometimes precedes death, whilst in some seasons and localities most of the bad cases are accompanied by excitement and frenzy, but this is frequently due to lead poisoning.

Give purgatives in large doses, combining several together, and administering them with stimulants in plenty of fluid. For a medium-sized ox or cow, use  $\frac{1}{2}$  lb. each of common and Epsom salts, ten croton beans, and a drachm of calomel, with three ounces of turpentine; and administer this in half a gallon of water. If no effect is produced in twenty hours, repeat the dose. Withhold all solid food; encourage the animal to drink gruel, sloppy mash, treacle and water; and give exercise, clysters, and occasional fomentations to the belly.

**Constitution**, in Politics, signifies a system of law established by the sovereign power of a state for its own guidance. Its main objects are to fix the limits and define the relations of the legislative, the judicial, and the executive powers of the state, both amongst themselves and with reference to the citizens of the state, regarded as a governed body. In continental countries, since the formation of the federal government of the United States of America, or, at all events, since the first French Revolution, the idea of a constitution has been generally that of a body of written public law, promulgated at once by the sovereign power. In Great Britain it is the whole body of the public law, consuetudinary as well as statutory, which has grown up during the course of ages, and is continually being modified by the action of the general will as interpreted and expressed by the

parliamentary representatives of the nation. A constitutional monarchy is one in which the sovereign is restricted in his powers by chambers of the representatives of the people; the 'granting of a constitution' accordingly means the transforming of a monarchy more or less nearly absolute into a constitutional state. The constitutions of the various countries will be found under FRANCE, GERMANY, &c., as also at PARLIAMENT, CONGRESS, GOVERNMENT, &c.

**Constitutions, APOSTOLIC.** See APOSTOLIC CONSTITUTIONS.

**Consubstantiation**, as opposed to Transubstantiation (q.v.), is the Lutheran doctrine that in the eucharist the body and blood of Christ are, in a way not to be explained, in, with, and under the unchanged bread and wine. See LORD'S SUPPER.

**Consuetudinary** or CUSTOMARY LAW is an unwritten law established by usage and derived by immemorial custom from remote antiquity. When universal, it is called common law; when particular, it is called custom in a narrower sense, as the custom of a trade or of a district. See CUSTOM, COMMON LAW.

**Consul**, the title of the two highest ordinary magistrates in the Roman republic. The idea of two supreme magistrates or joint-presidents of the state seems to have been interwoven with the earliest conceptions of political organisation in Rome. After the expulsion of Tarquin, Lucius Junius Brutus and Lucius Tarquinius Collatinus were chosen joint heads of the state; but the title of *consules* appears first to have been introduced about 300 B.C. At first, the consuls seem to have differed from the kings in little else than their limited tenure of office, and the power which their fellow-citizens retained of calling them to account at its termination. They never assumed the golden crown, but their dress in almost every other respect was regal. They made peace and negotiated foreign alliances, had the supreme command of the army, and appointed the public treasurers. They likewise exercised the judicial functions of royalty. Dates were always determined by naming the consuls of the year. The symbol of their authority was the bundle of rods (*fascies*), with the axe in the centre, which was carried before them by twelve lictors. For a considerable period the consuls were chosen exclusively from the *populus* or patricians, as opposed to the *plebs*. At length, however, two plebeian officers called *tribuni plebis* were appointed as a sort of democratic rivals to the aristocratic consuls. The result of this rivalry was that the consulship was opened to plebeians, the famous *Lex Licinia* (367 B.C.) ordaining that one of the consuls should belong to that order. This law was more stringently re-enacted in 342, and from that time it was customary for one of the consuls to be a plebeian. This same law prohibited any individual from holding the same office within ten years, but the enactment was often suspended. The appointment of *Censores* (443) and of *Prætores* (367) relieved the consuls of many of their judicial functions. In the government of the provinces, the aid of the former consuls was called in, the consul thus appointed having the title of *pro-consul*. In sudden and critical emergencies, the consuls were either superseded by a Dictator (q.v.), or absolute power for the occasion was conferred on them by the decree of the senate, which ran in the famous formula: *Videant consules ne quid respublica detrimenti capiat*—'Let the consuls look to it that the state take no harm.' The consuls were inaugurated by a great procession to the Capitol and a sacrifice to Jupiter Capitolinus. The shadow of the consulate survived the downfall of liberty;

but the election of the consuls was taken from the people and conferred on the senate. Then their number was increased; they were divided into classes; till at last the office became a mere honorary appointment conferred by the emperor.

The title of consul was revived in the French republic after the revolution of the 18th Brumaire, and lasted till the coronation of Napoleon as emperor, 18th May 1804.

**Consul**, the name given to those officers whom the state maintains in foreign countries for the protection of its trade and vindication of the rights of its merchants, and to whom the further duty is assigned of keeping the home government informed of all facts bearing on the commercial interests of the country. The practice of appointing such officers originated among the trading communities of Italy about the middle of the 12th century, and gradually extended itself, and in the 16th century had been adopted by all the countries of Europe. In addition to their commercial duties, others of a more strictly political kind were frequently confided to consuls in places in which there was no ambassador or political agent. In almost all civilised countries consuls are divided into consuls-general, consuls, vice-consuls, and consular agents. British consuls are appointed by commission from the crown. The consul's first duty on his arrival is to exhibit his commission to the authorities of the country to which he is accredited, in order that he may obtain their recognition of his appointment. This recognition is communicated to him in a document called an *exequatur*, which is a formal authorisation, issuing from the country in which his duties lie, to do, within the jurisdiction of that country, the different acts incidental to consular authority.

There are, speaking generally, two kinds of consuls: professional consuls, who devote their whole time to the consular office, and are always subjects of the appointing state; and persons who discharge consular duties in addition to following their ordinary callings, and who are often merchants resident in the district, and not subjects of the appointing state.

The duties of British consuls are of a very various character. One of their main duties is to give advice and assistance to British subjects generally in the difficulties arising from foreign surroundings, and, in particular, to protect their countrymen in the lawful exercise of trade. In upholding the rightful interests of his countrymen, or in obtaining redress of injuries done them, the consul may, if necessary, report the matter to the British ambassador or, in a serious case, to the home government. The commanders of British warships visiting the district are entitled to call on the consul for aid in procuring supplies. Consuls also have important duties in connection with the British mercantile marine. They exercise a disciplinary jurisdiction over merchant sailors, and, in case of wrecks, endeavour to recover ships and stores. They have also duties with regard to the relief and repatriation of distressed British seamen and other British subjects. They furnish annually to the Foreign Office commercial reports, which frequently contain valuable information as to the conditions of trade and industry. In addition, periodical reports are made by consuls, quarterly or monthly, to the Board of Trade, to the Registrar-general, and to the Board of Agriculture with regard to matters coming within the purview of these departments respectively. A consular officer has authority to issue passports to British subjects, and also to administer oaths, take affidavits, and do any notarial act which any notary public can do within the United Kingdom. It is also within his province to decide, as arbitrator appointed,

by consent, commercial disputes between British citizens. He keeps a register of all British subjects within his district, and also registers of births and of deaths of British subjects occurring there. Consular officers are authorised, by a warrant signed by the Secretary of State, to act as marriage officers under the Foreign Marriage Act, 1892, and, in that capacity, are entitled to celebrate marriages between persons one of whom at least is a British subject. The conditions under which such marriages may be celebrated are now regulated by the Foreign Marriages Order in Council, 1913.

Consuls, while not entitled to the privileges accorded to persons of a diplomatic character, have a right to discharge their public duties without hindrance; and official documents relating to their consular duties are inviolable. They do not have immunity from the jurisdiction of the ordinary tribunals of the foreign country, but it is generally recognised that they are immune from personal taxation. The functions and immunities of the consular service of the United States have been considerably extended by special treaties with other countries.

In many non-Christian and partially civilised states the consuls of the civilised powers discharge functions more ample and more responsible than those which are discharged by consuls in western countries. Within the borders of such states they act as judges, generally speaking, in all matters, civil and criminal, which concern their countrymen. The extra-territorial jurisdiction thus exercised by the consular courts within the territory of a foreign state means, in practical effect, that a citizen of a civilised power who enters the territory of that state remains under the jurisdiction of his home state. The extra-territorial jurisdiction exercised by British consular courts is regulated by the Foreign Jurisdiction Act, 1890, and by Orders in Council applicable to particular countries and territories. The system of exempting resident foreigners from the jurisdiction of native courts, and of maintaining for their protection judicial tribunals administering the law of their home state, had its origin and took shape in a series of agreements, usually termed 'capitulations,' entered into between the Ottoman empire and the several western states. By treaty, concession, and custom a similar system of extra-territorial protection was established in other oriental states, e.g. China, Japan, Persia, and Siam, as well as in many parts of Africa. The extra-territorial consular jurisdiction in Japan was abolished in 1899. In 1914 Turkey, on the eve of entering into war against the allied powers, declared the abolition of the capitulations. Great Britain and the other allied powers protested, and during the war the controversy remained in suspense. Under the settlement which has followed the war, Palestine, Syria, Mesopotamia, and other communities and territories, formerly belonging to the Turkish empire, are provisionally recognised as independent nations, subject to the administrative advice and assistance rendered by a mandatory power. Thus in Palestine, under the provisional administration of Great Britain, the old capitulatory régime has not been re-established, and the courts, as re-constituted, both civil and criminal, now exercise jurisdiction over all persons without regard to nationality. Accordingly in Palestine consuls no longer discharge judicial functions. In Egypt consular courts had long before the war given place to international courts or mixed tribunals; and now the whole judicial system of Egypt is being reorganised. As regards communities and territories which still remain within the Turkish empire, the treaty of peace with Turkey contains provisions dealing with the relation of foreigners to native tribunals and the extent of consular jurisdiction.

The consular service was reorganised after the report of Sir William Walrond's committee in 1903. From that time the service was recruited by competitive examination; provision was made for promotion from one grade to another; and a regular scale of pay and allowances was substituted for the former system, under which each post had a salary peculiar to itself. Since 1918 many important changes have been introduced in the organisation of the consular as well as of the diplomatic service. The scales of pay in the consular service have been assimilated to those for the diplomatic service. The examination tests imposed on candidates have been made more serious. Between the consular service and the diplomatic service a new commercial diplomatic service has been formed, to undertake the work of organising and developing our system of commercial intelligence. Both the commercial diplomatic and the consular service are under an additional parliamentary under-secretary, who is head of the Overseas Trade Department.

See *British Consular Instructions* (1807), issued by the Foreign Office; Oppenheim, *International Law* (3d ed. 1920); Jenkyns, *British Rule and Jurisdiction beyond the Seas* (1902). For American practice, see Hinkley, *American Consular Jurisdiction in the Orient* (1906).

**Consulate of the Sea**, a celebrated code of maritime law, the earliest extant edition of which was printed at Barcelona in 1494. The date of its original compilation is in doubt, being given by some as the 14th century, but by others as early as the 11th. *The Book of the Consulate* is the proper title of the work. It consists of the settled usages in respect of trade and navigation of the maritime communities of the Mediterranean, and contains (1) a code of procedure issued by the kings of Aragon for the guidance of the courts of the consuls of the sea; (2) a collection of ancient customs of the sea; (3) a body of ordinances for the government of cruisers of war. The code, originally in Catalan, was translated into Castilian, Italian, and French in the 16th century, and into Dutch and German in the 17th, and passed largely into the maritime law of Europe and America. See Twiss's *Black Book of the Admiralty* (1874); in the appendix (vol. iii.) is a translation of 'The Customs of the Sea.' See **MERCANTILE LAW**.

**Consumption**, in Political Economy, is that department of the subject which treats of the use of wealth. It is the converse of production, which refers to the making or creating of wealth. As production is the first stage in economics, consumption is the last. Consumption is the chief end of industry, for everything that is produced and exchanged is intended in some way to be consumed. Consumption may be divided into two heads—reproductive and non-reproductive. Wealth consumed in reproduction is simply Capital (q.v.). Wealth consumed as capital, while it is the final stage in one process of industry, becomes an item in a further process of industry. A shopkeeper who, having made a thousand pounds in his business, afterwards uses it in farming, proposes thereby to apply his money to a new kind of reproductive employment. Industry is to a large degree simply a continuation of this process. Wealth which is produced to-day will to-morrow be consumed in fresh production.

Regarded as non-reproductive, consumption is that use of wealth which has no fresh production immediately in view, as in the typical case of the application of wealth to the satisfaction of human needs. The wants of men, as well as the means of satisfying them, have varied greatly at different periods of history, and do still greatly vary in different countries and different states of society.

As regards wealth applied to consumption, we may recognise three stages: (1) necessities; (2) comforts; (3) luxuries. The commodities which were once a luxury are now in civilised countries merely a comfort or even a necessity. In the middle ages a linen shirt was a luxury even at royal courts. In fact, nothing perhaps so marks the development of comfort as the general use of underclothing, whether woollen, cotton, or linen. In the economics of all ages the question of luxury has claimed great attention. The extravagance of the wealthy was both in ancient and mediæval times considered so dangerous to society that Sumptuary Laws (q.v.) were passed to repress it, often without the desired effect. On the other hand, the luxury, extravagance, and even prodigality of the rich have been justified on the ground that such expenditure was necessary to provide labour for the industrial classes; but economically this notion will not stand examination. It should be clearly understood that consumption should be both rational and moral, and that the just and rational needs of men have the first claim on society.

As all wealth is produced in order to be consumed, and as there can be no consumption without production, it will be obvious how the great processes of production and consumption are correlated to each other. If there be insufficient production, consumption is checked and suffering ensues through human wants not being satisfied. On the other hand, over-production frequently tends to bring about commercial crises. When the effective consumption is unable to absorb the mass of commodities, the market becomes overstocked and the industrial process is deranged.

**Consumption.** See TUBERCULOSIS.

**Contagious Diseases Acts** were passed in 1865, 1867, and 1868 for about twenty seaport and military towns; to a certain extent they also applied elsewhere, and similar acts were largely adopted in the British colonies. The main features of this legislation were (1) the registration and police supervision of prostitutes; (2) the periodical examination of these women, which might be compelled; (3) their detention in hospital when necessary. The acts were from the first strongly opposed as contrary to constitutional freedom and public morality, as giving undesirable safety to vicious practices, as dangerous to virtuous women, as treating unequally the two sexes, and as encouraging clandestine prostitution. Their operation was inquired into by a Royal Commission in 1870, which was generally favourable to their retention; and by a Select Committee in 1882, which reported that the acts had diminished venereal disease, and had increased the efficiency of the army. The army returns, however, left this fact in some doubt. They were condemned by a wave of strong public feeling in 1883, and have since been repealed. This repeal was not carried out in India till 1897. The system of police control of prostitution was definitely rejected by the Medical Congress in London in 1913, in favour of confidential notification with systematic diagnosis and treatment. The police method leaves the worst spreaders at large. See WOMEN'S RIGHTS.

**Contagious Diseases (Animals) Acts.** This series of acts is designed to prevent the introduction and spread of contagious diseases among animals. The earlier acts were revised and consolidated in the Diseases of Animals Act, 1894; and, since the date of this consolidating act, its scope has been extended by subsequent statutes—e.g. an Act of 1896, as to the slaughter of foreign animals, an Act of 1903 dealing with sheep-scab, the Dogs Act of 1906, and the Poultry Act, 1911. The administration of the acts in Great Britain is

now controlled by the Ministry of Agriculture, which, by an act passed in 1919, was substituted for the Board of Agriculture. The Ministry has extensive powers to issue orders for carrying out the statutory purposes. Local authorities are also authorised to make regulations on the subject, and to appoint inspectors. The acts, the orders issued by the Ministry, and the regulations made by local authorities constitute together an elaborate administrative code. The animals protected include cattle, sheep, goats, and all other ruminating animals; swine; and, for certain purposes, horses, asses, mules, and dogs. By the Poultry Act, 1911, poultry in course of conveyance by land or water are brought within the ambit of the acts. The diseases dealt with are cattle plague or rinderpest, contagious pleuro-pneumonia, foot-and-mouth disease, swine fever, sheep-pox, and sheep-scab. In addition, the Ministry, in exercise of the powers conferred on it, has issued orders as to glanders or farcy, rabies, anthrax, epizootic lymphangitis, and tuberculosis. The local authorities responsible are, in England, the borough councils in boroughs with a population exceeding 10,000, and elsewhere the county councils; and, in Scotland, the town councils in burghs with a population exceeding 7000, and elsewhere the county councils.

Every person having in his possession an infected animal must isolate it and give immediate notice to the police, who must immediately inform the Ministry, and, in cases of pleuro-pneumonia and foot-and-mouth disease, also inform an inspector of the local authority. A 'place'—i.e. the actual spot, the field or building—where the disease exists is provisionally declared to be infected when an inspector signs a declaration of the existence of disease at that place. This provisional declaration is subject to confirmation by the Ministry in the case of cattle-plague, or by the local authority in the case of pleuro-pneumonia and foot-and-mouth disease. Further, the Ministry, acting on the report of the local authority or independently, may declare any 'area'—i.e. a district containing the infected place—to be an infected area. The Ministry has full powers to make regulations as to isolation and disinfection in an infected place or area, or as to the movement of animals, carcasses, or persons within, or into, or out of, such a place or area. In the case of certain diseases a duty, and in the case of other diseases a discretionary power, is conferred on the Ministry or a local authority to slaughter affected or suspected animals. A record of all animals so slaughtered must be kept, and compensation is paid to the owners. The Ministry in various orders has made regulations as to the mode of ascertaining the value of animals slaughtered, and as to applications for, and payment of, compensation. Where animals are slaughtered by order of the Ministry, compensation is paid out of funds provided by parliament; where the slaughter has been ordered by a local authority, compensation is paid out of the local rate. An owner who is guilty of any offence against the acts is liable to forfeit, in whole or in part, his claim for compensation. The Ministry is empowered to issue, and has issued, orders prescribing the ports at which alone foreign animals may be landed, and regulating the inspection, slaughter, and removal of animals so imported, and the carcasses of such animals. The Diseases of Animals Act, 1910, amended by the Exportation of Horses Act, 1914, deals with the shipping of horses. The Act of 1903 provides for inspectors having power to enter premises to examine sheep, and for the establishment of sheep-dipping tanks by local authorities. The Ministry of Health in England and the Scottish Board of Health in Scotland have power to issue orders for the inspection of dairy cattle, the registration of dairies, and

other matters relating to dairies, cow-sheds, and milk-shops. The Milk and Dairies (Consolidation) Act, 1915, sect. 1, and the Milk and Dairies (Amendment) Act, 1922, set out the purposes for which, and the conditions under which, such orders may be issued. These acts also contain provisions designed to prevent the sale of tuberculous milk.

Special statutory provision as to dogs is made in the Dogs Act, 1906, and the regulations issued under that act. Persons contravening these regulations are guilty of an offence under the Diseases of Animals Acts, and the inspectors appointed under these acts have power to prosecute offenders against the Dogs Act, or orders issued in virtue of the powers given in that act.

**Contango.** See STOCK-EXCHANGE.

**Contarini**, the name of a noble family in Venice, one of the twelve that elected the first Doge. Between 1043 and 1674 eight Doges were furnished by this family, which also counted amongst its members four patriarchs, and a large number of generals, statesmen, artists, poets, and scholars (see VENICE).—CARDINAL GASPARO CONTARINI (1483–1542) distinguished himself as Venetian ambassador at the court of Charles V., and was papal legate at the Diet of Ratisbon (1541), where he displayed great moderation, seeking by concessions to bring about the reunion of the Protestants with the church.—SIMONE (1563–1633) was Venetian ambassador at several Italian courts, in Spain, in Constantinople, &c., and was a Latin poet.—LUDOVICO (1629–53) was ambassador in Paris.

**Conté**, NICOLAS JACQUES, French painter, chemist, and inventor, was born at Annon-sur-Orne, near Sées, 4th August 1755. Displaying precocious artistic ability, he early acquired a fair competency, mainly through his work as a portrait-painter. Turning thenceforth to scientific pursuits, he discovered a substitute for plumbago—war with England had cut off the supply—and in 1795 took out a patent for a form of lead-pencil which still bears his name. His experiments in military ballooning led to his appointment in 1796 to the command of all the aerostatic establishments of France. As head of the Conservatoire des Arts et Métiers, he was a pioneer in technical education. In 1798 he devised a barometer similar to the later one of Vidi. During Napoleon's Egyptian expedition his services were of the utmost value, not only as chief of the aerostatic corps, but in making good grievous losses in matériel; in a country almost uncivilised he contrived machinery of every kind, and so provided the army with bread, cloth, arms, munitions, engineering tools, operating instruments, &c. One of the first members of the Legion of Honour, he died at Paris, 6th December 1805.

**Contemporaneity**, in Geology, has a somewhat more extended signification than the word bears in ordinary language. When a geologist speaks of the Silurian systems of America and Europe having been accumulated contemporaneously, he does not infer that they were precisely synchronous, but merely implies that each occupies the same relative position in the succession of systems. Each was preceded by a Cambrian and succeeded by a Devonian system; but for aught he can tell, the Silurian period may have commenced earlier or endured longer in one area than the other. Huxley suggested the term *homotaxis* ('similarity of order') as a substitute for contemporaneity. According to this view we should apply the term *homotaxial* instead of *contemporaneous* to widely separated systems which contain the same assemblages of fossils—all that the proposed term indicates being this, that the order of organic succession was the same in both regions. All the evidence, however, goes to show that in the earlier

ages of the world the climate of the earth was not differentiated into zones as it is now, so that faunas and floras were enabled to extend themselves readily in every direction. Hence, although it is impossible to say that any particular bed of palaeozoic or mesozoic limestone in Europe is of precisely the same age as a similar limestone in America, yet it seems in the highest degree probable that the great system to which both these limestones happen to belong was accumulated during one and the same long-continued period. Geologists seem to be justified, therefore, in describing the successive systems of the Old and New Worlds as actually contemporaneous.

**Contempt of Court**, a disregard of the rules or an offence against the dignity of a court which has power to punish for such offence. Contempts, according to the law of England, may be classed as (1) disobedience to the King's writ; (2) contempts in the face of the court, as when a witness refuses to be sworn or prevaricates in his evidence, or where jurymen refuse to give a verdict; (3) contemptuous words or writings concerning a court; (4) refusing to comply with the rules and awards of a court; (5) abuse of the process of a court; and (6) forgery of writs, or any deceit tending to impose on a court. Any act which insults or resists the power of a court or the persons of the presiding judges, or which plainly tends to create a disregard of judicial authority, may be a contempt, as unseemly behaviour, applauding, talking boisterously and obstreperously while the business of a court is proceeding, intimidating a suitor to discontinue his action, kidnapping or corrupting witnesses or jurors, obstructing officers of court and the like. Contempt is occasionally punished by fine (e.g. of £500 during the Parnell Commission), but oftener by commitment to prison for an indefinite period. Similar powers are exercised by judges in Scotland, where contempts may be punished arbitrarily by censure, fine, or imprisonment, either by the court of its own instance or under a summary complaint by the public prosecutor. In the United States also the courts have power to fine and imprison all such contempt of their authority, every court being the exclusive judge of its own contempt, and having power to preserve its own dignity. Motions and affidavits for attachments in civil suits are on the civil side of the court, but as soon as the attachment issues the proceedings are on the criminal side. For Contempt of Parliament, see PARLIAMENT.

**Conti**, HOUSE OF, a younger branch of the Bourbon House of Condé (q.v.). Its founder and first prince was Armand de Bourbon Conti, brother of the great Condé. He was born at Paris in 1629, and took his title from the little town of Conti, near Amiens. Though feeble and deformed, and set aside for the church, he took with ardour to the career of arms, but after 1657 retired from the world, and died at Pézenas in 1666.—LOUIS ARMAND, eldest son of the preceding, was born in 1661. After a short but promising career in arms, he died childless in 1685.—FRANÇOIS LOUIS, Prince de la Roche-sur-You et de Conti, brother of the preceding, and the most remarkable of the family, was born at Paris in 1664. Educated under the eyes of the great Condé, he early conceived a passion for war, and already in his first campaign in Hungary covered himself with glory. Falling into disgrace with the court, he was banished to Chantilly, but pardoned by the intercession of Condé before his death. Subsequently Conti served under the Duc de Luxembourg, who was warmly attached to him, and took a brilliant part in the victories of Steinkirk and Neerwinden. In

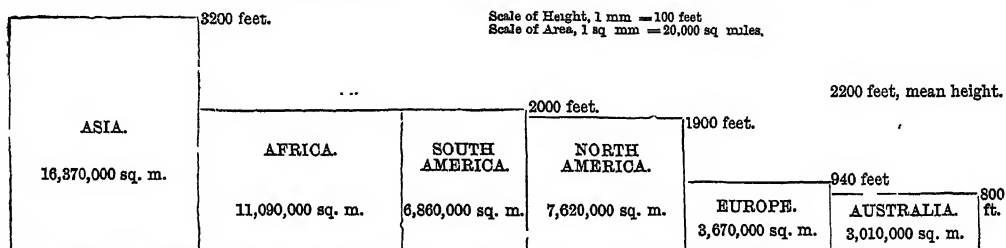

1697 he narrowly escaped being made king of Poland. On his return to France he was still coldly received by Louis, who, however, was at last forced by disaster to employ him. He received the command of the army of Flanders in 1709, but died on the 22d February of the same year. Saint-Simon, in his *Mémoires*, thus speaks of him: 'He was the delight of armies, the divinity of the people, the hero of officers, the darling of parliament, and the admiration of the most learned savants.'—The last member of the House of Conti was LOUIS FRANÇOIS JOSEPH, who was born 1734, and died at Barcelona, 1807.

**Contiguity, LAW OF.** See ASSOCIATION OF IDEAS.

**Continent.** This name, originally applied to a great division of the earth's surface holding together, or continuous, has latterly come to have a more precise scientific meaning. Six continents are recognised by geographers—Asia and Europe (which, strictly speaking, form but one continent, the division between the two being arbitrary and uncertain); the three great triangular peninsulas,

Africa, North America, South America; and the vast islands, Australia and Antarctica.

The earth's surface is divided by the 1000 fathom (6000 feet) line of ocean soundings into two equal parts, one a region of depression surrounding the south pole and stretching northward in three wide branches or ocean-basins, the other a region of elevation surrounding the north pole and stretching southward in three great arms crowned by the continents. All the land rising above sea-level forms collectively the *continental area*, and amounts to  $\frac{1}{4}$  of the earth's surface. Geological evidence shows the extreme probability that the continental and abysmal areas have never changed places, but are permanent features of the earth's surface. Continental rocks, granite, gneiss, schist, and their derivatives, differ entirely from those of oceanic islands. Detached portions of the continents, though now far from the mainland, may therefore be readily recognised (see ISLANDS). Wegener's theory of continental drifting has, however, gained many adherents. Around all continents the action of waves has carved out a ledge or terrace, the continental shelf, of variable width, on which the

Relative Areas and Average Heights of the Continents, according to Murray.

bottom slopes gently from the land to soundings of 100 fathoms, and then abruptly plunges to the oceanic depression (see SEA). The absolute elevation of continents or mountains above mean sea-level cannot easily be determined, on account of the permanent distortion of the sea surface by the attraction of the projecting mass of land. This heaping up of the sea has been calculated at 300 feet for the vicinity of the Himalayas at the Bay of Bengal, and 2000 feet for the Chilean Andes. Sir John Murray calculated the average height of continental land above sea-level as 2200 feet, and gave as probable estimates the mean heights represented in the diagram. But see also the table in the article ANTARCTICA. Particulars of each of these continents will be found under their respective names.

The continents occur in north and south pairs, united by a narrow isthmus or archipelago, or separated only by a shallow strait. They are directed south-south-eastward, tapering from the north, and frequently ending in a series of south-pointing peninsulas, which are often partially submerged so as to form archipelagoes of small islands on the eastern side. Each continent has an axis or backbone of high land, usually a plateau containing an area of internal drainage, and serving as a watershed for rivers flowing to all sides. This high land is situated towards the south, and runs east and west on the whole in Eurasia, giving the north-flowing rivers long slopes, and the south-flowing streams a short and rapid run. Africa is a transition type, the watershed being on the whole nearer the east; Australia, more extreme, has the main watershed lying close to the east coast. In the two Americas there is a high western mountain-ridge or plateau running from north-west to south-east, and a low range on the eastern coast, leaving great central low plains watered by large rivers.

The interior of a continent has usually a very low rainfall (see DESERT), and is subject to great extremes of temperature between summer and winter, and between day and night; hence the term continental climate. Land and sea breezes and the Monsoons (q.v.) of tropical coasts result from this circumstance.

**Continental System**, the name given to Napoleon's plan for shutting England out from all connection with the continent of Europe. This system began with Napoleon's famous 'Berlin Decree' of November 21, 1806, which declared the British Islands in a state of blockade, and prohibited all commerce and correspondence with them; all merchandise belonging to an Englishman became a lawful prize, and all trade in English goods entirely prohibited. No ship coming direct from Britain or from a British colony was allowed to enter any port.

Britain was not long in making reprisals. By an 'Order in Council,' issued January 7, 1807, all neutral vessels were prohibited from entering any port belonging to France or her allies, or under her control. Every neutral vessel violating this order was to be confiscated with its cargo. Still more oppressive for neutral commerce was a second order in council of November 11, 1807, by which all harbours and places of France and her allies in Europe and the colonies, as well as of every country with which England was at war, and from which the English flag was excluded, were placed under the same restrictions as if strictly blockaded. These orders were followed by new French measures. By the Milan Decree of December 17, 1807, strengthened by a second of January 11, 1808, from the Tuileries, any vessel, of whatever nation, that had been searched by an English ship, had submitted to be sent on a voyage to England, or paid any duty to the English government, was to be declared *denationalised*, and treated as English.

Most of the countries of Europe were coerced by Napoleon into joining the continental system. The great war of 1812 against Russia was largely owing to her refusal to adhere to it any longer. It was a violent interruption of human intercourse, which could not last long, and could only serve to strengthen the hatred of Europe against French tyranny. Accordingly, with the breaking up of Napoleon's power, the continental system fell to the ground. The policy of England in connection with the continental system can be justified only on the ground that it was necessary to avert a supreme national danger. It was not without its mischievous results, for the measures adopted in regard to neutral commerce led to the American war of 1812.

**Contorted Strata** are beds which are highly folded, plicated, and twisted—the folds being extremely irregular, and giving rise to rapid changes in the direction and angle of inclination. Contorted strata are frequently crumpled and puckered—the fossils and pebbles which they may chance to contain being compressed, flattened, and distorted—facts which show that the beds have been subjected to great crushing and squeezing.

**Contour.** When, on a map of any district or country, a line is drawn through points on the earth's surface which are all at the same height above mean sea-level, the curve so obtained is termed a *contour-line*. For equidifferent altitudes a series of such lines may be drawn. It is obvious that they may be ideally laid down by projecting orthographically on the map the sections of the earth's surface made by a series of horizontal planes at equal distances apart; or (what is the same thing) were the sea-level to rise 100 feet, then to 200 feet, and so on, above its normal level, the sea-margins made at each successive rise would be the contour lines of the district for 100 feet, 200 feet, &c. These lines, which are drawn on British Ordnance Survey maps for intervals of usually 50 feet, however they may vary in form in different cases, have certain common properties which render them of assistance to the surveyor, engineer, and geographer. Suppose, for example, the case of a hemispherical hill be taken (see fig.), and that the contours (which are, in this case, concentric circles) are drawn for each 100 feet of altitude. It will be noticed that where the shortest distance between two successive contours is least, there the hill is steepest; for, in ascending the hill at that part, a given length inwards horizontally is accompanied by the greatest vertical ascent. In other words, the steepness of slope or gradient at any point in any given direction is inversely as the distance between the contours at that point in the given direction. The line of steepest slope at any point is therefore the shortest line which can be drawn to the next contour which it cuts at right angles. This is the course which would be taken by water running down the hillside, and hence is termed a *stream-line*. Thus in any given system of contour-lines the corresponding system of stream-lines can be obtained by drawing a system of orthogonal curves.

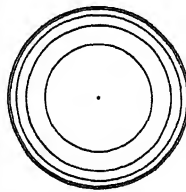

The method of contours has found many applications in science besides the one already detailed. Especially in meteorology has it been of service; here isothermals and isobars drawn on a map are simply lines drawn through points having the same temperature and barometric pressure respectively; the corresponding stream-lines being lines of flow of heat or of atmospheric pressure. Similarly,

lines of equal magnetic dip, variation, and intensity are examples of applications in terrestrial magnetism.

The method is also applicable to other dimensions in space than those we have dealt with. The contours of a curve are points; of a surface (exemplified above), curves; while those of a solid are surfaces. From the examples given it may be seen that a contour is a point, line, or surface at, along, or on which some physical property or characteristic is constant. Generally the advantage of the method is that by its means the mutual variations of three quantities may be represented by lines in two dimensions.

**Contraband of War** is the term applied to neutral property on board ship on the high seas, or in the territorial waters of a belligerent state, which is by nature capable of being used to assist in, and is on its way to assist in, the naval or military operations of the enemy. A neutral state is under no obligation to prevent its subjects from trading in contraband of war. It lies with the belligerent state, if it has the requisite naval power at its disposal, to prevent neutral vessels from transporting to the enemy such articles or commodities as may be of use to the latter for carrying on the war. Under international law the belligerent has a right to seize the prohibited goods, and, in exercise of this right, a belligerent cruiser is entitled to stop and search any neutral merchantman she may meet on the high seas or within her own or her enemy's territorial waters. Such visit and search were formerly called out at sea, but during the Great War, owing to the magnitude and variety of the cargo carried by modern vessels, the ease with which contraband could be concealed, and the danger from enemy submarines, it was the practice, when search at sea was impossible, to divert the ship into the nearest port of the belligerent and carry out the search there. Where the search of the vessel is made at sea, and the search discloses grounds of suspicion, the belligerent commander may take possession of the vessel, secure her papers, and send her by means of a prize crew to the most accessible port of his own, or an allied, state for adjudication by a prize court of his own state. Not only are the contraband goods liable to condemnation, but the vessel carrying contraband may be condemned if the contraband, reckoned either by value, weight, volume or freight, forms more than half the cargo. Property in neutral goods or vessels which are seized by a belligerent remains in the neutral until judgment of confiscation has been pronounced by a competent tribunal after due investigation. The tribunals set up by the Admiralty of maritime belligerents for the purpose of deciding upon the validity of the captures made by their cruisers are called Prize Courts.

The range of articles included within the category of contraband has never been definitely settled. A distinction was long recognised between 'absolute' contraband, consisting of articles, such as arms and ammunition, which are either solely of use in war or are particularly adapted for purposes of war, and 'conditional' contraband, consisting of articles, such as food-stuffs and clothing, which are capable of being used for the purposes either of war or of peace. The Declaration of London (1909), articles 22 and 24, set out lists of absolute and of conditional contraband, and on 4th August 1914, at the beginning of the Great War, Great Britain issued a proclamation containing lists of absolute and conditional contraband which were identical with those in articles 22 and 24 of the Declaration of London, except that aircraft were transferred from the conditional to the absolute list. The circumstances of the war, however, very soon

demonstrated the inadequacy of these lists, and fresh lists were issued from time to time. In the final British list, which was formulated in a royal proclamation dated 2d July 1917, and which amended and consolidated the earlier lists, the articles to be treated as absolute contraband and the articles to be treated as conditional contraband continued to be set out separately; but, in actual practice, during the later period of the war no distinction was made between absolute contraband and conditional contraband. The grounds upon which the British government proceeded were stated in an official memorandum, issued by the Foreign Office on 13th April 1916, as follows: 'The circumstances of the present war are so peculiar that his Majesty's government consider that for practical purposes the distinction between the two classes of contraband has ceased to have any value. So large a proportion of the inhabitants of the enemy country are taking part, directly or indirectly, in the war that no real distinction can now be drawn between the armed forces and the civilian population. Similarly, the enemy government has taken control, by a series of decrees and orders, of practically all the articles in the list of conditional contraband, so that they are now available for government use. So long as these exceptional conditions continue, our belligerent rights with respect to the two kinds of contraband are the same, and our treatment of them must be identical.' See J. A. Hall, *The Law of Naval Warfare* (2d ed. 1921).

**Contra-bass.** See DOUBLE BASS.

**Contract**, the voluntary agreement of two or more persons, by which something is to be given or done upon one side, for a valuable consideration, either present or future, upon the other. English lawyers usually adject to this definition the qualification that the agreement is enforceable by law, an agreement not enforceable by law being regarded as void. Every contract requires a consideration, a *quid pro quo*, but as a general rule any consideration, adequate or inadequate, will be sufficient. For the making of a contract there must be a communication between the parties of their intention—i.e., in one shape or another, there must be offer and acceptance of distinct terms. An offer or proposal can be revoked at any time before it is accepted; and in strict law, silence does not give consent. When silence is taken to constitute acceptance, it must be silence under such circumstances as to amount to acquiescence. An acceptance must be unqualified, otherwise there is no contract. As the validity of a contract rests upon the consent of parties, persons legally incapable of giving consent cannot be parties to a contract. Contracts made by a person under the age of twenty-one are as a general rule voidable, unless they have been made for his benefit, or, as in England, for his 'necessaries.' And persons in a state of absolute drunkenness cannot contract, although a lesser degree of intoxication may be compatible with legal consent. Similarly, contracts made by a lunatic are voidable when it can be shown that his state was known to the other contracting party. Further, the consent given must be genuine, and a contract will be void if there is mistake or error in either of the parties with regard to any essential particular. Thus, if A sell to B a bar of brass in the belief that it is a bar of gold, and B buy in the same belief, the contract is bad by error. Misrepresentation, or innocent misstatement of fact, and fraud, or wilful misstatement of fact, will also vitiate a contract, as will force and fear or undue influence exercised to compel the consent of either of the parties. A contract may also be void by impossibility—e.g. when the thing

agreed to be done is naturally impossible, as in the case of a pianoforte player who is prevented from performing his agreement by dangerous illness; or impossible by construction of law, as when a change in the law of the country supervenes upon and contradicts a private agreement. Besides these, the law refuses to recognise contracts to perform any illegal act, as to burn a house or steal a horse; and such an agreement may be in itself a crime, as conspiracy. Contracts against good morals, as, e.g., an agreement to pay the price of prostitution, are denied legal recognition and enforcement, as also are agreements against the public policy of the country where they are made. Examples are agreements in fraud of the revenue, as in smuggling transactions; or contracts in restraint of marriage, which are held to be against public policy as tending to decrease the population. Thus a contract not to marry is void.

Contracts are variously classified. The law of Scotland adopts the old division of the civil law into Nominate Contracts and Innominate Contracts. The nominate contracts are loan, commodate, deposit, pledge, sale, permutation, location, society or partnership, and mandate. The law of England distinguishes between Contracts of Record and Contracts under Seal—both of which are formal, or dependent for their validity upon their form—and simple contracts, which depend for their validity upon the presence of consideration. Contracts of record are the judgments of a court; recognisances, as contracts made with the crown in its judicial capacity; and the obsolete acknowledgments of debt known as Statutes Merchant and Staple. Deeds and bonds may be taken as examples of contract under seal. Of simple contracts, some require no specialities of form; others are by law required to be in writing, as, e.g., a bill of exchange or an assignment of copyright. Contracts are distinguished into express or implied accordingly as they are based upon formal statements in words, spoken or written, or upon matter of inference and deduction either from the conduct of the parties or from the provisions of law. They are also distinguishable into executed contracts, where the transaction is completed the moment the agreement is made, as where an article is paid for and delivered over the counter, and executory contracts, where some future act is to be done after the arrangement is completed, as where an agreement is made to build a house in six months. A contract of benevolence is one made for the benefit of only one of the contracting parties. See BREACH, DAMAGES, HUSBAND AND WIFE, SALE, WARRANTY.

The remedy for breach of contract is an action for a certain sum due by the defaulter or for damages, ascertained by a jury; but where the remedy of damages is inadequate or unsuitable, the courts may enforce a contract by decree for specific performance of the thing agreed to be done, or by injunction forbidding an act agreed not to be done.

**Contractility.** See MUSCLE.

**Contractions.** See ABBREVIATIONS, PALÆOGRAPHY.

**Contract Notes**, also called BOUGHT AND SOLD NOTES, or ADVICE NOTES, are notes of a purchase or sale signed by a broker, and delivered to his principals, by which the bargain through him is completed. They are used by all kinds of brokers, and the following is the form of a *stockbroker's* contract and note:

2 OLD BROAD STREET, LONDON, 20th December 19—.  
BOUGHT by order and on account of A. B., Esq. (subject to the rules and regulations of the London Stock Exchange),  
160 Anglo-Dutch Rubber Shares, at £2... £330 0 0  
Brokerage..... 1 12 0

C. D. & Co.,  
Members of the Stock Exchange, London.

£321 12 0

These notes are, in fact, transcripts from books in which it is the practice of brokers to enter or register their transactions. The bought notes and the sold notes are respectively delivered to the principal parties; and as they contain the essential parts of the bargain, they will suffice as evidence, in the absence of a corresponding entry in the broker's books; but if they describe the particulars differently or incorrectly, as one species of goods for another, or erroneously state the terms, no contract arises, and a variation of this nature cannot be corrected by a reference to the broker's book.

Contract notes are compulsory when the value of the stock or security is £5 or upwards; they require an *ad valorem* stamp. See **BROKER, SALE**.

**Contrafagotto** (Ital.), or **DOUBLE BASSOON**. a Bassoon (q.v.) an octave lower than the ordinary bassoon.

**Contralto** is the deepest or lowest species of musical voice in boys, in eunuchs, and best of all in women, where its beauty of tone gives it the preference. This quality of the human voice was too much neglected by the French and German composers and singing-masters. Rossini and the Italians have, on the other hand, abundantly utilised its capabilities, and it is now one of the normal parts in the choral music of all nations. The powers of expression which it possesses are quite peculiar, and cannot be supplied by any other kind of voice. Its tone-character (timbre) is serious, spiritual, tender, and romantic. The low contralto in particular has a fullness of tone combined with power in the lower range. The high contralto has generally the same range of compass as the mezzo-soprano, but differs from it in the position of the cantabile and in its character of tone. Contralto voices generally consist of two registers, the lowest beginning at F or G below middle C, and reaching as high as the A or B above it. The higher notes up to the next F or G partake more of the character of the soprano. See **VOICE**.

**Contract Social** ('Social Contract') is the name of a famous work (1762) by J. J. Rousseau, and of the theory maintained in it that government is based on the consent, direct or implied, of the governed. See **ROUSSEAU, SOPHISTS**.

**Contravallation**, **LINES OF**, form a chain of works round a besieged place to resist the sorties of the garrison. See **BLOCKADE, CIRCUMVALLATION, and SIEGE**.

**Contrayerva**, a medicine once in much repute against low fevers, and as a mild stimulant and diaphoretic, also as efficacious against snake-bites, whence the Spanish name, consists of the root-stocks (rhizomes) of different species of *Dorstenia*, a tropical American genus of the natural order Moraceæ. The genus is remarkable for the plane receptacle in which the numerous small flowers are depressed, the female flowers more deeply so. In Jamaica the name is given to a birth-wort (*Aristolochia odoratissima*) of similar reputation; and the other is there distinguished as Spanish contrayerva.

**Control Department**. See **COMMISSARIAT**.

**Convalescent Hospitals** are institutions of the greatest importance. Many patients die on returning to their own unhealthy homes from our ordinary hospitals; the convalescent home or hospital supplies a valuable stage in the process of cure. Either a series of detached cottages or one large and well-appointed house may serve to secure pure air and wholesome treatment. Of the latter kind, one of the first and best models was the magnificent establishment at Vincennes, founded in 1857.

**Convallaria**. See **LILY OF THE VALLEY**.

**Convection**. See **HEAT**.

**Convent**. See **MONACHISM**.

**Conventicle** (Lat. *conventiculum*, a diminutive of *conventus*) originally meant a cabal among the monks of a monastery. The word was given as an appellation of reproach to meetings of the English and Scottish Nonconformists in the 17th century. Severe statutes were often passed for the suppression of these conventicles, especially the Conventicle Act of 1664, which was repealed by the Toleration Act of 1689.

**Convention**, in Diplomacy, is a kind of treaty (especially military) of a temporary kind.

In Politics, it is a branch of the royal prerogative of Britain that no parliament shall be convened by its own authority, or by any other authority than that of the sovereign. Where the crown is in abeyance, this prerogative cannot of course be exercised, and the expedient of Convention Parliaments has been resorted to, the enactments of which shall afterwards be ratified by a parliament summoned in accordance with the provisions of the constitution. The convention parliament which restored Charles II. to the throne met five weeks before his return, and was afterwards declared to be a good parliament, notwithstanding the absence of the king's writs. In like manner, at the Revolution of 1688, the Lords and Commons, on the summons of the Prince of Orange, met in convention, and disposed of the crown and kingdom, and this convention was subsequently declared to be really the two Houses of Parliament, notwithstanding the want of writs and other defects of form. Under the name of Convention there also took place a meeting of the Estates of Scotland, called by the Prince of Orange on the same occasion. The word convention was frequently used in the United States during the struggles with the British authorities which preceded the revolutionary war. For the French National Convention, see **FRANCE**; for the Geneva Convention of 1864, see **GENEVA, PEACE**; for the Bern Convention, see **COPYRIGHT**; for the Convention of Royal Burghs, see **BOROUGH**.

**Conversano**, a town of south Italy, 18 miles SE. of Bari, with a fine cathedral; pop. 15,000.

**Conversion**, a conscious change of heart prompting a repentant sinner to a new life, and a part of regeneration. Popularly the name means the sensible experience of this, and obviously there will be as much variety in its intensity and immediateness in individual cases as there was in their temperaments and antecedent spiritual conditions. The man who really knows something of the human heart will no more sneer at the grotesque expression of his experience from the lips of an awakened collier than he will smile at its intensity in the pages of a St Augustine or a Bunyan.—The word is applied also to a change of religion or of creed, as that of John Henry Newman from the Anglican to the Roman Catholic Church. By those who disapprove the change, such a conversion is called *perversion*.

**CONVERSION**, in Logic, signifies that one proposition is formed from another by interchanging the subject and predicate. Thus, 'No A is B' has for its converse, by simple conversion, 'No B is A.' For the rules of conversion, see any handbook of formal logic.

**Conveyancing**. A conveyance may be defined as the form prescribed by law or custom for transferring property from one person to another. In the earliest stage of society, before written titles and contracts were in use, property was transferred by symbolical acts, performed in the presence of witnesses. Thus, in Ruth, iv. 7, a person surrendering his rights binds himself by plucking off his

shoe and giving it to his neighbour; 'and this was a testimony in Israel.' Among the ancient Goths and Swedes, the conveyance of land was made in the presence of witnesses, who extended the cloak of the buyer, while the seller threw into it a clod of land. Similar to these symbolic forms are the old English and Scottish modes of conveyance by solemn delivery of seisin, sasine, or possession. Goods have always been transferred with less ceremony than land; but the customs of ancient markets provided in certain cases for delivery in presence of witnesses, that frauds and disputes might be avoided.

Written forms of conveyance are almost as old as the art of writing. An early example is given in Jer. xxxii. 9-12, where the prophet describes his purchase of the field of Hanameel, and the book or written evidence of the purchase subscribed by the parties and their witnesses. The Romans carried the art of conveyancing to high perfection. They had public registers in which formal documents might be recorded; and the same legal forms were used by notaries and lawyers throughout the empire. The Roman law favoured freedom of alienation, and applied the same principles to movable and immovable property. When the barbarians broke into the empire, they brought their primitive customs with them; and Sir H. Maine has shown that barbarian custom and Roman law combined to form the feudal system. The great aim of feudalism was fixity of tenure; but the churchmen, who were also the lawyers and conveyancers of the period, were led by their own interest, and also by their superior education, to favour free alienation, both *inter vivos* and by will.

In England and in Scotland feudal ideas so far prevailed, that for some centuries the owner of land was hampered in dealing with it by the incidents of his tenure. He was liable for military or other service, and his land was subject to many incidental claims of a vexatious nature (see COPYHOLD, ESCHEAT, FEUDALISM, FINE, FREEHOLD). The church lawyers were driven to devise a whole system of conveyancing, the object of which was to enable corporations and private persons to evade the strict rules of the common law. Political insecurity led to the invention of other forms of secret conveyance. In England by the end of the 17th century the art of conveyancing had become a complicated mystery, and all dealings with land, in the way of commerce or of family settlement, were attended with expense and difficulty. Modern conveyancing has been rendered more simple and reasonable, and, on the whole, less expensive, by a series of reforms extending from the acts prepared on the advice of the Real Property Commissioners in 1832-33 to the Conveyancing Act, 1881, and the Settled Land Act, 1882.

In Britain it is not necessary to employ a professional person to prepare a conveyance; but the risk run by those who trust to a deed or will drawn by an unskilled person is considerable. Conveyancing is part of the ordinary work of solicitors, and in Scotland of writers to the Signet. In England many members of the bar devote themselves entirely to conveyancing; and there is also a special class of practitioners known as conveyancers who are members of the Inns of Court, but not called to the bar. Like solicitors, conveyancers are required to take out an annual certificate. In some of the large cities in the United States, companies have been formed to undertake conveyancing, and to guarantee titles to real estate. In learning and practising his art, the conveyancer is much assisted by collections of precedents, which contain the styles and forms which have been found most safe and useful. By turning over any of the books of precedents now in use, even the

ordinary reader may obtain some notion of the variety and the importance of modern conveyancers' work. In the United States the laws of conveyancing are not uniform; but in general the essentials of a conveyance of land are that it shall be in writing, signed and sealed by the grantors, acknowledged before the officer appointed by law, and delivered and recorded in the office appointed. In most states conveyancing is done by members of the bar, but elsewhere by conveyancers not practising in court. See DEED.

**Convict.** See PRISONS, CRIMINAL LAW.

**Convocations** (from Lat. *convocare*, to 'call together') were originally provincial synods of the clergy or the ancient ecclesiastical councils of the archbishop, but became incorporated into the English constitution of church and state, and endowed with certain parliamentary privileges. Some writers distinguish between councils and convocations—the former as being for spiritual purposes, and summoned without authority from the crown; the latter as being for civil purposes, and by command of the crown. This distinction, however, has no foundation in fact, the truth being that the same assemblies discharged ecclesiastical functions, such as the enactment of canons, and civil functions, as the voting of subsidies to the crown, since the clergy were not subject to taxation save that levied by themselves in their provincial synods. The circumstances attending the famous assembly at Northampton in 1282, in the reign of Edward I., helped to settle the form which convocations have since assumed. In England the provinces of Canterbury and York have each their convocation. Previous to the Reformation these were sometimes convened into a National Synod; but since then, matters have usually been concluded in the convocation of Canterbury, and transmitted to York for concurrence.

A convocation consists of three elements—(1) the archbishop; (2) the suffragan bishops of the province; (3) the clergy of the second order. They originally met in one assembly, but since the beginning of the 14th century the clergy in the province of Canterbury have retired into a distinct chamber, presided over by a prolocutor, with officers and journals of their own. These two bodies are called the Upper and Lower Houses. In the Convocation of York the same distinction exists, but on the occasions of their meeting, the business has been generally conducted in one assembly. The archbishop has the sole power of summoning, presiding, and proroguing; he has also a veto upon all measures. He cannot, however, summon without authority from the crown. The Upper House is the proper *locus synodi*, where the bishops have a right to sit and vote, and before the Reformation the mitred abbots had place there also. The Lower House consists of the lesser dignitaries, as deans and archdeacons, and the proctors sent by capitular bodies and by the parochial clergy. In Canterbury the beneficed clergy send two proctors for each diocese; in York the clergy send two proctors for each archdeaconry, except Sodor and Man, which sends one. The Lower House deliberates on matters proposed by the archbishop; it may present petitions to the Upper House and state grievances, be with it in judicature on persons convened, and dissent from and so hinder the passing of any synodical act. Till 1534 the provincial synods or convocations could enact canons at pleasure, but in that year was enacted the statute 25 Henry VIII., chap. 19, making a license from the crown necessary before any new canons could be framed or published.

The passing of subsidies in convocation ceased in 1665, and the records were destroyed in the fire of London in the following year. Meetings of convo-

cation fell into abeyance in 1717, being indefinitely prorogued as a punishment for the synodical condemnation of a book by Bishop Hoadly, who was high in favour with the government. They have been revived (in 1852 for the province of Canterbury, in 1856 for York) with considerable advantage to the church, but their action has been and is greatly restricted. In Ireland the convocations of the four provinces assembled at Dublin, all together, and were on the model of those in England. From the Union downwards, the Irish convocations never assembled. Since the disestablishment the legislative assembly of the Protestant Episcopal Church is called the General Synod. An act of parliament in 1663 regulated the meetings of convocation in Scotland; but shortly after the Revolution of 1688, the Episcopal Church ceased to be the national establishment; and ever since the meetings of the Presbyterian Church, embracing clergy and laity, have been called General Assemblies. See ASSEMBLY (GENERAL), COUNCIL.

The position of the Church of England as respects its convocations was till 1919 exceedingly anomalous, but incidental to certain circumstances in the constitution and polity of the country. As practically interwoven with the state, the church possessed little independent action, its articles, liturgy, organisation as to benefices, &c. being all affected by civil statutes, its discipline falling within the scope of the ecclesiastical courts, a class of tribunals apart from the ministering clergy. The church, therefore, in its capacity as an institution to teach certain doctrines of religion, was left little to do in the way of jurisdiction. It was further urged, as a reason for restricting the power of convocation, that, being purely sacerdotal, it might be apt to run into excesses, and put forth claims adverse to the prevailing tone of sentiment on religious matters. A desire for a fuller expression of spiritual independence was met by the Enabling Act of 1919, by which a National Assembly was set up with defined legislative powers, subject to the veto of parliament. The National Assembly consists of the houses of bishops and of clergy (the two convocations) and a house of laymen (men and women)

elected by the lay members of the diocesan conferences. Two voluntary houses of laymen (one for each province) had already, since 1905, formed with the two convocations a Representative Church Council. The convocations of Canterbury and York assemble annually at the opening of parliament.

**Convolvulus** (Lat. *convolvère*, 'to twine together'), a genus of

Convolvulus (*Calystegia sepium*).

plants, the type of the order Convolvulaceæ. This order contains about a thousand known species, herbaceous and shrubby; generally with a twining stem and milky juice, chiefly tropical. Many are cultivated as ornamental plants, particularly species of Convolvulus and Ipomœa.

The acrid milky juice is often strongly purgative; and jalap and scammony are products of this order. Some species, however, have large, farinaceous roots, capable of being used as food, of which the Batatas or Sweet Potato (q.v.) is the most important. A few are natives of Britain, and are known by the name of Bindweed. A common name in the United States is Morning Glory. *C. arvensis* is a troublesome weed in some sandy soils in England, and *Calystegia sepium* in richer soils. The wood of *C. scoparius*, a shrubby species, native of the Canary Isles, called 'Rosewood,' or *Legnum Rhodii* by apothecaries, has so strong a smell of roses that the essential oil it yields on distillation is employed to adulterate the attar of roses.

**Convoy** (Fr. *convoi*) is the name given to one or more ships of war appointed to protect a fleet of merchant-vessels against the attacks of an enemy or of pirates. If a merchant-ship parts company with the convoy, or neglects to obey the convoy's instructions or signals, all claims of insurance are forfeited. The name is sometimes applied to the merchant-vessels so escorted. In the military service a convoy is a train of wagons or canal boats laden with provisions, treasure, or warlike stores, and escorted by a detachment of troops.

**Convulsion**, in Medicine, is sometimes used of any involuntary contraction of the voluntary muscles of the body; but especially of seizures in which the body is thrown into violent spasmodic contractions, the sensibility and voluntary motion being for a time suspended. In adults convulsions almost always indicate the presence of grave disease, either of the brain (particularly Epilepsy, q.v.) or of the kidneys. In children, especially before the age of three years, they are of much more common occurrence, and, though serious in themselves, may be due to temporary and comparatively trifling causes. The following description applies chiefly to the convulsions of children. A fit of convulsions may last from a few minutes to some hours, and may readily prove fatal, if not relieved within a short period. The first symptom observed is often a twitching of particular muscles or groups of muscles, and a change in the habitual expression or colour of the face, with rigidity of the limbs, and turning of the globes of the eyes suddenly upwards. The fingers are sometimes clenched in the palm, and the feet turned inwards; sometimes, however, convulsions occur absolutely without warnings of this kind, and even in the midst of perfect apparent health. Their cause is usually to be found in some source of irritation, especially in the digestive organs; as, for instance, disordered dentition, worms in the intestine, indigestible or unsuitable food, &c. Most epidemic fevers are also apt to be attended, in children, by convulsions in their early stages, and if severe, particularly in the case of whooping-cough, during their progress as well; and diseases of the brain and its membranes at every stage. Convulsions are greatly promoted by bad ventilation and injudicious feeding, with deficient exercise; and a great part of the cure consists in discovering and removing the causes of the disease.

When a child is suddenly seized with a tendency to spasm, such as twitching of the features, or contractions of the fingers and toes, it should be placed at once in a very free current of air, with its feet towards the fire; the extremities should be kept warm, and a cold lotion may be applied to the head, especially if there is much flushing of the face; a little castor-oil may be given unless the bowels are loose; and if there is flatulence, the belly may be rubbed with a warm hand, or with some simple stimulating liniment, such as camphorated oil. If an actual convulsion occur, the feet, or if

possible the whole body, should at once be put in hot water to which a little mustard has been added, and cloths wrung out of cold water frequently applied to the head. If there is any suspicion that worms or undigested food may be the cause, a purgative Clyster (q.v.) should be given; and aperient medicine by the mouth as well, if the child be able to swallow. Nothing more should be attempted without medical advice. The further treatment generally consists in the administration of nerve sedatives, especially bromide of sodium or potassium and chloral, and in obstinate cases chloroform, with careful attention of course to any cause of irritation that may be present.

Convulsions are rare amongst horses and cattle. In young dogs, however, they frequently occur from intestinal worms, disordered digestion, or in connection with distemper or other debilitating diseases: they usually disappear when their special causes are removed.

**Convulsionaries**, the name given to a fanatical sect of Jansenists who sprang up in France about 1730. Their meeting-place was the churchyard of St Médard, in a suburb of Paris, where was the tomb of a certain Francis of Paris, who died in 1727, and was reckoned very holy by the Jansenists on account of his extravagant asceticism. At this tomb a multitude of people poured forth fanatical prayers, preachments, and prophesying. Miracles are also alleged to have been performed, for proof of which we are referred to a work written by M. Montgeron, a French senator, and entitled *La Vérité des Miracles opérés par l'Intercession de François de Paris* (Paris, 1737). After 1731 the fanaticism of the convulsionaries increased to utter madness. 'They threw themselves into the most violent contortions of body, rolled about on the ground, imitated birds, beasts, and fishes, and at last, when they had completely spent themselves, went off in a swoon.' In 1733 the king issued an order for the imprisonment of these fanatics, but it was found impossible to put a complete stop to the mischief. They took to predicting the downfall of the throne and the church, which prophecy the French Revolution appeared to fulfil. They were not much heard of in Paris after the middle of the eighteenth century, but occurred in country-places at various times within the nineteenth century. They brought Jansenism into so much disrepute, that Voltaire declared the tomb of Francis to be the grave of Jansenism. See Mathieu, *Histoire des Miraculés et des Convulsionnaires* (1864).

**Conway**, a river in North Wales, famous for the bold romantic scenery along its higher, as well as for the richly beautiful scenery along its lower course. It rises in a small mountain-lake round which meet the three counties of Merioneth, Denbigh, and Carnarvon; and it runs 30 miles northward past Llanrwst and Conway to Beaumaris Bay. In its last ten miles, a smoothly-flowing if winding stream, it is navigable for vessels of 100 tons. At Conway it is half a mile broad at spring-tides, which rise here from 21 to 24 feet. Pearl-mussels are found at its mouth.

**Conway**, or ABERCONWAY, an ancient and picturesque little seaport town of North Wales, in Carnarvonshire, situated on the left bank of the river Conway at its estuary, 45½ miles NW. of Chester by rail. The river is crossed by a fine tubular bridge constructed by Stephenson in 1848, as well as by a suspension bridge built by Telford in 1826 (see BRIDGE). The town is triangular in form, and is surrounded by a high wall 12 feet thick and 1 mile in circumference, pierced by four Moorish-looking gates, and crowned by twenty-one round towers. In its south-eastern corner are the magni-

ficent remains of Conway Castle, rising proudly from a rock above the river. It was first built by Hugh Lupus, Earl of Chester, and rebuilt in 1284 by Edward I., to check the Welsh. Its walls are 12 to 15 feet thick, with eight vast towers, four of which are each surmounted by a slender turret. The Plas Mawr ('great mansion'), a noble timber house erected in 1585, profusely covered with ornament, is occupied by the Royal Cambrian Academy of Art. A Cistercian abbey was founded here by Llywelyn ab Iorwerth, prince of North Wales, in which Llywelyn the Great was buried. Population, 6500. Conway (a chartered borough since 1876) is one of the Carnarvon boroughs. It is still visited by vast numbers of tourists, but as a place of resort it has been left far behind by Llandudno, 4 miles to the north.

**Conway**, HUGH, the pseudonym of Frederick John Fergus, who was born in 1847, the son of a Bristol auctioneer. He adopted that pseudonym from the school frigate *Conway*, stationed on the Mersey, which he entered when he was thirteen for the purpose of training for a seafaring life. His father set his face against this, so young Fergus entered the auctioneer business, employing his leisure in writing clever newspaper verse and occasional tales. Some songs of his were accepted and published in 1878, a volume of verse in 1879; but it was the issue and rapid sale of his melodramatic story, *Called Back*, as vol. i. of Arrow-smith's Bristol Library (1884), which made him famous. Within five years 350,000 copies of this book had been sold. Fergus sold his share in the auctioneer's business in Bristol, and went to London, where he adopted the profession of authorship. His *Dark Days* followed, and just as in *A Family Affair*, and other works which he now produced in rapid succession, he had begun to show higher capabilities as a novelist, he died of malarial fever at Monte Carlo, 15th May 1885.

**Conway**, MONCURE DANIEL (1832-1907), free-thinking author, born in Stafford county in Virginia, entered the Methodist ministry in 1850, but, after a course at Cambridge (U.S.), settled as a Unitarian preacher at Washington in 1854, and at Cincinnati in 1857. He was a strong opponent of slavery, and in 1863 came to England to lecture on the war. In London he became head of the South Place Institute (for advanced religious thought). He published *The Rejected Stone* (1861), *The Golden Hour* (1862), *Republican Superstitions* (1872), *Idols and Ideals* (1877), *Demonology and Devil-lore* (1879), *Thomas Carlyle* (1881), *Pine and Palm* (1887), *A Life of Paine* (1892), whose works he edited (2 vols. 1892), and an *Autobiography* (1904).

**Conway**, SIR WILLIAM MARTIN, born at Rochester in 1856, was professor of Art at Liverpool (1885-88), and Cambridge (1901-4), wrote on the Dutch wood-engravers, Reynolds and Gainsborough, Flemish painters, Dürer, on his own noteworthy exploring and mountaineering expeditions, and contributed the article on Art to this work. He became M.P. for the English Universities in 1918.

**Cony**. See HYRAX, RABBIT.

**Conybeare**, WILLIAM JOHN, joint-author with Dean Howson of *The Life and Epistles of St Paul* (1851), was born 1st August 1815, son of the dean of Llandaff, and was educated at Westminster and Trinity College, Cambridge. His post as principal of the Liverpool Collegiate Institution (from 1842) ill-health compelled him to exchange for the vicarage of Axminster. He died at Weybridge in 1857. *Essays, Ecclesiastical and Social* (1856), and a novel, were his only other works.

**Conyza**, an unimportant genus of Compositæ (sub-order Tubulifloræ). *C. squarrosa* is known

as Fleabane and Ploughman's Spikenard, and has a strong peculiar smell, traditionally said to drive away fleas and gnats.

### Cooch Behar. See KUCH BIHAR.

**Cook, DUTTON**, dramatic critic and author, the son of a solicitor, was born in London, 30th January 1829, spent four years in his father's office, then entered a railway office, which he left to follow the full bent of his literary and artistic tastes. He studied painting and engraving, wrote a successful melodrama, acted as 'dramatic critic for the *Pall Mall Gazette*, 1867-75, and then for the *World* till his death, 11th September 1883. He wrote for various newspapers and magazines, including *Temple Bar* and *Chambers's Journal*, and his eight novels, and others, were always interesting and well written, but sometimes failed in catching the average novel-reader. He wrote the dramatic and theatrical lives for the first two volumes of the *Dictionary of National Biography*, was also author of *A Book of the Play* (1876), *Hours with the Players* (1881), and *On the Stage* (1883).

**Cook, ELIZA**, a favourite minor English poetess, daughter of a London tradesman, was born at Southwark in 1818. She contributed poetical pieces to various magazines from an early age, and issued her *Melania and Other Poems* in 1838, which, along with the issue of volumes in 1864 and 1865, established her reputation as a meritorious verse writer of sound morality, and clear, sensible, and simple treatment. She conducted *Eliza Cook's Journal* (1849-54) till ill-health obliged her to relinquish it; in 1864 a pension of £100 a year was conferred upon her by government. She also wrote *Jottings from my Journal* (1860), and *Laconics* (1865). She died 25th September 1889.

**Cook, JAMES**, one of England's greatest navigators and maritime explorers, was born at Marton, in Cleveland, Yorkshire, where his father was an agricultural labourer, on October 28 (according to another authority, November), 1728. After a meagre education, Cook was apprenticed at the age of thirteen to a haberdasher at Staithes, 10 miles north of Whitby. After a short experience of this life, he was bound apprentice to Whitby ship-owners, and spent several years in the coasting and Baltic trade. In 1755 he entered the royal navy as an able seaman, and in four years rose to the rank of master. For about ten years after this he was mostly engaged in surveying about the St Lawrence and the shores of Newfoundland, and the results as embodied in his sailing directory (1766-78), are of value even at the present day. During this period he devoted himself to the study of mathematics, and otherwise qualified himself for the highest rank in the navy. In 1768 he was raised to the rank of lieutenant, and placed in command of the *Endeavour*, appointed to convey the expedition for the observation of the transit of Venus in the Pacific. The *Endeavour* sailed on August 25, and arrived at Tahiti in the following April, the transit being successfully observed on June 3. On the return, New Zealand was for the first time circumnavigated, and its coasts charted; the east coast of Australia was surveyed and taken possession of in the name of Great Britain. The strait which separates Australia from New Guinea was sailed through, and the distinction of those two islands established beyond doubt. Continuing his voyage by Java (Batavia) and the Cape of Good Hope, Cook anchored in the Downs on June 12, 1771. One important result of the voyage was to disprove the existence of the 'great southern Continent,' which had been supposed to extend from the Antarctic as far north as 40° S. Cook was promoted to the rank of commander, and given the command of a

second voyage of discovery in the *Resolution* and *Adventure*, which sailed from Plymouth, July 13, 1772. This expedition was out for three years. The great object was to discover how far the lands of the Antarctic stretched northwards. For this purpose Cook sailed round the edge of the ice, and penetrated as far south as possible, his farthest south point being 71° 10', in long. 110° 54' W. During the intervals between the Antarctic voyages, Cook cruised in the Southern Pacific, visiting Tahiti, exploring the New Hebrides, discovering New Caledonia, and many of the island groups in the Pacific. Plymouth was reached on July 29, 1775. One important feature of the second voyage was that, owing to the precautions taken by Cook, there was only one death among his crews during all the three years—a marked contrast to the fearful losses sustained during other voyages of this period.

Cook, who had been promoted to captain, and received an appointment in Greenwich Hospital, had scarcely been home for a year before he was appointed to the command of another expedition, the main object of which was to discover a passage round the north coast of America from the Pacific. Cook sailed from Plymouth in the *Resolution*, July 12, 1776, followed by Captain Clarke in the *Discovery*. Leaving the Cape on November 30, the expedition visited Tasmania and New Zealand, and spent the year 1777 cruising among the Pacific Islands. In the beginning of 1778 the Sandwich Islands were discovered, when Cook made for the west coast of North America. This he followed and surveyed from 45° N. as far as Icy Cape on the inside of Behring Strait, where he was compelled to turn back, reaching Karakakoa Bay in Hawaii, Sandwich Islands, January 17, 1779. At first the expedition was treated in the most friendly way by the natives. For some reason their attitude changed, and on February 14, when Cook landed with a party to recover a stolen boat, the natives set upon them with sudden fury, Cook being clubbed and stabbed to death at the edge of the water. Part of the body was recovered and buried, and in 1874 a monument was erected near the spot where he fell. Many varied accounts have been given of Cook's death, and many reasons adduced for the changed attitude of the Hawaiians; but the probability is that he simply fell a victim to a sudden outbreak of savage fury. Cook did more than any other navigator to add to our knowledge of the Pacific and the Southern Ocean; his observations have stood the test of modern investigations; in character he was honest and just, both to his own men and to the natives with whom he came into contact, and who almost invariably became greatly attached to him. A pension of £200 was granted to his widow (whom he married in 1762), and £25 to each of his three children.

An account of the first voyage originally appeared as vols. ii. and iii. of Hawkesworth's *Voyages* (1773); the narrative of the second was written by Cook himself, 2 vols. with 1 vol. of plates (1777); that of the third appeared in 3 vols. and an atlas (1784), partly by Cook and partly by Captain James King. See Kippis's *Life and Voyages of Captain James Cook* (1788; reprinted (1883); Sir J. K. Laughton's article in the *Dict. Nat. Biog.*; Besant's monograph (1890); the unabridged reprint of Cook's *Journal of his First Voyage* (ed. Wharton, 1893); and the *Life by Arthur Kitson* (1907).

**Cook, JOSEPH**, lecturer and author, born at Ticonderoga, New York, in 1838, graduated at Harvard and Andover, and after three years' preaching went to Europe in 1871, where he studied in Germany, and made a tour of the Mediterranean countries. In 1873 he commenced a series of 'Monday Lectures' in Boston, which, endeavouring to harmonise science and religion.

and discussing social and political questions, became very popular; and in 1880 he began an extended lecturing tour around the world. Besides his lectures, he has published a number of works on such subjects as *Biology* (1877), *Heredity* (1878), *Marriage* (1878), *Labor* (1879), *Socialism* (1880). He died 25th June 1901.

**Cook, SIR JOSEPH**, Australian statesman, was born in 1860 at Silverdale, Staffordshire, and there began life as a coal-miner. Emigrating to Australia in 1885, he entered politics in 1891, and subsequently held various offices in the New South Wales legislature and in the Commonwealth parliament. At first a Labour member, he later became a Liberal and staunch Free-trader. He was prime-minister of the short-lived Liberal government of 1913-14. At the Peace Conference of Versailles (1919) he was a representative of Australia, and in 1921 was appointed High Commissioner for Australia. He was made a Privy-councillor in 1914, and G.C.M.G. in 1918.

**Cook, THOMAS**, railway excursion and tourist pioneer, was born at Melbourne, Derbyshire, 22d November 1808. His educational advantages were few, and his early days were spent in gardening, then in wood-turning and cabinet-work, and in printing. In his twentieth year he became a village missionary, and whilst thus occupied his sympathies were actively enlisted in the cause of temperance and free trade. But from 1841 his time and toil were engaged chiefly in the initiation and promotion of railway excursions. His first trip was from Leicester to Loughborough in 1841, his aim being the furtherance of the temperance cause. The Midland Railway was for some years the centre of his operations, and the town of Leicester his home. In spite of the great difficulties that had to be encountered, the business grew until not only in Great Britain but throughout the world agencies have been established, and the tourist tickets of Thomas Cook & Son are found everywhere. The firm greatly assisted the English government during the Sudan troubles, and on behalf of the Indian government they convey the Mohammedan pilgrims from India to Mecca. The founder died 18th July 1892. See Fraser Rae, *The Business of Travel* (1891).

**Cook, MOUNT** (*Aorangi*, 'the sky piercer'), the highest peak of Australasia, is one of the Southern Alps near the centre of the range, on the western side of the South Island of New Zealand. It is 12,349 feet high, is covered with perpetual snow (the snow-line being 3500 feet lower than in Switzerland), was scaled to near the summit by Green in 1882, and to the summit by Fyfe, Graham, and Clark, 25th December 1894. See F. Du Faur, *The Conquest of Mount Cook* (1915).

**Cooke, GEORGE FREDERICK**, actor, born in Westminster in 1756, made his first public appearance at Brentford in 1776, and in the period between 1784 and 1800 became very popular in the English provinces and in Ireland, attaining a front rank in his profession, in spite of drinking habits that increased with his years. From 1801 to 1810 he played at Covent Garden both in comedy and in tragedy, and rivalled Kemble in the public favour; although here, also, from 1803, when he was hissed off the stage for drunkenness, his intemperance was a notorious thing, and a matter for jesting apology. His best characters were Richard, Shylock, Iago, Sir Giles Overreach, and Sir Pertinax MacSycophant. In 1810 he visited America, and appeared before enthusiastic audiences in the chief northern cities, where admiration for the actor secured indulgence and pity for the extravagances of the drunkard. He died in New York city, 26th September 1811; a monument marks his grave, erected in 1821 by

Edmund Kean, who regarded Cooke as the greatest of actors. See his *Life* by William Dunlap (Lond. 1813).

**Cooke, SIR WILLIAM FOTHERGILL**, electrician, born at Ealing in 1806, served in the Indian army from 1826 to 1831, and after studying medicine at Paris and Heidelberg, abandoned this for telegraphy, and in 1837 entered into partnership with Professor Wheatstone. After experiments on various railway lines, they patented the single needle apparatus in 1845. In 1846 Cooke formed a company, which paid £120,000 for the partners' earlier patents. In 1867 Cooke and Wheatstone received the Albert gold medal; Wheatstone was knighted in 1868, and Cooke in 1869. He died 25th June 1879.

**Cookery.** The art of cookery, like other arts and handicrafts, is one which cannot be taught in an encyclopædia article, but the general principles which underlie the operations of cookery may be briefly expounded. This part of the subject—the chemistry and physics of cookery—has been much neglected until very lately.

The chief agent in cookery is heat, and therefore a large part of our subject is the consideration of the chemical and physical changes which occur in food materials when subjected to the agency of heat. We may apply this agent either by bringing the food into direct contact with the source of heat, or by exposing it to radiations from the source of heat. Roasting, toasting, grilling, and to a partial extent, baking, are examples of the latter; while stewing, frying, and the so-called 'boiling' of food—i.e. immersion in hot water—are examples of heating by contact. The term 'boiling' is commonly misapplied in a manner that leads to confusion of ideas. Thus we speak of boiling a leg of mutton, boiling fish, boiling potatoes, &c. quite improperly. The food in question is not boiled, should not be boiled; it is merely immersed in water, which is conveniently used as a heating agent. As will presently be shown, even the water itself should not in most cases boil. Frying, properly conducted, is another example. Here a bath of fat is used to convey the heat.

What are the changes effected on the food by the action of cookery? is the fundamental question to be answered in treating cookery as a branch of applied science. What is the difference between a raw and a cooked potato? What is the difference between a raw and a cooked leg of mutton? and other such questions throughout. We all know the difference in flavour, but the chemical and mechanical changes are but little understood. To answer these questions we must first know something of the composition of the uncooked viands.

For this purpose the old-fashioned division of the elements of organic substances into proximate and ultimate is very convenient. The ultimate elements—carbon, oxygen, nitrogen, hydrogen, &c.—are not cookable, and in their uncombined state do not concern our subject; but the proximate elements, or more properly proximate constituents, such as albumen, gelatin, starch, cellulose, &c., are altered, and the whole subject will be best understood by considering separately the alterations which occur to these in the course of cookery.

Taking first the constituents of vegetable food, the largest of these is the material of the cell walls of the vegetable, *cellulose*, or woody fibre. The next in quantity, as existing in ordinary articles of food, is *starch*, or *fecula*, or *farina*. Both of these are carbohydrates—i.e. compounds of carbon with water, or the elements of water, and they contain these elements in the same proportions, but their structure and digestibility are very different. Starch in its raw state consists of small granules

(see STARCH) which, placed in cold water, sink to the bottom without any degree of solution or other change by union with the water. In this condition they are practically indigestible in the human stomach, but when cooked, starch is the most easily digestible of all human food.

The changes that take place in the cookery of starch are considerable. If pure starch (arrow-root is such) be placed in water raised to the temperature of 140° F., the granules swell considerably, and the mixture becomes pasty or viscous. A little stirring breaks up the distended granules, and we obtain a glairy paste such as used by the laundress, and seen in cooked arrow-root. If the heat be now raised from 140° to the boiling-point, and the boiling continued, the jellied mass becomes thicker and thicker; and if there are more than 50 parts of water to 1 of starch, a separation takes place, the starch settling down with its 50 parts of water, and the excess of clear water standing above. We have here a case of hydration or combination with water as the result of cookery, and the probable cause of the improved digestibility. Dry starch may be raised to 300° without becoming thus semi-soluble. The hydrate once formed may be dried by evaporation, and still retains some water and the same degree of solubility. Many farinaceous preparations, such as corn-flour, &c., consist chiefly of starch in this condition. This, however, is not the limit of starch cookery. If it is heated to about 400°, it is converted into *dextrin*, which is completely soluble in water at all temperatures, the solution being mucilaginous but not pasty. Dextrin differs from starch in other properties (see DEXTRIN), but is composed of the same elements in the same proportions,  $C_6H_{10}O_5$ —i.e. six equivalents of carbon to five of water, or its elements. This change of starch into dextrin is of great practical importance as an operation of cookery, inasmuch as it anticipates the first stage of the digestion of starch.

The saliva, the pancreatic juice, and one of the intestinal secretions contain a peculiar principle which has received the name of *animal diastase*, from its resemblance to the diastase of malt. This converts the starch of food into the completely soluble dextrin, a change absolutely necessary for its assimilation as nutriment. In some animals the supply of this is so small that starch is almost worthless to them as food. It passes through the body unaltered. Such is the case with the carnivora. Human infants, when suddenly deprived of their mother's milk, have not sufficiently developed the power of salivary, pancreatic, and intestinal secretion of diastase to digest starch, and therefore demand assistance. Such assistance may be afforded by carrying the cookery of starch to what we venture to call the second stage—viz. its complete or partial conversion into dextrin. Thus, ordinary flour or oatmeal, simply heated in boiling water or milk, is merely subjected to the first stage—viz. hydration of the starch; but if the flour or oatmeal be well *baked*, a considerable proportion of its starch is converted into dextrin. A knowledge of this is of great importance to mothers, and also to nurses preparing food for dyspeptics, as adults vary greatly in their powers of diastatic secretion.

The reader will now understand why bread is rendered more digestible by toasting, and why crust of bread is more digestible than the crumb, in spite of greater hardness. In the ordinary baking of bread a variable amount of the starch is converted into dextrin. Well-baked bread is more digestible than under-baked. In the cookery of oatcakes, bannocks, scones, and all kinds of biscuits, this should be understood. The writer enjoys the luxury of hot rolls without their in-

digestibility, by simply moistening stale crusts of bread and reheating them in a kitchen oven. They thus become softened like new bread, and more digestible than before on account of the dextrinisation of a larger proportion of the starch. Baked and fried potatoes have a similar advantage.

The Diastase (q.v.) of malt may be employed for the dextrinisation of farinaceous food by adding malt flour or extract of malt to it; or the grain itself may be malted. The temperature at which malt diastase acts most vigorously is about 140°. At lower temperatures it acts more slowly; at much higher, its curious property is destroyed. To illustrate its action, make some oatmeal porridge very thick, then add about  $\frac{1}{16}$ th part of dry malt flour at about 140°, and stir. In a few minutes the thick pudding becomes quite sloppy owing to the greater solubility of the dextrin into which the starch has thus been converted.

The cellulose—i.e. the stalks and the cell walls, such as the fleshy part of leaves, &c.—are more or less digestible, according to their looseness of structure and their interfuidity or succulent character. Thus we may digest a raw lettuce more easily than a raw cabbage, or the inner leaves of either more readily than the outer leaves or stalks. The action of cookery on cellulose appears to consist in the loosening of its fibres, and rendering them more soluble. It is therefore advantageous that the water in which green vegetables, such as cabbages, are cooked should boil vigorously, the agitation of the steam bubbles assisting in the loosening of the fibres. Cellulose, like starch, may be converted into dextrin and sugar by the combined action of moderate heat with moisture and an acid. This change is aided by a little diastase. Sawdust and old rags may thus be converted into digestible and nutritious food, but not with commercial profit *at present*. An example of such conversion in Nature's laboratory is afforded by the ripening of a pear. Many varieties which are hard, woody, and sour when full grown in autumn, become gradually softer and sweeter, and finally delicious by simple storage. The action of *ensilage* (see ENSILAGE) of cattle food probably includes some degree of such conversion of cellulose.

The nitrogenous constituent of grain, the *gluten*, is not so greatly altered by cookery. The writer's investigations of this neglected subject lead him to the conclusion that the alteration which does occur is that of a partial hydration rendering the gluten more soluble, but this hydration is not so decided and definite as in the case of starch. There is one constituent of vegetable food which demands no cookery. This is pecten (otherwise pectose and pectin)—i.e. vegetable jelly. It exists most abundantly in fruits, and is familiar to all in the form of currant jelly, apple jelly, &c., which are pecten plus sugar. The cookery of vegetable casein will be discussed with that of the casein of milk.

Of the proximate elements of animal food the most abundant is gelatin; it constitutes about half the weight of the body of most animals. It exists in two forms—soluble and insoluble. Its cookery consists in the hydration of the insoluble form and rendering it soluble, as in the stewing of bones, tendons, skin, &c. in a stock-pot until their gelatin becomes soluble jelly. The muscular fibre itself, which with its enveloping membranes form lean meat, is subjected to a similar change, but less completely, in the course of cookery.

The cookery of *albumen* differs materially from any of the preceding. Albumen exists in raw flesh meat as one of its juices, being a glairy liquid which is distributed between the muscular fibres and the joints, and around the bones, forming a lubricant, and probably conveying material of

growth and renewal. It is typically seen in the white of eggs. When heated to about 134°, white fibres begin to appear within it. If the heat is continued, and gradually increased, they increase, until at about 160° the whole mass becomes white and nearly opaque. It is now coagulated into a tender, delicate, jelly-like substance, easily digestible and highly nutritious. If the heat is further raised, it becomes harder and harder, up to 212°. If this heat is continued, it shrinks, and becomes tough and horny, losing some of its water of composition, and its easy digestibility.

Ignorance of these particulars, and further ignorance of the fact that water has the same temperature, whether 'simmering' or boiling violently, causes the spoiling of vast quantities of food and wasting of much fuel in this country. The cooking temperature for all animal food is from 160° to 180°. When maintained for any length of time at the temperature of boiling or 'simmering' water, it is spoiled. To prove this, take a beefsteak and cut it in half. Place one half in water in a common saucepan, and boil or 'simmer' it for half an hour or more. Place the other half in water in an open-mouthed jar (such as a gallipot), and place the jar in a saucepan of water so that only the outer water shall boil; cook it thus, and compare with the first. At a continued temperature of 212° not only does the albumen become toughened, but the gelatin also becomes dehydrated, hardened, and indigestible. All stewing operations should, therefore, be conducted at 30° or 40° below the boiling-point. When the exposure to a higher temperature is but for a short period, little or no mischief is done. This is the case in frying and grilling of animal food. These operations should always be rapidly conducted.

Besides the above-named constituents of animal and vegetable food, there are the saline juices necessary for supplying the saline constituents of the blood, and upon which the flavour of food largely depends. These are not altered by cookery, but are too frequently sacrificed. Potatoes, for example, contain a certain proportion of potash salts. The writer has examined the water in which potatoes have been cooked and that which is condensed when they are steamed, and finds that if the potatoes are peeled, a large proportion of the salts pass into the water. If they are cooked 'in their jackets,' much less is lost; but when baked or fried, all is retained. The complete retention of the juices is one of the reasons why roasted and grilled meat has more flavour than that which is cooked in water.

The changes which cookery effects on fat appear to consist in partial dissociation of its proximate elements. It is composed of a fatty acid combined with glycerine. These are partially separated by heat.

Another constituent of both animal and vegetable food is *casein*. It does not exist in the flesh of animals, but is an important component of milk; is the solid basis of the curd which is separated by the action of rennet or acids (see *CASEIN*). It also exists in peas, beans, and other seeds of leguminous plants. It is highly nutritious. There are two forms of casein—the soluble and insoluble. It is soluble as it exists in milk, but insoluble after precipitation by acids or rennet, as in making cheese. An infant that digests the casein of milk cannot digest it after separation as cheese.

The writer has succeeded in partially reconvert-ing the insoluble to the soluble form by adding bicarbonate of potash in the proportion of  $\frac{1}{4}$ th to  $\frac{3}{4}$ th of an ounce to 1 lb. of cheese; the potash dissolved, in about a teacupful of water, and the cheese, grated or sliced, added to the solution, which is boiled until the cheese dissolves, forming a custard-

like result. This may be added to oatmeal porridge and a multitude of other preparations. The theory upon which this method of treating cheese was founded is, that the curdling of milk is due to the combination of an acid with the natural alkali of the soluble casein, chiefly consisting of potash. The artificial addition in the proportion named not only renders the cheese more digestible, but restores the saline constituent of the original milk, which in the course of cheese-making, passed into the whey. The importance of thus rendering cheese more digestible, and supplying its saline dietetic deficiency, will be understood by the fact that 20 lb. of cheese contain as much nutriment as a sheep weighing more than 60 lb. Lean beef and mutton contain from 72½ to 73½ per cent. of water, cheese about 30 per cent. and no bone. Cheese may be stored and carried almost as easily as coal.

Of late in Great Britain much more attention than formerly has been bestowed on cookery, and the subject is now generally taught in schools and in colleges of domestic science.

See *BOILING, STEWING, &c.*; also *DIET, DIGESTION*.

**Cook Islands**, or HERVEY ARCHIPELAGO, lie about midway between the Society and Navigator groups, near 20° S. lat., and 158° W. long., and are some volcanic, some coralline; Mangaia, Atiu, and Rarotonga are the chief. The natives, mainly of the brown Polynesian stock, are some 7400 in all, of whom 3300 are in Rarotonga, which is mountainous (reaching 3000 feet) but fertile. Formerly cannibals, they are now all Christians. The islands, annexed by Britain in 1888, were made over to New Zealand in 1900. Each island is governed by an island council of *ex officio*, nominated, or elected members.

**Cookstown**, a town in County Tyrone, Ireland, 53 miles W. of Belfast by rail, with manufactures of linen, and bleach-works; pop. 3700.

**Cook Strait**, discovered by Cook on his first voyage, separates the North and South Islands of New Zealand, and is 20 to 80 miles wide.

**Cooktown**, a port (dating from 1873) in the north of Queensland, on the Endeavour River, 1050 miles NNW. of Brisbane, and 122 NE. of the Palmer gold-field. There are handsome public buildings and a monument (1889) to Captain Cook, who beached his ship, the *Endeavour*, here in 1770. Near there are gold-diggings and tin-mines, pearl-fisheries, and fisheries of trepang.

**Cooler**. See *BEER, REFRIGERATION*.

**Coolgardie**, a mining station in Western Australia, 270 miles NE. of Perth, with which it is connected by rail and telegraph. Gold was discovered here in 1892, over 500 oz. being obtained in a single afternoon with the aid of a tomahawk; the next year the even richer field of Kalgoorlie was opened up, and mining settlement has grown mainly round that centre, the present population being about 30,000. The native gold is remarkably pure, some specimens of sponge gold assaying 99.91 per cent. of gold with 0.09 of silver.

**Coolidge**, CALVIN, thirtieth president of the United States, was born at Plymouth, Vermont, 4th July 1872, and educated at Amherst College. He entered a law office at Northampton, Massachusetts, where he began to practise in 1897, becoming prominent later in local and state affairs. A city councillor in 1899, he was city solicitor in 1900-1; in 1904 became clerk of the courts and chairman of the republican city committee; and in 1910 mayor. He sat for Northampton in the state senate 1912-15 (as president in 1915), was lieutenant-governor of Massachusetts in 1916-18, and governor in 1919 and 1920. His defeat of the Boston police strike gained him favour in the re-

publican party. He became in 1921 Vice-president of the United States, but the death of Mr Harding, 2d August 1923, brought him to the presidential chair. He was elected for a full term from March 1925.

**Coolies** (Hind. *kali*, 'labourer'), Indian and Chinese labourers who emigrate to foreign lands, whether at their own charge or at the expense of the foreigner whom they bind themselves by contract to serve for a fixed term of years. Labourers who migrate from one part of India to another, as for instance from Bengal to Assam, are also called coolies. The European and American residents in the treaty ports of China give the same name to the lower class of Chinese labourers in their service.

In China, during the 18th and 19th centuries, pressure of population produced a continual outflow, chiefly from the southern provinces of Fuh-Kien and Kwangtung. The emigrants swarmed over the archipelago, settled by thousands and tens of thousands in Java and in the Straits Settlements, and threaten eventually to displace the natives in Siam and the Malay Peninsula. The discovery of gold attracted large numbers of Chinese to California and Australia. The first railway across the Rocky Mountains was partly made by Chinese labour, and M. Lesseps invited their help for the excavation of the Panamá Canal. In spite of his utility, the coolie has become an intolerable offence to the working-classes of America and Australia. He is accused of gambling, opium-smoking, and immorality; but the head and front of his offending is his working for low wages. In 1881 the United States negotiated a treaty with China, by which restriction of Chinese immigration was secured to the States in return for American prohibition of the opium trade on the coast of China. Another treaty between the two powers in 1888, prohibiting the entry of Chinese labourers into the United States for a period of twenty years, was refused ratification by the Peking government. In British colonies the attempt has been made to exclude the obnoxious coolie by the imposition of a poll-tax. In Canada, especially British Columbia, the number of Chinese immigrants has been such as to call forth attempts to exclude them. In 1885 it was enacted that every Chinese entering Canada—with certain exceptions—should pay a head-tax of \$50. In 1901 this tax was increased to \$100, and in 1904 to \$500. The chief classes exempted are consular officers with their suites, merchants, and members of the learned professions, with their wives and children in each case. Those who have been admitted may go abroad and return if they register and pay a small fee. In Australia similar acts failed to secure the desired end. In 1888 the New South Wales legislature passed an act to prohibit the landing of Chinese immigrants; but the law-courts decided against the legislature. At a conference of delegates from the governments of all the Australian colonies, it was unanimously agreed to endeavour to secure the exclusion of the Chinese, by means of a new treaty between the British and Chinese governments. The existing treaties which promise protection to the Chinese immigrant are the Treaty of Nanking (1842), the Treaty of Tientsin (1858), and the Convention of Peking (1860). Under the Commonwealth, Chinese and Japanese have been more or less effectually excluded by the indirect method of an education test.

The coolie in the United States and in some British colonies is an uninvited and unwelcome visitant. At the same time his services have been eagerly sought in other colonies, the governments and planters of which have borne all the expenses of his passage, paid him a small advance, and in addition paid head-money to the agent who obtained him. To recoup this expenditure, the planter required the coolie to bind himself to serve for a term

of years at a fixed rate of wages. Coolies thus indentured occupied a similar position to apprentices, soldiers, and sailors. The system is liable to the grossest abuse. The dark story of coolie emigration to Peru and Cuba, carried on from Macao (q.v.), rivals in atrocity the horrors of the slave-trade and slavery. This branch of the coolie traffic was brought to an end in 1874 by an enactment of the Chinese government, requiring that in the contract a clause should be inserted securing to the coolie a free passage home at the expiration of his term. The planters were not willing to incur this obligation, and coolie emigration from Chinese ports ceased. During the years between 1847 and 1875 there was a fearful loss of life, some perishing on shipboard in vain attempts to recover their liberty, others dying of ill-treatment or disease, or by suicide. The only redeeming feature was that sooner or later the bondage ended. The slave was a slave until death: the coolie could look forward to the end of his contract.

Coolie emigration under contract to British and French colonies was mainly Indian, with a small percentage of Chinese in its ranks. Both the Indian and the colonial legislatures took great pains to prevent abuse of the system, not without some success. Every step of the process, from the first solicitation of the labourer, until the ship carried him out of port, was regulated by the Indian government. The agents who collected the coolies, the depots where they were lodged, the contracts they signed, the ships in which they embarked, were inspected, licensed, supervised by government. Protectors of emigrants were appointed in Calcutta, Madras, Bombay, and Karachi, from which ports only the emigration was lawful. In like manner the colonial governments enacted regulations and appointed protectors, to secure to the coolie limitation of his task, sufficient food, suitable lodging, and medical care in sickness. The imperial government intervened by conventions entered into with foreign governments, with France in 1861, with the Netherlands in 1870, to secure the fair treatment of the coolie in foreign colonies. That all this legislation was neither unnecessary nor unfruitful is proved by the case of Réunion. In 1880 M. Rougon reported to the French government that the coolies in this island 'were badly clothed, badly fed, badly paid, and badly cared for when sick.' The Indian government, receiving similar reports, put in force a provision of the Emigration Act, and prohibited emigration to Réunion. The British consul at Cayenne reported that the coolies in French Guiana suffered 'barbarous and inhuman treatment'; and in 1876 emigration to that colony was stopped. According to the Indian Emigration Act of 1883, emigration under contract was lawful to the following places: British colonies—Mauritius, Jamaica, British Guiana, Trinidad, St Lucia, Grenada, St Vincent, Natal, St Kitts, and Fiji; French colonies—Martinique, Guadeloupe; also to Dutch Guiana, and the Danish island, St Croix. In 1886 the Jamaica government suspended immigration from China and India to that colony; but it was resumed in 1891. In Trinidad the coolies were usually well fed, not overworked, and well treated in sickness. In Mauritius Indians formed two-thirds of the population in 1911. The greater part of Port Louis had passed into their (and Chinese) hands, and many sugar estates have been purchased by Indians. Emigration to French colonies had been forbidden in 1886, and Dutch Guiana was the only country outside the British Empire to which Indian coolies could be sent when, in 1916, it was announced by Lord Hardinge that the whole system was to be abolished by degrees. The position of free Indians in Natal had long been a bone

of contention, and the Indian government had prior to 1916 forbidden emigration thither.

Coolie labour in India is regulated by acts of 1882 and 1883, but complaints of unfair and even cruel treatment were made, and an amending act was passed by the Viceroy's Council in 1901, regulating the importation of coolie labour to the tea-plantations of Assam. The coolie traffic between the southern ports of India and Ceylon is constant and mutually advantageous. The coolies of Ceylon are not indentured, and are free to leave on a month's notice. In the last years of indentured emigration some 10,000 coolies left India yearly, and about half that number returned. The rest settled in the countries to which they were sent.

The Pacific islands have been the scene of a 'labour trade' to supply the demand for cheap labour in the sugar-growing parts of Australia; shiploads of natives from some of the Polynesian islands were imported under conditions very like enforced slavery, as was proved by a Royal Commission (1884), and stricter regulations were introduced. In 1901 there were in Queensland 9237 Polynesians, 2269 Japanese, and 939 Indians or Ceylonese, besides 1557 other coloured aliens. The Australian Commonwealth in that year passed an Immigration Restriction Act for the gradual elimination of Polynesians. From 1904 the Chinese in the Transvaal gold-mines (53,000 in 1907) created much controversy, and all were repatriated by 1910.

The literature of this subject consists chiefly of parliamentary papers and government reports. Besides those referred to above, the following may be named: Correspondence, Papers, or Reports on the Macao Coolie Trade (1871 to 1875); on Coolie Emigration from India (1874); on the Coolies in Assam (1867), in Surinam (1877), in Trinidad (1885); on Coolie Importation from India to French Guiana (1878); and on Chinese Immigration into the Australasian Colonies (1888). *The West Indies and Spanish Main*, by A. Trollope (1860); *The Coolie: his Rights and Wrongs*, by E. Jenkins (1871); *In Quest of Coolies*, by J. L. A. Hope (1872); Charles Kingsley's *At Last* (1872); and Churchyard's *Blackbirding in Southern Seas* (1888), may be consulted.

**Coomassie.** See KUMASI.

**Cooper, ASHLEY.** See SHAFTESBURY.

**Cooper, SIR ASTLEY**, surgeon, was born, a clergyman's son, at Brooke Hall, Norfolk, 23d August 1768. In his seventeenth year he went to London, and became a pupil of Mr Cline, one of the most noted surgeons of his day. He devoted himself with ardour to his profession, and was a constant attender at the dissecting-rooms, and also at the lectures of the famous John Hunter. In 1789 he was appointed demonstrator of anatomy at St Thomas's Hospital; and two years after he assisted in the lectures on anatomy and surgery. In 1793 he was appointed lecturer on anatomy at the College of Surgeons, in 1800 surgeon to Guy's Hospital; and in 1813 professor of Comparative Anatomy in the College of Surgeons. Meanwhile, Cooper had been enriching medical literature by various contributions. An essay on the effects resulting from the destruction of the *membrana tympani* gained him, in 1802, the Copley medal of the Royal Society, of which he was elected a fellow three years afterwards. In 1804-7 appeared his great work on *Hernia*, with life-size illustrations, a contribution of the utmost value to medical science, though in a pecuniary point of view it proved very unprofitable to himself. The practical part of his profession was not neglected during this time. He was the first to attempt the tying of the carotid artery, an attempt which, though unsuccessful in his hands, has since proved effectual in the hands of other practitioners. His annual income, which in the

fifth year of his practice only amounted to £100, had in 1813 risen to the enormous sum of £21,000. In 1817 he tried what has been considered the boldest experiment ever attempted in surgery, the tying of the aorta, which did not prove successful. In 1820 Cooper removed a tumour from the head of George IV., who conferred a baronetcy upon him some six months after. In 1827 he was elected President of the College of Surgeons, in 1828 became sergeant-surgeon to the king, and in 1830 was made vice-president of the Royal Society. Other honours flowed in upon him. He was made a member of the French Institute, and corresponding member of the Royal Academy of Sciences, a D.C.L. of Oxford, and an LL.D. of Edinburgh. Ever busy with his pen as with his knife, he in 1822 published a great work on *Dislocations and Fractures*. His treatise on the *Anatomy and Diseases of the Breast* (1829-40) was characterised by all the care, research, and originality which distinguished his previous works; so likewise was his *Anatomy of the Thymus Gland* (1832). Cooper died 12th February 1841, and was buried in the chapel of Guy's Hospital. A colossal statue to his memory is erected in St Paul's Cathedral, London. As a teacher, Cooper possessed the faculty of communicating knowledge in a manner at once easy and agreeable; and he elevated medical surgery, the operations of which before his time had been described as a series of 'frightful alternatives, or hazardous compromises,' into a science. See his *Life* (2 vols. 1843).

**Cooper, JAMES FENIMORE**, an American novelist, was born at Burlington, New Jersey, September 15, 1789. His father, a man of wealth and Federalist member of congress, was of Quaker descent, and his mother, a Swede, was also of Quaker ancestry. In 1790 the family removed to Cooperstown, New York, then in a wild frontier region of great natural beauty. Cooper entered Yale College in 1802, a boy of thirteen. After remaining there three years, he was dismissed for some minor act of alleged misconduct. In 1806 he shipped as a common sailor, and in 1808 entered the navy as a midshipman. He rose to the rank of a lieutenant, but in 1811 resigned his commission, and married Susan, a sister of Bishop De Lancey of New York. His first novel, *Precaution* (1819), was a failure; and the thirty-two tales which followed it were of extremely unequal quality. Among those which had signal merit we may name *The Spy* (1821), *The Pilot* (1823), *The Last of the Mohicans* (1826), *The Prairie* (1826), *The Red Rover* (1831), *The Bravo* (1831), *The Pathfinder* (1840), *The Deerslayer* (1841), *The Two Admirals* (1842), *Wing-and-Wing* (1842), and *Satanstoe* (1845). His other writings include a meritorious *Naval History of the United States* (1839; abridged edition, 1841), and *Lives of Distinguished American Naval Officers* (1846). His works of fiction have long enjoyed great popularity; and his best productions, in spite of conspicuous faults, well deserve all the favour they have received. His sea-tales and stories of frontier life are in all respects his best. Cooper's descriptive talents were of very high order; and some of his characters, such as 'Long Tom Coffin,' 'Birch,' 'The Big Serpent,' and especially 'Leather Stocking' (Natty Bumppo), are drawn with as much strength and life as almost any in the whole range of fiction. The peace of many of the later years of his life was much disturbed by literary and newspaper controversies and actions for libel, in nearly all of which he was successful. He conducted his own lawsuits, and usually pleaded his own cases with admirable tact and ability. One good result of these suits was to put upon the newspaper press of his own time and country some degree of restraint from the scandalously savage and virulent freedom of speech

which then prevailed. On either side of the Atlantic Cooper's own severity of language won him no small amount of personal unpopularity; yet no man loved his own country better than he; and his high regard for the nobler side of the English character, and his appreciation of the grand achievements of British history, found frequent expression in his writings. These writings, other than the best of his novels, contained much to excite opposition, and they brought upon him, not altogether undeservedly, the reputation of being a proud, contentious, and somewhat wrong-headed man; yet there was in his real character much sweetness, as well as great strength, purity and dignity, and unqualified honesty. His pride was large, but unmixed with personal vanity. He died at Cooperstown, 14th September 1851. See *Life* by Lounsbury (1882); also *Letters and Journals* (2 vols. 1914), edited by Morse, and *Correspondence* (2 vols. 1922), edited by his grandson, J. Fenimore Cooper.

**Cooper, PETER**, manufacturer and philanthropist, born at New York, 12th February 1791, assisted his father in his successive occupations of hatter, brewer, and brickmaker, and served an apprenticeship to a carriage-builder, 1808-12. He next made independent ventures as a machinist, cabinetmaker, and grocer, and established a glue factory on Long Island. He erected large iron-works in Baltimore in 1828, and in 1830 constructed there, from his own designs, the first locomotive engine ever built in America. He afterwards built an iron-wire factory in New York, and large blast-furnaces in Pennsylvania; and he was largely instrumental in bringing about the laying of the Atlantic cable. To provide the working-classes with educational advantages, of which he himself had enjoyed so few, he erected and endowed the Cooper Union (1854-59), one of the most useful institutions in New York, where free lectures, reading-room, art collections, and technical schools have been provided. In 1876 he received the Independent nomination for president. He died in New York, 4th April 1883. See *Life* by Mrs Carter (1889).

**Cooper, THOMAS**, the Chartist poet, born at Leicester in 1805, was apprenticed to a shoemaker at Gainsborough, taught himself Latin, Greek, Hebrew, and French, and became a schoolmaster at twenty-three, and at the same time a local Methodist preacher. After reporting for some of the newspapers in the Midlands, he became leader of the Leicester Chartists in 1841, and was an active editor of tracts. He lectured in the Potteries during the riots in August 1842, was arrested on a charge of conspiracy and sedition, and sentenced to two years' imprisonment in Stafford gaol. Here he wrote *The Purgatory of Suicides*, a poem in the Spenserian stanza, and *Wise Saws and Modern Instances*, a series of tales, which were both published in 1845. Next year appeared his *Baron's Yule Feast*, a *Christmas Rhyme*, and a series of papers headed 'Condition of the People of England' in *Douglas Jerrold's Newspaper*. In 1848 he began to lecture on history and politics in London, and set up the *Plain Speaker* and *Cooper's Journal*, two short-lived penny weeklies. He published two novels, *Alderman Ralph* (1853), and *The Family Feud* (1854), and relinquishing sceptical opinions he had held since his imprisonment, became a Christian lecturer. In 1867 his friends purchased an annuity for him; in 1892 he got a Civil Service pension of £200, but died 15th July of the same year. Cooper published his *Autobiography* in 1872, and an edition of his *Poetical Works* in 1878.

**Cooper, THOMAS SIDNEY**, animal-painter, was born at Canterbury, 26th September 1803, and successively coach-painter, scene-painter, and

drawing-master, lived three years at Brussels (1827-30), was elected an A.R.A. in 1845 and an R.A. in 1867, and lived till his 99th year, dying 7th February 1902. See his *My Life* (2 vols. 1890).

**Cooperage** is a very ancient art, well known to the Romans. The bulge or belly of a barrel is formed by so shaping each stave that, when all are hooped together, their edges shall coincide perfectly; each stave, made broadest in the middle, is narrowed down in a curved line towards each end. A skilful cooper can work this curve so accurately, that no further fitting or alteration shall be needed when the staves are put together. The staves are made to meet at their inner edges, and by driving the hoops very hard, the inner part is compressed until the slight gaping outside is closed, and thus slight inaccuracies of fitting are remedied.

There are several branches of cooperage. The *wet* or *tight* cooper makes vessels for holding liquids. The *dry* cooper does inferior work, such as barrels for containing dry goods, where an inferior degree of accuracy is sufficient. The *white* cooper makes churns, pails, &c., which for the most part have straight sides.

The best work is made of oak, which must be thoroughly dried before being put together. In warm countries, the drying of the sun is sufficient, and casks are therefore mounted in summer only; but in Britain, artificial drying is commonly resorted to. The hoops are hammered down from the narrow to the wide part of the cask, by means of a mallet striking a piece of wood held against the hoop. Iron hoops are sometimes put on hot, in order that their contraction on cooling may bind the work together. Most ingeniously constructed machinery is now generally used in barrel-making.

**Cooperage**, on the North Sea, is that demoralising system of selling or bartering strong drink, tobacco, or other articles, to fishermen or sailors, from Dutch or other foreign vessels called *copers* (Ger. *kaufen*, Dut. *kopen*). They ostensibly cruise with the English fishing-fleets to sell foreign tobacco on which no duty has been paid, and what on shore would cost four shillings is perhaps sold for eightpence. The trade began in the middle of the 19th century by foreign vessels from Dutch ports trading with English smackmen in articles of clothing, which grew into the more profitable barter and sale of tobacco and spirits. An English smack, until the insurance company refused to insure her, has been known to take out £500 worth of grog and tobacco, and clear another £500 in two months in the traffic. To counteract the evils of the system, Mr E. J. Mather, in 1882, started a mission for the deep-sea fishermen, which in 1888 had at command eight mission ships, stored with good literature, woollen clothing, tobacco, and medicine, and a staff of twelve clergymen as honorary chaplains. The Customs Commissioners refused the necessary concessions for the sale of tobacco at a cheap rate in 1885, but granted the same in 1887, and now on each voyage extensive drawings are made for that commodity. Queen Victoria became the patron of the mission, and it is duly registered by the Board of Trade. As a result of an international conference at The Hague between the six fishing powers, a convention was signed in 1887, one of the provisions of which contemplated the absolute prohibition of the sale or barter of spirits on the North Sea. The North Sea Fisheries Acts (1888 and 1893) give effect (as far as Great Britain is concerned) to the recommendation of the convention. The sale of spirits to fishermen and others on board fishing-vessels is prohibited; fishermen are forbidden to buy spirits at sea; the exchange or barter for spirits of any article, especially the fish caught,

nets, or gear of the fishing-boat, is also prohibited. Vessels trading in provisions, &c. must be licensed, and penalties from £10 to £50 are exigible for offences against the convention. See E. J. Mather's *Nor'ard of the Dogger* (1887).

**Co-operation.** In the social and economic sense of the word, co-operation generally means the association of work-people for the management of their own industrial interests, in store, workshop, or other undertaking, and the equitable distribution of profits among those who earn them. In Great Britain it has succeeded best in distribution, that is, in the form of co-operative stores for the supply of the domestic wants of the workmen's families; in Germany and Italy it has flourished chiefly under the form of people's banks, for furnishing mutual credit to workmen and also small tradesmen. Co-operative production has not yet made corresponding progress. The co-operative movement acquired vitality with the foundation of the Rochdale Society of Equitable Pioneers in 1844. Before that date there had been instances of co-operative industry among English miners, New England fishermen, and the Greek sailors of the Levant. In Great Britain there exist even yet co-operative societies, which were founded prior to 1844; one at Govan, said to have been established in 1777, and another at Hull, started in 1795. The earliest in England, however, was that founded in 1794 at Mongewell, in Oxfordshire, by Shute Barrington, Bishop of Durham. During the Owenite agitation from 1820 to 1845, the movement began to assume national importance, hundreds of societies rising up, which for the most part rapidly disappeared. By general consent it is agreed that the movement took practical and permanent form with the Rochdale Pioneers (1844). The founders were twenty-eight weavers, nearly all of whom were socialists of the Owen school and Chartists; and their original capital was £28, painfully collected by subscriptions of twopence, afterwards raised to threepence a week. With this capital they opened a store for supplying themselves with provisions, but at first they had only four articles to sell—flour, butter, sugar, and oatmeal. Their success, which was steady and rapid, was chiefly due to their device of limiting interest on shares to 5 per cent. and dividing profits among members in proportion to their purchases. By 1857 they had a membership of 1850, a capital of £15,000, and annual sales to the amount of £80,000. Their society, its organisation and methods of conducting business, became a model to the working-men in the north and centre of England, as also in Scotland. In this way the movement rapidly spread, and the societies are now over 1450 in number, with nearly two million members. In 1864 the Wholesale Society for the supply of commodities to the various stores was established at Manchester, and a second at Glasgow in 1869; but the two work in harmony, and may be considered as one institution. In 1871 the *Co-operative News* was started as the organ of the co-operators. Since 1869 national congresses of co-operative societies have been held every year in one or other of the large towns of Great Britain. These may be regarded as the annual parliaments of co-operators. The efforts after organisation culminated in the consolidation of the Co-operative Union with a regular constitution drawn up in 1873. Subject to the congress, the Union is governed by a United Board of twelve members, representing the six sections into which the union is divided. The sectional boards have monthly meetings of their own. The Central Co-operative Board, consisting of all the members representing the seven sections, comes together for business only at meetings of congress.

Having thus sketched the general development

of English co-operation, we shall now more specifically indicate the rules and organisation of the societies. Any one may become a member on paying an entrance fee of one shilling, and members may pay up their shares at the rate of threepence a week. Shares are usually one pound each, and one or two of these shares, transferable but not withdrawable, constitutes all the capital a member is required to hold. The other share capital that a member may hold is withdrawable. The interest on capital is limited to 5 per cent. Goods are sold at the prices current among respectable shopkeepers in the neighbourhood, and after paying expenses the nett profits are distributed quarterly among the members in proportion to their purchases. These dividends may be allowed to accumulate in the store, but no member is permitted by law to hold more than £200. The general rule is that payments be made in ready money, a system to which co-operation largely owes its success, but which is not yet universal. At the congress of 1888 complaints were made that the credit system is to some extent permitted. Irrespective of the amount of his investments, each member has only one vote. The members elect a committee for the management of the business. The committees have frequent meetings, and control the employees of the store. The members themselves hold quarterly and in many cases monthly meetings. The Wholesale Society is a federation of retail societies, which have to take up shares, and they participate in the management in proportion to their membership. The Wholesale is a large and growing organisation for the supply of goods to the various societies composing it, with purchasing depôts not only in Great Britain and Ireland, but in North America, Spain, Denmark, and Germany. From 1876 to 1907 it was its own shipper for its North Sea traffic. It has also extensive productive works, as boot and shoe factories at Leicester, soap-works at Durham, woollen-cloth works at Batley, &c. Besides the productive works thus conducted by the Wholesale Society, there are a number of societies for production alone, societies for working corn-mills, and a number of retail societies which carry on corn-mills and various branches of domestic production. In addition to the societies already mentioned, there is a co-operative fire and life insurance society, and the *Co-operative News Society*, started in 1871 for carrying on the organ of the co-operators. It also publishes the *Wheat-sheaf*, the *Scottish Co-operator*, *Labour Co-partnership*, *Irish Homestead* (monthly), besides many local *Records*.

The following statistics were presented to the Co-operative Congress of 1922. The wholesale societies of England and Scotland make rapid progress. The English society in 1921 had 1205 members, and a total capital of £23,287,747, and the sales amounted to £81,941,682; it has purchasing agencies in Canada, Australia, the United States, Germany, Sweden, Denmark, and Greece; and the sales of the productive department were £26,569,333, the capital engaged in production being £9,969,222. Of the Scottish society the membership was 273, the capital £5,694,379, and the sales £22,041,158, with £409,394 of profit, while the sales of the productive department were £7,023,453. The retail societies in 1921 numbered 1352, with 4,548,557 members, having a share capital of £74,818,802, and the sales for the year were £218,780,384, with £14,253,671 of profit. The production societies, as distinct from the wholesale productive departments, had an output in the United Kingdom of £6,581,587 (profit, £322,358). The Co-operative Insurance Society undertakes fire, life, and fidelity insurance. Of agricultural societies, 181 farm 73,438 acres, with a capital of £3,262,901. The Women's

Co-operative Guild has 666 branches, with over 28,000 members. The Co-operative Union had 1307 societies belonging to it, representing 3,814,437 members. It organises the annual congress, and has parliamentary and international committees, and committees on production, propaganda, education, &c. By its efforts its various connected societies voted £128,786 for educational purposes in 1918.

In Ireland co-operation has been of much more recent growth than in England or Scotland, but its development has been unexpectedly rapid and beneficial. In 1890 there was only one society, while at the end of 1915 there were over 1000 of all kinds, with 140,000 members and a turnover of £4,184,984. The movement is principally directed to agriculture, and the Irish Agricultural Society had in 1915 344 creameries, with 45,385 members and £276,250 share and loan capital, and produced butter worth £3,499,264. These creamery-dairy societies are formed by small local farmers, who bring their milk to be separated or made into butter, the profits being divided. Their influence has greatly improved dairy-farming and butter-making in Ireland. There are also flax-growing societies, agricultural banks on the Raiffeisen principle, to aid small farmers with capital on co-operative principles, agricultural requisite supply societies, egg, poultry, pig societies, and the like.

The International Co-operative Alliance has 118 members, representing 569 societies in Britain and the Continent. Its object is to further the growth of co-operation, and by 1919 it had held nine congresses—in London, 1895; Paris, 1896; Delft, 1897; Paris, 1900; Manchester, 1902; Budapest, 1904; Cremona, 1907; Hamburg, 1910; and Glasgow, 1913.

In the United States of America co-operation has not made such progress as might have been expected from the energy and spirit of initiative prevalent among the people. Though co-operation had previously existed among the fishermen of New England, the Brook Farm (q.v.) experiment may be regarded as the starting-point of the movement. In Philadelphia co-operative building societies have provided the workmen with from 80,000 to 100,000 homes. The same form of co-operation flourishes in other parts of the country. A notable and thoroughly successful effort in productive co-operation was begun in the cooping trade at Minneapolis in 1874. But in America the influence of co-operation has been on a limited scale.

In France the co-operative movement has taken the direction of productive societies, especially in the building and furniture trades. They had contracts for the Paris Exhibition of 1900 for several million francs. They have a state subsidy of 150,000 francs. There are also numerous baking societies, and over 1785 co-operative credit societies, mostly agricultural.

In Germany co-operation has flourished greatly in the form of people's banks. These originated in 1849 under the auspices of Schulze-Delitzsch, at the little town of Delitzsch in Saxony. Schulze-Delitzsch was salaried counsellor (*amwalt*) or general manager of the societies till his death in 1883. In 1884 there were 800 societies (called after Raiffeisen, their founder) whose function it is to provide mutual credit for the small farmers of Germany. In 1906 there were 14,200 credit societies, 1837 distributive societies, 5246 agricultural societies, besides many others. The General Union of German Trade and Industrial Self-help Co-operative Societies, which carries on the traditions of Schulze-Delitzsch, is the chief body, though it does not recognise the distributive societies. In Italy co-operation is making great progress, chiefly in the form of people's banks. In 1906 there were about 1461 of these banks. Co-operation in other

forms also is rapidly making way—there are co-operative dairies, bakeries, and many others. In Belgium co-operation has established itself on a very considerable scale at industrial centres, in stores, bakeries, &c. In Denmark co-operative dairies, bacon-curing factories, egg-export societies, &c. have practically monopolised all the agriculture of the country (see DAIRY). In Russia co-operation dates from 1865, and although impeded throughout by political conditions, it had made steady progress before the revolution of 1917. Societies are of five types—consumers, credit, industrial, agricultural, and mixed. The Soviet policy towards the movement has been to preserve the outward form of co-operation, but to transfer all real control to the Soviet government; the All Russian Council of Co-operative Congresses being merged in the 'Centrosyus'.

The various Professional and Civil Service stores, begun in 1864, are simply a result of the application of the co-operative system to supply the wants of the middle classes; and these stores now do a very large business, the largest being the Army and Navy Stores, London. The salient difference between them and the workmen's store is that the former admits of the system of privileged shareholders, whereas the latter are open to every one who pays an entrance fee of one shilling.

From the above facts it will be apparent that the purpose and tendency of the co-operative movement is that the workmen, through the principle of associated industry, by means of a joint capital, should equitably manage their own affairs so far as they can. Such management, we have seen, has been applied on a large scale to distribution and to people's banks, and has had a considerable success also in various forms of domestic production, as in corn-mills, bakeries, boot and shoe factories, dairies, &c. Though essentially a workmen's movement, it owes much to the enlightened guidance of men of other classes, to Robert Owen, Maurice, Kingsley, to Neale, Holyoake, Hughes, Ludlow, and the Marquis of Ripon. So far as it has gone, the movement has been a real and effectual training for the intelligence, business capacity, and moral character of the workmen. It has taught them thrift, foresight, self-control, and the habit of harmonious combination for common ends; and it has opened up an unlimited field for peaceful, hopeful, and successful effort in the future.

See Holyoake's *History of Co-operation* (2 vols.), and his *Self-help a Hundred Years Ago* (1888); the reports of the Co-operative Congress; *Working-men Co-operators*, by A. H. D. Acland and B. Jones (1898); *Reports on Co-operation in Foreign Countries*, a blue-book issued in 1886; *Co-operation at Home and Abroad*, by C. R. Fay (1920); *Co-operation in India*, by H. W. Wolff (1919). See also *History of Co-operation in the United States*, published under the auspices of Johns Hopkins University (Baltimore, 1888).

**Cooper's Hill**, a ridge on the borders of Beiks and Surrey, commanding a beautiful view of the Thames valley, the scene of a famous poem by Denham (q.v.). Cooper's Hill College, established in 1870 for the education of engineers for the Indian Works Department, to which a forestry school (1885) was attached, was closed in 1906.

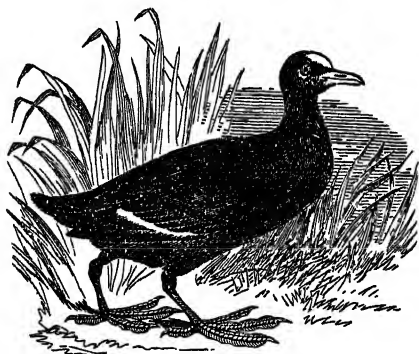

**Co-ordinates**. See GEOMETRY (ANALYTICAL).

**Coorg** (a corruption of *Kodagu*, a 'steep mountain'), a province under the government of India, on the eastern slope of the western Ghāts, and bordering on Mysore; area, 1583 square miles; population, 164,000. The capital is Merikara. Coorg is mainly within the basin of the Kaveri River; great part of its area is 3000 feet above the sea. The yearly rainfall is 122 inches, and hence the climate is humid. Nearly the whole of this rugged

region is covered with forests, which form the main natural wealth of the country, though gold and iron are found. The natives, a branch of the Dravidian stock, speaking a language akin to Kanarese, are handsome and athletic mountaineers. Agriculture is limited to the valleys. Coffee (injured recently by disease), cardamoms, and cinchona are grown. Polyandry used to be the rule. Cairns and dolmens are common, and the country is intersected by earthen ramparts, which are from 15 to 25 feet in height, with deep ditches.

**Coot** (*Fulica*), a water-bird in the same family as the rails (*Rallidæ*), and in the old order *Grallæ*. The members of the genus are well marked by a scalloped fringe round the long toes, which thus show an approach to the webbed condition. The beak is straight and short, but expands in a curious swollen patch on the front of the forehead. The tail is very short. The coots are essentially aquatic, almost always afloat, and especially frequent still waters. They feed on water-plants and small animals. The European species generally migrate southwards in winter.

The Common Coot (*F. atra*) is widely distributed in Central and South Europe, and in Western Asia. It is about 16 inches in length, and has a

Common Coot (*Fulica atra*).

predominantly slaty black colour, with a narrow white band across the wings. The beak has a pale flesh colour; a bald patch on the forehead is pure bright white; the feet are dark green. Coots make a large rough nest of water-plants and stems among the rushes, or on a rock in the middle of the stream. Coots are practically resident birds in Britain. The American coot (*F. americana*) is common in all parts of North America.

**Cooté**, SIR EYRE, soldier, born in County Limerick in 1726, entered the army at an early age, and from 1754 to 1762 served in India. It was by his arguments that Clive was induced to risk the battle of Plassey, and for his services in this and other engagements Cooté was in 1759 given the command of the newly raised 84th regiment. In 1760 he defeated Lally (q.v.) at Wandiwash, near Madras; and his capture of Pondicherry in 1761 completed the downfall of the French in India. Cooté returned to England, and was knighted in 1771. In 1779 he assumed the command-in-chief in India, with the rank of lieutenant-general, and in 1781 routed Hyder Ali at Porto Novo, a second time saving the presidency. He died at Madras, 26th April 1783. See Life by Wyly (1922).

**Cooté**, RICHARD (1636-1701), first Earl of Bellamont, supported William III., and was appointed governor of New England in 1695. He sent out Captain Kidd to put down piracy, and afterwards arrested him.

**Cootehill**, a town in County Cavan, Ireland, 88 miles NW. of Dublin; pop. 1550.

**Copaiba**, or COPAIVA, BALSAM OF, a valuable drug, consisting chiefly of a resin (resin of copaiba) and a volatile oil (oil of copaiba). It flows from incisions in the stems of various species of *copaifera* trees, natives of the American tropics, which belong to the natural order Leguminosæ. When these trees become old or surcharged with copaiba, it is no unusual thing for the stems to burst with a loud booming sound. The balsam has a peculiar, aromatic, but not disagreeable odour, which, however, is highly persistent, while its taste is decidedly acrid. It has stimulant properties, is diuretic, laxative, and in large doses often an active purgative. It is, however, mostly on account of its powerful action on the mucous membrane that it is used, and it is accordingly much employed in affections of the urino-genital system, in chronic catarrhs, &c. The resin itself has been found efficacious given in the form of a cough-pill. Balsam of copaiba is sometimes adulterated with castor-oil or volatile oils. The former of these is readily detected if any milkiness is produced when the balsam is shaken with ten times its volume of petroleum benzine. The volatile oils may be recognised by shaking the balsam with a little alcohol, when, being more soluble, they are removed first.

**Copais**, LAKE. See BÆOTIA.

**Copal**, a resinous substance used for a variety of purposes in the arts. It appears in commerce in smooth rounded masses, colourless or lemon-yellow, translucent or transparent, rather brittle, and in a cold state, almost without smell or taste. It is readily fusible and inflammable, is insoluble in water, and only partially soluble in alcohol and oil of turpentine, but becomes entirely soluble in them when it has been for a short time melted. Various useful pale-yellow or almost colourless varnishes and lacquers are made by dissolving melted copal in alcohol, oil of turpentine, or boiled linseed-oil. The chief sources of copal are the East Indies, Africa, and South America, but the varieties derived from these countries differ in their origin. The East Indian is the exudation of a large tree, *Vateria indica*, African from *Copaifera mopane* and *Hymenæa verrucosa*, American from *H. Courbaril*. Zanzibar supplies most of the best copal. *Gum Animé* is the name applied to copal frequently found in rounded masses embedded in sandy soil. See also KAURI.

**Copalchi Bark**, a bark resembling Cascarella Bark (q.v.) in its properties, and produced by a shrub of the same genus, *Croton niveus*, a native of Central America (see CROTON). The bark is in quills a foot or two in length, and has a thin corky epidermis. Copalchi Bark is much used as a substitute for cinchona in Mexico, where it goes by the name of *Quina blanca*, and is imported, although not to a large extent, into Europe. It contains a minute proportion of a bitter alkaloid resembling quinine.

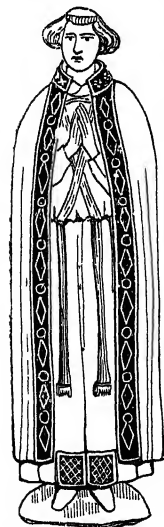

**Copán**, an Indian village in the south-western corner of the Central American state of Honduras, in a mountainous region, the site of a Maya city, of which magnificent ruins remain, first described by Stephens. See Maudslay, *Glance at Guatemala* (1899); Morley, *Inscriptions at Copan* (1920).

**Coparcenary**, an estate in England originating in descent to two or more persons, called thence coparceners or parcenars. It generally arises under the rule of law which makes the daughters of one dying without male heirs inherit equally, but it may also arise by local custom, as in the case of Gavelkind (q.v.). Although the property remains undivided, yet each parcenar is entitled to a dis-

inct share of it, and consequently there is no benefit of survivorship as in joint-tenancy, but the right of each descends to his or her heirs. The rule of descent is also *per stirpes*, so that the heirs of one who has predeceased the common ancestor take only the share which would have come to their immediate ancestor had he or she survived, and thus in the rare case of gavelkind a grandson of the common ancestor will also exclude his own sisters. Division may be carried through by voluntary agreement, or in an action of partition. Such parts of the property as cannot be divided (such as the manor-house, &c.) pass to the eldest sister or her issue, but an equivalent in value is assigned to the remaining sisters. Now, under modern statutes, instead of actual partition the property may be sold by order of the court, and the proceeds divided. These principles resemble closely the law of common property in Scotland, under which each *pro indiviso* owner may sell his right, and may insist on an action of declarator and division. If the subject is indivisible in a reasonable sense, it may be sold and the price divided. In the case of heirs-portioners in Scotland, also, such things as a peerage, a public office, or a mansion-house with accessories form a *præcipuum* for the eldest sister. Where the *præcipuum* comes under a settlement, compensation is generally due to the younger sisters. An Advowson (q.v.) is exercised in turns according to seniority. See GAVELKIND.

**Co-partnery.** See PARTNERSHIP, PROFIT-SHARING.

**Cope** (Lat. *cappa*, *pluviale*), an ecclesiastical vestment worn in the Latin Church during processions, solemn lauds and vespers, and other solemnities, but not by the celebrant at mass. The Greek form of the cope (*manduas*) is restricted to archimandrites and bishops. The cope of the former is plain, that of the latter with a pattern of wavy stripes. The Armenians alone use the cope as the vestment for mass. In the Church of England the cope was allowed as an alternative to the vestment or chasuble by the Common Prayer-book of 1549. Both were forbidden by that of 1552, but legally revived under Elizabeth in 1559. By Canon xxiv. of 1603, the principal minister at the Holy Communion in cathedral or collegiate churches, together with the epistoler and gospeller, is directed to wear the cope, and at Durham it was so worn till Bishop Trevor's episcopate (1752-71), when one of the prebendaries disused it, finding it interfered with his wig. The cope, however, has been customarily worn by the clergy officiating at coronations; while some further revival of its use has taken place of late years. The cope was originally a cloak worn for ordinary purposes. In form it is a semicircle, without sleeves and with a hood. It is fastened across the breast with a clasp or morse. Copes soon began to be ornamented with embroidery, and even with jewels; and so early as the 13th century they became the most magnificent and costly of all the vestments of the priesthood.

Cope.

**Cope, CHARLES WEST, R.A.**, subject-painter, was born at Leeds in 1811, the son of a landscape-painter. He attended the schools of the Royal

Academy, and studied for two years in Italy. He began to exhibit in the Academy in 1833, and produced a long series of sacred, historical, and domestic subjects. In 1843 his cartoon, 'The First Trial by Jury,' gained a £300 prize at the Westminster Hall competition; and in 1844 he was selected to execute, in the House of Lords, a mural painting of 'The Black Prince,' which was followed by 'Prince Henry,' and in the Peers' Corridor a series of eight subjects from the Civil War, completed about 1865. He was elected an A.R.A. in 1843, and an R.A. in 1848; and from 1867 to 1874 he held the professorship of Painting. He retired in 1883. He was an original member of the Etching Club, and his plate of 'The Life Class of the Royal Academy' (1865) ranks as one of the most vigorous figure-subjects ever etched by an Englishman. He died 20th August 1890.

**Cope, EDWARD DRINKER**, American naturalist, born in Philadelphia, 28th July 1840, was professor of Natural Sciences at Haverford College, 1864-67, and afterwards appointed palæontologist to the United States Geological Survey. His numerous papers and works on palæontology are highly valued; and to the discussion of the theory of evolution he contributed over a dozen works of importance. He was a member of numerous scientific societies in America and in Europe, and among other recognitions of his services to science, he, in 1879, received the Bigsby gold medal of the Royal Geological Society. He died 12th April 1897.

**Cope, SIR JOHN**, an English general, was a cornet in 1707, and, having been made a Knight of the Bath, in 1742 commanded the troops sent to the assistance of Maria Theresa. On the landing of Prince Charles Edward in 1745, Cope was commander-in-chief of the government forces in Scotland. After a fruitless march to the Highlands, he returned with his troops by sea to Dunbar, and on 21st Sept. was totally defeated at Prestonpans. His defeat is celebrated in the Jacobite song, 'Hey, Johnnie Cope, are ye waukin' yet?' Cope died 28th July 1760. See *Life* by Cadell (1899).

**Cope.** See KOPECK.

**Copenhagen** (Dan. *Kjøbenhavn*, 'Merchants' Haven'), the capital of Denmark, and headquarters of the national commerce, literature, and art, is situated on the low-lying eastern shore of the island of Zealand, in the Sound, which is here about 12 miles broad; an outlying portion, Christianshavn, stands at the north end of the island of Amager or Amak, which is separated from Zealand by a narrow arm of the sea. The channel forms a fine and capacious harbour, which is bridged over so as to connect Christianshavn and the main part of the city at two points. Fortifications on the land side were removed in 1863; so that the city practically incorporated the suburbs Østerbro, Nørrebro, Vesterbro, and Frederiksberg. The total population in 1735 was 60,000; in 1835, 120,000; in 1880, 235,254; in 1911, 559,393; in 1921, 710,353, or without suburbs, 561,344. To counterbalance the expected injury to the city's commerce from the opening of the Baltic Canal, a great free port (free from customs dues) was constructed in 1890-94 to the north of the harbour. The business quarter stretches from the harbour in a north-east direction towards the principal and central square, Kongens Nytorv, which in itself forms the focus of the life of the city. Farther north and east of this point lies the aristocratic quarter, with the handsome Amalienborg Square and its royal and ministerial palaces; this district is bounded in the extreme north by the citadel and the adjoining public gardens and walks on the shores of the Sound.

Amongst its few buildings of historical interest or intrinsic beauty, the metropolitan cathedral

church, known as Vor Frue Kirke, rebuilt after the bombardment of 1807, possesses statues of Christ and the Apostles, and a baptismal font, designed and in part executed by Thorwaldsen. Trinitatis-kirke is remarkable for its round tower, which is ascended by a winding causeway instead of steps; and Holmens' Kirke contains interesting monuments to the great naval heroes, Juel and Tordenskjold. An English church, built at a cost of £10,000, was consecrated in 1887. The royal palace, called Christiansborg, was rebuilt between 1794 and 1828, but was never remarkable for architectural beauty. The principal part of the vast building was destroyed by fire in 1884, when many precious works of art were destroyed. Happily most of the pictures in its great art gallery were saved. The castle of Rosenborg (1610-24), where the regalia are kept, contains interesting collections of objects of art; and the palace of Charlottenborg (1624) is now used as an academy of arts. Notable buildings are the magnificent Renaissance new town-hall (Raadhus) and the new art museum. The university was founded by Christian I. in 1479, has five faculties, 100 teachers, and 4500 students; all professors are obliged to give a series of public lectures free, and there are many foundations for poor students. Connected with the university are an observatory, a botanical garden, zoological and other museums and laboratories, a polytechnic institution, and a library of 500,000 volumes, with many ancient northern MSS. There is a veterinary and agricultural college. Copenhagen is the centre of Danish literature and art, and is the seat of the Royal Society, founded in 1742; the Royal Society for Northern Antiquities, founded in 1825; and many scientific societies. The Royal library contains 900,000 volumes, besides great treasures of Sanskrit and other MSS. The Museum of Northern Antiquities in Prindsens Palais, is unrivalled in its kind, having been made what it is mainly by Wojsaae. The Thorwaldsen Museum, opened in 1846, consists of works of art by that sculptor himself, and others left by him to the Danish nation, for which a separate building has been erected. Copenhagen contains also a number of well-supported benevolent institutions, banks, theatres, an exchange, &c. There are statues of several of the Danish kings, of Tycho Brahé, and of the poets. The chief exports of Copenhagen are grain, rape-seed, butter, cheese, beef, cattle, wool, hides, bones, and grain-spirit. Porcelain, pianos, clocks, watches, mathematical instruments, chemicals, sugar, beer, pencils, and tobacco are manufactured.

About the middle of the 12th century, Copenhagen was but a fishing-village, in the neighbourhood of which Bishop Axel, or Absalon, built a castle. In 1254 the village obtained the privileges of a town, and in 1443 King Christopher made it the capital of the kingdom. It was several times attacked by the Hanseatic League; was besieged by the Swedes in the 17th century; was bombarded by the English, Dutch, and Swedes in 1700; suffered grievously by fires in 1728, 1794, and 1795; witnessed a great sea-fight in its roads on 2d April 1801, when the English, under Sir Hyde Parker, with Nelson as his second in command, destroyed the Danish fleet; and (to prevent the Danish fleet from falling into the power of Napoleon) was bombarded by the English from the 2d to the 5th of September 1807, great destruction in life and property being wrought (see DENMARK). Most of the fortifications that defend the city date from 1836-1900. It was decided in 1920 to abolish the land defences.

**Copenhagen Fields**, in North London, noted as the meeting-place of an immense gathering of labour unionists on 21st April 1834, with the object

of overawing the ministry. But the crowd, seeing the military and other preparations made to receive them, dispersed quietly without attempting to carry out any of the violent designs with which they were credited. Since 1855 the site has been occupied by the Metropolitan Cattle Market.

**Cope'poda**, an order of minute marine and fresh-water crustaceans, belonging to the Entomostraca (q.v.).

**Coper'nicus**, NICOLAS, founder of the modern astronomy, was born 19th February 1473, at Thorn, which had lately belonged to the order of the Teutonic Knights (q.v.), but had become part of Poland. His father, a Polish subject, was apparently a Germanised Slav, and his mother of pure German extraction. Copernicus seems to have spoken German as his mother-tongue; but Poland and Germany still dispute with each other the honour of producing him. Brought up under the guardianship of his uncle Lucas, prince-bishop of the great Prussian diocese of Ermland, he matriculated at Cracow 1491, and there studied mathematics, optics, and perspective. Leaving without taking a degree, he enrolled himself in 1496 in the 'Natio-Germanorum' of Bologna University as a student of canon law, and was next year appointed canon of Frauenburg, the cathedral city of the diocese of Ermland, standing on the shores of the Frisches Haff. The year 1500 he spent at Rome, where he lectured on astronomy, and (6th November) 'observed an eclipse of the moon.' The following year he began the study of medicine at Padua, medicine in that age being essentially dependent on astronomy, and was at Ferrara, in 1503, invested with the doctorship of canon law. In 1505 he left Italy never to return to it, and settled in his native Prussia. 'Scholasticus' of Breslau till 1538, and canon of Frauenburg, yet Copernicus never became a priest. Appointed permanent medical attendant on his uncle, he lived with him from 1507 till 1512 in the princely castle of Heilsberg, 46 miles from the town of Frauenburg, where, besides thinking out his new astronomy, he had toilsome administrative and other duties to perform, involving him in frequent journeys. After his uncle's death in 1512, he lived at Frauenburg with an income as canon calculated at about £450 of present money, not merely to study the stars in his tower *Cura Copernicana*, but to execute difficult and multifarious offices as bailiff, military governor, judge, tax-collector, vicar-general, and physician. These offices he fulfilled with vigour and success, even while his difficulties were increased by the intrigues and wars which ultimately led to the restoration of West Prussia to the Teutonic Knights, and its incorporation with the Protestant state of Brandenburg. The coinage having been grossly debased by the Teutonic Knights and the three leading commercial towns of Prussia, Copernicus set himself strenuously to the task of its reform, and advocated the establishment of a single mint for the whole of Prussia. In 1523 he was appointed administrator-general of the diocese. The *De Revolutionibus* he completed in 1530, but could not be prevailed on to give it to the press till just before the end of his life. In 1542 he was seized with apoplexy, accompanied by paralysis on the right side. On the 24th May 1543 the first printed-copy of the work arrived at Frauenburg, and was touched by his dying hands only a few hours before he expired. His memory gone, and his faculties all obscured, it could only be said he seemed to know what it was he touched.

Besides the *De Revolutionibus*, Copernicus wrote and published at Cracow a Latin translation of the Epistles of the Byzantine author Theophylactus Simocatta, and a treatise on trigonometry. His

life was written by Gassendi; more recently by Von Hipler (1873), and Polkovski (Warsaw, 1873). By far the most complete account of Copernicus's life and labours is, however, the great biography by Dr Prowe (2 vols. Berlin, 1883; volume of documents, 1884). Copernicus's family name of *Koppernigk* is derived from a village so called in Silesia, and was Latinised by himself as *Copernicus*, and indeed by him generally so spelt.

THE COPERNICAN SYSTEM is that which represents the sun to be at rest in the centre of the universe, and the earth and planets to move round it as a centre. It got its name from Copernicus, who (although some vague general notion of the system seems to be due to Pythagoras) first distinctly drew the attention of philosophers to it, and devoted his life to its demonstration. For the rest, the glory of developing on the lines he broadly laid down, belongs to Kepler, Galileo, and others, and to Newton, who finally marked out the form of modern theoretical astronomy. Many who reverence the name of Copernicus in connection with this system, would be surprised to find, on perusing his work, how much of error, unsound reasoning, and happy conjecture combined to secure for him in all times the association of the system with his name; yet, with all its faults, that work marks one of the greatest steps ever taken in science.

Entitled *De Revolutionibus Orbium*, and dedicated to Pope Paul III., it consists of six books. The first contains the following propositions: 1. That the universe is spherical. This is established by such arguments as that the sphere is the most perfect figure, &c. 2. That the earth is spherical, which flows from the same kind of considerations. 3. That the earth and sea make one globe. 4. That the motions of all the heavenly bodies must be uniform and circular, or compounded of uniform and circular motions. Here, again, we meet with singular reasons. A *simple* body must move circularly, and nothing but circular motion could give periodicity to phenomena. 5. That, supposing the distance of the stars to be immense, there is no reason why the earth should not have a motion round its axis as well as a motion in its orbit. 6. That the sphere of the stars is immensely distant. The proof is fanciful, and shows he had no notion of a universe of stars pervading space. 7 and 8. The ancients were wrong in placing the earth at the centre of the universe. The arguments under this head are as fanciful as those which they were designed to refute. The falling of a body to the earth he deduces from the assumption, that it is only given to wholes to move circularly, while it is of the nature of parts, separated from their wholes, to move in right lines. That there must be a *centrum mundi*, an entity unknown to modern science, is admitted, the question being as to its position. 9. It is possible for the earth to have several motions. 10. He establishes the order of the planets, and draws a diagram of the system much as it is now represented. Following the old systems, such as the Ptolemaic, he lays down a *sphere* for the fixed stars. It is clear, also, that he had no idea of the motions of the planets other than that they were such as would be caused by their being fixed in immense crystal spheres revolving round the sun.

The sum of Copernicus's astronomical achievements is, mainly, the shifting of the centre of the solar system from the earth to the sun, and the consequent explanation of the alternation of day and night by the earth's rotation round itself, and of the vicissitude of the seasons by the earth's revolution round the sun. This complete transformation in astronomy was due in the first

instance to the sense of order in Copernicus's own mind, which, ever more clearly, protested against the inverse conception of a much smaller body at the centre, and a far greater at the circumference, and all the repugnant notions regarding the movements of the planets which such a conception involved. Discriminating motion as an attribute of matter, and space as the scene but not the subject of motion, Copernicus explained how the celestial sphere was but a limitation of space, and its movement only apparent; and how the 'backward loopings' of the paths pursued by the planets were only the perspective result of their real movements in conjunction with the real movements of the earth. Such was the comprehensive scheme of astronomy conceived by Copernicus; but it was impossible for him, with the instruments and ascertained facts then at his disposal, to master all the details. Instead of grasping the idea of elliptic orbits, he still abode by that of uniform circular motion, and had therefore to retain the 'epicycles' to account for 'irregularities,' though he reduced this apparatus of checks and balances to the number of thirty-four. It was reserved for Kepler to dispense with the epicycles (see PROTEMY, ASTRONOMY, KEPLER). Catholic churchmen received Copernicus's work with much favour; the only theological objections came from the Protestant party. Luther denounced Copernicus as an arrogant fool who wrote in defiance of Scripture, and Melancthon urged the suppression of such mischievous doctrines by the secular power. The conduct of the *De Revolutionibus* through the press having been delegated by Copernicus's friend, George Joachim von Lauchen (Rheticus) to Oslander (q.v.), the latter, by way of conciliating existing prejudices, foisted on the work a preface (*Prefatiuncula*) quite foreign from Copernicus's intentions, in which the doctrine of the earth's rotation is represented as a mere hypothesis, which has been attributed wrongly to Copernicus himself.

**Copiapó.** See ATACAMA.

**Copland, JAMES**, physician, was born at Deerness, in the Orkneys, in 1791, studied at Edinburgh, and settled in London in 1820. He wrote a well-known *Dictionary of Practical Medicine* (3 vols. 1832) and other works. He died 12th July 1870.

**Copley, JOHN SINGLETON, R.A.**, portrait and historical painter, was born 3d July 1737, at Boston, U.S. His parents, both of English extraction, had emigrated from Ireland in the previous year. It has usually been asserted that Copley was a self-taught artist; but Mr W. H. Whitmore of Boston has shown that he was instructed by his stepfather, Peter Pelham, the portrait-painter and engraver, and probably also by John Smibert. At the age of sixteen he was executing portraits of considerable merit; and in 1755 Washington sat to him. In 1766 and 1767 he sent over works for exhibition in the rooms of the Society of Incorporated Artists; and in June 1774 he left for Europe. In London he was well received by Reynolds, West, and Strange, and he was commissioned to paint the king and queen for Governor Wentworth. Passing to the Continent in August, he studied in Italy, returning to London in the end of 1776. His first important subject-picture was the 'Youth rescued from a Shark,' presented by the artist to Christ's Hospital School; which was followed by 'The Death of Chatham' (1779-80), an impressive subject, in which the portraits of the peers were carefully studied from life, and the still finer 'Death of Major Peelson' (1783). Both are in the National Gallery; the former was engraved by Bartolozzi, the latter by Heath. In 1789-90 he executed the immense 'Siege and Relief of Gibraltar,' now in

the Guildhall. Among his numerous other popular works may be named 'The Surrender of Admiral De Winter to Lord Duncan,' 'Charles I. demanding the Surrender of the Five Members,' now in Boston; 'Charles I. signing Strafford's Death-warrant,' and 'The Assassination of Buckingham.' He died 9th September 1815, leaving a son, the future Lord Lyndhurst. Copley's historical subjects are more original, spirited, and finer in colour than those of his friend and countryman West. See *Lives* by Perkins (1873) and Mrs Amory (1882), and his *Letters and Papers* (1915).

**Coppée**, FRANÇOIS (1842-1908), poet, was born at Paris. For three years a war-office clerk, he early gave himself to poetry, and already with *Le Reliquaire* (1886) and *Les Intimités* (1867) he took his place in the front rank of the 'Parnassiens.' Later volumes of poetry were *Les Humbles*, *Le Cahier Rouge*, *Olivier*—his one long poem—*Les Récits et les Élégies*, and *Contes en Vers*. His thought is marked by its distinction, his style by its perfection, and his exquisite treatment of Parisian elegy and idyll stand admittedly amongst the triumphs of modern poetry in France. His earliest dramatic poem, *Le Passant* (1870), owed much to the acting of Sarah Bernhardt, and was followed by *Deux Douleurs*, *L'Abandonnée*, *Le Luthier de Crémone*, and *La Guerre de Cent Ans*, which prepared the way for *Madame de Maintenon* and its 'succès d'estime' (1881), *Severo Torelli* (1883), his masterpiece in dramatic verse, and *Les Jacobites* (1885). Dramatic critic for some years to *La Patrie*, Coppée entered the Academy in 1884, and won fame in yet another field by several volumes of prose tales. See studies by Lescure (1889) and Schoen (1910).

**Copper**, probably the first metal employed by man, was early obtained from Cyprus, whence the name. Some prehistoric weapons are of unalloyed copper; the early use of Bronze (q.v.) was very extensive. Like gold and silver, copper is found native, but rarely and in small quantities. It can be extracted from its ores at a comparatively low heat, and is not altered by exposure to dry air; although in moist air, in the presence of carbonic acid, it soon takes on a coating of the green carbonate of copper. It has a characteristic fine red colour and takes a brilliant polish. It is nearly nine times heavier than water, its specific gravity being from 8.8 to 8.95. Next to silver it is the best conductor of heat and electricity, hence its many useful applications. Its point of fusion lies between silver and gold, but unlike these metals, it absorbs oxygen when strongly heated in the air, and scales of black oxide form rapidly on its surface. Copper is moderately hard, and is highly malleable, ductile, and tenacious, although not so strong as iron. When held, in the form of sheet or wire, in a flame, it communicates to it a highly characteristic green colour. Whereas steel is hardened by being heated to redness and suddenly cooled in cold water, copper is softened by the same process. Copper forms two important compounds with oxygen—cuprous and cupric oxides.

**Cuprous Oxide** (red oxide, sub-oxide),  $\text{Cu}_2\text{O}$ . This is obtained by heating to redness the black oxide with nearly its own weight of finely divided copper in a well-covered crucible, to protect the mixture from the oxidising action of the air. It is got as a hydroxide by adding grape-sugar to a solution of sulphate of copper, and then caustic soda, till a blue precipitate, which is first formed, is redissolved. The solution, on being gently warmed, deposits the hydroxide as a rich orange-yellow powder. On continuing the heating till the liquid has reached the boiling-point, and maintaining the ebullition for some time, the powder changes into

the red anhydrous oxide. This oxide is used in colouring glass a fine ruby tint. It is not acted on by air or moisture, and for this reason is produced on copper surfaces as a bronze to keep the metal itself from becoming stained. The salts of this oxide are generally colourless, but they are liable to absorb oxygen and pass into the blue-coloured cupric salts. Cuprous chloride is the most important salt, being used for absorbing carbonic oxide in gas analysis.

**Cupric Oxide** (copper monoxide, black oxide),  $\text{CuO}$ , is the scale or rust of copper which peels off the surface of the metal when heated. It is got for chemical purposes by heating nitrate of copper to redness in a crucible with occasional stirring, and carefully avoiding any possible admission of coaly matter. By the use of cupric oxide Liebig established the method by which the composition of all organic substances has been determined, as it readily gives up its oxygen at a red heat to carbon and hydrogen, converting them, respectively, into carbonic acid and water, from the weight of which the composition of the organic body is calculated. This oxide is used for staining glass, to which it imparts a green colour; and its solution in ammonia has the remarkable property of dissolving cotton fibre. The *Hydroxide*,  $\text{Cu}(\text{OH})_2$ , is obtained as a blue precipitate by adding caustic soda to sulphate, or other salt, of copper, which, as in the case of the cuprous oxide, becomes anhydrous on boiling, the blue precipitate becoming black and granular. The salts of cupric oxide are readily obtained by dissolving it in the necessary acids; for example, in sulphuric acid for the sulphate, and in nitric acid for the nitrate of copper.

**Cupric Sulphate** (sulphate of copper, blue vitriol),  $\text{CuSO}_4$ , occurs native in veins of copper and iron pyrites, and is manufactured on a large scale by gently roasting native copper sulphide (copper pyrites), when oxygen is absorbed from the air, the anhydrous sulphate thus obtained being dissolved in water, and from this solution the salt crystallises out. The blue crystals are much used by the dyer and calico-printer, in electroplating, for grain-dressing before sowing, for potato-spraying, for preserving organic substances, and, in very small quantities, for purifying water.

**Cupric Nitrate**,  $\text{Cu}(\text{NO}_3)_2$ , has crystals of an intense blue colour and deliquescent; it is much used in calico-printing as an oxidising agent.

**Cupric Cyanide**,  $\text{CuCy}_2$ , along with cyanide of potassium, gives the solution from which copper is deposited on an iron surface. It is not, however, necessary to prepare pure cupric cyanide, as the sulphate in excess of potassium cyanide serves the purpose.

**Cupric Arsenite**,  $\text{CuHAsO}_3$  (Scheele's green), is a well-known green pigment, got by adding an alkaline arsenite to cupric sulphate, and washing the precipitate till free from sulphate, and drying. This colour has been much used for wall-papers, but has been supposed to have insanitary effects. See ARSENIC.

**Copper Acetate**,  $\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2$ , is got by adding copper hydroxide, or carbonate, to acetic acid. It forms dark blue prisms. If acetic acid is allowed to act on metallic copper in the presence of air and moisture, a basic acetate is slowly formed termed *verdigris*; this has less acetic acid than the previous compound, and is much less soluble. It has a bluish-green colour. Verdigris and arsenious acid boiled together in water form the fine colour termed *emerald green*—an aceto-arsenite of copper.

**Copper Stearate** is obtained by adding stearate of soda to sulphate of copper in hot solutions. It is a light bluish-green powder used for colouring candles.

The pigment, *Brunswick green*, used in the arts, is an oxychloride of copper.

Copper in any liquid is easily discovered by placing in it a plate of polished iron, when it will be observed coating the metal with its well-known reddish tint, making its appearance over the part of the plate immersed in the fluid. If the quantity of copper is very small, the liquid should be concentrated till it half fills a watch-glass, and a bright steel needle used in place of an iron plate. Solutions of cupric salts have a blue or greenish-blue colour, but this on addition of ammonia in excess becomes an intense purplish blue.

*Native Copper*, although frequently met with wherever copper ores occur, is yet rarely discovered in sufficient quantity to admit of its being systematically worked. It is found crystallised in cubes and in modifications of this form; also in arborescent pieces, in thin laminae, and in irregular lumps or masses. Sometimes it forms a nucleus with first a layer of red oxide and then a second layer of carbonate of copper around it. The largest masses of native copper are obtained from mines in Russia, and from copper-bearing rocks in the neighbourhood of Lake Superior. One mass was mined at Minnesota in 1859, weighing 500 tons, which required the work of forty men for a year to extract it. A larger yet was got in 1866 at the Central mines, Lake Superior, and weighed 800 tons. Native silver occurs along with native copper.

The ores of copper are numerous. *Cuprite*, *ruby copper*, *cuprous oxide*, or *red oxide of copper*, is the richest ore. It contains, when pure, nearly 90 per cent. of copper. *Malachite* (q.v.), or *green carbonate of copper*, consists, when pure, of 57 per cent. of the metal. This ore occurs largely in Russia, South Australia, and in some localities in South America. *Chessylite*, *azurite*, or *blue carbonate of copper*, in a pure state contains 55 per cent. of copper. *Chalcopryite*, *copper pyrites*, or *yellow copper ore*, a sulphide of copper and iron, is, from its abundance, the most important of copper ores. Although containing, when pure, 35 per cent. of copper, yet on account of impurities, what is mined in England does not yield, on an average, more than 8 per cent. of the metal. Some of the auriferous copper pyrites of the western states of America and elsewhere is worked as an ore of gold (see GOLD). *Erubescite*, or *purple copper ore*, is also a sulphide of copper in which the proportion of the metal varies from 60 to 70 per cent. *Tetrahedrite*, or *gray copper ore*, is a sulph-antimonite of copper of very variable composition, but often containing from 30 to 40 per cent. of copper, &c. *Atacamite* (q.v.) is an oxychloride of copper mined in Chile, and found in other countries. *Melaconite*, or *black oxide of copper*, and *Chrysocola*, a silicate of copper, are sometimes smelted as ores of the metal.

**METALLURGY OF COPPER.**—*Smelting*.—In practice, the process of smelting copper from ore (copper pyrites) like the Cornish is somewhat complicated, but in theory it is comparatively simple. The main impurities of the ore are quartz, iron, sulphur, and very commonly arsenic. The process is conducted with a view to separating the iron and quartz as a fusible slag, and to dissipating the sulphur and arsenic, by converting them into sulphurous and arsenious acids, through oxidation in the furnace. Reverberatory furnaces are used, and these are of two kinds, calciners and melting furnaces. Gas is used to some extent for supplying heat to copper furnaces, but a stream of coal-dust is found to have greater advantages. There are never fewer than six operations in the 'Welsh' process of copper-smelting, and when so limited, a favourable admixture of ores, such as copper pyrites and copper carbonates, is necessary. In the *first*, the ore is calcined in a furnace for at least twelve hours, by which time the greater part of the sulphide of iron is decomposed, and much sulphurous and

other acids have formed and escaped in fumes—i.e. a partial oxidation of the iron and sulphur takes place. In the *second*, the calcined ore is melted along with siliceous slags obtained in later stages of the process. Here a fusible slag, consisting in great part of silicate of iron, is formed, and the sulphides of iron and copper are run off as a regulus, termed *coarse metal*, and granulated in water. In the *third*, the coarse metal is calcined again for twenty-four hours, during which time most of the sulphide of iron is converted into oxide. In the *fourth*, the calcined coarse metal is melted with slags rich in oxide of copper, and also with rich ores, as oxide and carbonate. These oxidise any sulphide of iron remaining, and a regulus called *white metal* is formed, consisting almost entirely of sulphide of copper, and containing about 75 per cent. of the metal. In the *fifth*, called 'roasting,' the regulus is very slowly melted, so as to allow of the gradual and thorough reduction of the sulphide by heated atmospheric air through the formation of oxide of copper. When oxide and sulphide of copper are heated together, they decompose each other, the sulphur escapes as sulphurous acid, and impure metallic copper, called *blister copper*, is produced, while other foreign bodies are for the most part removed in the slag. In the *sixth*, the copper from the previous operation is refined. To effect this, it is melted in a furnace, and exposed to the oxidising influence of the air for from fifteen to twenty hours, by which time it is full of dioxide, and this is in turn reduced by throwing pure coal on the surface of the molten metal, and then stirring it with a pole of green birch-wood.

Shaft or cupola furnaces, instead of those of a reverberatory kind, are used in some countries for smelting copper ores where these are highly ferruginous, or oxidised, or comparatively poor.

*Flotation*.—Of late, great developments have resulted from the application of improved methods in the use of so-called 'porphyritic' ores, in which the copper-bearing minerals are sparsely disseminated through a great bulk of rock. With modern mining methods and 'flotation' a very small proportion of copper may suffice to make a deposit pay. The ore is ground very small and mixed with water, a little oil, or some substance that behaves in a similar manner, and other chemicals. The mixture is then worked up into a froth. Whatever other forces may be at work, the differences of surface-tension separate the copper mineral from the other constituents of the rock. The water (with the help of the 'gangue-modifier') attaches itself to the gangue, while the copper-bearing particles, protected from wetting by the oil, adhere to the air-bubbles and rise to the surface. By flotation the concentration of copper sulphides can be much more satisfactorily effected than by merely gravitational methods.

*Wet Copper Extraction Process*.—Soon after iron pyrites (sulphide of iron) began to be used as the source of sulphur for the manufacture of sulphuric acid, it was thought desirable to recover the copper, amounting to a small percentage of the pyrites used. The burnt pyrites, consisting chiefly of oxide of iron, along with 4 or 5 per cent. of copper, is mixed with from 12 to 15 per cent. of crushed rock-salt and the mixture properly calcined, when the whole of the copper is converted into a soluble chloride. The roasted mass is then lixiviated, and the copper contained in the solution thrown down as metal by scrap iron. This precipitate contains about 75 per cent. of pure copper, and is mixed with the copper of the later stages of purification got in the dry process. A vast variety of more or less similar processes have been applied to different copper ores. The underlying principle is that some soluble salt of copper (as chloride or sulphate) has to be formed and dissolved out. Instead of precipitating

the copper by means of iron, it is advantageous where pure copper is wanted (as for electrical purposes) to remove it from the solution by electrolysis.

**APPLICATIONS OF COPPER.**—The metal is used for a great variety of purposes. It is most largely consumed along with zinc in the production of Brass (q.v.). To a less, but still considerable, extent it is made into bronze and gun-metal, in which it is alloyed with tin and other metals (see BRONZE). Alone it is employed for boilers, stills, cooking vessels, pipes, wire and wire-cloth, nails, and spikes. In the form of thin plates it has long been in demand for engraving and etching upon, and in the shape of strong rollers it is extensively employed for a like purpose by the calico-printer. Copper does not cast very well, but it is admirably adapted for producing works of art in electro-deposit instead of casting them. This process is extensively employed, and does even for objects as large as life-sized statues. In this way engravings and pages of type are also copied for the printing-press. For its use in coating other metals, see BRONZING. Copper is the metal usually chosen for lightning conductors, and for other purposes where high electric conductivity is an advantage. Writing-pens are made of an alloy consisting for the most part of copper, and for some purposes are better than those made of steel, as they do not corrode nearly so soon. These pens are usually white in colour. An alloy of copper, 'yellow metal,' is used for sheathing the bottoms of timber ships, so as to prevent molluscs and seaweeds from encumbering them. Copper, owing to its ductility, may be made into pipes, tubing, &c., by high pressure alone, without heat.

The copper-mines of the United Kingdom appear to have first risen into importance in the early part of the 18th century. According to Sir C. Lemon (*Journal of the Statistical Society*, vol. i.), the produce of the Cornish mines in 1771 was 27,896 tons of ore, yielding 3347 tons of copper. In 1856 (Hunt's *Mineral Statistics for 1856*) the returns were: Cornwall, 163,245; Devon, 42,025 tons of ore; together yielding 13,500 tons of metallic copper. After 1860, the year of their maximum yield, the quantity of copper obtained from mines of the United Kingdom steadily and rapidly declined from 236,696 tons of ore and 15,968 of metal, to 6792 and 532 tons respectively in 1901, and 136 and 72 tons in 1921.

The copper ore mined in other parts of the country besides Cornwall and Devon is negligible. Copper is chiefly smelted and refined at Swansea and its neighbourhood, but to some extent also in Lancashire. The English smelting works are now largely supplied with ore from Spain, South Africa (see CAPE OF GOOD HOPE), the United States, and Australia (q.v.). The entire quantity of metallic copper ore and regulus imported into the United Kingdom in the year 1922 was 33,169 tons.

The production of copper in the United States has increased rapidly since 1872. In that year the quantity obtained was 12,500 tons, while in 1921 it was as much as 505,586,098 lb. From the United States comes more than half of the world's production. The richest mine in the world is said to have been that at Laurium called Calumet (q.v.), on Lake Superior, in which region copper was mined by the ancient Indian or pre-Indian inhabitants. The states of Arizona and Montana are also productive; but copper occurs in several other parts of the Union.

**Copper Age**, a name sometimes given to a stage in culture leading on to the Bronze Age (q.v.), distinguished by the use of copper unmixed with tin. Such a stage seems to have occurred in some regions before tin was imported from Central Asia, &c. See METALLURGY (*Ancient*).

**Copperas**, or sulphate of iron, is used in dyeing black, in tanning, in making ink, and as a dressing for crops. See DYING.

**Copper Glance**, a mineral consisting of sulphide of copper ( $\text{Cu}_2\text{S}$ ), crystallises in the orthorhombic system, with pseudo-hexagonal symmetry, and is often twinned. It is of a lead-gray colour, with a black streak and metallic lustre sometimes rather greasy. It is soft (hardness  $2\frac{1}{2}$ ) and sectile.

**Copperhead** (*Trigonocephalus contortrix*), a venomous snake, allied to the rattlesnake, found in eastern North America. It has a thick body from 2 to 3 feet long, and a short tail without rattles, and is slow and clumsy in its movements; but, lurking in dark and moist places, and giving no warning, is more dreaded than the rattlesnake. The term was given to the peace party during the American civil war.

**Coppermine River**, so named, in common with the Copper Mountains to the west of it, from the metallic products of the vicinity, runs through the Mackenzie district of Canada, and after a course of 250 miles enters Coronation Gulf about  $68^\circ$  N. lat., and  $116^\circ$  W. long. It was discovered by Hearne in 1771. Its course is continually interrupted by falls and torrents.

**Copperplate Printing**. See ENGRAVING.

**Copper Pyrites**, or CHALCOPYRITE. See COPPER, PYRITES.

**Coppet**, a village of Switzerland, 8 miles N. by E. of Geneva, with a château, where Necker and his daughter, Mme. de Staël, are buried, and where the latter spent much of her life.

**Coppice**. See COPSE.

**Copra**, or COPPERAH, is the commercial name for the kernel of the coconut broken into small pieces and dried in the sun. From 500 lb. of copra 25 gallons of coconut oil should be obtained. The oil is used in making margarine. Marseilles and Hamburg are the chief seats of the copra-pressing industry. See COCONUT.

**Coprolites** (from Gr. *kopros*, 'dung,' and *lithos*, 'a stone') are the fossilised excrements of animals found in Palaeozoic, Mesozoic, and Tertiary strata. Their true nature was first inferred by Dean Buckland (1829), from their occurrence in the bodies of several species of Ichthyosaurus, in the region where was situated the intestinal tube. It has been since shown that they are the voidings chiefly of saurians and of sauroid fishes. They often contain portions of scales, bone, teeth, and shells, the indigestible parts of the food on which the animals lived. Occasionally they may be found exhibiting the spiral twisting and other marks produced by the conformation of the intestinal tube, similar to what is noticed in the excrement of some living fishes. These peculiar markings obtained for them the name, when their true nature was unknown, of 'larch-cones' and 'bezoar-stones.' Coprolites contain much phosphate of lime, and have thus been largely exploited for the manufacture of manure. Most of the so-called coprolites of commerce, however, are mere concretions and not fossil excrements.

**Copse**, or COPPICE, is a wood or plantation of broad-leaved trees, cut over every 10 or 12 years (as in hazel), or 16 to 18 (as in oak), or 25 to 30 (as in alder), and reproducing itself by means of new shoots thrown out from the stools or suckers sent out from the roots. No coniferous tree has sufficient reproductive power for coppice-treatment. Chestnut, oak, ash, hazel, lime, maple, sycamore, hornbeam, willow, and alder coppice better than beech, birch, and aspen, though the softwoods often become dominant on moist land. The best coppice crop for any given land and the best age

for cutting depend mainly on the local market for small wood. Copses may either be simple and pure or mixed, or they may be 'stored' with standard trees (preferably with light-demanding trees like oak, ash, elm, &c.) left to form an OVERWOOD over the coppiced UNDERWOOD, and to grow into timber-trees. Copse-woods were formerly worked under stringent regulations (see FORESTRY), and under the Statute of Woods (1543) '12 standills or stors of oak' were to be left per acre, or in default of oak, then 'elm, ash, asp, or beech.' It was in such copses and in hedgerows that most of the oak timber for the British navy used to be obtained. On good soil oak and ash are still the best standards, while, as in simple coppice, hazel, ash, and chestnut are usually the most profitable part of the underwood. Copse-woods used to be very profitable, but now they hardly pay. Oak coppice cut over every 16 to 20 years used to supply large quantities of tanning-bark and of charcoal, and ash and hazel cut over at shorter intervals supplied material for hurdles, thatching-rods, crates, agricultural implements, &c. In the Scottish Highlands most of the old coppices, now unprofitable, have reverted to the wild condition of 'natural woods' (See also WILLOW.)

**Coptis**, a genus of Ranunculacæ. *C. trifolia*, called Gold Thread on account of the appearance and colour of its rhizomes, is a native of swamps in the colder northern regions of both hemispheres. It has ternate leaves and solitary white flowers. The bitter rhizomes are used in America as a tonic, and as a yellow dye. That of *C. Teeta* of Assam is used in India as a bitter tonic.

**Copts**, the Christian descendants of the ancient Egyptians. The name (in Arabic, *Kubt*) is most probably derived from the same root as *Egypt*. The Copts form but a small part of the population of the country. A large proportion live in Cairo, but there are numerous populous settlements of Copts in Upper Egypt, notably at Girga, Negâda, Luksor, Asyût, Dendera, and Ikhmîm. They are essentially townsmen, engaged as clerks on account of their undoubted mathematical talents; or employed in the finer handicrafts, such as gold-smithery; and their occupations account for their paleness as compared with their Moslem neighbours. The few Copts who work in the fields do not differ perceptibly from the Moslems, and the resemblance to the 'ancient Egyptians' is visible in both, though the inbreeding of the Copt has, some think, retained the ancestral lineaments more faithfully. They are of middle stature, have black eyes, and black curly hair; dress like the Moslems, but are generally distinguished by a black or blue turban; the women are veiled. Their character is in general gloomy, deceitful, and avaricious; they are ignorant, drunken, and sensual. In religion they are Monophysites (q.v.) of the Jacobite sect; but a few are united to the Greek and Roman Catholic and Protestant churches. When the Council of Chalcedon in 451 pronounced the Jacobite opinion heretical, some of the Copts supported the verdict, and bitter jealousies ensued between these 'royalists' and the Jacobite Copts. The division of the Christians made the Moslem conquest in 640 a comparatively easy matter. They ascribe their conversion from heathenism to St Mark, whom they regard as the first patriarch of Alexandria. Their highest dignitary is the patriarch of Alexandria, whose residence, however, is in Cairo. Their other orders of clergy are twelve bishops, and archpriests, priests, deacons, and monks. The patriarch is named by his predecessor, or chosen by lot from among the monks of the convent of St Anthony.

He is not permitted to marry, and when he sleeps it is necessary to waken him every quarter of an hour. He nominates the metropolitan of Abyssinia (see ABYSSINIA).

The Copts are very strict in some of their religious observances, and hate other Christian sects even more than they hate the Moslems. They maintain the seven sacraments—baptism by tinea immersion; confirmation; penance or confession; orders; matrimony; unction; and the eucharist, administered in both kinds to all, even young children, and formed of leavened bread which has been dipped in wine. They keep Wednesday and Friday with great strictness as fast-days, and have besides an onerous fast of Nineveh, lasting fifty-five days, and lesser fasts of the Nativity, the Apostles, and the Virgin. Each fast is followed by a feast. Pilgrimage to Jerusalem is prized highly. A priest may be married to one virgin provided the ceremony takes place before ordination; if the wife die, he may not marry again, nor may the widow of a priest remarry. The Copts seldom marry outside their own sect; the wedding ceremonies are very peculiar, and may be read in L. Oliphant's *Land of Khemi*; the bride is expected to remain at home until confined, or for a year if barren (see Lane's *Modern Egyptians*). The Coptic ritual, liturgy, vestments, &c. are specially interesting as preserving unchanged very ancient Christian forms. The churches, of which the most celebrated are those built in the Roman fortress of Babylon at old Cairo, and those in the Nitrian valley, are remarkable for peculiarities of construction and plan, and for exceedingly beautiful carved ivory screens. An admirable account of them is given by Mr Butler. They have many schools, but only for boys, who learn the psalms, gospels, and apostolic epistles in Arabic, and then the gospels and epistles in Coptic. The Coptic, however, is not grammatically taught, and is not now a spoken language, having been everywhere supplanted by the Arabic. It has not been spoken in Lower Egypt since the 10th century, but lingered for some centuries longer in Upper Egypt. It is, however, still used by the Copts in their religious services, but the lessons, after being read in Coptic, are explained in Arabic. The Coptic language is the descendant of the ancient Egyptian, but the alphabet is Greek uncial, probably introduced soon after their conversion to Christianity. 'The romance of language could go no further than to join the speech of Pharaoh and the writing of Homer in the service-book of an Egyptian Christian' (Butler). There are two principal dialects of the language—the Sahidic or Upper Egyptian, and the Memphitic or Lower Egyptian, which is sometimes exclusively called Coptic. A third dialect, the Bashmuric, of which only a few remains exist, was spoken in the Delta, and is interesting from its points of resemblance to the language of the hieroglyphics. The literature is wholly religious. The last old man who spoke Coptic as his natural speech died in 1633.

See the article *EGYPT*; A. J. Butler, *The Ancient Coptic Churches of Egypt* (1884), and *The Arab Conquest of Egypt* (1903); Mrs Butcher, *The Church in Egypt* (1897); A. de Vlioger, *The Early Coptic Church* (1900); Montague Fowler, *Christian Egypt Past and Present* (1901); Dowling, *The Egyptian Church* (1909).

**Copyhold**, a species of estate or right of property in land, in Ireland and England. Copyhold is expressed technically as 'tenure by copy of court-roll, at the will of the lord, according to the custom of the manor.' This means that it is tenure of land, being part of a manor, the title being evidenced by the court-rolls of the manor, and the right of the owner being in conformity with the immemorial customs of the manor. The addition,

'at the will of the lord,' serves only as a memorial of the derivation of this species of estate from the estates granted in old times to the bondsmen or *Villeins* (see *SLAVERY*), which were of course resumable at the pleasure of the lord. But the will of the lord is now absolutely controlled by the custom of the manor, which forms the law of the tenure.

The custom of each manor varies. In some the lands are held for life only, generally, however, with a customary right to renewal or to appoint the successor; in some they descend according to particular rules; in most, however, they descend according to the ordinary rules of succession. But the custom, whatever it may be, cannot be altered.

Various money-payments are due by the copyholder to the lord. These are divided into the *rents*, an annual payment of the nature of the Scottish feu-duty, *fincs*, payments on particular occasions, such as alienation or succession; and *heriots*, or the best piece of personal property, to which, on the death of the copyholder, the lord becomes entitled.

In the case of an heir succeeding there is no surrender, but there is admittance only upon payment of the customary fine, and it is enforced by a customary penalty.

The inconveniences arising from the variety of customs to which copyhold lands are subject led to the passing of a long series of Copyhold Acts, having for their main object the gradual extinction of this tenure by the process of 'enfranchisement,' i.e. the conversion of copyholds into freeholds. The supervision of this process was entrusted to Copyhold Commissioners, who were subsequently amalgamated with the Inclosure Commissioners and the Tithe Commissioners under the name of the Land Commissioners for England, and, in 1889, the powers and duties of the Land Commissioners were transferred to the Board of Agriculture. Under the Copyhold Act of 1894, which consolidated, with various modifications, the earlier acts on the subject, copyholds may be converted into freeholds either voluntarily or compulsorily. In voluntary enfranchisement the compensation to be paid to the lord for the loss of his manorial rights is determined by mutual agreement. Compulsory enfranchisement may take place at the instance either of the tenant or of the lord. In the former case the compensation is a fixed sum of money; in the latter case, it takes the form of an annual rent-charge. In spite of these statutory provisions designed to put an end to copyhold tenure, this form of tenure still remains common in England.

The Law of Property Act, 1922, provides that, from the commencement of the act (1st January 1925) every parcel of copyhold land shall be enfranchised and become freehold, subject, pending payment of compensation, to manorial incidents having money values, such as fines and heriots, but free from other customary suits and services. Under the rules set out in Parts V. and VI. of the act, all manorial incidents, including rents, fines, heriots, and the like, are to cease either (a) when, within five years after the act comes into operation, the lord and tenant agree on compensation; or (b) when the lord or tenant, within the like period, serves a notice on the other to have compensation fixed by the Ministry of Agriculture under the Copyhold Act, 1894; or (c) at the expiry of ten years. Provision is made for making the compensation payable in twenty annual instalments, secured by a terminable rent-charge burdening the land. The act also provides a uniform system of succession.

**Copying** is a term in general use for a great many different processes, but may be described generally as the reproduction, usually either on an enlarged or reduced scale, of any drawing, map, or other work of art. A few of the methods employed

may be shortly described. If the copy is to be the same size as the original, the easiest way is to trace it. A piece of tracing-paper (which may be bought at any stationer's) is put over the drawing, and the principal lines gone over with pencil. The back of the tracing is then rubbed with black lead or ruddle, and put on the clean paper on which the copy is to be made; the traced lines are gone over with a hard point, and thus indicated faintly on the paper. Guided by the traced lines, the copy can then be drawn in. It is usual to have the ruddle or black lead on a separate piece of thin paper, and interposed between the tracing and the paper. When the copy is required of a different size from the original, the simplest way is to sketch it by hand and eye, but where more mechanical accuracy is required, the method of squares is very useful. The original is covered with squares of any convenient size by pencil lines or threads; a piece of paper for the copy is prepared with a corresponding number of squares, of a smaller or larger size, according as the copy is wanted smaller or larger. These squares must bear the same proportion to the squares on the original, as the copy is to bear to the original. It is then a comparatively easy matter to copy in each square the part of the original in the corresponding square. To avoid confusion if the squares are small, it is well to number them along each side of the drawing. If it is not convenient to cover the original drawing with pencil lines, or to tie threads over the face of it, a very good way is to draw the squares on a piece of tracing-paper, and put that over the original; the same tracing-paper will, of course, do any number of drawings. A pair of proportional compasses will be found very useful for fixing the proportional size of the squares. Any drawing consisting principally of straight lines, such as a plan, can be conveniently reduced by constructing a scale to suit the reduced size required. The lines of the original are measured by its scale, and the same proportion of the smaller scale gives the necessary measurement. The Pantograph (q.v.) is another means of making a reduction or enlargement, but is very seldom used now. It is only accurate in a general way. Perhaps the simplest and most exact method is to get the original photographed to the required size; the copy can then be traced on to clean paper as already described.

The copying of letters and other documents for commercial purposes is usually done by means of the ordinary copying-press. A letter written with specially prepared ink can be transferred to another piece of paper by means of damp and pressure. Common ink thickened with a little sugar will serve as copying-ink. Many modifications of this arrangement have been devised for producing copies of letters, circulars, &c. from written or typed copy. A document is transferred by pressure with the hand to a gelatinous slab, from which as many as fifty or sixty copies, more or less distinct, can be retransferred by rubbing with the hand. Many devices (cyclostyle, electric pen, &c.) apply the principle of the stencil. A very useful method of manifold writing is largely employed in telegraphic news work, and for duplicating invoices by retail tradesmen. Carbonised paper is put alternately with sheets of thin paper ('fimsy'), and thus, whatever is written on the top sheet by a hardish pencil is duplicated on the others. Carbon copies can be made in like manner with a typewriter. When an indefinite number of copies of any drawing or other subject is required, there are many printing processes which may be employed. Letters or circulars, if written with lithographic ink, can be transferred to stone, and any number printed. Engineers' or architects' drawings executed in *line* can be very successfully reproduced in any

size by photo-lithography; see the various processes described at LITHOGRAPHY, ILLUSTRATION OF BOOKS, PHOTOGRAPHY.

**Copyright**, in its most elementary form, is the exclusive right to multiply copies of a book. Some rudimentary notions of copyright may perhaps have existed before the introduction of printing; but such a right neither required nor received any definite recognition until the invention of the printing-press invested it with practical value. At first the right to publish was the subject of royal licenses and patents, granted as a rule not to the author but to the printer, and intended mainly as an instrument of the rigid censorship then exercised over the press. In England the publishers belonging to the Stationers' Company acquired a virtual monopoly under the operation of the Licensing Acts. When, at the end of the 17th century, the last of these acts expired and was not renewed, the publishers, dissatisfied with the doubtful protection of the common law, procured the passing of the Copyright Act of 1709, which was the earliest statutory recognition of authors' rights. Under this act authors acquired the sole right of printing their books during a term of fourteen years from first publication; and if the author should be living at the end of that time, during a further period of fourteen years. It was commonly supposed that in addition to the protection of this act the author had a copyright unlimited in time at common law; but in the celebrated case of *Donaldson v. Beckett* (1774), which led to a remarkable division of opinion among the judges, it was decided by the House of Lords that if any common-law right had existed in published works, it had been taken away by the statute. It became well settled, however, that the common law continued to protect the author against the unauthorised publication of unpublished works.

At the union with Ireland the Copyright Act was extended to that country, thus putting an end to the trade in cheap editions printed in Dublin and secretly imported into Great Britain. In 1814 the term of copyright in books was extended to twenty-eight years, and the residue of the author's life if he were living at the end of that term; while by the Copyright Act, 1842, which for seventy years remained the basis of the law as to books, it was extended to forty-two years from publication, or the life of the author and seven years, whichever period was the longer. In the meantime copyright had been successively extended by other acts to engravings and prints, sculpture, plays and lectures, while the act of 1842 applied it to music; it was not until 1862 that paintings, drawings, and photographs were made the subject of copyright. The addition of several acts, relating chiefly to international copyright, brought the number of statutes in force in 1911 to above twenty. Apart from their number, these statutes were very badly drawn, and totally lacked system; and the resultant confusion had been stigmatised by a Royal Commission as far back as 1878 in the following terms: 'The law is wholly destitute of any sort of arrangement, incomplete, often obscure, and even when it is intelligible upon long study, it is in many parts so ill-expressed that no one who does not give such study to it can expect to understand it.'

After many abortive efforts at reform, the law at length was placed on a clear and intelligible basis by the Copyright Act, 1911, which repealed nearly all the old statutes and consolidated the law, with numerous amendments, in a short code of thirty-seven sections; at the same time it abrogated the common-law right in unpublished works, copyright in which was henceforward to depend entirely on statute.

Apart from the great simplification thus achieved, the principal changes in the law made by the Act of 1911 were these:

All classes of works are treated on practically the same basis, and the term of copyright is in most cases very considerably extended; new classes of works are brought within the scope of copyright—e.g. works of architecture, entertainments in dumb show, cinematograph productions, and mechanical instrument records and rolls; registration of copyright and the requirement that a notice reserving performing right should be printed on music are abolished; the sole right to dramatise, to translate, or to reproduce on any kind of mechanical instrument is secured to the author; and the self-governing dominions are given a free hand in copyright legislation.

The main provisions of the act may be summarised as follows:

**Subject-matter of Copyright.**—Copyright subsists in every original literary, dramatic, musical, and artistic work, subject to certain conditions depending, in the case of published works, on the place of first publication, and, in the case of unpublished works, on the nationality or place of residence of the author when the work was made. Briefly it may be said that British subjects and residents in the United Kingdom have copyright in all their unpublished works, and all authors have copyright in works first published in the United Kingdom; colonial and foreign works also may enjoy copyright under analogous conditions.

**Rights.**—Copyright means 'the sole right to reproduce the work or any substantial part thereof in any material form whatsoever; to perform, or, in the case of a lecture, to deliver, the work or any substantial part thereof in public; if the work is unpublished, to publish the work or any substantial part thereof; and also includes the sole right to translate; to dramatise a novel, or *vice versa*; and to make any record, perforated roll, cinematograph film or other contrivance by means of which the work may be mechanically performed or delivered. It is also an infringement of copyright for any person to sell or let for hire, import for sale or hire, or, under certain conditions, to distribute or exhibit in public any work which to his knowledge infringes copyright. Certain acts are, however, expressly declared not to be infringements of copyright—viz. (a) any fair dealing with any work for purposes of private study, research, criticism, review, or newspaper summary; (b) the use of his original sketches, studies, &c. by an artist, within certain limits; (c) the making or publishing of paintings, drawings, engravings, or photographs of works of sculpture or artistic craftsmanship which are permanently situated in a public place or building, or of works of architecture; (d) the reproduction of short passages from published copyright works in school-books, under certain conditions; (e) the publication in a newspaper of the report of an address of a political nature delivered at a public meeting, or, unless the report is prohibited by notice in the prescribed manner, of any other address or lecture delivered in public; (f) the reading or recitation in public by one person of any reasonable extract from any published work.'

The sole right to make records, perforated rolls, and other contrivances reproducing musical works is subject to this limitation, that if the owner of the copyright allows one person to make such contrivances, or makes them himself, any other person may do so likewise, on certain conditions, which include the payment of a royalty of 2½ or 5 per cent. on the ordinary retail selling price of every contrivance sold by him.

**Term.**—The term of copyright is in most cases the life of the author and fifty years after his death; but after the expiration of twenty-five years (or, in the case of a work published before December 16, 1911, thirty years) after the author's death, any one

may reproduce the work for sale on certain conditions, which include the payment of a royalty of 10 per cent. of the published price. For works of joint-authorship the term is the life of the author who dies last, or fifty years after the death of the author who dies first, whichever period is the longer; while posthumous literary, dramatic, and musical works, and engravings, in which copyright subsists at the author's death, are protected until the expiration of fifty years from the date of first publication, performance, or delivery in public.

Photographs and records, perforated rolls and similar contrivances, are protected for fifty years from the making of the original negative or plate. Government publications also enjoy copyright for fifty years from first publication; but under the terms of a Treasury minute most Blue-books and other official documents may be freely reproduced.

If a work which has been published or publicly performed is withheld from the public after the author's death, the Judicial Committee of the Privy Council may grant a license for its republication or performance.

*First Ownership, Assignments, &c.*—The author is usually the first owner of the copyright in a work; but (1) the copyright in engravings, photographs, and portraits made to order belongs to the person giving the order, if there is no agreement to the contrary; and (2) similarly the copyright in a work made by a person in the course of his employment under a contract of service or apprenticeship belongs to the employer; but if the work produced under these conditions is a contribution to a newspaper, magazine, or similar periodical, the author may in general prevent its reproduction otherwise than as part of a newspaper, magazine, or similar periodical. This last-mentioned provision does not apply to encyclopædias, dictionaries, year-books, and similar works; and it may be observed that the complicated provisions under the old law as to the respective rights of author and publisher in the case of collective works, such as encyclopædias, magazines, &c. are all swept away. Subject to the exception just stated with regard to employers, the matter is left entirely to agreement; the author retains the copyright unless he parts with it in writing. The first owner of the copyright in photographs and in records, rolls, &c. is the owner of the original negative or plate at the time when it is made.

Assignments and licenses must be in writing signed by the person making them. The author cannot, however, in general assign, or grant any interest in, the copyright for the last twenty-five years of the term; the reversionary interest in this period forms part of the author's estate at his death, and may be bequeathed by his will. Articles in collective works are, however, an exception to this rule; the copyright in them may be assigned outright for the full term.

*Remedies.*—In cases of infringement, an action may be brought for an injunction (in Scotland, an interdict), damages, or an account of profits. Infringing copies, plates, &c. are forfeited to the owner of the copyright; this does not, however, apply to the case of architecture, nor can an injunction or interdict be obtained to restrain the construction of a building which has been commenced, or to order its demolition. If the defendant in an action for infringement proves that at the date of the infringement he was not aware and had no reasonable ground for suspecting that copyright subsisted in the work, the plaintiff cannot get damages or an account of profits, but only an injunction or interdict. Infringing copies made outside the United Kingdom may be seized on importation on notice to the customs. Infringements committed knowingly are

also offences punishable by fine or imprisonment on summary conviction. Civil actions must be brought within three years, and summary proceedings within six months, after the date of the infringement.

*Delivery of Books.*—The act also requires the publisher of every book published in the United Kingdom to deliver a copy free of charge to the British Museum, and also, if demanded, to the Bodleian Library, Oxford; the University Library, Cambridge; the Library of the Faculty of Advocates, Edinburgh; that of Trinity College, Dublin; and (with certain exceptions specified in Board of Trade Regulations) the National Library of Wales. Failure to deliver copies renders the publisher liable to a fine, but has no effect on copyright.

*Retrospective Effect.*—Works already in existence and actually entitled to copyright under the old law at the date when the act came into force (i.e. in the United Kingdom, 1st July 1912) enjoy the extended rights given by the act; the benefit of the extended term of copyright goes to the author or his representatives, subject to certain provisions safeguarding the interests of persons who had bought, or were otherwise interested in, the copyright under the old law.

*Unrepealed Acts.*—The 1911 act leaves unrepealed (1) the Musical Copyright Acts of 1902 and 1906, which provide stringent summary remedies for hawking pirated music; and (2) certain sections of the Fine Arts Copyright Act, 1862, which penalise the fraudulent marking of paintings, drawings, and photographs.

*Colonial Copyright.*—The Copyright Act extends to the British possessions generally, but not to any self-governing dominion which does not adopt it. All the self-governing dominions except Canada have adopted the act or passed substantially identical legislation. The old Copyright Acts, so far as they were previously operative (and also the local legislation on the subject), remain in force in Canada.

*International Copyright.*—Copyright may be extended by order in council to foreign works on conditions of reciprocity. Great Britain (with her colonies) is a member of the Berne Copyright Union, the other members being Belgium, Denmark, France, Germany, Hayti, Holland, Italy, Japan, Liberia, Luxemburg, Monaco, Morocco (French Protectorate), Norway, Portugal, Spain, Sweden, Switzerland, and Tunis. The union is regulated by the Berne Convention of 1886, the Acts of Paris of 1896, and the Berlin Convention of 1908; its fundamental principle is that each country undertakes to give to authors belonging to every other country of the union the same rights as it gives to its own authors. Great Britain also had before the war a copyright treaty of 1893 with Austria-Hungary.

*United States.*—Before 1891 copyright in the United States could only be obtained by American citizens or residents. The Chace Act of 1891 first permitted the extension of American copyright to foreigners on conditions of reciprocity; and by virtue of presidential proclamations issued under this act and the act of 1909 (which is the statute now in force), British subjects may obtain copyright in the United States on substantially the same footing as American citizens. All books in the English language, and books in any language by a citizen or domiciled resident in the United States, must be set up, printed, and bound there; moreover, all published works must bear the statutory notice of copyright (which in the case of books is 'Copyright, 19—, by—'), and must be registered and two copies deposited with the 'Register of Copyrights, Library of Congress, Washington, D.C.' The term of copyright is in

the first instance twenty-eight years from first publication, which may, however, be extended for a further twenty-eight years. Citizens or residents of the United States have copyright in the United Kingdom for their unpublished works, and for works first published in the United Kingdom or published simultaneously there and in the United States.

**Other Foreign Countries.**—It is not possible here to give details of foreign copyright laws. The general term of copyright in some of the principal countries may, however, be shortly stated, as follows: life of the author and eighty years, Spain; life and fifty years, Belgium, Denmark, France, Hungary, Norway, Portugal, Russia, Sweden; life and thirty years, Austria, Germany, Japan, Switzerland; life and forty years, or eighty years from publication, whichever is the longer (but subject during the last forty years to a general right of reproduction on payment of a 5 per cent. royalty), Italy.

**Copyright during the War.**—The effect of the war was to suspend the Berne Convention as between belligerents, and to suspend or destroy the treaty with Austria-Hungary, and therefore to deprive of copyright works produced during the war in enemy countries. The Enemy (Copyright) Act, 1916, conferred copyright on such works and vested it in the Public Trustee; other legislation allowed copyright subsisting before the war, but belonging to enemies, to be vested in the Public Trustee. Licenses to publish could be granted by the Board of Trade. The peace treaties provide for the resumption of copyright protection.

See the works of MacGillivray, Oldfield, Robertson, Copinger, and Briggs on the subject of copyright; also the articles BOOK-TRADE, PATENTS, TRADE-MARKS.

**Coquelin**, BENOÎT CONSTANT, actor, born in 1841 at Boulogne, where his father was a baker, was admitted to the Conservatoire in 1859, and having gained the second prize for comedy, made his début at the Théâtre Français, December 7, 1860, as Gros-René in the *Dépit Amoureux*. For over a quarter of a century he played here with unbroken success, both in classical pieces and in rôles created by himself; in the broader aspects of comedy, standing without a rival. From 1897 to his death, 27th January 1909, he was director of the Porte St Martin.—His brother, ERNEST ALEXANDRE, 'Coquelin cadet' (1848-1909), was also an admirable actor.

**Coquerel**, ATHANASE LAURENT CHARLES, an eloquent minister of the French Reformed Church, was born in Paris in 1795. He studied theology at Montauban, and became in 1818 minister of the French church in Amsterdam, but came to Paris in 1830 on the invitation of Cuvier, and preached here until his death, 20th January 1868. In 1848 he was elected a delegate to the National Assembly by the department of the Seine. His writings, all marked by earnestness and liberal sympathies, include a reply to Strauss (1841), six collections of sermons (1842-56), and *Christologie* (1858).—His son, ATHANASE JOSUÉ LAURENT (1820-75), also a Protestant pastor of liberal tendencies, was born at Amsterdam. A still more 'advanced' theologian than his father, he found himself at variance with the Protestant Consistory and the predominating influence of Guizot in his somewhat rigidly orthodox old age. Among his works were an edition of Voltaire's letters on toleration (1863) and *Jean Calas et sa Famille* (1857).

**Coquilla Nut**, the fruit of the Piassava palm, *Attalea funifera*. On account of their large size (3 to 4 inches long) and the hard texture and beautiful mottling of their dark-brown endosperm, they are imported by turners. See FIBROUS SUBSTANCES.

**Coquimbó**, the port of La Serena, 9 miles distant from it, stands on a bay near the mouth of the river Coquimbó, and is connected by rail with Valparaíso and Santiago. It has a good harbour and exports copper, silver, and manganese ores, wool, cattle, hay, and cobalt; pop. 15,000. The province of Coquimbó occupies the entire breadth of the country from the sea to the Andes. Its area is 14,000 sq. m.; pop. 160,000. The rainfall is small save in the south, where some farming is carried on. The main occupation is mining. See CHILE.

**Coracias.** See ROLLER.

**Coracle** (Celt. *corug*, Gael. *curach*), a boat made of a slender frame of wood or wickerwork, and covered with skins, used by the ancient Britons. A coracle covered with tarpaulin is still used on some Welsh rivers and on the Irish west coast.

**Coracoid**, an important paired-bone in the breast-girdle, forming along with the scapula the articulation for the fore-limb, and always lying ventrally. In the lower fishes the entire girdle is cartilaginous; in the bony fishes distinct coracoids first appear; they are well seen in Amphibia and in all reptiles except snakes; they are very large and strong in birds; but become mere processes of the scapula in mammals. They very often exhibit a special anterior portion known as the pre-coracoid. See BIRD, SKELETON.

**Corais** (Fl. CORAY), ADAMANTIOS. See KORAES.

**Coral**, a term loosely applied to any animal in the class Coelenterata which forms a hard skeleton. The tubular organ-pipe coral, the noble or red coral of commerce, and the reef-building madreporal corals, are familiar examples. Presuming an acquaintance with the general features of the class, as summed up in the article COELENTERATA, we may notice at the outset the fact that the formation of hard supporting structures is exhibited in very varied degrees, in manifold styles of architecture, and in widely separated forms.

**Different Kinds of Coral.**—(1) Among the Hydrozoa the skeletal investment of the polyp

A, branch of *Dendrophyllia*; B, part of a stock of red coral with (a) fully extended polyp, and (b, b) two polyps, partly extended.

types, when present, is usually horny. In one subdivision, however, the supporting framework is limy, and to these forms—Millepores and Stylasterids—the title Hydrocorallina is fitly applied. (2) It is, however, in the other sub-class

of Coelenterates—the Actinozoa—that the formation of coral structure becomes emphasised and perfected. In many simple and in most colonial forms, a skeleton is formed, as isolated spicules or continuous. When continuous it may be horny, or limy with an organic basis, or to all appearance entirely limy. (a) Among the Alcyonaria, of which Alcyonium (q.v.) is a convenient type, Tubipora, with the spicules united to form tubes and crossing platforms; Corallium, with a branched axis of fused spicules; Isis, with a jointed axis alternately limy and horny; Heliopora, with limy cups inclosing the individual animals, and traversed as they grow by successive horizontal floors at slight intervals, are examples of different forms of coral occurring in distinct groups. (b) Among the Zoantharia, of which Actinia or any sea-anemone is a familiar example, the Actinaria have no skeleton, and therefore include no coral forms; the Antipatharia have a varied non-calcareous supporting skeleton, and include some forms known as 'black corals'; the third subdivision, the Madreporaria, always have a continuous limy skeleton, and include the best-developed corals. Most madrepores are colonial, and the common connecting skeleton is either solid (apart from mere gaps) or perforated by canals which establish community of life between the individual members. Hence it is usual to distinguish two sections of Madreporas as Aporosa and Perforata. (3) The earliest corals of Palaeozoic strata—the Rugosa or Tetracoralla—are distinguished by four primary partitions.

**General Structure.**—In discussing further the general structure, it will be convenient to leave the widely separated Hydrocorallina out of account. The most general fact that can be stated at the outset is, that with the possible exception of the sea-pens, the cells which form the skeleton are at least originally epidermic. Free spicules, connected lattice works, solid cups, illustrate various degrees of lime deposition; while supporting axes, ensheathing tubes, and what look like tolerably

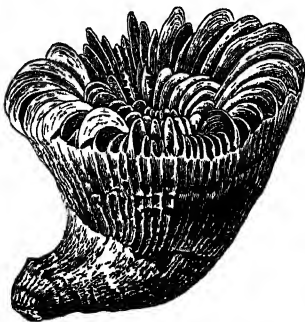

Fig. 2.—*Caryophyllia borealis*, single individual.

complete casts of the entire animal, are the main types of coral architecture. In detail, however, those main types vary widely, and in the cup-corals especially, the structure is often very complex. In a simple madre-pore coral, representing a single individual, the following structures are at once obvious. The main cup-like mass, known as the *theca*, is usually attached by its base to some foreign object. A terminal depression—the *calyx*—contains the animal, the soft parts of which extend more or less over the lips. Within the cup, when the animal has died away, radial partitions are seen, forming various systems of *septa*. Some of these often meet in the middle of the cup to form a central pillar or *columella*. When the coral is colonial, as is generally the case, complications arise by the fusion of individuals. The deeper parts of growing corals are sometimes separated off by cross partitions (*tabulae*), but this is rare in the Zoantharia. In large masses of madre-pore certain portions of the skeleton are often left behind by the animals, and being exposed to the water,

become corroded and altered. In regard to the development of corals, it is hardly possible yet to make any useful general statements. For the animals themselves, it must be enough here to refer to the articles on ALCYONIUM and ANEMONE, which, though not themselves 'corals,' are good examples of the two sub-classes to which most corals belong.

**General Life.**—Corals are predominantly passive forms, and are much modified by their environment (currents, &c.); the great majority are permanently fixed, except in embryonic life. Flabellum may be noted as an instance of a coral-cup which becomes free as an adult. The limy material which forms the skeleton seems, in many cases at any rate, to be derived not from the water, but from the minute animals which constitute the food. The great majority are colonial, yet cases of division of labour are very rare. Many corals are richly coloured, but the meaning of the numerous pigments is still imperfectly known. Masses of corals furnish browsing ground for crowds of animals, not a few of which intrude into the colonies, while others have become established parasites. Some corals also include parasitic Algae (see SYMBIOSIS). Semper describes some very interesting cases of the constant association of worms and corals, and notes how the guest has permanently modified the host (see COMMENSALISM). It is interesting to notice, apart from actual modification of form, how various worm-organisms act upon the 'sea-meadows of coral' much as earth-worms do upon land-meadows (see Huxley's *Invertebrates*, p. 171).

In most corals the sexes are separate, and even the colonies may be entirely male or female. In Corallium, hermaphrodites may occur, or different branches be of either sex. As is common in sessile passive organisms, asexual or vegetative reproduction is a marked feature. Semper considers the budding of the Fungia colony as illustrating 'alternation of generations.'

**Distribution.**—Of the madre-pore corals, the 'solitary' forms, which never form great masses, are for the most part widely distributed deep-sea animals, while the reef-builders are as markedly dwellers in shallow water, from the low-tide mark to about 20 fathoms, and are limited to warm waters. They are not found on the western coasts of Africa and America. In the waters of the Central Pacific reef-corals are found in greatest profusion and variety; but those of the Red Sea, Indian Ocean, and East Indies are not far behind. Over eighty fossil genera of the Palaeozoic Rugosa are known, and of the other Actinozoan corals, about 1800 fossil, and as many living species. Of these, the vast majority are madrepores, and only a small number Alcyonarian. Both sets begin in Silurian times, but were for long outnumbered by the Rugosa. Most existing genera date only from the Tertiary period. The 'areas of past distribution of coral-reefs in no way correspond with those distinctive of the modern seas.' See Heilprin, *Distribution of Animals* (1887).

**Important Forms.**—The most important corals are the reef-builders (Poites, &c.). The delicate colour, exquisite architecture, and labyrinthine complexity make the limy skeletons beautiful objects. Yet more beautiful, however, is the wealth of colour often exhibited by the living forms. Caryophyllia is a simple and solitary cup-coral found on the south coast of England. Bathyactis and Deltocyathus are almost world-wide. Antipathes—the black coral—has a valuable hard axis like ebony. Fungia is worth noting on account of its flat mushroom-like shape and Semper's observation (see above) in regard to alternation of generations; among Alcyonarian

forms may be noted the blue coral (*Heliopora cerulea*) of many Pacific coral-reefs, the horny and beautifully coloured sea-fan (*Gorgonia flabellum*), and the familiar organ-pipe coral (*Tubipora musica*).

More important, however, in practical interest is the red coral (*Corallium rubrum*) of commerce. In this coral the limy spicules are fused to form the familiar solid axis. The most important banks are those of Algiers and Tunis, and off the Sardinian, Sicilian, and Balearic islands. Great quantities are fished near Naples, and at Sciacca in Sicily. The coral is roughly dredged, freed from its rind, assorted according to colour, and manufactured in Naples, Leghorn, Genoa, &c. Pale rose-coloured coral, not spoilt by the boring of worms and other intruders, fetches very high prices. The industry is a very important one, though in recent years it has seriously declined. The most important markets are in Asia, Africa, parts of Russia, Japan, and South America.

CORAL ISLANDS is the name given to certain low islets which are composed for the most part of the calcareous skeletons of various kinds of corals. An atoll or typical coral island consists of a somewhat ring-shaped reef inclosing a lagoon. Such reefs vary in size from less than a mile up to 90 miles long and may be 10 miles wide—the breadth of the annular reef being on an average about a quarter of a mile. *Barrier-reefs*, which have a similar breadth, are found surrounding islands or bordering mainlands, from which they are separated by a navigable channel. *Fringing-reefs*, on the other hand, extend outwards from the shore, with no separating lagoon-channel. In the case of atolls and barrier-reefs there is generally a navigable passage through the reef into the lagoon or lagoon-channel, which is kept open by the scour of the tide. It is upon atolls or barrier-reefs that islands occur. Only very rarely, however, are these islands co-extensive with the reef—generally they appear as longer or shorter belts, forming a series of islets straggling along its surface. As reef-building corals do not flourish in water having a lower temperature than 68° F., they are necessarily restricted to tropical and subtropical seas—from many regions of which, however, they are excluded by the presence of cold currents coming from extra-tropical latitudes, by the muddy character of the water opposite the mouths of large rivers, and by other causes.

The rock of a coral-reef is a white limestone composed chiefly of masses of corals, coral debris, and sand, together with the hard parts of molluscs, echinoderms, bryozoans, and calcareous algae. Not infrequently this rock has been changed by the chemical action of percolating water into a compact or crystalline mass, which has lost all, or nearly all, trace of its organic structure. Chamisso (q.v., known also as a poet), the naturalist who accompanied Kotzebue the Russian navigator in his voyage of discovery into the South Sea in 1815-18, appears to have been the first to show how such reefs are converted into dry land. He describes how the polyps cease to grow when they reach the surface of the sea, and how the reef, exposed at low-tide, by and by becomes disintegrated, while broken coral debris is heaped up by the action of the breakers so as eventually to form a high bank which can only be covered during spring-tides. This bank of coral blocks and debris solidifies in time, and remains exposed to the fierce heat of the sun, so that the mass shrinks and cracks, and flakes are detached from it, and raised one upon another by each returning tide. 'The always active surf throws blocks of coral (frequently of a fathom in length and 3 or 4 feet thick) and shells of marine animals between and upon the foundation-stones; after this the calcareous sand lies undisturbed, and offers to the seeds of trees

and plants cast upon it by the waves a soil upon which they rapidly grow to overshadow its dazzling white surface. Entire trunks of trees, which are carried by the rivers from other countries and islands, find here at length a resting-place after their long wanderings: with these come small animals, such as lizards and insects, as the first inhabitants. Even before the trees form a wood, the real sea-birds nestle here; strayed land-birds take refuge in the bushes; and at a much later period, when the work has been long since completed, man also appears, builds his hut on the fruitful soil formed by the corruption of the leaves of the trees, and calls himself lord and proprietor of this new creation.' According to Professor L. Agassiz, the large blocks torn off by the breakers are loosened not by shrinkage under the sun's heat, as Chamisso supposed, but by the innumerable perforations of various boring molluscs.

The origin of coral-reefs is a question which has at various times given rise to discussion. According to Chamisso, the corals commenced to grow on shoals in the sea—on the tops of submarine mountains in short. The circular form of the atoll and its basin-shaped lagoon he believed to be due to the natural growth of the coral. The most vigorous growth took place upon the outward edges of the reef, where the largest and most massive corals flourished. In the interior the coral growth was hindered by the accumulation of shells, coral debris, and sand swept forward by the waves. The reef, therefore, as it approached the surface would gradually assume a basin-shape—the outer edges, or peripheral and actively growing portion, forming the reef—the interior part, where growth was retarded or prevented by sediment, &c., forming the lagoon. Other writers attempted to account for the annular form of atolls by supposing that the reefs had grown upwards from the crests of submarine volcanic craters. The not infrequent occurrence of volcanoes and volcanic islands in the coral regions of the Pacific Ocean was thought to favour this supposition, but the enormous diameter of many atolls seemed to preclude the possibility that these larger atolls, at all events, could be founded on the lips of submarine craters. And when at length it was discovered that reef-building corals flourish only in comparatively shallow water, this hypothesis was rejected, since it was extremely unlikely that so many submarine volcanic mountains should rear their summits just to the limits within which the corals could begin their superstructures.

Darwin, during the famous voyage of the *Beagle*, was naturally fascinated by the problem of the origin of these remarkable reefs, and while he admitted that certain atolls might very likely have been formed in the manner described by Chamisso, yet he could not believe it possible that a broad mountain-summit lay buried at the depth of a few fathoms beneath every atoll, and nevertheless that throughout the immense areas occupied by many of those reefs not one point of rock should project above the surface. The theory of subsidence which he subsequently advanced seemed to account for all the phenomena, and until recently it commanded nearly universal assent. According to Darwin, each atoll has passed through the successive stages of fringing-reef and barrier-reef. Since reef-building corals do not thrive at greater depths than 100 feet or thereabout, it is evident that the foundations of a coral reef could not have been laid in deeper water. And as such moderate depths occur only round islands and off the shores of continents, the reef-builders would begin their work by forming at first a fringing-reef. Slow subsidence of the sea-bottom is supposed to have supervened; but while the foundations were being carried down, the corals continued to grow upwards, the

rising of the reef keeping pace with the sinking of the sea-bottom. Thus by-and-by the fringing-reef is converted into a barrier-reef. We have now only to suppose that the movement of subsidence and the labours of the corals continue until the reef-encircled island disappears below the waves, and a complete atoll will be the final result. Darwin's views were illustrated and strongly supported by Professor J. D. Dana, who accompanied the Wilkes exploring expedition round the world in 1838-42, while MM. Couthouy and Beete Jukes likewise upheld the hypothesis of subsidence. The researches of Professors L. Agassiz and Le Conte amongst the reefs of Florida have shown that Darwin's views are there inapplicable. They attribute the formation of the southern portion of Florida, which consists of a series of concentric barrier-reefs, to the natural growth of the coral alone aided by the mechanical action of the sea—a view which, stated generally, is the same as that held by Chamisso. Professor Karl Semper likewise, after examining the reefs of the Pelew Islands, came to the conclusion that the form of these reefs had been determined by the natural growth of the corals, modified by local conditions, which is just Chamisso's explanation. But Darwin had already expressly stated that some reefs might have originated in the manner suggested by Chamisso; and geologists apparently recognised that the conditions of the great Florida reef were hardly analogous to the isolated atolls which rise from profound depths in the open ocean.

In 1880, however, Dr (afterwards Sir) John Murray of the *Challenger* expedition, published another explanation which has given rise to considerable discussion. He returns to the old views of Chamisso, maintaining that reefs have grown up from the tops of submerged and partially submerged banks and mountains. To the objection that it is hard to believe that so many banks and cones should occur just at the proper depth from the surface, Sir J. Murray replied that it was not necessary to suppose that all the submarine eminences were of equal or nearly equal height. Some may have risen at first above the level of the sea, and subsequently have been reduced by the waves and breakers to the condition of shoals; while others that did not reach to the limits within which reef-builders live may have been brought up to that zone by the accumulation upon them of the hard parts of pelagic organisms. For these forms of life flourish in extraordinary numbers in the surface-waters of the tropics where reefs abound, and as they die, their hard parts falling to the bottom will accumulate there along with the exuviae of creatures living at such depths, until they come to form considerable deposits. This levelling-up of submarine banks to the zone within which coral-builders thrive is the most marked feature in Sir J. Murray's hypothesis. His further account of the mode in which atolls and barrier-reefs have been formed is a more particular and scientific development of Chamisso's explanation. The growth of a reef is regulated by the food-supply of the corals; those growing on the external parts of the reef are most favourably placed in this respect, consequently they thrive best, and have the advantage over those that are growing in the centre of the reef; and this difference in the rate of growth of the outer and inner areas will be intensified as the reef approaches the surface. Eventually the corals of the interior die, and the dead coral rock is gradually removed by the solvent action of the sea-water which contains carbonic acid. In this manner the reef assumes a basin-shaped form. Fringing-reefs, according to Sir J. Murray, are converted into barrier-reefs by the simple outward growth of the coral upon a talus of its own debris, forced off from the

edge of the reef by the breakers. The lagoon-channel that eventually separates the reef from the land is formed in the same way as the lagoon of an atoll—namely, by the dissolution and removal of dead coral rock. Professor A. Agassiz published in 1882 an account of his detailed examination of the Tortugas and the Florida reefs, in which he shows how the bottom of the sea in those regions has been gradually raised by the accumulation of the exuviae and skeletons of massive organisms which flourish in prodigious numbers on the sea-floor, forming the submarine plateaus known as the Florida, Yucatan, and San Pedro banks. He thought it was by the gradual upward growth of such accumulations that the sea-bottom was eventually raised to the zone in which reef-builders thrive. He thus arrived independently at the same general conclusion as Sir John Murray.

In his work on the Solomon Islands (1887) Dr Guppy supported the hypothesis advocated by Murray. He showed that we have there elevated reefs which exhibit the very structure which we should expect to find on that hypothesis. He found some of those islands largely composed of earthy calcareous deposits having the same character and origin as the various volcanic muds and organic oozes which the *Challenger* expedition dredged at depths varying from 100 to 2000 fathoms. These deposits reached to heights of over 1000 feet, and in some cases denudation had exposed an underlying nucleus of volcanic rock. The earthy calcareous beds were covered with a comparatively thin crust of true coral rock.

In 1910 Mr F. Wood-Jones put forward a theory arrived at from a study of the Cocos-Keeling Islands. Sir John Murray sees in the deposition of fine sediment the agent that brings the sea-floor up to the level at which corals can thrive. Mr Wood-Jones sees in this same deposition the agent that prevents corals from thriving at greater depths. In other words, sedimentation makes the growth of coral possible simply by making further sedimentation impossible; and it does this by bringing up the bottom to the region disturbed by waves and currents. The form of the reef is attributed to a similar cause. Against the theory of solution within the atoll, Mr Wood-Jones urges that not removal but deposition is there going on; that more coral sand enters than leaves the lagoon. He maintains that the ring-form is characteristic even of reefs below the surface, and of many separate colonies on the reef. The latter take the form of a dome, which flattens as it grows. Its increasing size and flatness enable sand to accumulate on the top, so that the rim grows while the centre dies off. The same process is held to occur in the atoll as a whole, and a similar principle explains the departure of the Cocos-Keeling atoll from circularity.

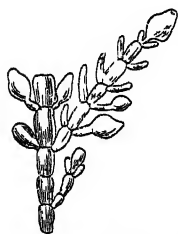

See COELENTERATA, ANEMONE (SEA), ALOYONIUM; text-books of Zoology—Huxley, Claus, &c., Darwin, Dana, Murray, Guppy, &c. on Coral-reefs; Milne-Edwards and Haime, *Hist. Nat. des Coralliaires* (1857-60); Mrs. E. David, *On a Coral Island* (1899); *The Atoll of Funafuti*, based on Mr C. Hedley's collections (1898); Wood-Jones, *Coral and Atolls* (1910); and Semper's *Animal Life*; Moseley and Quelch, *Challenger Rep.*, vols. ii. and xvi.; for skeleton, Von Koch, *Morphologisches Jahrbuch* (1879-86); for red coral, Lacaze-Duthiers, *Histoire Naturelle du Corail* (1864) for fossil forms, Zittel's *Paläontologie*; systematic works—Dana, *Zoophytes* (1848-49); S. J. Hickson, *Introduction to the Study of Recent Corals* (1924).

**Coral Fishes** (*Squamipennes*), a name applied to a family of bony fishes in the spiny-rayed or Acanthopteron order. They are tropical forms, abundant about coral reefs, usually small, with short, deep, often brightly coloured bodies. The family includes the Archer-fish (q.v.), the very beautiful *Chaetodon*s, the genus *Chelmo* with

peculiarly elongated snout, and other interesting forms.

**Coral Flower**, or CORAL TREE (*Erythrina*), a tropical and subtropical genus of papilionaceous trees and shrubs, with long racemes of beautiful flowers of a rich dull crimson or a scarlet colour, resembling coral. Some species are thorny, and are hence used for hedges, notably *E. corallodendron* in the West Indies, and *E. indica* in the East. The wood is so light and spongy that it is used not only for portable objects, such as ladders, but even as a substitute for cork.—*Jatropha multifida*, a totally different plant, of the order Euphorbiaceæ, is also sometimes called Coral Tree.

**Coralline** (*Corallina officinalis*), a limy seaweed, exceedingly common on British coasts, where it adds much to the beauty of the rocky pools. In spring it appears as a thin crust, with a fresh delicate pinkish or purplish colour. With the increasing sunshine it grows into prettily jointed and branched tufts, spreading like brushwood over the surface of the rock. Its purple colour increases in depth, till the plant grows old and begins to die; then the brightness pales, and the limy incrustation finally remains as a white skeleton. The purple colour soon fades on exposure; a bright white light is produced by holding a piece of the alga in a candle flame; an unpleasant smell lingers for years about the dried specimen. The coralline was formerly regarded as an animal, 'since all lime,' Linnæus said, 'is most truly a product of animals.' But neither for this, nor for its supposed medicinal (vermifuge) virtues was there any warrant. The common coralline, along with a few other species, forms a genus of the

Portion of Branch of *Corallina officinalis* magnified.  
(From Lundsborough.)

family Corallinææ, of the Rhodophycæ, or Floridææ. Melobesia is an allied form of similar stony character. It is sometimes used for manuring fields, and is said to have been one of the principal constituents in the mortar of Iona cathedral. Certain Hydrozoa (q.v.) are sometimes called corallines.

**Coralline Crag**. See CRAG and PLIOCENE.

**Coral Rag**, or CORALLIAN, a group of the Oxford or Middle Oolites. See JURASSIC SYSTEM.

**Coral-root**, a name given (1) to the cruciferous plant *Cardamine* (or *Dentaria*) *bulbifera* (see DENTARIA); and (2) to a genus of orchids, *Corallorhiza*, whereof one, the rare *C. innata*, occurs in boggy woods in Scotland. They are rootless saprophytes, with scale-leaves, and a fleshy root-stock which branches like coral.

**Coral Sea** is that section of the Pacific which stretches between Australia on the west and the New Hebrides on the east. In 1874 the *Challenger* expedition found parts of it to be 14,700 feet deep. See PACIFIC.

**Coral Snake** (*Elaps*), small venomous snakes in the same family (Elapidae) as the Cobra (q.v.). The typical species (*E. corallinus*) frequents woods and thickets in South America. Their very small mouth makes them less dangerous. The usual colour is rich red with black and yellow transverse bands, and it is an interesting fact that besides the venomous Elaps, at least two other genera occur which are quite harmless. These, Mr Wallace suggests, probably derive advantage from their close resemblance to the venomous forms.

**Coram**, THOMAS, philanthropist, was born at Lyme Regis, Dorsetshire, in 1667 or 1668. He was

bred a seaman, and rose to be a merchant captain. Already in 1694 we hear of him as settled at Taunton, Massachusetts, and engaged in benevolent work of various kinds. A few years after he seems to have returned to sea, and to have settled in London, after suffering shipwreck off Cuxhaven in 1719. In London he interested himself in the settlement of Georgia, and in planting English artisans in Nova Scotia; but he soon began his long agitation for the foundation of a foundling hospital. Children were first admitted in 1741. Coram's portrait was painted by Hogarth, a warm patron of his scheme. More thoughtful for others than for himself, Coram fell into poverty, from which he was relieved in 1745, by an annuity of £161 contributed by his friends. He died 29th March 1751. See Life by Compston (1918).

**Cor Anglais**, a wind-instrument of the reed species, similar in construction to the Oboe (q.v.), to which it has the same relation as the Bassett-horn (q.v.) has to the Clarinet (q.v.). It is usually made in the key of F, a fifth lower than the ordinary oboe, and has the same range—viz. from E in the bass stave to B<sub>4</sub> above the treble stave.

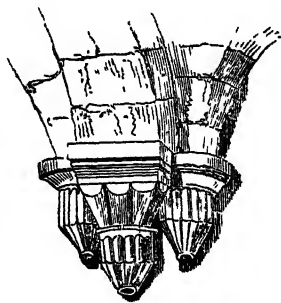

**Corato**, a town in southern Italy, on a fertile and well-cultivated plain, 25 miles west of Bari; pop. 50,000.

**Corban**, properly an offering to God in fulfilment of any vow. This might either be of some possession devoted to God, redeemable by an equivalent in money, or it might be a pledge to deprive one's self of something lawful in itself, as wine, for a longer or shorter period. A man might so interdict himself by vow, not only from enjoying anything himself, but also from giving it to others, and thus many of the old Jews juggled their consciences into getting rid of natural responsibilities, as the support of decayed parents, and the like. It was this miserable selfishness, under the thin garb of religious hypocrisy, that our Lord rebukes in the Scribes and Pharisees (Matt. xv. 5; Mark, vii. 11).

**Corbeil**, a town in the French department of Seine-et-Oise, on the Seine, 20 miles S. of Paris, with manufactures of clocks, cotton, and paper, and large flour-mills and granaries, for the supply of Paris; pop. 10,000.

**Corbel**, in Architecture, a projection of stone or wood from the face of a wall, used for supporting pillars or other superincumbent weights.

Corbels proper were originally plain on the sides and carved on the front only. Such were the Romanesque corbels, which are so numerous and so richly ornamented. The carving at first resembled the end of wooden beams, but gradually all sorts of figures were introduced, chiefly heads of men and animals. Corbels of great size were likewise used to carry the projecting parapets of castles.

Corbel:  
Kirkstall Abbey.

**Corbet**, RICHARD, poet and bishop, was born in 1582, son of a gardener in Ewell, Surrey. From Westminster School he passed to Broadgates Hall (now Pembroke College), next to Christ Church, Oxford. He took orders, and had already enjoyed preferments at Cassington, Oxfordshire, and Stewkley, Bucks, as well as a prebend in Salisbury,

when in 1620 he was made Dean of Christ Church at thirty-seven. In 1624 he was appointed to the see of Oxford, and translated to that of Norwich in 1632. Here he died in 1635, and was buried in his cathedral. Corbet was famous for his conviviality and wit, and his poetry reflects his cheerful and genial temper. His longest piece, *Iter Boreale*, describes a holiday-tour of four students; the best, and best known, is the *Fairies' Farewell*. See J. E. V. Crofts in *Essays and Studies*, x., 1924.

**Corbey**, or **CORBIE**. See **CORVEL**.

**Corbie-steps**, or **CROW-STEPS**, the stepped slopes of gables. This is a Scottish term, derived

Corbie-steps, from a house formerly in the Castle-wynd, Edinburgh.

no doubt from the *corbelled* or projecting character of the steps, and afterwards corrupted into crow-steps from the resemblance of corbelled to corbie or crow. The origin of this mode of finishing a gable probably arose from the steps used for passing from one side of the roof to another — the parapet

defending the passage being stepped in conformity with the slope of the stairs. Crow-steps were the almost invariable finish of Scottish gables from the 14th to the 17th century, and they were also much used in the Low Countries.

**Corbridge**, a town of Northumberland, near the confluence of the Cor with the Tyne, 4 miles east of Hexham, was a parliamentary borough in 1295. Near it is Corstopitum, an important Roman station excavated in 1907 and following years.

**Corchorus**, a genus of Tiliaceæ. *C. olitorius* is widely diffused in tropical countries, being cultivated both as a pot-herb (Jew's Mallow) and on account of its fibre. For the closely allied *C. capsularis*, see **JUTE**. The Japanese shrub, common in gardens on account of its double yellow flowers, called by gardeners *C. japonicus*, belongs to the Rosaceæ, and is correctly known as *Kerria japonica*.

**Corcyra**. See **CORFU**; also **CURZOLA**.

**\*Corday d'Armans** (perhaps better **DE CORDAY D'ARMONT**), MARIE-ANNE CHARLOTTE, known as CHARLOTTE CORDAY, was born at St Saturnin, near Sées (Orne), 27th July 1768. The descendant of a noble family, with Corneille's blood in her veins, she yet welcomed the Revolution, for from Voltaire she had imbibed 'philosophic' theories, from Plutarch ideas of antique heroism. But she was horrified at the monstrosities of the Jacobins; and her hatred of their acts was intensified by converse with a party of proscribed Girondists, who had fled to Caen in Normandy. She resolved to rid her country of one of the heads of the Jacobins, and came with that view to Paris. Whether to slay Robespierre or Marat was an open question; but while she debated the matter with herself, a demand of the latter for two hundred thousand more victims, marked him out for her weapon. Twice she failed to obtain an audience, but on the evening of 13th July 1793 she was admitted on the plea that she had important

news from Caen to communicate. She found Marat in his bath, and her pretended denunciation of the fugitive Girondists, some of whom were her own friends, called forth the remark: 'They shall receive their reward; I will have them all guillotined at Paris.' Straightway she drove her knife to his heart; he died with a stifled cry. Charlotte was at once arrested, and brought before the Revolutionary Tribunal, where she gloried in the act. In the Conciergerie she sat to the artist Hauser; on the evening of 17th July she was guillotined. The executioner held up her head to the multitude, and slapped it; in the sunset the beautiful dead face seemed to blush. See works on her by Vatel (3 vols. 1872), Mrs Van Alstine (1889), R. Focke (1895), and DeFrance (1909); also Austin Dobson's *Four Frenchwomen* (1890).

**Cordeliers** ('cord-wearers'), the name applied in France to the Observantists, or strictest branch of the Franciscans (q.v.), on account of their wearing a girdle of knotted cord. During the Revolution the name was applied to the members of a political club which was instituted in 1790, and assembled in the chapel of a Franciscan monastery. Its leaders included Danton, Hébert, Camille Desmoulins, and Marat, and for a time it rivalled the more famous club of the Jacobins (q.v.). The height of its influence was the period of Camille Desmoulins' journal, *Le Vieux Cordelier*. Soon after the fall of Danton, the Cordelier club lost its influence, and it was insignificant when closed by the Convention in August 1795.

**Corderius**, the Latinized name of Mathurin Cordier, grammarian, born in Normandy in 1478, who taught at Paris (where he had Calvin for a pupil), and, becoming a Protestant, settled at Geneva. There he died, famous as a skilful teacher of youth, on the 8th September 1564. He wrote a long series of grammatical works, of which the best known throughout Europe was the *Colloquia Scholastica* (1564).

**Cordia**, a drupaceous genus of Boraginaceæ, trees or shrubs. Some species are valued for their fruit, their timber, or both.

**Cordierite**, **DICHOITE**, or **IOLITE**, a natural silicate of magnesia, alumina, and ferric oxide. It crystallises in stout orthorhombic prisms, and is of various shades of blue, sometimes with a tinge of gray or brown. It exhibits the property of dichroism very clearly, often appearing deep blue when viewed in the direction of the vertical axis, but red or yellow when seen by transmitted light at right angles to that direction.

**Cordilleras** (lit. 'chains'), a name applied in America to various chains of mountains. The Cordilleras of South America are described under **ANDES**; and the Rocky Mountains are the Cordilleras of North America. Those of Central America extend from Darien to the north of Mexico. See **AMERICA, MEXICO**.

**Cordite**, a smokeless powder (see **GUN-COTTON**) invented by Sir Frederick Augustus Abel, and used in the British Army since 1892, is made of a mixture of gun-cotton, nitro-glycerine, and vaseline; and is named from its string-like or cord-like appearance. See **RIFLES**.

**Córdoba**, or **CORDOVA**, a city of Spain, capital of the province of Córdoba, 74 miles ENE. of Seville. It stands on the right bank of the Guadalquivir, here crossed by the Moorish 'Puente Viejo' of sixteen arches, and occupies a slope connected with the Sierra Morena. The old turreted walls inclose gardens and vineyards; but the interior shows narrow and dirty streets. Córdoba was from the 9th to the close of the 12th century a Moorish town of the first rank, renowned for its

rich mosques and palaces, and still more for its university. Among the principal buildings is the cathedral, built as a mosque in the 8th century, the most magnificent Mohammedan temple in Europe, and converted (1236) into a Christian church. Córdoba was at one time celebrated for its manufacture of goat leather, called *cordovan*, whence the term *cordwain*, but that industry is now almost entirely gone from it. Cordovan, still prepared in the Levant, is used in bookbinding and for finer boots and shoes. Córdoba has a bishop's palace, a lyceum, a theatre, a fine casino, museum, &c. It manufactures silverware, silk fabrics, paper hats, &c. Called by the Carthaginians the 'gem of the south,' Córdoba was (152 B.C.) founded by the Romans as Corduba. Taken by the Goths in the 6th century, it fell (711) to the Moors, in whose hands it remained till 1236, when Ferdinand III. of Castile struck it a blow from which it has never recovered. In 1808 Córdoba was taken and plundered by the French. Córdoba was the birthplace of the Latin poet Lucan, the philosopher and dramatist Seneca, and the Arabian philosopher and heretic Averroes. Pop. 74,000.—The province of Córdoba has an area of 5300 sq. m., and a pop. of 565,000; see ANDALUSIA.

**Córdoba**, a central province of the Argentine Republic, mostly pampa land, rising to the Sierras de Córdoba and de Pocho in the west. Area, 67,000 sq. m.; pop. 800,000. Cattle-raising is the chief industry. The climate is healthy, but very dry; the temperature ranges from 18° to 107° F.—The capital, Córdoba, lies 240 miles WNW. of Rosario. It has a cathedral, a handsome city-hall, the old university building, with walls from 4 to 6 feet thick, a national observatory, and noble baths. The university (1613) sank greatly after the expulsion of the Jesuits (1767), until in 1870 several German professors settled here. The town possesses also a national college, a school of art, a school of agriculture, and an academy of sciences, which publishes a valuable *Boletín*. Founded by Cabrera in 1573, the town was famous during the Spanish occupation as a seat of learning and the centre of the Jesuit missions in South America. It was afterwards falling into decay, but the opening of the railway in 1870 brought transit trade, and greatly restored its prosperity. In the hot months of December, January, and February, however, the place is a very trying residence. Pop. 150,000.

**Córdoba**, a town of Mexico, 54 miles WSW. of Vera Cruz, in a fruitful valley, 3045 feet above the sea. Formerly important, it sank greatly after the revolution; but in later years it has in some degree recovered its trade. It is surrounded by rich coffee-plantations. Pop. 10,000.

**Cordon**, in military operations, is a line of sentries within sight of each other inclosing or guarding any particular space of ground, to prevent the passage of unauthorised persons. If intended to guard against contagious diseases, it is called a *cordon sanitaire*.

**Cordon Bleu**, originally the 'blue ribbon' which in France supported the insignia of the Order of the Holy Ghost; but playfully transferred to good cooks, who after examination received a medal, also suspended from a 'blue ribbon.'

**Córdova**. See CÓRDOBA.

**Cordova**, a port and mining village on the south coast of Alaska, 440 miles WNW. of Juneau, terminus of the Copper River railway, produces copper, coal, petroleum, and gold; pop. 1000.

**Corduroy**, a ribbed kind of Fustian (q.v.), a cotton stuff made after the fashion of velvet.

**Cordus**, VALERIUS (1515–44), greatest of the early German botanists, was born at Simtshausen, near Fraunkenberg, son of Euricius Cordus (1486–1535), a native of the same place, also notable for a botanical work (*Botanologicon*, Cologne, 1534), as well as Latin poems and medical books. Valerius Cordus studied at Marburg and Wittenberg, made extensive botanising journeys in Germany and Italy, discovering many new species, and died suddenly in Rome. For his *Dispensatorium pharmacorum* see PHARMACOPŒIA. His great work is his *Historia Stirpium*, edited after his death by Gesner (1561). See E. L. Greene, *Landmarks of Botanical History*, vol. i. (Washington, 1909).

**Cordyceps**, a genus of fungi (Pyrenomycetes), parasites on insects and spiders. *C. militaris* attacks caterpillars, filling the whole body (whose outward shape is preserved) with a dense mass of fungus-threads (sclerotium). From this sprout bright orange-red, club-shaped stromata, whose perithecia contain asci which produce spores. *C. Taylori* has an antler-shaped stroma. See FUNGI.

**Cordyline**, a genus of Liliaceæ, resembling *Dracæna*, inhabiting warm countries. The leaves of some yield fibre.

**Corea**. See KOREA.

**Coregonus**, or WHITEFISH, a genus of palatable, herring-like Salmonidæ. They differ from salmon and trout in having larger scales, a smaller mouth, and teeth absent or very minute. In Arctic regions the whitefish are marine, except when they ascend rivers to breed; elsewhere they are like char, mostly imprisoned in lakes—relics of ice ages. They probably illustrate the origin of species in isolation. The British and Irish forms are known as Vendace, Pollan, Powan, Schelly, Gwyniad, and Houting; and *Coregonus sapidus* or *albus* is a much-esteemed American species.

**Corella**, a town of Spain, in Navarra, 49 miles SSW. of Pamplona, trades in wine, grain, oil, almonds, esparto, and brandy; pop. 7000.

**Corelli**, ARCHANGELO (1653–1713), surnamed 'il divino,' Italian composer and violinist, was born at Fusignano in the Bolognese. He visited Germany (probably Bavaria and Hanover) and Paris as a violinist, but about 1685 had settled in Rome, where he spent the rest of his life, warmly befriended by Cardinal Ottoboni. He was the first of the great violin virtuosos, and founded the technique of violin-playing. His compositions, including concertos, sonatas, and minor pieces for the violin, mark an epoch in chamber music, and had great influence on later composers, as Bach.

**Corelli**, MARIE (1864–1924), adopted daughter of Charles Mackay (q.v.), was trained in a French convent for a musical career. Though not favoured by the critics, she secured high popularity amongst novel-readers and the 'general public.'

**Corentyn**, a river of South America, forms the boundary between British and Dutch Guiana, and enters the Atlantic by a broad estuary. Its upper course is remarkable for the beauty of its scenery, especially of its great cataracts. It is navigable for 150 miles from the sea.

**Corfe Castle**, a village-borough of Dorsetshire, in the 'Isle' of Purbeck, 4 miles SE. of Wareham. Its famous castle, dating from early Norman times, is the traditional scene of the murder of King Edward the Martyr by his step-mother Elfrida (978); and more than twenty knights, 'most noble and valorous in arms,' were done to death within its walls by King John. In 1643 it was gallantly defended by Lady Banks for six weeks against 600 Roundheads. Taken through treachery two years later, it was dismantled; and its beautiful ruins, with their 'hanging towers,' cover nearly 3½ acres.

**Corfinium**, capital of the Peligni, was selected by the allies in the Social War to be capital of Italy. See **ROME**, vol. viii. p. 772.

**Corfu**, the most northerly and second in area of the Ionian Islands, at the entrance to the Adriatic, separated from the mainland of Greece and Albania by a channel from 2 to 12 miles broad, is 40 miles long from north-west to south-east by  $3\frac{1}{2}$  to 20 miles broad; area, 227 sq. m.; pop. of the nome, 138,400. The island is traversed by mountains, bare and rocky in their upper slopes, culminating in Pantokratoras, 3000 feet high, at the north-east end. The surface is largely covered with luxuriant groves of olive, cypress, and ilex. The winters are rainy, the summers hot and dry. The principal products are olives and wine, oranges, citrons, figs. Maize is the chief cereal, but yields only about a quarter of the consumption. Olive-oil is the principal export. Wine is also exported to Italy and Central Europe. There is little agriculture. Fishing, too, is left to the Albanians and Italians. The principal town, Corfu, having 38,600 inhabitants, is finely situated on the east coast, with some good streets and a fine esplanade, and has a good anchorage and is in direct steam communication with Alexandria, Athens, Italy, and England. Corfu is the seat of a Greek and of a Catholic archbishop, and has a palace. An Ionian Academy, founded by Lord Guildford in 1823, lost its importance after the foundation of Athens University. The town underwent great improvements during the British protectorate. The ancient name of the island is Kerkyra or Corecyra, but from its shape it was also called Drepane, or 'sickle.' It has been incorrectly identified with the Homeric *Scheria*. About 734 B.C. the Corinthians planted a colony here, which, by its commerce, growing rich and powerful, fought with the mother-city (665 B.C.) in a sea-battle. After many vicissitudes, Corfu fell under the Roman dominion (229 B.C.). For the more modern history, see **IONIAN ISLANDS**.

**Cori**, a small town of South Italy, 30 miles S.E. of Rome. It preserves the name and occupies the site of *Corā*, one of the oldest cities of Latium. The ancient remains still existing include those of the old walls, temples of Hercules and of the Dioscuri, and a fine bridge.

**Coriander** (*Coriandrum sativum*), an annual plant of the natural order Umbelliferae, with branching stem, 1 to 2 feet high, the lower leaves bipinnate, the upper leaves more compound, and globose fruit. It is a native of the south of Europe and of the East, and has long been cultivated for the sake of its fruit; and has thus become naturalised in some parts of England, although its fruit (coriander seed) is much less used in Britain than in Germany and some other European countries. The whole plant, when fresh, has a very offensive smell; but the ripe and perfectly dry fruit has an agreeable aromatic smell and a sweetish aromatic taste. It is used in medicine as a carminative, and as a corrective of certain purgatives; also in domestic economy as an aromatic, being very often mixed with bread in the north of Europe; spirituous liquors are flavoured with it; and confectioners cover it with sugar to make a well-known kind of comfit. In the south of England it is common to sow coriander and caraway together, the coriander yielding a crop in the first year, and the caraway in years following. Coriander delights in a rich soil, and is much cultivated and used in India.

**Corigliano**, a town in the Italian province of Cosenza, on the slopes of a castle-crowned hill, 4 miles from the Gulf of Taranto. Pop. 15,000, mostly employed in cultivating the vine and corn.

**Coringa**, a seaport in Godavari district, Madras, stands at the northern mouth of the Godavari River, 8 miles S. of Cocanada. It has declined much owing to the obstruction of its harbour by a bar, and to its having been twice overwhelmed by a tidal wave—in 1787 and 1832.

**Corinna** (surnamed *Muia*, 'the fly'), a Greek lyric poetess, a native of Tanagra, in Boeotia, who flourished about 500 B.C. She is said to have instructed Pindar, and to have vanquished him in a poetic contest. Only a few fragments of her work remain, collected by Bergk in his *Lyrici Poetae Graeci* (Leip. 1843).—Madame de Staël's *Corinne* was an Italian improvisatrice. For her, see **Vernon Lee's Studies of Italy in the 18th Century**.

**Corinth**, a city of Greece, celebrated in antiquity, situated on the rocky isthmus of Corinth ( $3\frac{1}{2}$  miles wide, and 262 feet high), which connects the Peloponnesus with the mainland. The city lay under the northern declivity of the mountain (1886 feet high, and forming one of the strongest natural fortifications in the world) on which stood its citadel (Acrocorinthus), and had three harbours, Lechaëum, to the west, on the Gulf of Corinth; Cenchreæ and Schœnus, to the east, on the Saronic Gulf. Its position, midway between the Ægean and Adriatic Seas, was exceptionally advantageous for trade. It was as easy to transport goods across the narrow isthmus—called by Pindar 'the bridge of the untiring sea'—as it was difficult to round the Peloponnesus. In its western harbour lay the ships of Italy, Sicily, and Spain; and to Cenchreæ came Egyptian papyrus, Libyan ivory, Syrian perfumes, Phœnician dates, Eubœan fruits, and Phrygian slaves. The exports of Corinthian manufacture were chiefly productions of art, such as statues, pictures, vases, pillars, and vessels of metal and earthenware. Syracuse, Molycria, Sollium in Acarnania, Ambracia, Anactorium, Leucas, Corecyra, Epidamnus, Apollonia, and Potidæa were among the colonies of Corinth. At its most flourishing period it is said to have had a population of 300,000, with more than half a million slaves employed in the fleet and in the colonies in the Mediterranean. It was at Corinth that the first triremes were built, and the first naval battle of the Greeks was fought between the fleets of Corinth and its colony Corecyra (see **CORFU**).

According to legend, the city of Corinth (anciently called *Ephyra*) was founded about 1350 B.C. by the Æolian Sisyphus, whose descendants ruled the country round till conquered by the Dorians under the Heraclid Aletes in 1074. Monarchy was abolished in 748, and an oligarchy of 200 families lasted till 657, when it was overthrown by Cypselus. He and his son Periander (629–585) greatly extended the city's industry and trade. In 582 the old Dorian constitution was restored. Corinth, which had formerly been the ally of Athens, after the Persian wars became jealous of the increasing power and commerce of the Athenians, and joined the league of the Dorian states. It waged an unsuccessful war on Athens in 458, and incited the Peloponnesians to begin (431) the Peloponnesian war (see **GREECE**). In 395, at the instigation of Persia, it entered into an alliance with Thebes, Athens, and Argos against Sparta, and the 'Corinthian War' began, which ended with the Peace of Antalcidas (387), dividing the supremacy of Greece between Persia and Sparta. Timophanes made himself master of Corinth in 366, but was overthrown and murdered by his patriotic brother Timoleon. The assemblies of the Greeks that appointed Philip and Alexander of Macedon the leaders against Persia, were held at Corinth in 338 and 336. Under the Macedonian supremacy it was occupied by a strong garrison. After the expulsion of the Macedonians it

joined the Achæan league (243), of which it formed part down to 146 B.C., when it was utterly destroyed by the Romans under Mummius. Exactly a century afterwards Corinth was rebuilt by Julius Cæsar, new-named *Colonia Julia Corinthus*, and peopled with veterans and the descendants of freedmen; and under Augustus and his successors it quickly became once more 'the citadel and star of Greece.' It reached almost its old importance as a trading and manufacturing town, and centred in itself the traffic that had formerly belonged to Athens and Delos. About sixty or seventy years before its completion by Hadrian, it was visited by St Paul, who, during a sojourn of a year and a half, planted a Christian church in Corinth, to which he addressed two of his epistles. The city was (from 27 A.D.) the seat of the pro-consul of the Roman province of Achaia, and the restoration of the Isthmian Games brought to it multitudes of Greeks from all parts of the Roman empire.

The Corinthians were devoted to the worship of the deities of love and of the sea. Aphrodite's temple was the oldest and the holiest in Greece. In her rites at Corinth, Phœnician influence is distinctly traceable. According to Strabo, in the most flourishing period of the city more than 1000 *hierodouloi* were kept there—'a source of much danger to strangers as of lustre and credit to the service of the goddess.' It was at Corinth, where unbridled licentiousness received such religious consecration, that the Apostle Paul wrote his description of heathen corruption in the Epistle to the Romans. Nowhere in the Hellenic world was licentiousness so prevalent. 'The vices of the Greeks were notorious in the Roman empire, the Corinthian vices even in Greece.' With all the artistic skill and culture of the Corinthians, and the lavish expense at which they adorned their wealthy city, they showed but little creative power. Yet Corinth produced the painters Ardicæ, Cleophantus, and Cleanthes; the statesmen Periander, Phidon, Philolaus, and Timoleon; Arion, the inventor of the dithyramb; and was the abode in later life of Diogenes. The ancient city has been excavated since 1896 by the American School at Athens.

Corinth was spoiled by Gothic hordes at the end of the 3d century, by Alaric in 396, and by the Slavs in the 8th century. In 1205 it was taken by the Franks, and from them it fell back into the hands of the eastern emperors, from whom in 1459 it was wrested by the Turks. It was held by the Venetians from 1699 to 1715, when it was retaken by the Turks, under whom it sank to a miserable village. After being delivered from Turkish domination in 1822, Corinth slowly increased from 1830 till the 21st February 1858, when it was utterly destroyed by an earthquake. The town has since been rebuilt in a more convenient position, 3 miles to the north-east. Its population is now 6000. A mile and a half east-north-east of New Corinth, on the Gulf of Lepanto (or Gulf of Corinth), is the western mouth of the canal through the isthmus. Two new towns have been laid out at its east and west mouths, the eastern named Isthmia, the western Posidonia. See CANAL.

**Corinth**, capital of Alcorn county, Mississippi, on two railways, 93 miles E. by S. of Memphis. Here General Rosecrans gained a decisive victory over the Confederates on the 3d and 4th October 1862. Pop. 5500.

**Corinthians**, FIRST AND SECOND EPISTLES TO THE, two letters written by the Apostle Paul to the church at Corinth in 57-58 A.D. (or, according to Harnack's Chronology, in 52-53 A.D.). The First Epistle deals in the main with the practical problems and difficulties which arose in connection with the

work and life of the Christian Church in the 1st century. Three motives led to its composition: (a) News had been brought to Paul that divisions existed in the Church; (b) Paul had written a previous letter to the Corinthians which had not been well received, and had occasioned some criticism; (c) Paul had received a letter from Corinth asking advice on certain points of difficulty which had arisen in the Church—e.g. the dress of women in public worship, the right of Christians to enter pagan temples and eat meat that had been offered to idols, &c.

1 Corinthians gives us the best picture we possess of the interior life of an apostolic church. From it we derive material of the greatest value with regard to the membership, the worship, the sacraments, the discipline, and the organisation of the early church.

Modern scholarship has exercised itself on the critical problems connected with the Second Epistle and its relation to the First, and reached the conclusion that the Second Epistle is probably not a unity, but a combination of two letters written by Paul at different times. These two letters are to be found in (a) 2 Cor. i.-ix.; (b) 2 Cor. x.-xiii. The last four chapters, it is maintained, constitute the intermediate epistle between 1 Corinthians and 2 Corinthians, referred to in 2 Cor. ii. 4, where it is described as a letter written 'out of affliction and anguish of heart with many tears,' and also in vii. 8-12, where it is said to have made the Corinthians 'sorry.' If the modern reconstruction is right, Paul wrote four letters to Corinth: (1) the lost letter referred to in 1 Cor. v. 1; (2) our present 1 Corinthians; (3) 2 Corinthians, x.-xiii.; (4) 2 Corinthians, i.-ix. There is more tension and emotion, and more impassioned denunciation in our 2 Corinthians than in any other writing of Paul. 'The order of ideas,' as Bishop Robertson says, is 'emotional rather than logical. A subject is not taken up, dealt with, and disposed of, but, like some strain in a piece of impassioned music, occurs, is lost in a maze of crowding harmonies, and recurs again and again.'

See Introductions to the New Testament by Julicher, Moffatt, and Peake; Commentaries by Robertson and Plummer (International Critical), T. C. Edwards (1 Cor.), Menzies (2 Cor.), Denney (Expositor's Bible); articles in *Hastings's Bible Dictionary* and *Encyclopædia Biblica*.

**Corinto**. See NICARAGUA.

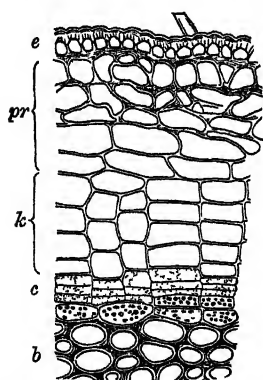

**Coriolanus**, CAIUS or CNÆUS MARCIUS, a Roman patrician, surnamed *Coriolanus* from his heroism at the capture of the Volscian town of Corioli (493 B.C.). Of a proud and haughty spirit, he was strongly opposed to the plebeians, who refused to elect him when a candidate for the consulship. After this, during a time of famine, he argued in the senate against a gratuitous distribution of the corn which had arrived from Sicily, unless the plebeians should give up their tribunes, but lately instituted. For this he was impeached, and banished. He took refuge among the Volscians, whom he aided in their war with the Romans. His victories at the head of his Volscian troops alarmed the Romans, who, on his approach to their city, sent a variety of deputations to plead with him. He was deaf to every entreaty. At last, the noblest matrons of Rome, headed by his old mother Veturia, and his wife Volumnia, leading her two children, came to his tent. (Shakespeare follows Plutarch in calling the mother Volumnia, while the wife is Virgilia.) Their tears cooled his fierce desire to be revenged on those who had dishonoured him, and he led back the Volsci to their own territories. Shakespeare's *Coriolanus* is a stately and impressive drama, its hero a magnificent creative realisation of the haughty but noble aristocrat of Plutarch's story.

**Cork** (Span. *corcho*, from Lat. *cortex*) is the extraordinarily developed corky layer (see below, and article BARK) of the bark of the Cork-tree or Cork-oak (*Quercus suber*) of the Mediterranean. Spain and Portugal chiefly supply the world with cork. The cork-tree is not of great size, generally 20 to 60 feet high, the trunk often 3 feet in diameter, much branched, with ovate-oblong evergreen leaves, entire or serrate. The acorns are edible, and resemble chestnuts in taste. The tree is usually twenty or twenty-five years old before it yields a gathering of cork, and attains an age of 150 years. The first produced (Virgin Cork) is of little value, but is removed in order that the next production may be better, for every successive formation is superior to that which preceded it, and it is not till the third gathering that cork of the highest quality is obtained. About every eight or ten years a crop is taken; but the improvement is being introduced of leaving the loosened cork-layer for some months as a protective jacket upon the tree. The cork-cambium is thus protected from the sun and the attacks of insects, and the new growth is thus both more rapid and of finer quality. In stripping off the cork, longitudinal and transverse incisions are made to the proper depth, and each piece is then cut away from the tree by a curved knife with two handles, like that of a cooper. The pieces are soaked in water, pressed flat, dried, and superficially charred, to remove decayed parts and conceal blemishes, before they are packed in bales for the market. Besides the use of cork for stopping bottles, casks, &c., it is much used, on account of its lightness, for floats of nets, life-belts, &c.; and on account of its impermeability to water, and its being a slow conductor of heat, inner soles of shoes are made of it. All these uses are mentioned by Pliny; but the general employment of corks for glass bottles appears to date only from the 15th century.

The *Spanish Black* used by painters is made by burning cork-parings in closed vessels. Cork-waste is also utilised for many objects, and most largely in the manufacture of linoleum.

The cork-tree is occasionally planted in England; it has been found to do well in some parts of the United States.

The wood of some trees possesses the cellular sponginess, lightness, and elasticity of cork in such a degree as to be sometimes substituted for it in many of its uses, as that of the *Anona palustris* (Corkwood

Formation of Cork in a branch of Black Currant, one year old (mag. 350 diameters):

*e*, epidermis; *b*, bast-cells; *pr*, cortical parenchyma; *k*, the cork-cells formed from *c*, cork-cambium. (Sachs.)

or Alligator Apple) in the West Indies, &c.

As already mentioned under Bark (q.v.), cork is by no means botanically the exceptional product it seems from the practical or popular point of view. The epidermis being usually only a single layer of definitely formed cells, it is insufficient either for covering or protection in almost all conditions of continuous growth and exposure to climate (the mistletoe being rather a less developed type than a true exception among woody plants, since its deeper ordinary epidermic cells never lose the power of multiplication). In sections of the young shoots of

dicotyledonous trees or shrubs this provision for replacing the epidermis can be beautifully traced; a layer of cells just outside the cellular envelope, the so-called cork-cambium, is seen to have already formed an appreciable thickness of cork-cells, easily recognised by their prismatic shape, tolerably regular vertical series, and thin walls. As the stem grows older the epidermis wears off and the cork-layer thickens, while the access of air to the living cellular envelope below is permitted by the occurrence of spaces empty or filled only with looser tissue, the *Lenticels* (see BARK), which, of course, become represented by the deep air-channels so obvious in the inferior quality of cork.

**CORK-CUTTING.**—The bark, after being cut into square pieces or sheets, is pressed to remove its natural curvature and flatten it. If it is found that simple pressure has not flattened it sufficiently, it is heated on the convex side, and the contraction thus produced straightens it. It is then cut into slips, and these slips into squares, according to the required size of the corks. These are rounded by the cork-cutter by means of a broad shap knife; the cork is rested against a block of wood, and the knife pushed forward, its edge at the same time being made to describe a circular curve. The knife requires continual sharpening; the workman has a board before him on which the knife is rubbed on each side *after every cut*. But cork-cutting is now largely done by machinery; in the United States the process has been carried to great perfection. Corking-machines are ingeniously contrived to force the cork into the neck of the bottle, and, if necessary, to wire it down. For *rock cork*, see ASBESTOS.

**Cork**, a maritime county in Munster, the south-most and largest of the Irish counties. Greatest length from east to west, 110 miles; greatest breadth, 70; average, 34. Area, 2900 sq. miles. Cork is hilly, with great variety of surface. The west part is rocky, mountainous, wild and boggy; the east and south, rich, fertile, and picturesque. The ranges run east and west, except the Boghra Mountains, between the Lee and Blackwater. The coast is bold and rocky, and from its indentations, 250 miles long; the bays, which run 3 to 25 miles inland, admitting large vessels. The chief bays are Bantry, Dunmanus, Baltimore, Glendore, Clonakilty, Kinsale, Cork Harbour, and Youghal. There are many isles off the coast, including Cape Clear Island, which lies in 51° 25' N. lat., and 9° 30' W. long., and, with the exception of a rock 4 miles to the SSW., is the southmost point in Ireland. In the west, Cork is divided from Kerry by a range of Silurian clay-slate running north-east and north, the chief points being 1200 to 2240 feet high. This range sends offshoots to the east, which divide the county into the parallel basins of the three chief rivers of Cork, the Blackwater, Lee, and Bandon: the lower parts of these basins are well cultivated and productive. The Lower Carboniferous limestone forms the largest lowland tracts and valleys of the county. Part of the Munster coalfield occupies 400 sq. m. in the north-west. Cork has many small lakes in the west. One of these lies at the source of the Lee, amid wild, picturesque scenery, with the ruins of a chapel on an islet frequented by pilgrims. The chief mineral productions are coal and iron, copper, barytes, limestone, fine dark-gray and also red marble rich in fossil shells, fullers' earth, brick-clay, marl. There is a thermal magnesian spring at Mallow. The climate is moist, but genial. The soils are calcareous, loamy, and moory. The dairies are extensive, and Cork butter stands in high estimation. The cattle are small in size, but yield large quantities of milk. Of the total area, about 25 per cent. is under crops. Among the manufactures

are leather, tweed, whisky, porter; and the chief exports provisions. Pop. (1841) 854,118; (1871) 517,076; (1911) 392,104 (including the county borough of Cork), of whom 90 per cent. are Catholics. Formerly Cork county sent two members to parliament, besides two for the city, and four for minor boroughs. In 1885-1922 the county returned seven members, the city two; and Bandon, Mallow, Kinsale, and Youghal were absorbed in the county. The county returns eleven members to the Free State parliament, the city four. The antiquities of Cork are stone circles and altars, two round towers, circular earthworks or raths—all relics of the days of paganism; ruins of abbeys and churches, chiefly built by descendants of the English invaders under Henry II.; and many ancient castles or square towers.

**Cork**, a city (with a Lord Mayor since 1900) and parliamentary borough of Ireland, capital of County Cork, and a county in itself, on the Lee, 11 miles above its mouth, and 166 SW. of Dublin by rail. Standing in the centre of a picturesque valley, it is built in part on an island, or group of islands, formerly a swamp, which the word *Cork*, *Corcoch*, or *Corcaig* implies; in part on the north and south slopes of the river-banks. The houses are generally of old red sandstone. Nine bridges cross the river to the central islands. There is a spacious public park of about 400 acres, the chief use of which is as a racecourse, and a walk known as the Mardyke, above a mile long, lined by noble elms, on the west of the city. There is also a beautiful public cemetery. Cork has a pleasant picturesqueness from its uneven ground, irregular streets, intersecting river, and overhanging heights. The chief buildings are St Anne Shandon's Church; the Protestant Cathedral (Early English), erected in 1865-75 at a cost of £100,000; the Catholic Cathedral, and several Catholic churches, monasteries, and nunneries; the bishop's palace; the city hall; the Carnegie Library; Queen's College; the Schools of Science and Art; and University College (a constituent college of the National University of Ireland), in buildings that would, as Macaulay said, be a credit to Oxford, while its engineering laboratories claim to be the best equipped in the country. By way of reprisal almost the entire centre of Cork, including the city hall and the Carnegie Library, was destroyed by fire on the night of December 11-12, 1920. The Lee in both branches is navigable to a mile above the city, and ships of 2000 tons reach the quays. Cork harbour, noted for its size and safety, is a basin of 10 sq. m., formed by the estuary of the Lee, and has been the main source of the rise and progress of the city. The estuary contains several large isles, rising abruptly and high above the water, with narrow channels between them. The entrance is by a channel two miles by one, defended by batteries, Carlisle Fort on the east side, and Camden Fort on the west, while Spike Island, now called Fort Westmoreland, commands the entrance. Spike Island, when disused as a convict establishment, became a military depot. Haulbowline Island was formerly an extensive store, naval dockyard, and military station of the British government. On the shores of the estuary are the towns of Passage and Queenstown (q.v.), a great Atlantic port of call, formerly called Cove of Cork. Cork harbour, outside the island on which Queenstown stands, is much frequented by wind-bound ships and ships waiting orders. The chief manufactures are leather, woollens, iron goods, gloves, gingham, friezes, flour, malt liquors and whisky, motors, and chemical manures. The chief exports are grain, provisions, butter, live-stock, leather, fish, and tweeds. Pop. (1871) 78,642; (1881) 80,124; (1901) 76,122 (parl. bor. 99,693); (1911) 76,673

(parl. bor. 102,435), five-sixths Roman Catholics. Cork returns four members to the Free State parliament.—Cork grew up around an abbey founded in 600 by St Finbar. The Danes in the 9th century built the city walls. Dermot MacCarthy, king of Cork or Desmond, surrendered it to Henry II. in 1172. Cromwell besieged and took it in 1649, and Marlborough in 1690. James II. landed at Cork in 1688. In Cork, William Penn became a Quaker. There is a statue of Father Mathew (q.v.), who laboured here many years. See Miss Cusack's *History of Cork* (1875). For the Earls of Cork, see BOYLE.

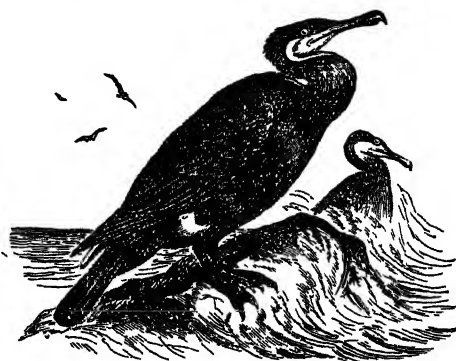

**Cork-oak, Cork-tree, Cork-wood.** See CORK and OAK.—The name Cork-tree is also given to various trees with light corky wood, as the East Indian *Millingtonia hortensis* (Bignoniaceæ) and the New Zealand *Entelia arborescens* (Tiliaceæ). The West Indian and American *Ochroma Lagopus* (Bombacaceæ), *Leitneria* (Leitneriaceæ), and *Anona* (Anonaceæ: see CORK) are called Cork-wood.

**Corkwing** (*Cremilabrus melops*), a species of Wrasse (q.v.).

**Corleone**, a town of Sicily, 21 miles S. of Palermo; pop. 16,000.

**Corm** (Gr. *kormos*, 'a stump')—sometimes called a *solid bulb*—the short and bulb-like subterranean stem of many monocotyledonous plants, e.g. crocus, gladiolus, tuberose, and arising through the annual storing of starch to be consumed by the next year's bud and flower. In functions, as in general appearance, the corm resembles the Bulb (q.v.); a vertical section, however, shows that while in each we have indeed a stem and leaves, the thickening is confined in the former case to the stem, in the latter to the leaves. Transitional forms occur, indeed, in most bulbs; the thickened leaves arise from a more or less thickened and shortened—i.e. corm-like—base. While a section of a corm shows the origin of its usually membranaceous leaves, and many corms produce new subterranean buds in the axils of their leaves, in either case they arise on the upper surface or sides of the parent corm, and there thicken as new corms. When borne on the upper surface, the new corms then gradually approach the surface of the ground as in crocus.

**Cormorant** (Gr. *Phalacrocorax*, 'bald-headed raven'), a genus of web-footed birds in the order Steganopodes, beside pelicans, solan-geese, and frigate-birds. They are familiar birds, frequenting islands in most parts of the world. They vary

Cormorant.

greatly in size, but have the following characters in common. The head is relatively small, and is naked behind the eyes and at the root of the beak. At the breeding season some forms exhibit a crest

and wattles. There is a dilatable membrane beneath the lower jaw, showing incipiently what becomes exaggerated in the pelicans. The bill is moderately long, straight, rounded above, and strongly hooked at the end; the nostrils are linear and inconspicuous. The neck is long, snake-like, and naked on the throat. The wings are of moderate length; the tail is rather short and rounded, but with stiff feathers, which are used as aids in progression. The unfeathered lower leg is very short; all the toes are united in a web; the middle claw is serrated and apparently used in trimming the plumage.

The numerous species live on the shores of islands, or sometimes inland by rivers—e.g. the Danube—and lakes. They feed exclusively on fishes, and are proverbial for their voracity. They do not dive when in flight, but from the surface of the water. The smaller of the two British species has been caught in a crab-pot at a depth of 120 feet. When the prey is inconveniently seized, it is often tossed in the air and more adroitly recaptured. Eels are said to form a favourite prey. Their haunts are often peculiarly dirty. The nests are usually built of seaweed, and are strong though rude; they are sometimes found on mangrove and other trees. The egg is bluish-green, but the colour is much obscured by thick incrustations of lime. When attacked, the larger species, at anyrate, fight vigorously and to purpose. The flesh is dark and fishy, but that of the young birds of some species is said to be eatable.

The Common British Cormorant (*P. carbo*) is an almost cosmopolitan bird about 3 feet long, for the most part of a blackish-green metallic colour, with brownish feathers on the shoulder region. When in full breeding plumage it has a crest on the head, white plumes on the throat, and a white patch on the lower flanks. The bill is black, the face yellow, the feet also black. It was formerly trained in England, as still in China, for fishing purposes. At first a ring is put round its neck to keep the bird from swallowing the fish it catches, but it soon learns to bring its prey to its master, being afterwards allowed to fish on its own account. The smaller species (*P. cristatus* or *graculus*) found on our coasts has a more decided green colour. The Dwarf Cormorant (*P. pygmaeus*), from South-eastern Europe, North Africa, Southern Asia, and the Florida Shag (*P. floridanus*) are other well-known species. Along with the genus *Urile*, the cormorants form a family (Phalacrocoracidae) including about three dozen species.

**Corn**, a general term for the seeds of cereal plants, thus including all the kinds of grain which form the food of men or horses. But it has also a specific sense, and denotes in any country that grain which furnishes the prevalent bread-stuff of the people. Thus, in England, corn generally means *wheat*; in the United States, *maize*; and in Scotland, *oats*. The word not only occurs in all the Teutonic tongues, but is seen also in Lat. *granum*, and Russian *zerno*. See CEREALS and special articles WHEAT, &c. See CORNS for a different word.

**Cornaceæ**, the cornel or dogwood order, are archichlamydeous dicotyledons, nearly allied to Umbellifere, containing about eighty species, mostly trees and shrubs, chiefly natives of the north temperate zone. The fruits of some are eatable; the bark and leaves of some are medicinal; some are valued as ornamental plants. See CORNEL, DOGWOOD, AUCUBA.

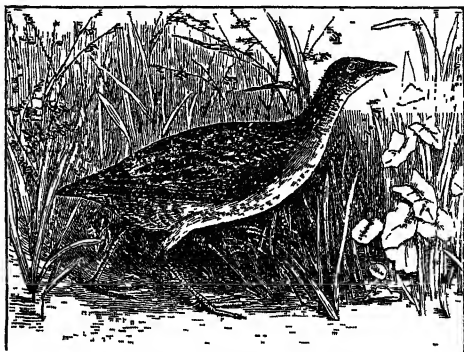

**Cornaro**, the name of a Venetian noble family, of which the most illustrious members were: (1) Caterina (1454–1510), married King James II. of Cyprus in 1472, after whose early death she was kept in mild imprisonment by the Venetians until

1489, when she set up a kind of court for poets and scholars at Assolo, near Bassano.—(2) Luigi, born 1467, an instructive example of temperance. Delicate by constitution, at forty he found his health so much impaired by his intemperance that an immediate change of life was absolutely necessary. He at once adopted strict rules of temperance both in meat and drink, by which means he prolonged a cheerful old age almost to a hundred years, dying in 1566. At eighty-three he published his famous *Discorsi della Vita Sobria* (Padua, 1558), which was translated into most European languages (Eng. 1779).

**Cornbrash**, a member of the Lower Oolites. See JURASSIC SYSTEM.

**Corn-cockle** (*Agrostemma Githago*), a tall beautiful caryophyllaceous weed, well known on account of its large purple flowers. It is often so common in cornfields as to be mischievous, especially on the Continent, and this not only because of its rankness and abundance, but also because of the deleterious nature of its seeds, which are injurious to man and poisonous to most domestic animals, and which sometimes require to be separated from the grain by a special kind of sieve.

**Corn-crake** (*Crex pratensis*), one of the true rails, in the old order of Grallatores, whose cry at least is very familiar in Britain. The bird itself is seldom seen; it is about a foot in length, and has colours varying from brownish-gray to red. The bill is shorter than the head, and slightly bent, the tail is very short, the legs are long and powerful. As a summer visitor to Britain, coming in May and leaving in autumn, the bird is well known by the harsh cry of the male, which is sometimes imitated for decoy purposes by running the thumb-nail along the teeth of a small comb. The cry is

Corn-crake (*Crex pratensis*).

mostly uttered in the evening and throughout the night, and is much less frequent after the young are hatched. Unlike the nearly related water-rails, the corn-crake frequents dry corn and hay fields. It can, however, swim well on occasion. Its running powers are very great, but it flies rather heavily. It is very prone to trust to concealing itself rather than to flight. The females are very faithful to the young birds, which are covered with black down when hatched. The species is widely distributed in Northern Europe and Central Asia, but its headquarters are in Africa. The flesh is very good eating. See RAIL.

**Corneæ**, one of the coats of the eye; so called from its resemblance to horn (Lat. *cornu*). See EYE.

**Corneille**, PIERRE, the greatest tragic dramatist of France, and the forerunner of Molière in genuine comedy, was born at Rouen on June 6,

1606. The son of a legal official, he was trained for the bar, and for some time tried with but slight success to obtain a practice in his birthplace. In 1629 he removed to Paris, where his comedy *Mélite*, which had already been performed at Rouen, proved so successful as to be run at the same time in two theatres, the Marais and the Hôtel de Bourgogne. It was followed by *Clitandre*, *La Veuve*, *La Galerie du Palais*, *La Suivante*, and *La Place Royale*. In these early pieces intricate and extravagant plots are handled with considerable ingenuity, but the writer's poetic genius only flashes out in occasional verses. For some time Corneille was numbered among Richelieu's 'five poets,' the others being Rotrou, Colletet, Bois-Robert, and L'Étoile. These writers were engaged to compose plays on lines laid down by the cardinal. Each of the five wrote an act, which was then criticised, altered, and paid for by their employer; among the pieces thus produced being *Les Tuileries*, *L'Aveugle de Smyrne*, and *La Grande Pastorale*. Corneille, however, was too independent to retain Richelieu's favour, and his dismissal followed at once on his proposing to alter a plot of the cardinal's devising. *Médée*, a tragedy which appeared in 1635, showed a marked advance on his earlier works, both in dramatic power and in style; and in 1636 the *Cid*, his most famous if not his best play, took Paris by storm. Richelieu ordered his literary retainers to write down the piece, and Scudéry called on the Academy to vindicate French letters in the eyes of Europe by passing formal censure on Corneille. The Academy, which had lately been founded by Richelieu, thereupon issued a hostile *examen* of the play; but adverse criticism was powerless against the general enthusiasm, and the phrase *beau comme le Cid* passed into the language. The result of the struggle between the minister and the dramatist is happily summed up in Boileau's famous couplet:

En vain contre le *Cid* un ministre se ligue,  
Tout Paris pour Chimène a les yeux de Rodrigue.

The story of the play was taken from *Las Mocedades del Cid*, a Spanish work by Guillem de Castro (q.v.), but Corneille's treatment of the subject was thoroughly original. With the appearance of the *Cid* the poetic drama took possession of a stage hitherto occupied by broad and shapeless farces, wooden imitations of Seneca, and the extravagant and off-hand pieces of Hardy. The graceful and heroic figures of the lovers, Rodrigue and Chimène, the nobility of the sentiments, the power and harmony of the verse, justify the enthusiasm which the play excited. It may not be its author's greatest effort, but there is a charm in the spirit of youthful ardour and tenderness which animates it such as is hardly to be felt again in Corneille's work, until we come to the exquisite lyric love-scene which he contributed in his old age to the opera of *Psyché*.

The *Cid* was followed in 1639 by *Horace*, a play which was founded on the story of the Horatii and Curiatii as told by Livy, and which contains, in the *tirade* spoken before her death by Camille, the most magnificent burst of invective in the French classical drama. *Cinna* appeared in 1639; *Polyeucte*, one of Corneille's noblest tragedies, in 1640; and *La Mort de Pompée* in 1641. *Le Menteur*, which was produced in 1642, entitles Corneille to be called the father of French comedy as well as of French tragedy. The play is a masterpiece. The character of Dorante, the liar, is drawn with admirable humour and insight, and the style, at once easy, graceful, and pointed, reaches a level of excellence which Molière did not surpass in his earlier works. *Théodore* was brought out in 1645, and *Rodogune*, perhaps the most impressive and

thrilling of Corneille's tragedies, in 1646. Between 1647—when he was made an academicien—and 1653 Corneille produced *Héraclius*, *Don Sanche d'Aragon* (an imitation of Lope de Vega's *Palacio Confuso*), *Andromède*, *Nicomède*, and *Pertharite*. These pieces, of which the last named was damned, show a decline in dramatic and poetic power. After the failure of *Pertharite* in 1653, Corneille ceased for a time to write plays, and occupied himself with making a verse translation of the *Imitatio Christi*. He returned to the stage in 1659 with *Œdipe*, which had considerable success, and which was followed by *La Toison d'Or*, *Sertorius*, *Sophonisbe*, *Othon*, *Agesilas*, *Attila*, and *Tite et Bérénice* (1670). In 1671 he joined Molière and Quinault in writing the opera of *Psyché*, and the loveliest verses which he ever penned are to be found in the scene between Psyche and Cupid (act iii. scene 3). His last works were *Pulchérie* (1672) and *Suréna* (1674).

His work did not bring him wealth, for he never received more than 200 louis for a piece. His private fortune was not large, and the pension which was granted him was not regularly paid. After his marriage in 1640 he lived habitually in Rouen until 1662, when he settled in Paris. His domestic life seems to have been a happy one. He and his brother Thomas married two sisters, and dwelt for a long time in contiguous houses. During his later years he had to compete with Racine, an inferior poet but a more dexterous playwright, and one who could cater more shrewdly for the public taste. The veteran dramatist spoke contemptuously of his rival's 'sighs and flames,' but his popularity waned before that of the younger writer, whose cause was espoused by Boileau and the king. Corneille died in Paris in the Rue d'Argenteuil on October 1, 1684.

Corneille and Racine are the chief dramatists of the classical school which held command of the French tragic stage from the middle of the 16th century down to the Romantic movement of 1830. The works of this school were modelled on the plays of Seneca—that is to say, on plays cast in the mould of Greek tragedy, but having even less action and more diffuse moralising. The writer who adopts this form of drama is bound down by a set of rigid rules which allow him to present only a few idealised personages in certain stereotyped situations. He cannot exhibit the development of character and the interaction of human passions. He is almost denied the use of incident, and the slow progress of his play to its climax is mainly brought about through the agency of messengers and confidants. Before Corneille the classic school had failed to produce a single good acting play; its adherents, nevertheless, succeeded in diverting him from the path on which he had entered when he produced the *Cid*, and in thereby cramping his rich and vigorous genius. 'Corneille,' says Mr Walter Pollock, 'was one of the first to make a move in the direction of the romantic drama, and wanted nothing but courage and self-sacrifice to carry out his intention.' (See his admirable articles on Victor Hugo and Romanticism in *French Poets*, 1879). Unfortunately, instead of disregarding the academic criticism of his day, Corneille turned from Spain to a 'Castilian Rome, remote from the world of romance, and set himself to compose plays of so severe and uneventful a type that he failed, save in one or two cases, to invest them with a strong sustained interest. In reading these plays we yield alternately to admiration and fatigue. The characters have a simplicity and grandeur which recall the work of the sculptor, but they have also something of its immobility. We can grasp them at once; they are not developed in the course of the drama. Corneille's heroes bear their fate with an inflexible

self-reliance which seems more than human, and therefore moves us the less. His heroines, his 'adorable furies,' resemble one another closely. 'Their love,' says Sainte-Beuve, 'springs from the head rather than the heart. We feel that Corneille knew little of women.' Where he excels his rivals is in the grandeur of his morality, in the eloquence and passion of certain scenes and speeches, in the splendid flashes of poetry with which he illumines the pale world of classic tragedy, in the power and music of his verse. Victor Hugo alone has made the Alexandrine move with the same swelling harmony and variety of cadence. The monotony which so often weighs on Corneille's readers was not due to any coldness or narrowness inherent in his genius. To be convinced of this it is enough to recall the brilliant comedy of the *Menteur*, the martial stir and glowing passion of the *Cid*, the lyric grace and chastened ardour of the central love-scene in *Psyché*. But his powers were in a measure misdirected. His place in literature must always be a very high one; but readers—other than French readers, at least—can hardly doubt that it would have been still higher had he been free to select and develop his characters at will, to exercise his humorous faculty and give full scope to his tragic powers in the fields of romantic drama.

See Guizot's *Corneille et son Temps* (1852; Eng. trans. 1857); Jules Taschereau's *Histoire de P. Corneille* (1828; new ed. 1870); Sainte-Beuve's *Portraits Littéraires et Port Royal*; Brunetière's *Époques du Théâtre Français* (1892); books on Corneille by Trollope (1881), Bouquet (1888), Lemaître (1888), Lodge (1891) Liéby (1892), Faguet (new ed. 1896), and Lanson (1898); editions by Lefèvre (1854) and Marty-Laveaux (1862-67); and Picot's *Bibliographie Cornélienne* (1875).

**Corneille**, THOMAS, younger brother of the great Corneille, was born at Rouen on August 20, 1625. He was a dramatist of considerable merit, was made a member of the Academy in 1685, and died at Andelys on December 17, 1709. His tragedies, *Cinna*, *Laodice*, *Pyrrhus*, *Bérénice*, *Timocrate*, *Ariane*, *Bradamante*, &c., are in general superior to his comedies. He wrote a verse-translation of Ovid's *Metamorphoses*. See a study by Reynier (1893).

**Cornel**, or CORNELIAN CHERRY (*Cornus mas*), the *Cornus* of the ancients, a small tree of the order Cornaceæ, is a native of the middle and south of Europe, and of great part of Asia. It is not found wild in Britain, although it is common in shrubberies, and was formerly much cultivated as a fruit-tree, as it still is in Germany and other parts of Europe. It has oval leaves, and small yellow heads of flowers, which appear before the leaves in spring, and which are much frequented by bees. The fruit is oblong, a little larger than a sloe, shining, red, or rarely yellow or white. It is late in ripening, and until quite ripe is very austere; but when perfectly mellow has an agreeable vinous acid taste; it is also made into a preserve, or gathered unripe and pickled like olives. It was formerly also fermented for a beverage. In Turkey it is much used in making sherbet. The wood of the cornel is extremely hard and tough, and was used by the ancient Greeks for lance-shafts; it is still valued by joiners, turners, and instrument-makers.—Dwarf Cornel (*C. suecica*), a native of mountain-pastures and bogs throughout the north of Europe and in Britain, is a herb about 6 inches high, with its umbels surrounded by four white bracts. The small sweetish red fruit is tonic, and is said to increase the appetite, whence the Gaelic name *Plant of Gluttony*. Dogwood (q.v.) belongs to the same genus.

**Cornelia**, the mother of the Gracchi.

**Cornelian**. See CARNELIAN.

**Cornelisz**, LUCAS, a Dutch subject and portrait-painter, was born at Leyden in 1495, the son

of Cornelis Engelbrechtsen, the master of Lucas van Leyden. Driven by lack of patronage at home to act as cook (hence his sobriquet *Kok*), he came to England and was court painter to Henry VIII., afterwards (1535-47) working in Ferrara.

**Cornelius**, PETER (1825-74), lyricist and composer, was a nephew of the painter (see below), and from 1864 professor of harmony at Munich. His *Barbier von Bagdad* is one of the great comic operas of the 19th century, ranking perhaps next after Wagner's *Meistersinger* and Goetz's *Tamung of the Shrew*. His *Literarische Werke* were edited in 1905-7.

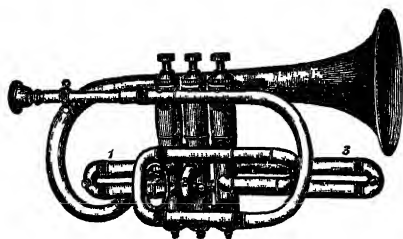

**Cornelius Nepos**. See NEPOS.

**Cornelius**, PETER VON, one of the first masters of the modern German school of painting, was born at Dusseldorf, 23d September 1783, and studied in the academy of his native town. When only nineteen years of age, he painted some remarkable frescoes for the old church of Neuss. A few years later he gave still more unmistakable proofs of a creative fancy in his illustrations of Goethe's *Faust* and the *Nibelungen Lied*. In 1811 he went to Rome, and joined the group of Veit, Schadow, and other Germans who were there at work, Overbeck being his chosen friend. This journey exercised a profound influence on the whole of his future career. The great importance of the early masters became ever clearer to him as he studied their choicest productions. While at Rome he aided in the decoration of the Casa Bartoldi, and gained wide reputation by two cartoons, 'Joseph's Interpretation of the Dream' and 'Joseph's Recognition of his Brethren.' From Rome he passed to Dusseldorf, where he became director of the academy, which he remodelled; in 1819 he was called to Munich, and entered the service of the then crown-prince of Bavaria. Here he remained till 1841, and executed those grand works on which his fame mainly rests, and which may be divided into two classes, Pagan and Christian, the former of which comprises the large frescoes in the saloon of the Glyptothek, all illustrating stories of the Greek gods and heroes; while the latter, or Christian series, begun after the completion of the former in 1830, consists of frescoes of New Testament scenes, extending from the 'Incarnation' to the 'Judgment,' and decorates the 'Ludwig's Church' in Munich, which was built for the purpose of affording scope for the genius of Cornelius. The 'Judgment' is the largest fresco in the world, larger even than Michael Angelo's 'Judgment' in the Sistine Chapel. In 1841 Cornelius was invited by the king of Prussia to Berlin, where he was appointed director of the Berlin Academy. Among his productions in the Prussian capital are the frescoes for the Campo Santo, or royal burial-place, where his 'Four Riders of the Apocalypse' display an impetuous and daring power which he had not hitherto evinced. Opinion is divided regarding the merits of Cornelius. By his own countrymen he is much admired; and certainly the importance of the impetus which he gave to mural decoration in Germany cannot be overestimated. French critics, on the other hand, regard him as more a thinker than an artist. He is admitted to have been a profoundly creative genius, but without mastery in manipulation or great power as a colourist. He formed, however, a school, from which have gone forth many illustrious pupils; but he lived to see it losing hold on public sympathy. A series of his cartoons is preserved in the National Gallery, Berlin, and his works have been reproduced by Amsler, Schoefer, Eberle, and the best German engravers. He died in Berlin, 6th March 1867. See his *Life* by Förster (2 vols. Berlin, 1874).

**Cornell University**, named from its founder, Ezra Cornell (1807-74), who desired to found a university where any person could find instruction in any subject, is pleasantly situated on the outskirts of the town of Ithaca, New York, and was opened in 1868 on a thoroughly unsectarian basis. Since 1872 it has been co-educational. One of the largest institutions of higher learning in the United States, it has numerous well-appointed buildings; the number of instructors is now about 950, and of students 7000 to 8000. By the terms of its charter the university must educate, free of all fees, one student annually from each of the 128 assembly districts of the state of New York, besides providing instruction in 'agriculture and the mechanic arts,' in return for the income derived from the sale of 990,000 acres of public lands, which was transferred to it by the state. The library is very extensive. The university comprises the Graduate School, College of Arts and Sciences, College of Law, Medical College (in Ithaca and New York), New York State Veterinary College, New York State College of Agriculture, College of Architecture, College of Engineering (civil, mechanical, and electrical). Besides ordinary subjects, instruction is given in mechanic arts, military science and tactics, and journalism.

**Cornet** (Ital. *cornetto*, Fr. *cornet à piston*), a brass treble wind-instrument, with a cup mouth-piece, is a comparatively modern modification of the Trumpet (q.v.). The tube, which is more tapered than in the trumpet, is less so than in the Bugle (q.v.), giving the cornet a tone intermediate between these, and more in harmony with other brass instruments of the trombone and saxhorn kind. It has the usual open notes, C (below the treble stave), G, C, E (stave), G, B $\flat$ , C (above the stave). It has also four higher notes, D, E, F, G, and a fundamental note, C (octave below the stave), but they are almost never used. To provide the connecting notes and half notes of the scale, it has three slides (1, 2, 3 in the fig.), the first, lengthening the tube to the extent of one tone; the second, a semitone; the third, three semitones. In playing, the air is diverted through these slides by means of three valves or pistons, which are depressed by the fingers of the performer, singly or in combination.

Although the cornet, from its recent invention, has not a place in classical music, it is sometimes used to play trumpet parts; and in modern orchestral music it is a useful and popular solo instrument.

Cornet.

In military reed and brass bands it is a solo and leading instrument respectively.

Originally the cornet or *cornopean*, as it was then called, was provided with 'crooks' (pieces of tube to insert between the instrument and the mouth-piece), to alter the pitch, which is naturally B $\flat$ , to A, A $\flat$ , G, and others, but it is now only used in B $\flat$  and A. Smaller cornets in E $\flat$  and D $\flat$  are sometimes used in military brass bands. The cornet-stop in the organ is named after an obsolete wind-instrument of the oboe species.

**Cornet** (Ital. *cornetta*, 'a small flag') was, until 1871, the lowest grade of commissioned officer in the cavalry, equivalent to *ensign* in the infantry, one of his duties being to bear the standard, which, however, is only carried by heavy cavalry regiments in the British army. With the lieutenant he assisted the captain in the daily duties connected with the troop to which he belonged. Before the abolition of purchase in 1871 a cornet's commission used to cost £450; but much larger sums were habitually paid in celebrated or fashionable corps. The pay was 8s. per day, with 1s. or 1s. 6d. extra for field allowance. In 1871 cornets were abolished, sub-lieutenants (probationary lieutenants, now called second lieutenants) being substituted.

**Corneto**, a picturesque, medieval-looking town of Central Italy, 12 miles N. of Civita Vecchia by rail, 3 miles from the Mediterranean. Pop. 7000. Corneto rose out of the ruins of the Etruscan city of *Tarquinnia*, whose remains, within a mile and a half of Corneto, are amongst the most important for the student of Etruscan history. The painted tombs, of which some twenty are specially interesting, were known in the 18th century; but it is mainly since 1842 that they have been examined; valuable new discoveries were made during excavations in 1881-82. See ETRURIA.

**Corn-flour** is the name applied to the finely ground flour of Maize (q.v.) or Indian corn.

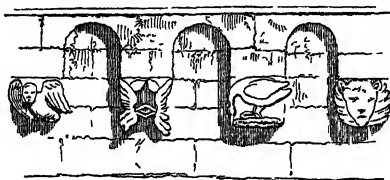

**Corn-flower** (see CENTAUREA) is a well-known composite weed of cornfields, universally known

Corn-flower, or Blue-bottle (*Centaurea cyanus*).

and admired for the beauty of its wreath-like circle of outer barren florets, and the splendid deep azure of their hue. It was formerly of some little medicinal repute, and its blue flowers were used in domestic dyeing; from early times, too, it has been used for decoration in wreaths and garlands. This use became specially prominent in Germany after 1870, on account of its being represented to be the Emperor William I.'s favourite flower.

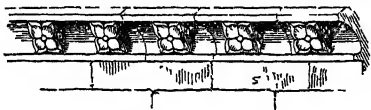

**Cornice**. In classical architecture the cornice is the uppermost member of the entablature, surmounting the frieze. Each of the orders has its peculiar cornice; but these, with their relation to the other portions of the entablature, will be better understood when explained in conjunction with that term (see ENTABLATURE). In the Gothic styles the form of the cornice varies greatly. In Provence and countries where Roman work abounded, the classic cornice was closely imitated (see ROMANESQUE ARCHITECTURE). In other

districts a row of corbels, carved in the grotesque Teutonic spirit, and bearing the parapet, forms the cornice. A series of small arches frequently rests on the corbels. This is the prominent style of cornice in all Rhenish and Lombardic structures.

Corbel Table.

In Early Gothic the small arches become ornamental—taking the form of trefoils with moulded edges, and the corbels become less uncouth. The decorated and perpendicular cornices are chiefly horizontal mouldings, with flowers or heads inserted

Cornice:

Eynsham Church, Oxon, circa 1450.

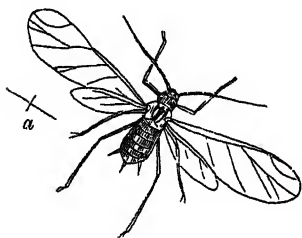

as enrichments. The term cornice is also applied to the plaster mouldings seen round the ceiling of rooms at its junction with the walls.

**Corniche.** See RIVIERA.

**Corniferous Formation**, name given in North America to a subdivision of the Devonian system. It embraces the Onondago (Corniferous) limestone, the Schoharie grit, and the Esopus grit. The name *corniferous* (Lat. *cornu*, 'horn,' *fero*, 'I bear') has reference to the common occurrence in the limestones of nodules of hornstone or chert.

**Corning**, capital of Steuben county, New York, on the Chemung River, 10 miles WNW. of Elmira, with glassworks, foundries, and other industries, and trade in tobacco and coal. It was named in honour of Erastus Corning (1794–1872), a capitalist interested in railways. Pop. 16,000.

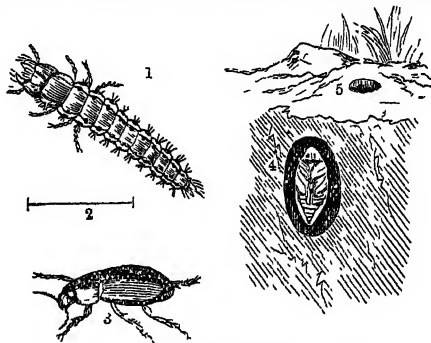

**Corn Insects.** While numerous insects are of great importance in carrying the fertilising

Corn Aphid:  
a, natural size.

pollen from one flower to another, and others are in themselves of direct use to man, there remains a vast crowd of more or less injurious forms. Of these some attack man and domestic mammals; others do damage quite as effectively by injuring fruit and forest trees, vegetables and crops. The following is a list of the more important species which attack our common cereals: (1) The Corn Ground Beetle, *Zabrus gibbus* (Coleoptera, Carabidæ), a dark bronze beetle, abundant in central Europe, less common in England. The adults devour the soft grain, most commonly of wheat, while the larvæ live on the leaves. (2) The Cockchafer (q.v.), *Melolontha vulgaris*. (3) The Midsummer Chafer, *Rhizotrogus solstitialis*, a beetle nearly related to the last, of

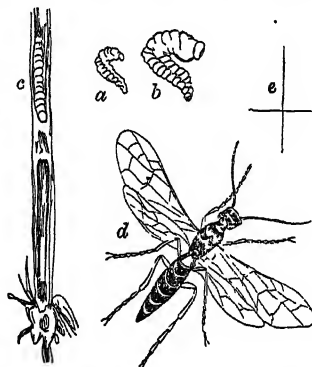

generally similar habit, the larvæ sometimes injuring the seed. Chafer grubs attack all cereals, as well as other plants. (4) Wireworms, the larvæ of Skipjack or Click beetles, *Agriotes lineatus* and other species, injuring all crops (see WIREWORM). (5) The Corn Saw-fly, *Cephus pygmaeus* (Hymenoptera, 'Wood Wasps'), a long, thin-bodied, small insect of brilliant black colour. The larvæ attack wheat, rye, and oats, feeding on the inside of the stalk, and eventually cutting it through near the ground. It rarely becomes a serious pest in Britain.

Corn Ground Beetle (*Zabrus gibbus*):

1, larva, magnified; 2, natural size of larva; 3, perfect insect, female, slightly magnified; 4, cell containing pupa; 5, a burrow.

(6) *Cecidomyia destructor*, the Hessian Fly (q.v.). (7) The Wheat Bulb-fly, *Hylemyia coarctata* (Diptera, Muscidæ), which is occasionally a source of serious loss to wheat-growers, the maggots feeding on the young shoots in spring. (8) The Gout-fly, *Chlorops taeniopus* (Diptera, Muscidæ), the maggots of which feed on the stems, causing a stunted growth and imperfect ears. Barley, wheat, rye, and many grasses are attacked, serious outbreaks being commonest on the first. Two broods are hatched each year, the mature flies appearing in May and September. The flies are yellow, with three black longitudinal stripes on the back, the abdomen greenish black, with black cross-bands. *Chlorops lineata* is a related species, also destructive. (9) Wheat-midge or Red Maggot, *Cecidomyia tritici* (Diptera, Cecidomyidæ), is an occasional source of serious damage to wheat, the eggs being laid inside the florets at the flowering period, and the maggots feeding on the developing grain. (10) Grain Aphid, *Aphis cerealis* (Homoptera, Aphidæ), sucks the sap from the stems and leaves of cereals, and sometimes does serious damage. (11) Cornthrips, *Thrips cerealium* (Thysanura, Thripidæ), a very minute insect which sucks the sap from the ears, generally of oats and wheat, and causes the grain to shrivel. (12) Leather-jacket or 'Grub', the larva of the Daddy-

Corn Saw-fly (*Cephus pygmaeus*):

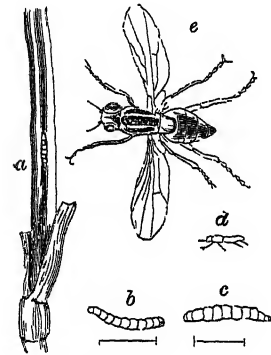

a, maggot, natural size; b, maggot, magnified; c, the maggot in its ear in the stem of the corn; d, female insect, magnified; e, female insect, natural size.

source of serious damage to wheat, the eggs being laid inside the florets at the flowering period, and the maggots feeding on the developing grain. (10) Grain Aphid, *Aphis cerealis* (Homoptera, Aphidæ), sucks the sap from the stems and leaves of cereals, and sometimes does serious damage. (11) Cornthrips, *Thrips cerealium* (Thysanura, Thripidæ), a very minute insect which sucks the sap from the ears, generally of oats and wheat, and causes the grain to shrivel. (12) Leather-jacket or 'Grub', the larva of the Daddy-

long-legs (q.v.) or Crane-fly, is a frequent source of damage, generally to grain sown on ploughed-up grass land. (13) Frit-fly, *Oscinus frit*, is a serious pest on oats, and occasionally attacks the other cereals. The maggots eat into the young stems in spring, and a second generation live on the developing grain, while a third live on wild grasses or winter corn during the winter.

Of a somewhat different habit from the above is *Tmea granella*, the Corn-moth (Lepidoptera,

Tineidae), in the same genus as the Clothes-moths. This form lays its very small eggs among stored grain or on the sheaves. The larvæ, or Corn-worms, appear among the grain on the granary floor, and when care is not taken to keep things clean and the grain well shovelled, often do much damage. From its voracity it is known as the wolf. It spins a web round several grains, and gradually devours them. Another of the granary pests is *Calandra granaria*,

Gout-fly (*Chlorops tenuipus*):

a, a portion of a culm or stem of wheat with a swollen joint, caused by larva of corn-fly; b, larva; c, pupa; d, fly, natural size; e, fly, magnified.

the Corn-weevil or brown Corn-worm (Coleoptera, Curculionidae), a small reddish-black insect, not quite two lines long, and without wings. It seems to have come to Europe from the East, but is now common in the southern regions. The female lays an egg in each of a number of grains, the larvæ soon develop, and a second brood is produced the same summer. The most successful method of arresting the mischief is fumigation with carbon bisulphide. The grain must be put in closed bins, or at least placed in tolerably airtight rooms. The liquid is placed in saucers on top of the corn, and the bins kept closed for at least twenty-four hours. 1 lb. carbon bisulphide is sufficient for 100 bushels.

For detailed accounts, see numerous leaflets published by the Board of Agriculture and Fisheries, London; also Miles, *Injurious and Useful Insects*; Petherbridge, *Fungoid and Insect Pests of the Farm* (1916); *Standard Encyclopædia of Modern Agriculture*; and Sorauer, *Handbuch der Pflanzenkrankheiten*, vol. iii. (1913).

**Cornish**, the ancient language of Cornwall (q.v.), for which see also CELTS.

**Cornish**, CHARLES JOHN (1858-1906), naturalist, born near Sidmouth, was a classical master in St Paul's School. Besides many articles in *The Spectator* and *Country Life*, he wrote *Life at the Zoo* (1895), *Nights with an Old Gunner* (1897), *The Naturalist on the Thames* (1902), *Animal Artisans* (1907, with memoir by his widow), and other books.

**Cornish Chough**. See CHOUGH.

**Cornish Moneywort** (*Sibthorpia Europæa*), a rare plant of the south of England, the only British representative of a small but widely distributed genus of Scrophulariaceæ. It is a small prostrate plant, found in damp shady places. It has crenately lobed reniform leaves and small, almost regular, yellowish flowers.

**Corn Laws**, the name popularly given to certain statutory enactments which had for their object a restriction of the trade in grain. The English corn laws date as far back as the year 1360, in the reign of Edward III. Before this

period, there seems to have been a general rule carried into effect by the crown against the exportation of any grain; and the Act of 1360 enacts the prohibition, but at the same time excepts certain places which the king may appoint by license. An Act of 1436 permitted exportation when the price of wheat did not exceed 6s. 8d. per quarter. Hitherto, there seem to have been no prohibitions against importation; but in 1463 an act was passed prohibiting it so long as the price at home was below the 6s. 8d. at which there was free exportation. The next change was in the reign of Henry VIII., when an Act of 1534 prohibited all exportation except by license specially granted under the great seal. This act was not found to work well; and twenty years later the previous arrangement was adopted of allowing exportation when the price stood below a certain point. In 1562 exportation was permitted when the price was under 10s. a quarter. Export duties of varying amounts were imposed from 1570 to 1689, when they were altogether abolished. The subsequent legislation for some time merely changed the price at which exportation might begin, generally enlarging it. After the Restoration, the policy of increasing the duties on importation, for the protection of agriculture and the landed interest at home, begins to be perceptible. At the same time the effect of that event on the relations of Scotland and England towards each other forms a curious illustration of such fiscal regulations. Under the Protectorate they were one country, with free intercommunion of trading privileges. Scotland was increasing in wealth under this arrangement; but the countries were separated by the restoration of Charles II., and became the same to each other as foreign nations. The English duties restricted the importation of grain from Scotland; and in 1663 the Scots parliament, in retaliation, laid heavy duties on the importation of English and all other foreign grain. Had not the union of 1707 made the two countries one again, England and Scotland would probably have continued a corn-law contest against each other, as was the case with the French provinces under the old regime.

The agricultural interest continuing powerfully to control this department of legislation, an act was passed in 1670 for virtually prohibiting importation into England until the home price had reached 53s. 4d., and laying a heavy duty on it above that point. This law had, however, little effect in favour of the landed interest, from the circumstance that then, and for long afterwards, Britain was an exporting, not an importing country—that is to say, it generally produced more corn than its population required. A new device was adopted at the Revolution of 1689, a bounty being awarded on exportation—i.e. a sum of 5s. was paid for every quarter of wheat sent abroad when the price fell below 48s., so that if the price in the foreign market would not induce people to export corn, the bounty, in addition to that price, might. For upwards of a century the numerous enactments in this department will be found to be a mere shifting, according to circumstances, of the incidence of the bounty on the one hand, and of the import duty on the other. In 1773 a permanent adjustment was supposed to be reached by Burke's act, which provided that the bounty should cease when the price reached 44s., prohibited exportation when the price was above that figure, and allowed importation at a nominal duty of 6d. at a price of 48s. In 1791, and during the wars of the French Revolution, further alterations in the corn laws favourable to the landed interest were effected. The bounties, however, were abolished in 1814. In 1815, after the conclusion of the wars, a law was

passed prohibiting importation of foreign corn when the price was below 80s. a quarter.

The principle of the sliding-scale which had been more or less followed in previous enactments was systematically carried out in the year subsequent to the great wars, in 1822, and particularly in 1828, when Wellington's sliding-scale was passed. The object of the device called the sliding-scale was to reduce the import duty as the price of grain increased, for the purpose of virtually prohibiting the importation when the price was low, and encouraging it when the price was high, so that at famine-prices grain might come in duty free. By the Act of 1828, the price of 62s. a quarter on wheat was taken as the turning-point. At that price the import duty was £1. 4s. 8d. For every shilling less in the price a shilling was added to the duty. When the price rose above this point a different gradation ruled, the duty decreasing by a larger ratio than the rise. Thus, when the price was 69s. the duty was 15s. 8d.; and when it rose to 73s. the duty sunk to its minimum of 1s. The effect of such fluctuation in rendering the trade a gambling one is obvious, and yet this was not acknowledged until it had been proved by a series of ruinous instances. Thus, an importer who, when the price of grain was 73s. a quarter, bought a cargo, if the price sunk 4s. before he could accomplish a sale, had not only to sell at that reduced price, but with a further reduction of 14s. 8d. a quarter paid as duty. What was still more important, the supplies to this country being so capricious and irregular, foreign countries did not grow corn habitually for the British market. In 1842 Sir Robert Peel tried a modification of the sliding-scale, which did not in the least degree mitigate the growing hostility to the corn laws.

The basis of this hostility to the corn laws was found in the population which had now grown up in the large towns. The effect of the industrial revolution connected with mechanical invention and the utilisation of steam had been to transform Great Britain from an agricultural into a manufacturing and commercial country. The new interests thus created were rapidly rising to supremacy. But the nation did not, till the very last, earnestly unite in calling for repeal. There was a powerful party who defended the corn laws, and represented, with great plausibility, that these restrictive statutes were for the public good. Their arguments might thus be summed up: (1) Protection was necessary, in order to keep certain poor lands in cultivation. (2) It was desirable to cultivate as much land as possible, in order to improve the country. (3) If improvement by that means were to cease, we should be dependent on foreigners for a large portion of the food of the people. (4) Such dependence would be fraught with immense danger; in the event of war, supplies might be stopped, or our ports might be blockaded, the result being famine, disease, and civil war. (5) The advantage gained by protection enabled the landed proprietors and their tenants to encourage manufactures and trade; so much so, that if the corn laws were abolished, half the country shopkeepers would be ruined; that would be followed by the stoppage of many of the mills and factories; large numbers of the working-classes would be thrown idle; disturbances would ensue; capital would be withdrawn; and what would happen then, the wisest could not foresee. Such arguments had great weight with the labouring-classes, the small-town shopkeepers, almost all the members of the learned professions, and an immense majority of both Houses of parliament. Those who endeavoured to represent the impolicy of a restricted trade in corn were generally set down as little better than mischief-makers. In the House

of Lords in 1839, Lord Melbourne, a Liberal premier, said, 'To leave the whole agricultural interest without protection, I declare before God that I think it the wildest and maddest scheme that has ever entered into the imagination of man to conceive.'

Meanwhile the ANTI-CORN-LAW LEAGUE concentrated the efforts of the free-trade party in Britain, and ultimately enabled them to carry the repeal of the corn laws, and to establish in practice the principle of free trade. In 1836 a number of philosophical radicals, among whom were Grote, Joseph Hume, and Roebuck, had formed an association for repealing the corn laws. In 1838 seven Manchester merchants formed an association of the same kind. The latter was soon joined by Cobden, who threw all his energy into the agitation, and secured for it also the eloquent advocacy of John Bright. Charles Villiers, who led their cause in the House of Commons, moved in February 1838 that the House resolve itself into a committee of inquiry on the corn laws. The motion was rejected by 342 to 195; and immediately the famous League was formed, with a central office at Manchester, its constitution dating from the 20th March 1839.

This was the beginning of a remarkable agitation, supported by lectures, verses, pamphlets, and popular oratory, which had a great influence on the economic and political education of the country. Large sums of money were raised, and a vast mass of popular literature bearing on the corn laws was diffused. In 1843 the League raised £50,000; in 1844, £100,000; in 1845, £250,000, for continuing the agitation. At a great meeting at Manchester in 1845, £60,000 were subscribed in an hour and a half.

The opposition to the corn laws steadily increased. Roused by the addresses of Mr Cobden, Mr Bright, and other leaders of the League, the people poured in petitions to parliament. The failure of the potato crop and the famine imminent in Ireland gave an overwhelming weight to the arguments of the League. At length the Conservative premier, Sir Robert Peel, became a convert to Free Trade (q.v.), and in 1846 carried a measure to put an end to the corn laws. By this act, the duty on corn was at once greatly reduced, and was to cease altogether in 1849, with the exception of a registration duty of 1s. a quarter, which terminated in 1869.

The repeal of the corn laws did not lead to a very great fall in the price of corn, nor did it result in the ruin of the agricultural interest. The vast expansion of industries, attended with a large increase of population and the growing demand for food, kept prices up to a tolerably high level. A markedly increased consumption of butcher-meat specially tended to enhance prices in that department and to raise the rent of land. With the development of American competition, about the year 1876, however, a new period set in. English agriculture *has* suffered severely, a fact which has largely contributed to the formation of a Fair-trade Party demanding among other things what they consider a moderate and reasonable protection for our landed and cultivating classes.

The pressure of American competition has also of late years led to the establishment of a corn-law system for the protection of agriculture in Germany. In France the duties on importation had been greatly reduced, but since 1881 things have followed the same course as in Germany. The greatly increased national expenditure caused by the Boer war led to the imposition in Britain of a revenue duty of 1s. per quarter on imported grain and flour, remitted again in 1903; and by that time Mr Chamberlain's scheme of preferential tariffs, including a tax of 2s. on non-colonial imported grain, was fairly, before

the country. See BRIGHT, COBDEN, FREE TRADE, PROTECTION, CHAMBERLAIN.

**Corno, MONTE.** See GRAN SASSO D'ITALIA.

**Corno Inglese.** See COR ANGLAIS.

**Cornouaille,** a district of Brittany, included within the modern department of Finistère. It is one of the most barren and desolate parts of France; the chief town is Quimper. The identity of the name with Cornwall is obvious. See BRITTANY.

**Corns** (Lat. *cornu*, 'horn,' through the French) are small hard growths, resulting from an increase in the thickness of the cuticle or epidermis, which is generally caused by the irritation of some excessive pressure or friction on the part. They occur most commonly on the feet as a result of tight or ill-fitting shoes. Corns are either hard or soft; the structure of both classes is essentially the same. A *hard corn* begins as an ill-defined thickening of the epidermis at one point. As irritation continues, the excessive growth of epidermis increases, and the papillæ (see SKIN) beneath also enlarge, giving the deeper part of the growth a fibrous appearance, popularly described as the 'roots' of the corn. Pressure upon the sensitive nerves of these papillæ causes the usual pain of corns. Old corns often have a bursa or sac developed beneath them, which in part protects the underlying structures. Excessive irritation sometimes causes this bursa, or in its absence the connective tissue beneath a corn, to inflame and suppurate; and the little abscess thus formed, confined by the hardened epidermis, gives rise to intense suffering. In so-called *fibrous corns*, more allied to warts, the enlargement of the papillæ predominates, and the pain is greater than in ordinary hard corns. *Soft corns* occur between the toes, where the warmth and moisture promote early separation of the epidermis, and growth of the papillæ; they are therefore more vascular than the other forms, and often extremely painful.

The treatment of corns consists in the removal of all undue pressure or friction, either by removing the shoe altogether, or protecting the corn by surrounding it with a border of some soft material, as Amadou (q.v.) or soft leather; or the hardened cuticle may be pared or filed away, the central part most deeply. Of late years a simple and convenient remedy has been introduced, now sold everywhere as a 'certain and painless cure for corns.' It consists of a solution of salicylic acid in collodion, one drachm to one ounce, with a small proportion of extract of Indian hemp. It is painted over the corn once or twice daily, and allowed to dry, with the effect of so softening the epidermis that, usually after six or eight applications, it can readily be peeled off with the aid of hot water. Soft corns should be freely dusted with oxide of zinc powder, and the affected toe isolated from its neighbours by means of medicated cotton-wool. If suppuration occur beneath a corn, the matter must be let out by a puncture, after the corn has been pared down. Those subject to corns should avoid patent leather boots, and wear large shoes, with thick, frequently changed socks, into which a talc and boracic powder may be daily dusted.

Corns affect horses as well as men. In the foot of the horse they occur in the heels in the angle formed between the bars and the wall, and consist in a bruise of the sensitive sole. Some forms of feet are especially subject to them. Corns constitute unsoundness; cause a short, careful, tripping gait; are a frequent cause of lameness amongst roadsters; are common in badly shod horses, and usually occur in the inside heels of the forefeet, these being more especially subjected to weight, and hence to pressure. The discoloured spot indicating the recent corn must be carefully examined.

If it is acutely painful and the animal very lame, a poultice will have the twofold effect of allaying irritation and relieving the sensitive parts by softening the hard unyielding horn. When less painful the discoloured horn should be carefully thinned with a fine sharp drawing-knife, but on no account must the bars or outer crust be removed; they are required for bearing weight, which may be further kept off the injured part by the use of a bar-shoe. A horse with a bad corn will often be enabled to go sound by cutting off about an inch and a half of the inner branch of the shoe at the heel, opposite the corn, and after the corn has disappeared, if carefully shod he may go all right with an ordinary shoe.

**Corn Salad,** or LAMB'S LETTUCE (*Valerianella*), a genus of Valerianaceæ, humble annual weeds, of which some are used as spring salads, especially in France and Germany. The commonest species is *V. oleracea*, which is naturalised in the United States, and often called Petticoat or Vetticost. There are several native American species.

**Cornstone,** an arenaceous or siliceous limestone, often mottled, and not infrequently concretionary. It usually occurs in those systems which are largely composed of reddish sandstones.

**Cornucopia** (Lat. *cornu*, 'a horn,' and *copia*, 'plenty'), in classical antiquities, the horn or symbol of plenty placed in the hands of emblematical figures of Plenty, Liberality, and the like, who are represented as pouring from it an abundance of fruits or corn. It is frequently used in architecture, sculpture, and heraldry.

**Cornwall,** a maritime county, forming the south-western extremity of England, and the southernmost part of the British Isles. It is peninsular, tapering westward from Devonshire to the Land's End, bounded on the E. by Devonshire, on the N. by the Bristol Channel, on the W. by the Atlantic, and on the S. by the English Channel. No part of the county is more than 20 miles from the sea. The total length from Welcombe to the Land's End is 81 miles, and the extreme breadth from Morwenstow to the Rame Head 45 miles. The Scilly Isles, 24 miles W. of the Land's End, form part of the county. The area is 1360 sq. m., of which 63·4 per cent. is under cultivation. There are very extensive stretches of moorland, much rocky and barren, but a large proportion useful as mountain pasture. The surface of the county is very irregular, and a ridge of rugged, bleak, rocky hills, interspersed with moors, stretches from the Tamar to the Land's End, a continuation of the Dartmoor upland, and forming the watershed. Brown Willy (1368 feet) is the loftiest point in the county. As this range is nearer the north of Cornwall than the south, the principal rivers are on the southern side, and empty themselves into the English Channel. With the exception of a few unimportant creeks, there are only two harbours on the north coast—the estuary of the Camel, on which is Padstow, and the bay of St Ives. For nearly the whole of its length this north coast is formed of bold and picturesque cliffs; but at Peranzabuloe and Gwithian there are hills of blown sea-sand, which have buried much good land. The southern coast is also for the most part bold and rocky, but indented with many headlands and bays. Between the Land's End (5° 41' 31" W.) and the Lizard Point (49° 57' 30" S.) is the deep indentation named Mount's Bay, from St Michael's Mount, with the harbour-works of Penzance. East of the Lizard is Falmouth Bay, into which opens Falmouth Harbour, one of the finest in Britain. On the eastern boundary of the county is another of the great havens of the kingdom, Plymouth Sound. The estuary of the Fowey also affords a small but per-

fectly sheltered deep-water harbour—of considerable importance in the middle ages. The chief river is the Tamar, which practically divides Cornwall from Devon, rising within 3 miles of the north coast at Wooley Barrows. It is tidal, and navigable for 19 miles (total length 59) from its embouchure in Plymouth Sound. Its principal Cornish tributary is the Notter, which enters it through the estuary of the Lynhir, and is navigable for 5 miles. The lower part of the estuary of the Tamar is called the Hamoaze. The Fowey is 30 miles long, and navigable for 6. The Fal is 20 miles long from its source to Falmouth Harbour, into which several smaller streams empty themselves through tidal creeks. The Camel (also called the Alan) is 29 miles long, 10 miles being tidal. There is a tradition that a large tract of land between the Land's End and the Scilly Isles was submerged by the sea. This is the fabled Lyonesse.

Cornwall is mainly composed of clay-slate, provincially called *killas*, which is broken along the higher ground by the protrusion of bosses of granite, in five larger and many smaller masses, probably connected beneath the surface. Associated with the granite are schorl and allied rocks, and there are many dikes of quartz- and felspar-porphry, locally termed *elvans*. The slates are interspersed with igneous rocks, interbedded and intrusive, and there has been much alteration. The Lizard district presents the most complex series in the kingdom. Serpentine and gabbro are the most distinctive rocks here; but there are schists and gneisses and porphyries in singular variety. The stratified rocks of the east of the county are recognised as Devonian; in the central region Silurian are largely represented; the western may be still older; and the Lizard are believed to be partly Archaean. Mining has been carried on in Cornwall from prehistoric times, and the county has been regarded as the Cassiterides (q.v.) of the Phœnicians and Greeks. The most profitable mines are near the junctions of the granite and *killas*, and the most important mining area at the present day is around Camborne and Redruth; the deepest and richest mine is Dolcoath, wrought to a depth of about half a mile. The county yields tin, copper, lead, iron, zinc, silver, cobalt, antimony, manganese, bismuth, tungsten, and arsenic in commercial quantities; and a greater variety of minerals (some unique) than any other part of the United Kingdom. Gold has been found in alluvial tin works or 'streams,' the largest nugget over two ounces. Of late years mining has been very much reduced, and almost all the mines now existing are tin, of which Cornwall yields nearly all that is raised in the kingdom. Radium has given a new importance to pitch-blende. Next to tin, the most important mineral product is china clay (*kaolin*), the decomposed felspar of granite which has undergone the natural process of kaolinisation. The chief centre of this industry is the district north of St Austell. Here also is found a peculiar kind of granite called china-stone (*petuntze*).

The fisheries of Cornwall are extensive and important, and in favourable seasons large quantities of pilchards are caught by seining, cured, and exported to the Mediterranean, where they form a common Lenten food. Herring and mackerel fisheries are also extensive, and enormous quantities are sent by rail to London and various inland markets. The climate is generally mild, but damp. In the extreme west of the county snow seldom lies, and the winter temperature is such that plants live and flourish in the open air that require protection almost anywhere else in England. At Trevarrick, near St Austell, and Lamoran and Penjerick, near Falmouth, many foreign trees and shrubs have been successfully acclima-

tised. Camellias grow and flower in the open air as luxuriantly as the common laurel in sheltered localities. The gardens at Tresco, Scilly, are quite tropical in character, from the variety and beauty of their tropical contents. This favourable climate has been turned to good account in the Scilly Isles and the Penzance district, by the development of market-gardening for the supply of early vegetables to the leading markets, particularly broccoli and potatoes, of which double crops are raised annually. With the exception of the peach, nectarine, and apricot, nearly all fruit-trees thrive and mature; and the banks of the Tamar are specially favourable to the growth of cherries and strawberries, for rail supply. As a general agricultural county (its moorlands excepted), Cornwall stands high: the soil is rich; crops are abundant, and in some localities very early.

There are very few manufactures; and most of the inhabitants, since the falling off in mining, are employed in agriculture. Pop. (1881) 329,484; (1921) 320,559. Cornwall returned 40 members to parliament prior to 1832, 14 till 1867, 12 till 1885, 7 (including the parliamentary borough of Falmouth and Penryn) till 1918, and now 5, for county divisions only. The bishopric of Cornwall, merged in that of Exeter since Saxon times, was restored in 1876, and the see fixed at Truro.

Cornwall remained in the hands of its Celtic inhabitants, and under the rule of the British Church, with more or less completeness, until it was finally subjugated by Athelstan in 936. The ancient Cornish language belonged to the Cymric or Brythonic group of the Celtic tongues (see CELTS), and was akin to Welsh and Breton. It was generally spoken until the reign of Elizabeth, and it was not until 1673 that it finally ceased to be used in public worship. It lingered in the extreme west of the county probably well into the 19th century; Bernard Victor (d. 1875) of Mousehole is by some regarded as the last who spoke it; while words and phrases have been handed down to the present day. The literature comprises a vocabulary dating probably from the 13th century, and some sacred dramas not earlier than the 14th. See Norris's *Ancient Cornish Drama* (1859); Whitley Stokes's editions of *The Life of St Meriasek* (1872), of *The Mystery of the Creation* (1864), and of the *Glossary of Cormac* (1864); the glossary of words still in use in Cornwall, published by the English Text Society in 1880; a paper by Laci-Szyima in the *Journal of the Royal Institution of Cornwall* for 1883; Jago's *English-Cornish Dictionary* (1887); and Jenner's *Handbook of the Cornish Language* (1904).

Cornwall abounds in rude stone and allied monuments—circles, remains of huts, menhirs, cromlechs, artificial caves or fogous, cairns and barrows, inscribed stones, and early crosses. The medieval antiquities are less important, the most noteworthy being the remains of the castles of the ancient earldom, created into a duchy in 1337 for the Black Prince. The eldest son of the reigning sovereign is Duke of Cornwall; and the revenues derived from the duchy by the Prince of Wales average £86,000 a year. In the management of the affairs of the duchy the Prince is assisted by a council, the chief officer of which is the warden of the Stannaries, by whose vice-warden the Court of the Stannaries, which has the local regulation of mining affairs, is held. See Tregellas's *Cornwall* (7th ed. 1891), works cited there, and the *Victoria History* 1906, *et seq.*

**Cornwall**, a port of entry of Ontario, at the mouth of the Cornwall Canal, and separated by the St Lawrence from New York state. It is on the Grand Trunk Railway, 67 miles SW. of Montreal, and has, among other factories, one of the principal woollen-mills in the Dominion. Pop. 7400.

**Cornwall**, BARRY. See PROCTER.

**Cornwallis**, CAROLINE FRANCES, was born on the 12th July 1786, the daughter of the rector of Wittersham and Eltham, in Kent. She acquired a thorough knowledge of Latin and Greek, and making herself conversant with nearly every study which occupies thoughtful men, from an early age she carried on a correspondence with many eminent persons. Her refusal to accept the hand of Sismondi did not forfeit his friendship, and she lived much in Italy. Her first work, *Philosophical Theories and Philosophical Experience, by a Pariah* (1842), was the first of a series of twenty 'Small Books on Great Subjects,' the said subjects including the Connection of Physiology and Intellectual Science, Ragged Schools, Criminal Law, Greek Philosophy, and the History and Influence of Christian Opinions. Miss Cornwallis also published in 1847, *Pericles, a Tale of Athens*. She died at Lidwells, in Kent, 8th January 1858. See her *Letters and Remains* (1864).

**Cornwallis**, CHARLES, MARQUIS, an English general and statesman, son of the first Earl Cornwallis, was born in London, December 31, 1738, and was educated at Eton and the Military Academy of Turin. He served as aide-de-camp to the Marquis of Granby during part of the Seven Years' War; in 1776 he was made a colonel, four years later Constable of the Tower, and the year after a major-general. In 1760 he had been returned to parliament for the family borough of Eye. Though personally opposed to the policy of forcing taxes upon the American colonists, he accepted a command in the war, and with an inferior force gained a victory over General Gates at Camden in August 1780, and more than held his own against General Greene at Guilford, March 1781. But his operations were hampered by the incapacity of his superiors, Howe, and after him, Clinton; and at length he was forced to surrender with all his troops at Yorktown, Virginia, 19th October 1781. This disaster proved the ruin of the British cause in America, and was the occasion of much dissatisfaction, resulting in a change of ministers at home. Cornwallis, however, who was high in favour with the king, escaped censure. In 1786 he was appointed governor-general of India and commander-in-chief, and in this double capacity distinguished himself by his victories over Tippoo Saib, and by unwearying efforts to promote the welfare of the natives, that proved less successful than they deserved. He returned from India in 1793, when he was raised to the rank of Marquis. As lord-lieutenant of Ireland, with Castlereagh as his secretary, he crushed the '98 rebellion, and showed a rare union of humanity and vigour in his measures for the pacification of the country. As plenipotentiary to France he negotiated the peace of Amiens in 1802, but showed little skill in diplomacy. Reappointed governor-general of India in 1804, he died at Ghazipur, in the province of Benares, October 5, 1805, on his way to assume the command of the army in the Upper Provinces. See his Correspondence, ed. by Charles Ross (1859); and the Life (in 'Rulers of India') by Karr (1890).

**Coro**, a town of north-western Venezuela, lies about 210 miles WNW. of Caracas, near the Golfete de Coro. It has a fine aqueduct, and a college; but it has greatly declined since the period 1527-78, when it was the capital of the Spanish province. Pop. 15,500. There are valuable coal-mines near. The port is La Vela, 7 miles NE. by rail.

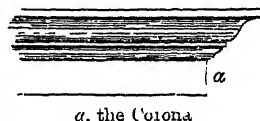

**Corolla**. See CALYX, FLOWER.

**Corollary**, a proposition the truth of which appears so clearly from the proof of another proposition as not to require separate demonstration.

**Coromandel Coast** is a name used vaguely for the major part of the eastern coast of what is now the province of Madras, on the west shore of the Bay of Bengal. It has hardly a single safe place of refuge for large vessels. The name is probably a corruption of *Cholamandalam*, 'country of the Cholas,' an old Dravidian people.

**Coro'na**, or CROWN, in Botany, an appendage of the corolla in some flowers; sometimes developed as a crown-like circlet within the petals, as in the common white narcissus, or prolonged like an internal united corolla, as in the daffodil. Much discussion has taken place as to its morphological nature, at first as to whether it was to be regarded as composed of modified stamens or supernumerary petals. But in many Caryophyllæ (e.g. *Lychnis*) each petal is seen to bear a *ligule*, so called from its resemblance to that of a grass-leaf (see GRASSES). These are regarded as of stipular origin; and in this way we come to look at the corona of a narcissus as composed neither of modified petals nor stamens, but of the united petaline stipules. See LEAF.

**Corona** (Lat., 'a crown'), in Architecture, the drip, or lower member of the projecting or upper part of a classical cornice (see ENTABLATURE). The term CORONA is also applied to the apse or semicircular termination of the choir. Corona is also applied in ecclesiastical nomenclature to a chandelier, in the form of a crown or circlet, suspended from the roof of a church.

a, the 'corona

**Corona**. See SUN, HALOS.

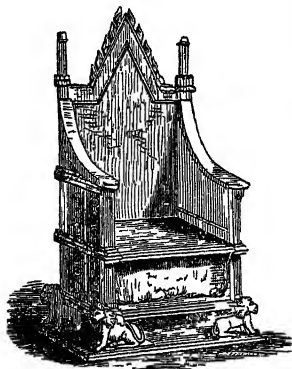

**Corona Borëalis**, a small and bright constellation near Hercules.

**Coronach**, a name formerly used for the funeral dirge amongst the Irish and the Scottish highlanders. The dirge, disused in Scotland, is in Ireland now commonly known as the *keen*.

**Coronation**. The practice of placing a crown on the head of a monarch at the commencement of his reign is very ancient, and there is probably scarcely any country in which it has not been followed in one form or another. Generally it has been accompanied by what was regarded as the still more solemn rite of anointing with oil, a ceremony which, from the times of the ancient Hebrews to our own, has been peculiarly significant of consecration or devotion to the service of God. In England, before the Norman Conquest, the term was more usually 'hallowing' or consecration than coronation; but it would seem that the ceremony as then performed at Kingston-on-Thames or Winchester was in all essentials the same as that which now takes place in Westminster Abbey, though now the ceremony is a mere pageant. Detailed accounts of many English coronations, from Richard I. downwards, have been preserved.

There have been considerable variations from time to time in the oath. Originally the king pledged himself to three things—peace and reverence to God and the church, justice to the people, the upholding of good and abolition of bad laws. In Edward II.'s time it became more precise, and assumed the form of question and answer. By the form settled after the Revolution of 1688—and amended in 1911 to spare offence to the feelings of Roman Catholics—the sovereign, in response to the Archbishop of Canterbury, swears to govern according to the statutes in parliament agreed on; to cause law and justice, in mercy, to be executed; and to preserve and maintain the Protestant religion established by law. This oath was held

both by George III. and George IV. to prevent them from granting Catholic Emancipation, and was also by many regarded as an obstacle to the disestablishment of the Irish Church (see Bishop Phillpotts, *The Coronation Oath*, 1828). The treaty of Union between England and Scotland provides that the oath of the preservation of the

Coronation Chair of the Kings of England.

government, worship, and discipline of the Church of Scotland should be taken not at coronation but at the accession of the sovereign. For the ceremonies connected with coronation, see CHAMPION, and books by Planché (1838), Jones (1883), and Woolley (1916).

The Scottish coronation stone, the *Lia Fail*, or 'Stone of Destiny,' was reputed to have been the stone which Jacob used for a pillow, and to have been brought

to Ireland, and from Tara to Scotland, where it lay at Scone, till in 1296 Edward I. carried it to Westminster. It now forms part of the coronation chair. Skene, in his monograph (1869), asserts it to have been quarried from the rocks near Scone. Irish antiquaries (e.g. Petrie) have insisted that it was at Tara four centuries after the alleged removal to Scotland, and is probably there still-buried, according to Dr Joyce.

**Coronea**, a town of Boeotia, SW. of Lake Copais, where in 447 B.C. the Boeotians defeated the Athenians, and in 394 Agesilaus the allied Greeks.

**Coronel**, a port of Chile, 12 miles S. of Concepción. Here are important mines of coal, which is exported. The place gives its name to a naval battle (1st Nov. 1914) of the Great War (q.v.). Pop 5000.

**Coronella**, a genus of non venomous snakes in the family (Colubridæ) to which the English Ringed Snake (q.v.), *Tropidonotus natrix*, also belongs. The genus is well represented in dry regions in Europe and North Africa. *C. levis* or *austriaca* is a very common European species between two and three feet in length.

**Coroner** (Lat. *coronator*, *corona*, 'a crown'), a very ancient officer, in England, at the common law. The coronator is mentioned in a charter of King Athelstan, 905 A.D.; and the office is said to be of Saxon origin. But Bishop Stubbs (*Constitutional History*, vol. i. chap. 17) finds the origin of the office of the modern coroner in an ordinance of 1194 A.D. for the election in every shire of officers to keep the pleas of the crown, whence the name. In this light, the Lord Chief-justice of the King's Bench is the principal coroner in the kingdom, and may exercise jurisdiction in that capacity in any part of England. There are, however, particular coroners in every county in England, and in some counties three or four, or even more. Every borough having a separate court of Quarter Sessions has a coroner; but since 1888 boroughs have ceased to have a separate coroner unless the population amounts to 10,000. Coroners were formerly paid by fees on each inquest, but now by salary out of the county rate. The coroner is chosen for life, and the election, which formerly lay with the freeholders, rests, under the Local Government Act

of 1888, with the county-council, or with the town-council of a borough having the right to appoint one. A coroner may, however, be dismissed by the Lord Chancellor for inability or misbehaviour in his office. By the statute of Westminster the first (3 Edw. I. chap. 10), it was enacted that none should be chosen but lawful and discreet knights; and in the time of Edward III. there is an instance of a man being removed from the office because he was merely a merchant. Subsequently it was thought sufficient if a man had lands enough to entitle him to be made a knight; and Blackstone complains that in his time it had come to be sought for the perquisites, and not for the honour of serving the country. This motive has now ceased. The coroner is now usually a professional man, frequently a solicitor or a doctor of medicine.

The office of coroner is to some extent the only one in England charged with the investigation of crime. When the coroner cannot act, there is no authority to examine witnesses until a suspected person has been actually charged or accused before a magistrate. But even the coroner's duties are very limited. They are defined by 50 and 51 Vict. chap. 71, which consolidates most of the previous statutes. The coroner can inquire only into the causes of violent or sudden death, and into these only when the body has been found. When such a death happens, it is the duty of the constable to give notice of it to the coroner, who then summons a jury from the body of the county for the purpose of making an inquisition into the matter. The coroner presides over the inquisition, and the court thus constituted is a court of record. The jury consists of twelve men at least, who are sworn and charged by the coroner; and the verdict must be found by twelve. The inquest is to be held before the coroner in whose district the body shall be 'lying dead.' If any be found guilty by such inquisition of murder or other homicide, the coroner is to commit them to prison or take bail for their appearance at the assizes, according to the gravity of the offence, and he must certify the inquisition under his own seal and the seals of the jurors, together with the evidence thereon, to the court in which the trial is to take place. The accused may thereupon be put on his trial without other indictment. The coroner is empowered to summon medical witnesses, who are liable to a penalty for non-attendance. He has power to pay a medical witness one guinea for a simple examination, and two guineas if a *post-mortem* examination of the body has been made. Coroners are required to appoint deputies in case of absence from illness or other reasonable cause. Another branch of the coroner's office was to inquire concerning shipwrecks and treasure-trove; but the former has been superseded by the provisions of the Merchant Shipping Acts 1854-1894. He is a conservator of the king's peace, in which capacity he is mentioned in the oldest treatises on the common law. As such, he may cause suspected felons to be apprehended, whether an inquisition has found them guilty or not. The coroner has likewise ministerial functions as the sheriff's substitute, in making out the panel of jurors, and in executing process in suits in which the sheriff is related either to the plaintiff or defendant. Beside county and borough coroners there are certain 'franchise' coroners, such as the coroner of the king's household.

Coroners or crowners, as they were also called in England, are mentioned in many old Scottish statutes; and there is no doubt that the office, as well as that of alderman and mayor, existed in those parts of the country that were peopled by persons of Teutonic race. But it was abolished or fell into desuetude, probably in consequence of

the succession war and the French connection; and in Scotland the duties are now chiefly performed by an officer appointed by the crown, styled the Procurator-fiscal (q.v.). In Ireland the office of coroner is regulated by 9 and 10 Vict. chap. 37. See Jervis, *Office and Duties of Coroner* (new ed. by Melsheimer, 1898).

In the United States the coroner is generally elected for a specified term by the voters of each county. He is authorised to employ deputies, assistants or clerks, as well as a legal adviser, and a physician to examine the cases which come before him. His powers and duties relating to the inquiry into cases of sudden or violent death are substantially the same as those of an English coroner. But he is confined to this function. Nor does the inquisition found before the coroner dispense with the necessity of an indictment found by the grand jury, as in England. In cases where the sheriff is absent or disabled, the coroner may sometimes act as an executive officer in his stead. He must in each term make a report under his official seal to the Court of Common Pleas of the state.

**Coronet**, an inferior sort of crown worn by persons of princely or noble rank, as a crown properly so called is worn by a sovereign. In England, coronets were worn by peers as far back as the reign of Edward III.; but the definite form given to the coronets of the different orders of the peerage is of later date, as is also the practice of placing within the coronet a cap of crimson velvet lined with ermine and surmounted by a gold tassel. The use of coronets by barons began in the reign of Charles II. Peers wear their coronets on the occasion of the coronation of a sovereign; and they are placed over representations of their arms, this being done even in the case of peers by courtesy. In 1665 Charles II. granted warrants to the Scottish and Irish kings of arms for the peers of those kingdoms to wear coronets similar to those of peers of England.

The following are the distinctive forms of the coronets in use in the United Kingdom: The coronet of the Prince of Wales differs from the royal crown only by the absence of one of the

points of more considerable height, with a pearl set on each, alternating with as many strawberry-leaves on the rim below. A viscount's coronet has sixteen, and a baron's six pearls set directly on the rim. The so-called pearls are always made of silver. No coronet belonging to a peer not of the royal family should be adorned with jewels.

The term *ducal coronet* is sometimes applied in heraldry to a decorative coronet like that of a duke, but with only three leaves, and without the cap, out of which (in place of out of a wreath) the crest issues.

The coronets of continental nobility are without caps, and otherwise differ somewhat from those in use in Great Britain. They are only used in blazonry, and are not worn on state occasions. The coronet of a French duke is like that in use in England, that of a marquis has three strawberry or parsley leaves alternating with three pearls, while a count's coronet has nine pearls. German dukes arch their coronets, and German counts often elevate their pearls. The coronet of the Dauphin of France was heightened with fleurs-de-lis, and arched with four or sometimes eight dolphins.

**Corot**, JEAN BAPTISTE CAMILLE, landscape-painter, was born at Paris, 28th July 1796, the son of a hairdresser who became a draper. Educated in the Lycée at Rouen, he became an assistant in a drapery establishment in Paris, and it was not till his twenty-sixth year that he was able to yield to his natural inclinations and begin the systematic study of art. He was instructed by Michallon and Victor Bertin, and in 1825 he settled in Rome, his small view of the Coliseum in the Louvre bearing that date. Here he studied under Aligny, '*L'Ingres des arbres*,' and in 1827 he returned to Paris, and contributed his '*Vue prise à Narni*,' and his '*Campagne de Rome*' to the Salon, where he constantly exhibited till the year of his death. His main sketching ground was at Barbizon, in the forest of Fontainebleau; but he made two other visits to Italy in 1835 and 1843. His earlier productions are careful and precise in execution, and it was not until about 1840 that he asserted his full individuality, and developed that style, characterised by great breadth and delicacy, and sacrificing accuracy of detail to unity of impression and harmony of general effect, which marks the works of his maturity. He was not an artist of great variety or of very extended range in subject and effect. He was the painter of misty lakes and vaporous rivers, of the quiet of moonlight, of the tender moments of pure sunrise, or of softly coloured evening; and these he has treated in the spirit of a true poet, introducing very appropriately his figures of peasants, or more frequently of nymphs and classical personages, who take their place most fittingly in scenes like his which tend towards the ideal and the idyllic. His works made their way slowly with the public, but wealth and fame came to him in the end. At the Salon he won medals in 1833, 1848, 1855, and 1867. In 1846 he received the Cross of the Legion of Honour, and in 1867 he became an officer of the order. He exercised a most powerful and clearly marked influence upon the younger French artists, with whom his genius, his frank kindliness, and his openhanded generosity rendered him the most popular of men and painters. In 1874, when the medal of honour of the Salon, which they expected to be bestowed on him, was awarded to Gérôme, they subscribed for a medal of their own, which they presented to '*le père Corot*,' as they were fond of calling him, only three months before his death, which occurred at Paris, 22d February 1875. Among his masterpieces may be named '*Danse de Nymphes*,' '*Macbeth*,' '*Homère et les Bergers*,' '*Orphée*,' '*Souvenir de Montefontaine*,' '*Joueur de Flûte*,' '*Un Matin à Ville*

PRINCE OF WALES

EARL

VISCOUNT

BARON

Coronets.

arches. The coronets of other princes, sons of the sovereign, are without arches. Princes, sons of the above, have a similar coronet, with strawberry-leaves substituted for fleurs-de-lis. The coronet of a duke has above the rim of gold eight strawberry-leaves, of which five are shown in pictorial representation. That of a marquis has four strawberry-leaves, alternating with as many large pearls upon short points. The coronet of an earl has eight

d'Avray, 'Dante et Virgile.' He is well represented in public and private collections in Britain and the United States. See Lives by Dumesnil (1875), Robaut (1880), Rousseau (1884), and Roger-Miles (1891); the monograph by D. C. Thomson (1892, republished from his *Barbizon School*, 1891); and books by Meier-Gräfe (1913), Moreau-Nélaton (1913), and Thomson (1914).

**Corozo.** See IVORY (VEGETABLE), BUTTONS.

**Corporal**, in the British army, is the grade of non-commissioned officer next below that of sergeant. On parade he falls in as a private soldier, but in barracks or camp he exercises certain disciplinary control over the privates, commands small guards, and does orderly duty. The distinctive badge is two Chevrons (q.v.). There are nine corporals to each squadron of cavalry, and five to each Company (q.v.) of infantry. A lance-corporal is an acting corporal, and wears one chevron only. In the artillery there is a special grade of non-commissioned officer below that of corporal, called a bombardier, with pay equal to the lowest rate of corporals in the infantry. The badge is one chevron, and there are acting bombardiers, but no lance-corporals. In the engineers there are corporals, second corporals, and lance-corporals. In the Household cavalry the title of *corporal of horse* is given to the non-commissioned officers corresponding to the squadron sergeant-majors of other cavalry regiments (see COLOUR-SERGEANT). A ship's corporal in the navy is a petty-officer under the master-at-arms, to guard against the smuggling of spirits on board, extinguish the fires and lights, and keep order below at night.

**Corporal**, in Roman Catholic ritual, is the linen cloth on which is placed the consecrated host, or the vessel containing it. The *pall* is a square piece of linen placed on the top of the chalice; while the *chalice-veil*, covering the chalice, is of the same materials and colour as the priest's vestments.

**Corporale.** See CHALICE.

**Corporal Punishment.** See FLOGGING.

**Corpora Quadrigemina.** See BRAIN.

**Corporation.** This, in England, is either aggregate or sole. A corporation aggregate is a society of persons authorised by law to act as one person, and to perpetuate its existence by the admission of new members. Without such legal authority a society, in the eye of the law, consists merely of individuals with rights and duties towards each other based on contract. A corporation sole consists of one person, the holder of a public office, and his successors, such as the sovereign, a bishop, the vicar of a parish, and most perpetual curates. Certain officers of state—e.g. the Treasury Solicitor—are corporations sole; and by recent statutes this status has been conferred on the Postmaster-general (Post-office Act, 1903) and on the Public Trustee (Public Trustee Act, 1906). The effect is that a continuous legal personality is attributed to the successive holders of the office, so that all the rights, proprietary and other, appertaining to the office are preserved entire, and the temporary holder of the office can, in his official capacity, sue or be sued on behalf of himself and his successors in the office. The conception of a corporation sole is peculiar to English law, and in ordinary usage the term corporation means a corporation aggregate.

A corporation could formerly be established only by charter from the crown or act of parliament, unless, indeed, it existed by immemorial prescription; but of late years the exigencies of commerce have led to the passing of various enactments, by compliance with which any society of persons may acquire for themselves the character of a corporation (see COMPANY). Many important municipal

charters were granted by ecclesiastical authority—e.g. till 1835 Newcastle had only a charter from the bishop of Durham. Boroughs, too, had frequently delegated from the crown, or some subject superior with royal rights, the power of incorporating trades or crafts within their own territory (see GUILDS). The procedure by which a borough may obtain from the crown a charter of incorporation is now regulated by the Municipal Corporations Act, 1882. A corporation always receives a corporate name, by which it sues and is sued, and it must possess a common seal, which is the proper evidence of its agreements and obligations. The majority of the members are entitled to act within the powers of the corporation, and may, by a bylaw, even delegate—except in the case of municipal corporations—the power of acting to a certain number of the members. For these acts none of its members are personally liable.

Corporations, whether aggregate or sole, are divided into ecclesiastical and lay, and the lay are subdivided into civil and eleemosynary. The ecclesiastical are such as are composed wholly of clergymen in their ecclesiastical capacity, and are chiefly for the purpose of holding ecclesiastical property. Civil corporations include municipal corporations, the universities, the colleges of physicians and surgeons, learned societies, and many trading companies incorporated. Eleemosynary corporations are for the administration of funds for charitable and pious purposes, such as hospitals, the colleges in universities, which, unlike the universities, the English law holds to be subject to visitation, &c. An important consequence of these distinctions is the effect it has on the right of *visiting* a corporation, or exercising a legal superintendence over its proceedings. The crown is the visitor of the archbishops, each archbishop is the visitor of his suffragan bishops, and each bishop is the visitor of all the ecclesiastical corporations in his diocese. Civil corporations have no visitor, but in both England and Scotland they are of course liable to be restrained by the courts where anything *ultra vires* is attempted. Eleemosynary corporations in England are visited by the founder and his heirs, or such persons as the founder appointed to be visitors. In the case of charitable endowments somewhat similar functions are, under the Charitable Trusts Acts, 1853 to 1894, performed by the Charity Commissioners (see CHARITIES).

A corporation may be dissolved by the death of all its members, or of such number as leaves not enough to make new elections in the way the charter requires; by forfeiture of the charter through breach of its conditions; by surrender of the charter; or by act of parliament. In all such cases the lands of the corporation revert to their several donors—the creditors, however, if any, being entitled in the first place to insist on a sale and distribution of the property, whether in a sequestration or otherwise.

In the United States a distinction is taken between public corporations, which exist for public purposes only, and private corporations, which are created wholly or in part for purposes of private emolument. A corporation may be created by act of the congress of the United States or by an act of a state, though in some of the state constitutions the power of creating corporations by special acts is taken from the legislature. In most of the states general acts have been passed for the creation of special classes of corporations. A corporation of one state may be made a corporation of another state in regard to property and acts within the territorial jurisdiction of the other state. A corporation having stockholders is 'organised' on lines corresponding to a company in England (see COM-

PANY). For trade corporations, see the article GUILDS.

**Corps d'Armée.** See ARMY CORPS.

**Corpse.** See DEATH.

**Corpse Candle.** See IGNIS FATUUS.

**Corpulency.** See OBESITY.

**Corpus Christi Festival**, the most splendid festival of the Roman Catholic Church. It was instituted in 1264 (see BOLSENA), in honour of the Consecrated Host and with a view to its adoration, by Pope Urban IV., who appointed for its celebration the Thursday after the festival of the Trinity, and promised to all the penitent who took part in it indulgence for a period of from forty to one hundred days. The festival is chiefly distinguished by magnificent processions. In France it is known as the *Fête Dieu*; in Germany, as the *Fronleichnamsfest*. For colleges, see CAMBRIDGE, OXFORD.

**Corpuscles, BLOOD.** See BLOOD.

**Corpuscular Theory.** See LIGHT.

**Corpus Delicti**, a term used in Scotland and elsewhere to signify the body or substance of the crime charged. To make out the corpus delicti is to prove that the crime charged has been committed; as, when a person is charged with murder, it must be proved that the deceased came by his death in consequence of the injury libelled, and not, for example, by natural causes.

**Corpus Juris Civilis**, the whole body of the Roman or Civil Law, as comprised in the Institutes, the Digest (or Pandects), the Code, and the Novellæ (see CODE, JUSTINIAN, LAW). The *corpus juris canonici* is the body of Canon Law (q.v.).

**Correction, HOUSE OF**, a prison for the reformation of petty offenders. See PRISONS, REFORMATORY AND INDUSTRIAL SCHOOLS.

**Correction of Proofs.** See PROOFS.

**Correggio**, ANTONIO ALLEGRI DA, was so styled from the place of his birth, a small town 20 miles E. of Parma, where he was born in 1494. Modern research has proved the inaccuracy of Vasari's highly coloured account of his struggles and poverty. His father, a well-to-do merchant or tradesman of Correggio, seems to have designed him for a learned profession; but he turned to art, studying under his uncle and three other masters. He is believed to have gained some idea of foreshortening and perspective from the works of Mantegna at Mantua, which he visited in 1511, and to have been influenced by the graceful colouring of Lorenzo Costa. At the age of about twenty he returned to his native town, where in 1514 he painted a 'Virgin Enthroned' for the Franciscan convent, a work, now in the Dresden Gallery, distinguished by more gravity, restraint, and religious feeling than characterise his later productions. In 1518 he began his great series of works at Padua by a beautiful fresco series of mythological subjects for the decoration of the convent of San Paolo, which are still in an excellent state of preservation. From 1521 to 1524 he was engaged upon his subject of 'The Ascension' in the cupola of the Benedictine church of San Giovanni, a fresco in which the master's power is fully visible. His next great monumental work was the decoration of the cathedral of Parma, commissioned in 1522. The subject chosen for the interior of the main dome was 'The Assumption of the Virgin.'

During the execution of these frescoes Correggio was also much occupied with easel-pictures in oils. Among these are his very celebrated Adoration of the Shepherds, known as 'La Notte' or 'The Night,' commissioned in 1522, now in the Dresden Gallery, a work of marvellous softness and delicacy. Five years later he painted 'Il Giorno,' an exquisite picture, now in the Parma Gallery.

In 1530 Correggio removed from Parma to his native town, where, in the same year, he purchased an estate, and in 1533 some additional land. The production of the 'Jupiter and Antiope' of the Louvre, 'The Education of Cupid' of the National Gallery, London, of the 'Danae' of the Borghese Gallery, and of the 'Leda' of the Berlin Museum, has been assigned to the painter's later years; and the 'Reading Magdalene,' of which the picture in the Dresden Gallery is now regarded as merely a 17th-century copy, was completed in 1528. He died at Correggio, at the early age of forty, on the 5th of March 1534, and was buried in the Franciscan church of the place.

The art of Correggio is distinguished by its grace and gaiety, by its sunny sensuous charm. His figures are rendered with a bounteous sweeping outline, and he delineates rapid motion and momentary attitudes and expressions with singular power. His colouring possesses the finest delicacy and luminosity; his foreshortening is bold and skilful, if sometimes rather extravagant; and, above all, he was unrivalled as a master of subtle and refined chiar-oscuro. His works present the strongest possible contrast to the gravity and restraint, to the reverential feeling and the accurately balanced compositions, of the earlier devotional painters of Italy.

His only son Pomponio, by his wife Girolama Merlino (whom Correggio married in 1520, and who died in 1529), was born in 1521, and was alive in 1593. He also was a painter, and an altar-piece from his hand is in the Academy at Parma.

See, besides Holroyd's *North Italian Schools* (1906), the Life of the painter by Ricci (trans. 1896), books by Brinton (1900) and Leader Scott (1902), and the very important work by Sturge Moore (1906).

**Corregidor** is the name given in Spain to the principal magistrate of a town, appointed by the king. Readers of *Gil Blas* will remember his functions and the terror of his name to evil-doers. The Portuguese corregidor has administrative but not governing powers.

**Correlation of Forces.** See ENERGY, FORCE.

**Correlation of Organs**, the close mutual dependence between different systems and structures within the organism. A three- or four-chambered heart is correlated with the development of lungs; animals with an allantois never have gills; the development of a placenta is all but co-extensive with the presence of milk-glands. So among plants parallel venation of the leaves is almost constantly correlated with monocotyledonous structure; and a restriction of the vegetative leaf-organs will show itself in a counterbalancing modification of flowers and fruit. From the time of Aristotle such correlations have been noticed; but it was not till after the work of Cuvier, Geoffroy St-Hilaire, Goethe, and their contemporaries, that the fact was adequately appreciated. It was only then, in other words, that the organism began to be really understood as a unity of mutually dependent parts. The general proposition that all the organs are partners in the general life, that if one member suffer all the members are more or less influenced, is sufficiently self-evident. But beyond this there are the special facts which show that certain organs are knit together by closer physiological bonds than others, that certain structures stand or fall together, that certain characters have a contemporaneous appearance in the historical evolution. The facts are well known; their explanation in many cases is difficult or quite obscure. See EVOLUTION, VARIATION.

**Correspondence Classes**, a method of instruction first fully developed in the United

States by the Chautauqua Literary and Scientific Circle (1878), and since adopted in England—e.g. under the Oxford University Extension (1889). See CHAUTAUQUA.

**Corrèze**, a French department, formed out of part of the old province of Limousin, and taking its name from a river, the Corrèze, flowing 52 miles south-westward to the Vézère; area, 2265 sq. m.; pop. (1872) 302,746; (1921) 273,808. The chief rivers of Corrèze are the Dordogne, the Vézère, and the Corrèze. The surface of the department is mountainous, especially in the north and east, where it is broken in upon by offsets from the Auvergne Mountains, which, in Mont Odonze, attain a maximum altitude of 3129 feet above the sea. The lower slopes are clad with forests, but the district is in general sterile. Minerals, particularly coal, iron, lead, alabaster, and granite of various colours, are found. The department is divided into the three arrondissements of Tulle, Brive, and Ussel. Tulle is the chief town.

**Corrib**, LOUGH, a lake of counties Galway and Mayo, the second largest in Ireland. Lying only 30 feet above sea-level, it is of very irregular shape, 25 miles long from NW. to SE., and 1 to 6 broad, with an area of 68 sq. m. From its south end, 4 miles north of Galway, it discharges its surplus waters by Galway River into Galway Bay. It receives the waters of Lough Mask, at its north end, through the Pigeon Hole and other caves, as well as those of the Clare and other smaller rivers. It contains many islets, and to the west are mountains 3000 feet high, whilst near it are many stone-circles.

**Corriche**, a moor on the borders of Kincardine and Aberdeen shires, 15 miles W. of Aberdeen. Here on 28th October 1562 Queen Mary's half-brother, the Earl of Moray, defeated the Catholic Gordon, Earl of Huntly, who himself fell in the battle, while his two sons were taken prisoners. There is a rather poor ballad on the subject, in broad Aberdeenshire dialect, quite at variance with the facts of history, and first printed in Evans's *Old Ballads* (1777).

**Corrie** (Gaelic *coire*, 'a caldron' or 'large pot'), a term applied in Scotland and Ireland to semi-circular recesses or cirques in mountains, generally flanked by steep and lofty cliffs. They vary in character according to the nature of the rocks. In some the declivities are rounded and smooth, but generally they are broken and rugged, the bounding cliffs rising to heights of 1000 or even 2000 feet. Similar features are recognised in many mountain-regions all the world over. The origin of corries has been a subject of some controversy by geologists. There can be no doubt, however, that they are due in the first place to denudation—to the action of torrents and springs and frosts, aided and directed by the natural division-planes of the rocks. Many of the corries in Scotland and other mountainous countries have been occupied by glaciers—the grinding action of which has tended to modify the form of the ground. Not a few corries are occupied by mountain-tarns.

**Corrientes**, a province of the Argentine Republic, between the Paraná and Uruguay rivers, extending from Entre Ríos to Misiones territory, with an area of 32,500 sq. m. The surface is generally flat, with numerous lakes and swamps, but has undulating stretches along the Paraná and in the east, and is heavily wooded in parts. Lake Iberá, a group of lakes and swamps covering some 1800 sq. m., is surrounded with a jungle, in which the 'tacuara', bamboo (30 feet) is conspicuous; and here jaguars and alligators abound. The mean temperature (72° F.) is the highest in the republic, but the extremes (44°—98°) are not so excessive.

As in Paraguay, Guarani is the common language, Spanish being employed only by the official and educated classes. Cattle-raising is the chief occupation; agriculture is very backward. Population, 400,000.—The capital, Corrientes, is almost hidden among orange-groves, 15 miles below the confluence of the Paraná and the Paraguay, and takes its name from seven *currents* formed by points of rock above the city; vessels of 9 feet draught can reach the town at all seasons. Steamers from Buenos Aires (832 miles) touch here, and in 1887–95 railway connection was made with the south by way of Monte Caseos. Pop. 30,000.

**Corrievreckin** (Gael. 'Brecan's cauldron'), a whirlpool or dangerous passage scarcely a mile broad, off the west coast of Argyllshire, in the strait between Scarba and Jura isles. It is caused by the meeting of tides (running 13 miles an hour) from the north and west, in the narrow passage into the Sound of Jura, round a pyramidal rock, which rises with rapid slope from a depth of 100 fathoms to within 15 feet of the surface.

**Corroboree** is the Australian name for a gathering of aborigines, generally in large numbers, at which dances and other exercises are gone through with much excitement. They usually take place on moonlight nights, and may last the whole night through.

**Corrosive Sublimate**, the popular name of the highly poisonous bichloride of mercury (mercuric chloride). See MERCURY.

**Corrugated Metal**. Iron and other metals in sheets and plates have communicated to them enormously increased rigidity and power to resist buckling and collapse by being corrugated. The process is merely an application to metallic substances of the old contrivance of 'goffering' or 'piping,' by means of which frills are stiffened and kept in shape. The metal to be corrugated is passed between pairs of rollers with ridged surfaces, the ridges of one fitting into the hollows of the other, and the sheets or plates operated on are bent and compressed into the wavy outline of the rolls. Walls and roofs of light and temporary buildings are extensively made of corrugated galvanised iron—i.e. sheet-iron first corrugated and subsequently coated with zinc by dipping the sheets into a bath of the liquid metal. The most important mechanical application of corrugated metal has been for the flues of large steam-boilers. About 1878 a system of annular corrugated iron flues was introduced, which increased the resistance of the flue to collapse, and saved fuel because of the greater heating surface presented by the corrugations. A spiral corrugated flue gives the greatest amount of strength.

**Corruption of Blood**. See ATTAINDER, TREASON.

**Corrupt Practices**. See BRIBERY.

**Corry**, a city of Erie county, Pennsylvania, at the junction of several railways, 37 miles SE. of Erie, has foundries, machine-shops, saw-mills, and other factories, natural gas and mineral springs; pop. 7000.

**Corsair**, a pirate or sea-robber, and specially any of those rovers who in former times cruised from the Barbary ports, as Algiers, Tunis, or Tripoli, and became the terror of merchantmen in the Mediterranean and the Atlantic Ocean, ravaging the coasts and seizing shipping, as far north as Cornwall, Baltimore in Cork, and even Iceland. Though piracy on a small scale had long prevailed, the immediate cause of the sudden development of corsair states and fleets at the beginning of the 16th century was the persecution of the Moors in Spain: the exiles looked for vengeance, and their necessities

compelled thieving; and when they were joined by adventurers from the Levant and not a few Christian renegades, who were attracted by the spoils of the Indies, then coming to Spain, they soon became a formidable power, and founded citadels and states (see ALGIERS, TUNIS, TRIPOLI, SALLÉE). Their greatest leaders were the brothers Urj and Kheyr-ed-din Barbarossa, the first pashas of Algiers. Kheyr-ed-din rose from a mere captain of a galley to be high admiral of Sultan Suleyman (Soliman the Magnificent), and defeated the combined imperial, papal, and Venetian fleets under Doia off Prevesa in 1538. Other famous corsairs were Dragut (Torghud), a Sardinian who died at the siege of Malta; Ochiaï (Ulûî 'Ali), who fought in the battle of Lepanto, 1571; Aidin Reis, or 'Drub-devil'; Sinan of Smyrna; Salih Reis; Ramadan; Ali Pichinin, &c. Many attempts were made to put down the corsairs, from Sir Robert Mansel's expedition in 1621 to the very important expedition against Algiers by the United States under Decatur (q.v.) in 1815—the first serious attempt to put an end to the long established evil—followed by Lord Exmouth's victory in 1816; but the jealousies of the European powers conspired to assure the pirates' immunity, and the Deys of Algiers levied blackmail upon Christian governments who wished to protect their trade. Nothing less than the French conquest could have suppressed so long-seated a disorder, which had infected the Mediterranean for more than three centuries, and even carried off captives from Ireland. See BARBAROSSA, GALLEY, PIRACY, SLAVERY; and *Corsairs of the Mediterranean*, by St-nlev Lane-Poole (1889).

#### **Corseult.** See DINAN.

**Corsica**, the fourth largest island of the Mediterranean and a French department, is 114 miles long by 52 miles broad, with 300 miles of coastline. Area, 3378 sq. m.; pop. (1872) 258,507; (1921) 281,959. Corsica is separated from the twin island of Sardinia, double its size, to the south, by the Strait of Bonifacio. It is 54 miles SW. of Leghorn and 98 S. from Genoa. Though now part of France, the island belongs geographically, historically, and linguistically to Italy. The promontory into which the north coast projects runs 23 miles north beyond the general north coast-line, and is 6 to 9 miles broad. The interior is a labyrinth of mountains, in which, however, a principal chain traverses the whole island from north to south, dividing Corsica into two regions, an eastern and a western zone. These regions are each divided by transverse chains into parallel valleys deeply hollowed by watercourses plunging from the high summits. The highest elevations are about the middle: Cinto (8898 feet); Rotondo (8607); Pagli-Orba (8283). On the west side the mountains reach to the coast, but on the east, between mountains and sea, there extend alluvial plains, edged seawards with lagoons and swamps, highly fertile but malarious, and deserted in summer. In Roman times these plains were densely peopled. Eucalyptus plantations, pure drinking-water supplies, draining and sanitary improvements, are now reclaiming the region. The west zone is occupied mostly with primary strata, granite, and schistose rock; on the east side the mountains are Cretaceous, with serpentine and porphyry. Corsica is watered by numerous streams, none navigable, with cascades glittering in all directions. On the east coast are the Tavignano, 47 miles long, from Lake Nino; and the Golo, 52 miles long. On the west the longest is the Taravo, 34 miles long.

The climate is highly salubrious. The soil is very fertile. On the lower slopes are olives, oranges, citrons, laurels, and vines. The most important of

these is the vine. Local supplies being inadequate, wine is imported from Algiers. Phylloxera has made it necessary to replant with American vines. Higher, up to 6250 feet, are magnificent chestnut-trees; higher still rise virgin forests of oak, pine, larch, &c. These again are overtopped by pastures. The highest summits are snow-clad for half the year. About one-sixth of Corsica is estimated to be covered with forest, but this includes in many places only confused thickets (*macchie*) of green oak, albutus, myrtle, and bloom. Chestnut-trees and cork oaks yield valuable crops. Campo dell' Oro around Ajaccio and the country north of Bastia are among the most fertile districts of the Mediterranean. The mutton or wild sheep is found; also wild boars, large foxes, and small deer, but no wolves or bears. The venomous ant, *innocentato*, is peculiar to Corsica, where are also the *Malmignata* spider and the tarantula. The minerals of Corsica are yet little worked. Anthracite and amianthus are found. Copper and silver-lead mines are worked near Calvi. Sulphide of antimony is extracted in Cape Corso. There are also arsenical, iron, and manganese ores. Among the valuable stones are red and blue granite, porphyry, jasper, alabaster, and marble. The Orezza mineral waters have a high medicinal value. Agriculture is backward. More modern methods are, however, gaining ground. Corsica has very few manufactures. The chief industries are gathering and sawing of briar-wood roots, the making of chestnut-wood extract for tanning, fishing, and rearing of cattle. Raw silk is raised. The principal ports are Bastia and Ajaccio; Calvi, Île Rousse, Porto Vecchio, Propiano, and Bonifacio are engaged in the coasting trade. Corte and Sartène lie inland. The chief imports are corn and other food-stuffs, building materials, coals, metal-ware, salt, cattle, cheese, fodder, brandy, pottery, glass-ware, and paper; and the chief exports briar-wood (*Erica arborea*) for pipe-making, chestnut-wood extract, timber, wine, olive-oil, chestnuts, cork, fruits, and early vegetables. There are railways from Bastia to Ajaccio, to Calvi, and to Ghisonaccia (with projected extension to Bonifacio). Excellent roads girdle the island. Corsica is divided into five arrondissements: Ajaccio, Bastia, Calvi, Corte, Sartène. The capital is Ajaccio, but the most important town is Bastia. The language is a corrupt Italian.

In early times known as Cyrrnos, Corsica in the 8th century fell to the Saracens, who in the 11th yielded it to Pisa. Thence it passed to the Genoese. Genoese towers, that defended the bays against Saracen incursions, still add a picturesque trait to the landscape. The Genoese, unable to subdue the Corsicans, who had risen under General Paoli, surrendered Corsica to the French, who conquered it in 1768; since then it has willingly united with France.

See Boswell's *Account of Corsica* (1768); Ortolli's *Contes popul. de l'Île de Corse* (1885); Paul Borda's *En Corse* (1887); *Corsica*, by Gregorovius (1878); J. W. Barry's *Studies in Corsica* (1893); L. H. Caird's *History of Corsica* (1899); G. Renwick's *Romantic Corsica* (1910); see also the articles on Paoli and Theodore, 'King of Corsica,' and for 'the Corsican,' BONAPARTE, NAPOLEON. For the Corsican blood-fund, see VENDETTE, and Prosper Mérimée's powerful picture of Corsican life, *Colomba* (1841).

**Corslet**, a kind of cuirass, formerly the usual body-covering of pikemen. It was made chiefly of leather, and was pistol-proof.

**Corsned.** See ORDEAL.

**Corso**, an Italian word used to express not only the racing of riderless horses, but also the slow driving in procession of handsome equipages through the principal streets of a town, such as used often to take place in Italy on festivals.

This custom has given a name to many streets in almost all the larger towns of Italy. The best known of these is the Corso in Rome, which is the scene of the celebrated diversions of the Carnival.

**Corsen**, WILHELM PAUL, a great German philologist, was born at Bremen, January 20, 1820. After studies in philology at Berlin, especially under Boeckh and Lachmann, and two years spent in teaching in a gymnasium at Stettin, he was called in 1846 to lecture at Schulpforta, and there he remained till 1866, when ill-health compelled him to retire to Berlin. There, however, he continued his arduous studies until he died, a martyr to learning, June 18, 1875. His earliest great work is his treatise, *Ueber Aussprache, Vokalismus, und Betonung der Lateinischen Sprache* (2 vols. 1858-59; 2d ed. 1868-70). It was followed by *Kritische Beiträge zur Lateinischen Formenlehre* (1863) and *Kritische Beiträge zur Lateinischen Formenlehre* (1866). His second masterpiece is *Ueber die Sprache der Etrusker* (2 vols. 1874-75), in which he labours with great ingenuity and vast learning to prove against the world that the Etruscan language was cognate with that of the Romans. H. Weber edited from his papers *Beiträge zur italischen Sprachkunde* (Leip. 1876).

**Cort**, CORNELIS (1533-78), known in Italy as Cornelio Piammingo, a famous Dutch engraver, in 1572 went to Venice, and finally settled at Rome, where he founded a great Italian school of engraving.

**Cort**, HENRY, ironmaster, born at Lancaster in 1740, became a navy agent in London in 1765. He made experiments to improve British iron, then inferior, and in 1775 started iron-founding at Fontley in Hampshire. In 1784 he patented his puddling furnace, and also his method of drawing out the puddled ball into bars, inventions intimately associated with the development of the iron trade. In 1789 his partner Jellicoe died, a defaulter to the amount of £40,000 in government funds; this utterly ruined Cort, who had to sacrifice property worth £250,000. He received a government pension of £200 in 1794, and died in 1800.

**Cortes**. See SPAIN, PORTUGAL.

**Cortes**, HERNANDO, the conqueror of Mexico, was born at Medellin, in Estremadura, in 1485, of a noble but decayed family. The longing for adventure which early filled his heart was not cured by two years' study at Salamanca. He sailed for San Domingo in 1504, and ere long accompanied Velazquez in his expedition to Cuba. After the island had been subdued he came into serious disfavour with the governor, but was reconciled, and became alcalde in the capital, Santiago. The discovery by De Córdova of Yucatan, and of New Spain (Mexico) by Grijalva, had already fired the ambitious mind of Velazquez, when Pedro de Alvarado, who had been despatched by Grijalva, arrived at Cuba; and his glowing accounts filled the governor with a fresh thirst for gain and glory. He hastened to fit out a new expedition, the command of which he gave to Cortes. Cortes sailed 18th November 1518, and one of the most romantic chapters in the history of the world began. The armament with which he entered on the conquest of a vast and civilised empire consisted, according to Bernal Diaz, of five hundred and fifty Spaniards, two or three hundred Indians, twelve or fifteen horses, with ten brass guns and some falconets. Scarcely had he touched at Trinidad when orders from Velazquez to supersede him reached the island. These Cortes refused to obey, and thus cut himself off from all hope save in success. He landed first in Yucatan, and entered New Spain at the river of Grijalva. Proceeding inland he reached Tabasco, and here he fought his first battle with the

natives. His victory gave him his invaluable interpreter, the beautiful and faithful Donna Marina. At San Juan de Ulua messengers from Montezuma (q.v.), the king of Mexico, reached him, bringing rich presents, but objecting to his expressed desire for a visit to the king. Here when the faction of Velazquez within his little force began to express openly their hesitation about proceeding farther, Cortes adroitly got his men to entreat him to change the purpose of the expedition into colonisation and conquest instead of mere trade, and was thereupon formally appointed captain-general and justicia-mayor.

He now founded Vera Cruz, and sent messengers to Charles V. He next united all opposing interests in that of the common safety by burning his ships behind him, and marched to Tlascala, whose warlike inhabitants, subdued after some hard fighting, became henceforward his ever-faithful allies. After some delay he started on his memorable march to Mexico, attended by some thousands of his Tlascalcan allies; and at Cholula a treacherous attempt, by orders of Montezuma, to entrap the Spaniards, was frustrated by his sleepless vigilance. On the 8th November 1519 he reached the capital, which Bernal Diaz says appeared when they first saw it like something in a dream, or like one of the enchanted castles in the book of Amadis. The city was situated in a great salt lake communicating with a fresh-water lake, and was approached by three causeways of solid masonry, one two leagues long, with wooden drawbridges at the ends. At the lowest estimate its inhabitants exceeded 300,000. Cortes had not been a week in the city before he had determined to seize the august person of the king, and hold him as a hostage; his pretext being a treacherous attack upon Vera Cruz. Montezuma was paralysed at the heroic audacity of his proposal, and was carried to the Spanish quarters, from which he was never to return. Seventeen of the king's officers brought from Vera Cruz were burned to death in his presence, and Montezuma himself put in irons the while. In general, however, but little apparent restraint was put upon him, and he was allowed to go to his temple accompanied by a guard of one hundred and fifty Spaniards. At length he was constrained to submit to a public act of vassalage to Spain, and to give gold to the value of 100,000 ducats.

But Cortes was far more than an ordinary *conquistador*; he inquired about the mines and the methods of cultivation, and made wide explorations into the country; while with characteristic religious zeal he destroyed the more hideous Mexican idols, and sternly forbade human sacrifices. Meantime, however, the Mexican hatred for the conquering invaders was beginning to surmount their fear, as they began gradually to discover that they were merely mortal men spite of the strange wonder of their horses and cannon, and moreover were miserably few in numbers. In the sixth month of his imprisonment Montezuma asked Cortes to depart. The conqueror craved delay, and learned a few days after the request that eighteen ships had arrived in the bay of San Juan. These ships had been despatched by Velazquez under Pamphilo de Narvaez, who sent a favourable message to Montezuma. Cortes left Alvarado in command, and hastened with but a handful of men to meet Narvaez, whose force numbered 800 men; and at Cholula, amid a blinding storm, surprised him in an unexpected night-attack in which but three of his own handful of heroes fell. The defeated troops gladly embraced the cause of the conqueror.

Fourteen days after the defeat of Narvaez came the news from Alvarado that the Spaniards were besieged in their quarters in Mexico. Cortes at once collected all his men, marched to his lieutenant's

relief, and reached the city, 24th June 1520. He found himself face to face with a whole nation in arms under Montezuma's brother as popular leader. A general attack was soon made upon him, and not repulsed without a desperate struggle. On the third day the unhappy Montezuma appeared on a battlement with the view of pacifying his people, but was wounded by a shower of stones—an indignity which, said the Spaniards, caused his death. Cortes burned the two great idols of the city, but this did not terrify the Mexicans, and he now saw that he must leave the city. His dispositions were quickly made; the start was made at midnight, 1st July 1520. The first gap was crossed safely by a pontoon which he had prepared for this purpose, but at once the lake was covered with a multitude of canoes, and so furious an attack made that it proved impossible to raise the pontoon to cross the second gap. Soon the water was choked with a crowd of struggling horses and men, and the retreat became a confused and hopeless rout. The second and third bridgeways were both broken down, but it was at the third that the greatest loss occurred. In the horrors of that awful night (*la noche triste*) were lost 450 Spaniards, forty-six horses, his artillery, 4000 Indian allies, and most of the Mexican prisoners. At Otumba, whither the miserable handful of survivors had retreated, Cortes found himself encompassed with an innumerable host, and there was a desperate battle, in which every individual Spaniard performed prodigies of valour. The exhausted victors were kindly received by their Tlascalcan allies, and Cortes at once began preparations to repair his disaster.

Before the end of the year Cortes was strengthened by the arrival of reinforcements and war-stores. Taking with him 10,000 Tlascalcanes, he marched to Tezcuco, and contrived to form alliances with some of the surrounding Indian tribes. At length his brigantines, built at Tlascala, were hauled to the lake by a canal dug for the purpose, and, after a perilous expedition round the lake and many ineffectual attempts to come to terms with the Mexicans, he began the formal siege of the city in April 1521. He himself, with 300 men, took command of the brigantines, as, in his own words, 'the key of the whole war was in the ships.' After defeating the Mexicans on the lakes, and destroying innumerable canoes, he made a series of simultaneous incursions along the causeways. The Mexicans fought with the fury of despair, and the triumph of the Spaniards proceeded only at the cost of the gradual destruction of the buildings in the city. Meantime the Spaniards themselves suffered desperate hardships from the ambuscades of their sleepless enemy, and becoming impatient, they demanded a general attack, in which they suffered a severe repulse. Although famine and pestilence fought for the Spaniards—as many as fifty thousand Mexicans dying of these during the siege—the city had to be destroyed before it could be taken. It fell at length, 13th August 1521, after a siege of seventy-five days, hardly to be surpassed in the history of the world for obstinacy and valour. Scarce any booty was obtained, the ruined houses were filled with heaps of dead, and almost the entire city had to be rebuilt.

Cortes now showed his wisdom by attempting to restore the native institutions. He rewarded his men with *encomiendas* or grants of Indians for labour and assistance in colonisation. He was formally appointed governor and captain-general of New Spain in 1522. He next sent out Alvarado on an expedition which led ultimately to the conquest of Guatemala, Sandoval to the north, and Cristóbal de Olid to Honduras. The last, unfaithful to his trust, rebelled, and the indefatigable Cortes at once set out on a perilous journey to subdue him; but

finding his rebellious lieutenant assassinated before his arrival, he returned to New Spain (1526) to find Ponce de Leon invested with the powers of government. In May 1528 he arrived in Spain, was received with marked honour by the king, and created Marquis del Valle de Oaxaca. He returned in July 1530 as captain-general, but to his disappointment was not appointed also civil governor of New Spain. He was poor and broken in health, and henceforward had the continual mortification to see the government muddled by envious and incompetent men. During ten years he was constantly engaged in making new discoveries to the north of Mexico, but now, says Bernal Diaz, 'everything turned to thorns with him;' and in 1540 he returned to Spain. He accompanied the emperor in his unhappy expedition to Algeria, and was mortified by having his offer to take Algiers, if given the command, slighted and despised. Voltaire's story of his proud speech to the emperor as he stood on the step of his carriage: 'I am a man who has given you more provinces than your ancestors have left you cities,' is true in spirit, if not in fact. Cortes wished to return to Mexico, but was not allowed till his impending suits were settled. His last years were darkened by neglect, deepened by the domestic vexation of his daughter Doña Maria's repudiation by a great Spanish noble to whom she had been betrothed. He went to meet her at Seville, fell ill, and died in a small village near that city, 2d December 1547. His body, first buried at Seville, was translated in 1562 to Tezcuco, and in 1629 to Mexico.

The great conquest of Cortes ranks as one of the most splendid achievements in the world's history, and indeed it is more like romantic fable than sober fact. Its hero was no common adventurer or mere courageous soldier, but a captain of admirable sagacity and resource, a statesman of rare penetration and foresight. To the reckless audacity of a Rupert he added the astuteness of a Hannibal—a combination that marks only the highest order of military genius. His whole character was constructed on heroic lines, and is marked with a certain conspicuous grandeur throughout. He was passionate, yet patient; fond of splendour, yet simple in diet; cruel sometimes, yet sincerely religious; silent and reserved, yet capable of inspiring the most devoted as well as the tenderest personal affection. In many things he resembles Cæsar, and like him he possessed that rarest power of knowing, as De Solis says of him, 'how to be a superior without ceasing to be a comrade.' See Prescott's *History*, and Lives by Sir Arthur Helps (2 vols. 1871) and MacNutt (1909).

**Cortona**, a town of central Italy, 69 miles SE. of Florence by rail. It stands 2130 feet above sea-level, looking down on the Valle di Chiana and the Trasimene Lake, and is one of the oldest cities in Europe, with mighty cyclopean walls of Pelasgic origin, Etruscan and Roman remains, numerous handsome *palazzi*, a fine cathedral, and half-a-dozen churches. These are rich in paintings by many old masters, including Luca Signorelli (q.v.) and Pietro Berrettini or da Cortona (1596-1669). The Accademia Etrusca (1726) has its seat here; its museum contains a multitude of Etruscan sarcophagi, vases, &c. Pop. of town, 4500; of commune, 30,000. See ETRURIA.

**Coruña**, LA (often in English, *Corunna*; among seamen, *Groyne*), a fortified seaport of Spain, and capital of a province of the same name, situated about midway between capes Ortegal and Finisterre, on a peninsula in the Bay (*ría*) of Coruña, 150 miles NNW. of León. The town divides itself naturally into the upper portion and the lower, called Pescaderia, which, formerly

a haunt of fishermen, is now the centre of wealth and trade. The harbour is commodious and protected by forts; and in 1888 a long-desired quarantine harbour was completed. There are large cavalry and infantry barracks, and some colleges. Electric cars were introduced in 1913. New docks and sewage works have been made. Sir John Moore's tomb is in the centre of the gardens of San Carlos. One mile north-west of the town stands the famous Torre de Hércules, restored, it is said, by Trajan, which serves as a lighthouse, and is nearly 100 feet high. The chief imports are Argentine maize, salt fish, and coal (mostly British); also machinery, cotton, and petroleum. The port's prosperity depends on the fishing industry (sardines especially). Other industries are cotton-spinning, the manufacture of cigars, glass-ware, and canned meats and fish. The principal exports are lace, tinned fish, ham and bacon, onions, chestnuts. The once flourishing export trade in cattle is almost extinct. Cuba is Coruña's best foreign customer. Many thousands of emigrants leave Coruña yearly for South and Central America. Pop. 62,000. Coruña dates its origin from the Phœnicians, from whom it was taken by the Romans in the 1st century B.C. Here in 1386 John of Gaunt landed to claim the crown of Castile in right of his wife, daughter of Pedro the Cruel; in 1554 Philip II. embarked here for England to marry Queen Mary; and in 1588 the great Spanish Armada, which had been refitted at this port, set sail for the conquest of England. Here also fell gloriously Sir John Moore (16th January 1809), after having with but 14,000 travel-worn men defeated Soult and 20,000 Frenchmen, fresh and flushed with the expectation of victory. Few exploits in English history are prouder than his memorable retreat, closed by the brilliant victory that covered the embarkation of the British troops.—The province (3000 sq. m.; pop. 700,000), the most north-westerly of Galicia and of Spain, is somewhat mountainous.

**Corundum**, a mineral consisting essentially of mere alumina, yet of great specific gravity—about four times that of water—and of remarkable hardness, being inferior in this respect only to the diamond. Mineralogists regard the Sapphire (q.v.) as a variety of corundum, and along with it the gems popularly known as Oriental Ruby, Oriental Topaz, Oriental Emerald, and Oriental Amethyst; but the name corundum is more usually limited to the coarser varieties. These, instead of exhibiting the brilliancy of gems, are in general of a dull and muddy appearance, and the crystals—which are usually six-sided prisms and six-sided pyramids—are externally dull and rough. The colour is various, often green, blue, or red, inclining to gray. Corundum is found in many parts of the world, and has long been used in India for polishing all gems except the diamond, which is too hard for it. Emery (q.v.), so well known as a polishing substance, is a variety of corundum.

**Corvée** is the name usually given to the obligation on the inhabitants of districts to perform gratuitous labour (such as the maintenance of roads) for the sovereign or feudal lord. The forced labour for the aristocracy was one of the grievances of the French peasantry, which led to the Revolution. See FRANCE.

**Corvei**, or **KORVEY** (*Corbeia nova*), a Benedictine abbey on the Weser, near Hörter, the most famous in Old Saxony, founded in 822. It was a colony from the monastery of Corbie in Picardy, then part of the country of the West Franks. It received rich endowments; was the centre of great agricultural improvement and prosperity during the earlier part of the middle ages; and the seat of a school, founded by Ansgar, the Apostle of

the North, which flourished greatly in the 9th and 10th centuries, and was next in reputation to Fulda. Its abbots were numbered amongst the spiritual princes of the German empire. In 1794 it was made a bishopric by Pius VI. Its territory then extended to about 20 square miles, with 10,000 inhabitants. In 1803 it was annexed to Nassau, from which it was transferred in 1807 to Westphalia, and in 1815 to Prussia. The Gothic church has a magnificent interior, and contains a multitude of princely monuments. The library and archives of the cloister, which contained most valuable records of the early ages of German history, were mostly destroyed—the *Chronicon Corbejense*, an alleged record of this abbey from its foundation to the end of the 12th century (pub. 1823), is a forgery; but there are meagre *Annales Corbeienses* (648 to 1148) printed in the *Monumenta Germaniae*.

**Corvette** was a term applied to a flush-deck vessel, ship or barque rigged, having only one tier of guns, either on the upper or main deck. This class of vessels are now called cruisers; see NAVY.

**Corvidæ**, a family of crow-like birds, in the old order of Passeres. The family is widely distributed, and includes towards 200 species; see CHOUGH, CROW, JACKDAW, JAY, MAGPIE.

**Corv'ius**. See MATTHIAS CORVINUS.

**Corvisart-Desmarte**, JEAN NICOLAS, BARON DE (1755–1821), born at Vouziers, founded a clinical school at the hospital of La Charité, became professor in the Collège de France, and was created baron by Napoleon. His name is associated with Percussion (q.v.) as a means of diagnosis.

**Corvo**, the most northerly of the Azores (q.v.).

**Corwen**, a town of Merionethshire, North Wales, on the right bank of the Dee, at the foot of the Berwyn Mountains, 10 miles N.E. of Bala. It is a great resort of anglers, and boasts traditions of Owen Glendower.

**Coryate**, THOMAS, was born at Odcombe, Somersetshire, about 1577, entered Gloucester Hall, Oxford, in 1596, but left like many better men without a degree, and after James I.'s accession lived by his wits, or rather his wit, about court. In 1608 he set out on a rambling journey on the Continent, passing through Paris, Lyons, Turin, Venice, Zurich, and Strasburg, and returning five months later with a record of 1975 miles, mostly on foot. His entertaining journal was at last published in 1611, with a huge collection of commendatory verses, as *Coryat's Crudities: Hastily gobbled up in Five Moneths' Travells in France, &c.* Next year, after dedicating his travel-worn shoes in his native church, he started again on his travels, visited Constantinople, Greece, Smyrna, Alexandria, and the Holy Land, and found his way by caravan to Mesopotamia, thence through Persia and Afghanistan to Agra, where he arrived in 1616. In December of next year he died at Surat. Letters of his were printed in 1616–18; and the *Crudities* was reprinted (2 vols.) in 1905.

**Corybantes**, the priests of Cybele (q.v.) in Phrygia.

**Corygaum**, a village in the presidency of Bombay, 16 miles S. of Poona, the scene of the last of the three battles which caused the subjugation of the Peishwa of the Mahrattas. Captain Staunton, with a native force of but 300 horse and 500 foot and 24 European artillerymen, fought with success the whole day long against 3000 infantry and 20,000 cavalry (January 1, 1818).

**Coryla'ceæ**. See CUPULIFERÆ.

**Cor'ymb**, a form of Inflorescence (q.v.) which may be regarded as a raceme in which the main

axis has been more or less arrested in development, while the lower flower-stalks are lengthened so as to bring their flowers almost to the level of those of the upper. As familiar examples may be cited hawthorn, candytuft, &c. After flowering, the main axis of a corymb often elongates into an ordinary raceme, as in many crucifers.

**Corymbi'feræ.** See COMPOSITÆ.

**Coryphæ'us** (Gr. *koruphē*, 'the head'), the leader of the chorus in ancient Greece. The name is now used to signify those of the highest distinction in any art or science. The French *coryphée* is generally used of the principal *danseuse* in the ballet.

**Coryphene** (*Coryphæna*), a genus of bony fishes, remarkable for the brilliancy of their colours. They are nearly allied to mackerels, belonging to the same family, Scombridæ. For some not very evident reason they are often popularly called 'dolphins.' The body is somewhat elongated, and is laterally compressed; the scales are very small; the head of the adults bears a sharp crest. The colours of silver, blue, and yellow have great beauty and metallic brilliancy, whether the fish be darting with extreme rapidity in the sunlit water, or lie dying on the shore. Apart from their marvellous beauty, the coryphenes are well known for their habit of pursuing shoals of flying-fish. Sailors often catch them with a glittering bit of metal for bait. They are frequently seen in the Mediterranean (four species), and also in the Atlantic, Indian, and Pacific Oceans. The most familiar species is *Coryphæna hippurus*.

**Coryza.** See CATARRH.

**Cos** (often called by the Italian name of *Stanchio*), an island off the coast of Asia Minor, was seized by Italy from the Turks in 1912, held in pledge for the fulfilment of the treaty of Ouchy, retained by the treaty of Lausanne (1923). Twenty-three miles long and five broad, with a population of 10,000, mainly Greeks, Cos consists mostly of fertile and well-tilled plains, partially of hilly country. It exports lemons, grain, wine, cotton, and silk. Many ancient Greek remains are scattered over the island. The chief town, Cos or Co, is situated on the north-east coast. In early times Cos was famous for its wine, its amphoræ, and its fine 'Coan garments.' It was the birthplace of Ptolemy Philadelphus, Apelles, and Hippocrates.

**Coscinomancy**, an ancient mode of divination by means of a sieve (Gr. *koskinon*) supported or suspended by a pair of shears, in some way not easily understood. It moved at the mention of the guilty person's name.

**Cosenza**, a town of Italy, capital of the province of the same name, formerly called *Calabria Citeriore*. It is situated 12 miles E. of the Mediterranean, and 262 SE. of Naples by rail, in a mountain-closed valley at the confluence of the Crati and the Busento. Seat of an archbishop, it has a cathedral, a fine court-house, and trade in oil, wine, silk, hemp, grain, earthenware, and iron and steel wares. Pop. 26,000. The ancient *Consentia*, a city of the Bruttii, was captured by the Carthaginian general Himilco, and was forced to surrender (204 B.C.) to the Romans, who afterwards colonised it. Alaric (q.v.) died here, 410 A.D.

**Cosgrave**, WILLIAM THOMAS, Sinn Féin member for Kilkenny city (1917) and county (1918) in the Imperial parliament, and for Carlow and Kilkenny (1922) in Dáil Éireann, in 1923 succeeded Griffith as president of the Dáil and Collins as finance minister, and furthered the treaty settlement.

**Coshery**, or COSHERING, in Ireland, was the ancient feudal right of a chief to quarter himself and his retainers on his tenantry at his own discretion.

**Cosin**, JOHN, a famous bishop of Durham, was born in 1594 at Norwich. Educated there and at Caius College, Cambridge, he became fellow of his college and secretary to Bishop Overall of Lichfield, next in succession chaplain to Bishop Neill of Durham, prebendary of Durham, rector of Elwick, archdeacon of the East Riding, rector of Brancepeth, master of Peterhouse, Cambridge (1634), and dean of Peterborough (1640). An intimate friend of Laud, he had already come into collision with the Puritans about his ritualistic reforms, and been denounced by Smart, a brother prebendary of Durham, as 'our young Apollo, who repairerth the Quire, and sets it out gayly with strange Babylonish ornaments.' In later invectives his antagonist did not spare his pluralism and even his fondness for tobacco. Prynne denounced also his chapel services at Peterhouse. Cosin was soon deprived of his benefices by the House of Commons, whereupon he retired to Paris, and for nineteen years of exile kept up there a Church of England service. At the Restoration he recovered his preferments, and in December 1660 was consecrated Bishop of Durham, and soon by his splendid energy, enthusiasm, munificence, and administrative ability, made his a model diocese. His personal dignity and commanding presence were perfectly in keeping with his conception of the part of one who was not only a bishop, but a prince-bishop. During his first seven years he spent no less than £34,500 upon his two castles, his cathedral, the library at Durham, and deeds of general benevolence. Imperious in temper, he sternly repressed Puritan and Roman Catholic recusancy alike; for, however devoted to ancient ritual and order, he hated Popery, and never ceased to regret the perversion of his own 'lost son' who had 'forsaken his mother, the Church of England.' He differed too from the rest of his party in his Puritan-like support of the strict observance of the Sabbath. During his last years Cosin earned great unpopularity by his opposition to the desire of the people of the Palatinate to be represented in parliament. He died in London, 15th January 1672. All Cosin's writings are inconsiderable, save his *Collection of Private Devotions* (1627), which was denounced by Prynne in his *Brief Survey and Censure of Mr. Cozen's Cozening Devotions*. A lasting service to the church was his contribution, invaluable from his profound liturgical learning, to the final revision (1661) of the Book of Common Prayer. Bishop Cosin's works were collected in 5 vols. in the 'Library of Anglo-Catholic Theology' (1843-55). His *Correspondence* was edited for the Surtees Society by Canon Ormsby (2 vols. 1868-70). See Life by Percy H. Osmond (1913).

**Co-sine.** See TRIGONOMETRY.

**Cosmas**, surnamed *Indicopleustes*, a merchant of Alexandria, who lived in the middle of the 6th century, and after having travelled much, returned to Egypt, where in monastic retirement he wrote in Greek a work of greater interest than value, in twelve books, on Christian Topography, extending to countries as far as India. An annotated translation of the work was edited in 1898 by M'Crimdell, and a critical text by Winstedt in 1910.

**Cosmas and Damian**, SAINTS, Arabian brothers, who practised as physicians at Ægæa in Cilicia in the 3rd century A.D., and who were cast into the sea as Christians, but, according to the legend, rescued by an angel. Thereafter, burning and stoning having proved ineffectual, they were beheaded in 303. Their relics were translated from Bremen to Munich in 1649, and their names commemorated in the Canon of the Mass.

**Cosmetics** (Gr. *kosmeō*, 'I adorn') are chemical preparations employed for improving the appearance of the skin and hair. Several of the

cosmetics in use are comparatively harmless, such as perfumed starch and chalk (see *ROUGE*); whilst others, such as *pearl white* (the subnitrate of bismuth, see *BISMUTH*), are more or less poisonous, and dangerous to use. At all times, the employment of cosmetics is to be discouraged, as the minute particles tend to fill up and clog the pores of the skin, and prevent the free passage of gases and vapours, which is so essential to the preservation of any animal organ in a thorough state of health.

**Cosmic Dust.** See *DUST*.

**Cosmo de' Medici.** See *MEDICI*.

**Cosmogony**, a theory of the origin of the universe (Gr. *kosmos*) and its inhabitants, such as is found in the mythologies of all peoples except those in the very lowest stages of culture. There is the utmost variety in the explanations given, the only idea that is at all widely spread being that in the beginning all things were held in solution by water. Other prevailing conceptions are those of the Phœnician and Egyptian generative world-egg; of the Hindu tortoise which supports elephants, themselves the actual bearers of the world; of the Polynesian air-god, Tangaloa, hovering over the waters. A very elaborate cosmogony is given in the Pehlevi *Bundêshêh*, ascribing creation to the free-will of a personal deity, as distinct from primordial matter, and this more elevated conception the religion of Zoroaster shares with the Jewish alone.

In the *Sanchonathon* we have presented in a Greek version a fragment of an interesting Phœnician cosmogony, which explains the origin of organic matter as due to a series of spontaneous emanations. But the most interesting cosmogonies we possess are the ancient Babylonian, of which one form is preserved in the Greek of Berossus, while another was deciphered by George Smith from the cuneiform inscriptions. These present startling identities with the creation story in the first chapter of Genesis.

Modern cosmogonists arrange themselves mainly according to their attitude to Theism (q.v.). Theists explain the world of matter and order as having come into existence at the omnific fiat. Pantheism (q.v.), again, holds the universe to be the very body and being of Deity, and as such to have been from all eternity. Most men of science, in modern times, stopping short of an actual cosmogony or genesis of the world, have pushed their inquiries into the order of development of its present state. Some assume the necessary existence of matter; with these there is no proper beginning of things, but an eternal round, under fixed laws of growth and decay. See *MATTER*.

In cosmogonical speculations, heat, air, atoms with rotatory motions, numbers—have all in turn been recognised as the fountain and causes of things. Of hypotheses as to the formation of our own rotating globe, of our system, and of all similar systems in space, the most notable is that of Laplace, founded on observation of the mutual relations of the planets, their common direction in rotation and revolution, their general conformity to one plane, &c., taken in connection with such facts as the rings of Saturn and the fundamental unity of the asteroids. Laplace had in some measure been anticipated by Kant. Thus arose the *Nebular Theory*, the evidence for which was carefully marshalled by Sir William Herschel; and which is still regarded by some physicists as indicated by the general tendencies of the laws of nature. Faye expounded his theory of the origin of the earth from meteorites, and discussed other cosmogonic theories in *Sur l'Origine du Monde* (2d ed. 1885). Following up this view of a formation of the planetary globes by natural causes, there have

been speculations as to the commencement and progress of organic Life (q.v.) upon them, and communication of it from one planet to another (notably by Lord Kelvin; and see Professor Tyndall's presidential address to the British Association in 1874). Darwin's work has completely altered the face of biological research and theory (see *EVOLUTION*, *DARWINIAN THEORY*, *SPENCER*). For the cosmogonies of the various nations, philosophies, and religions, see *MATERIALISM*, *GNOSTICISM*, *NEO-PLATONISM*, *THEOGONY*, *HEGEL*, *ADAM*, *CREATION*; articles on Assyria, Babylonia, Egypt, India; on Scandinavian Mythology; on Greece (*Ancient Religion*); and on Spontaneous Generation; also Gunkel's *Schöpfung und Chaos* (1895), and Cheyne's *Traditions of Ancient Israel* (1897).—For the 'Cosmological Argument,' see *THEISM*.

**Cosne**, a town, with iron manufactures, in the French department of Nièvre, and on the right bank of the Loire, 120 miles SSE. of Paris; pop. 8500.

**Cosquin**, EMMANUEL, an eminent French folklorist, was born at Vitry-le-François in Marne, where his father was a notary, as well as *maire* for nearly twenty years, 25th June 1841. He made his studies at the college of his native town, taking at the close of his course the diploma of licentiate in law, and here he has lived ever since. He has contributed many articles on religious questions to the Conservative and Catholic journal, *Le Français* (since November 1887 incorporated with *Le Moniteur Universel*), as well as numerous articles on more general questions to other newspapers and magazines, and has translated *La vraie et la fausse infallibilité des Papes* (1873), and *Le Concile du Vatican* (1877), two works by Mgr. Fessler, general secretary of the Vatican Council. But his most important work was a series of articles from 1876 to 1881 in the pages of *Romania*, which at once arrested the attention of scientific folklorists everywhere. These were collected into two volumes, issued in 1886 as *Contes populaires de Lorraine*, perhaps the most really important contribution made to storiology since the classical collections of J. F. Campbell (1860-62) and Von Hahn (1864). The stories were taken from a limited region, and were for the most part poorer in detail than parallel versions found elsewhere, but they possessed in their scientific accuracy a value which belongs unhappily to but few collections of folk-tales available to the student. The theory of the origin and transmission of such stories that M. Cosquin supports in his admirable introduction and in his no less luminous than learned notes, is a development of that put forth by Benfey in the famous introduction to his translation of the *Panchatantra* (1859), that not only the bases of these stories but their combinations have been carried from India within the historical period. M. Cosquin's position has been vigorously assailed by Mr Lang and others, but has been as vigorously defended by himself. See *FOLKLORE*.

**Cossacks** (Russ. *Kazák*), a large body of Russian subjects who held of the crown by military tenure. The name has been variously derived from words meaning, in radically distinct languages, 'an armed man, a sabre, a rover, a goat, a promontory, a coat, a cassock, and a district in Circassia.' The Cossacks are by some held to be Tatars, by more to be of nearly pure Russian stock; but the most probable view is that they are a people of very mixed origin. Slavonic settlers seem to have mingled with Tatar and Circassian tribes in the regions to the south of Poland and Muscovy, in the Ukraine and on the lower Don, and to have given to the new race, first heard of as Cossacks in the 10th century, a predominantly Russian character. On the conquest of Red Russia by Poland, numerous Russian

refugees fled to the Cossack country; and more on the Tatar conquest of Muscovy. The numbers of the Cossacks were also recruited from time to time by adventurers or fugitives from Poland, Hungary, Wallachia, and elsewhere; but in physique, as in language and religion, the Cossacks have always been mainly Russian. They distinguished themselves in war against Turks and Tatars, and were known as a powerful military confederacy in the 15th century. The kings of Poland and the tsars of Muscovy employed them largely to defend their frontiers, especially against nomadic neighbours; but the connection between the Cossacks and their lords paramount was always very elastic, and was frequently repudiated to suit the convenience of either party. The Cossacks became the outposts of Russian domination in Siberia, Central Asia, and the Caucasus. Living near, or, as 'free Cossacks' amongst, hostile peoples, they developed their peculiar military organisation—either forming a cordon of military settlements along the confines of occupied territory, or isolated camps in the nomad country beyond. Agriculture they eschewed; self-reliance and readiness at all times for defence or assault were their chief characteristics; though such of them as inhabited the banks of the Don and Dnieper, and their islands, became and still are skilful boatmen and fishers. Their political constitution was completely democratic; all offices were elective for one year only, and every Cossack might be chosen to any post, including the supreme one of Attaman or Hetman. This organisation they in great measure retained. The Emperor Nicholas I. made Hetman a title of the Czarévitch. It became that of the head of the Ukrainian republic, and was applied to other Cossack leaders in the confused events that followed the Russian revolution, when the Don, Kuban, and Terek districts became (1918) short-lived republics, playing their own part in the dissensions of Reds and Whites, of Russians, Ukrainians, and Poles. There have been two main branches of the Cossacks—the Ukraine and the Don Cossacks. To the first belonged the Zaporogian Cossacks, those dwelling near the *Porogi* or falls of the Dnieper. From them again are descended the Tschernomerian Cossacks, those of the Kuban Valley and of Azov. From the Don Cossacks spring those of the Volga or of Astrakhan, of the Terek Valley, of Orenburg, of the Ural, and of Siberia. They furnished a large and valuable contingent of light cavalry to the Russian army, and are very patient of fatigue, hunger, thirst, and cold. Though the Cossacks have generally been represented in the west of Europe as little better than fierce savages, they have left a very favourable impression on those who have dwelt amongst them. Jonas Hanway found them in 1743 'a civilised, and very gallant as well as sober people;' and many more recent travellers agree in asserting that in intelligence, cleanliness, refinement, and enterprise they are greatly the superiors of the average Russians. For pictures of old Cossack life, see *Taras Bulba* and other tales of Gogol.

**Cossimbazar** (*Kasimbázár*) was at the end of the 17th century the chief English agency in Bengal. It stood on the Bhagirathi near Murshidabad (q.v.); but its site is now a swamp.

**Cossus.** See GOAT MOTH.

**Costa, ISAAC DA.** See DA COSTA.

**Costa, SIR MICHAEL**, a popular musical conductor and composer, was born at Naples, 4th February 1810. As he early showed a decided talent for music, he was sent to the Royal College in his native city for education, where he greatly distinguished himself and produced

various compositions (1825–29). He settled in England, and in 1831 his ballet of *Kenilworth* was produced with success. He was conductor at the King's Theatre (1832), at Covent Garden (1846), to the Philharmonic Concerts (1846), and to the Sacred Harmonic Society (1848). His great work, the oratorio *Eli*, produced at the Birmingham Festival of 1855 (where he conducted till 1879), raised him to eminence as a composer. *Naaman*, which was less successful, was first sung in Birmingham in 1864. From 1857 till 1877 he conducted at the Handel Festival, and in 1871 he became director of Her Majesty's Opera. He was knighted in 1869. Costa was the author of several ballets, and of some operas, including *Malek Adhel* (1838) and *Don Carlos* (1844). As a composer he holds a respectable place, but it is as a conductor that he will be longest remembered, Meyerbeer, in 1862, styling him 'the greatest *chef d'orchestre* in the world.' He died 29th April 1884.

**Costa Rica**, the most southerly of the five older republics of Central America, is divided into seven provinces (San José, Alajuela, Heredia, Cartago, Guanacaste, Punta Arenas, and Limón), and occupies the entire breadth from sea to sea between Nicaragua on the one side and Panamá on the other, with an area of 20,000 sq. m., or about two thirds that of Ireland. The population, which is mostly concentrated in a central plateau of about 3500 sq. m., was in 1885 officially estimated at 213,785, including some 10,000 uncivilised Indians; in 1921 (with 3500 Indians) at about 468,000. The whites are mostly of pure Spanish descent. Except on the coast, the country is generally mountainous, with many volcanoes, all under 11,500 feet; on the Atlantic slope dense forests prevail, but wide savannahs are more frequent on the Pacific side. The climate is mild and temperate in proportion to the elevation, and the soil of the valleys and uplands is very fertile. Prior to the discovery of gold in 1823, Costa Rica was a land of poverty, owing its title of 'The Rich Coast' solely to the anticipations of its first Spanish settlers; since then, foreign capital has opened up much of the country, and brought its products within reach of a market. Although rich in gold, silver, manganese, copper, and other metals, its chief industry is agriculture; but the population is very scanty, and only a twentieth part of the land is under cultivation. Besides valuable timber and dye-woods, it yields tobacco, sugar, bananas, cacao, rubber, sarsaparilla, and vanilla, which, with hides, tortoise-shell, and mother-of-pearl, are largely exported. But the staple is coffee and bananas, of which latter over 10,000,000 bunches are exported. Of the total annual exports, coffee and bananas represent about five-sixths. The imports are chiefly manufactured goods from Great Britain, and wheat and other products from the United States. The chief ports are Punta Arenas and Limón (q.v.); the other places of any note are San José, the capital, and the cities of Cartago, Alajuela, Heredia, and Limón.

Discovered by Columbus in 1493, and probably first settled on his fourth voyage, in 1502, Costa Rica has had much the same history as its neighbours: *pronunciamentos* have been frequent; the 1872 constitution was the ninth since the declaration of independence in 1821; and for the ten years preceding 1883 that constitution was practically suspended. It has been repeatedly altered. The president is chosen every four years, and the members of congress are elected for the same term. There is a small standing army, besides a militia, which embraces all males between the ages of eighteen and fifty. The peace strength is about 500, the war strength 50,000. Although the Roman Catholic is the state church (with an archbishop

of Costa Rica and a bishop of Alajuela), religious liberty is guaranteed. There are 400 miles of railway. A movement for Central American federation was set afoot in 1920; but Costa Rica held back, and meanwhile the other states fell apart again. A boundary dispute of old standing with Panamá was settled in Costa Rica's favour in 1921, after an invasion by Costa Rica of the territory claimed by both and held by Panamá.

See Niederlein, *Costa Rica* (Phila. 1898); Villafranca, *Costa Rica* (N. Y. 1895); and books by Biolley (Washington, 1889), Calvo (Chicago, 1890), Peralta (Lond 1873), and De Périgny (Paris, 1910 and 1918); and for the history, Fernandez (1889) and Barrantes (1892).

**Costello**, LOUISA STUART, English authoress, was born in 1799, daughter of an army captain in the baony of Costello, Co. Mayo. In Paris, and afterwards in London, she painted miniatures, and enjoyed the patronage of the Burdett family. From 1852 she received a civil list pension of £75 until her death, which took place at Boulogne, 24th April 1870. Her first production, at least of any note, was *Specimens of the Early Poetry of France* (1835), but it was her bright descriptions of travel in Auvergne, Béarn and the Pyrenees, North Wales, Venice, and the Tyrol, that made her really popular. Her semi-historical novels on Catharine de' Medici, Mary of Burgundy, and Anne of Brittany were read in their day.

**Coster**, the usual name of LAURENS JANSZON, according to the Dutch the inventor of printing, who was born at Haarlem about the year 1370. He is supposed to have made his great invention between the years 1420 and 1426, to have been sacristan (*Koster*) at Haarlem, and to have died of the plague about 1440. No question has caused more discussion than that between Coster and Gutenberg; an account of this controversy is given under PRINTING. It is unpatriotic not to argue for the native hero, whose relics are exhibited and to whom monuments have been raised. Yet the most thoroughgoing assault on the claims of Coster and of Haarlem, as being founded on local legends, was made in 1870 by a Dutchman, Dr A. van der Linde. See, however, Hessels, *Haarlem the Birthplace of Printing* (1888).

**Costiveness**. See CONSTIPATION.

**Costmary**, ALE-COST, or simply COST (*Chrysanthemum Balsamita*, or *Balsamita vulgaris*), is a herbaceous perennial composite of southern Europe. It was introduced from Italy in 1568, and is cultivated in gardens (as in Britain, and in the United States) for the fragrance of the leaves. The leaves were formerly put into ale and negus, and are still occasionally used by the French in salads.

**Costs**, the technical name in English law for the expenses incurred in legal proceedings. (In Scotland they are called Expenses, q.v.). Costs are either (1) between solicitor and client—i.e. the charges which a solicitor is entitled to recover from the person employing him as remuneration for professional services; or (2) between party and party—i.e. those which are allowed to the party succeeding in an action against his adversary. As a general rule, costs follow the event, and the costs of the successful party are paid by the loser; but the rule is subject to important exceptions. (1) A party suing or defending *in forma pauperis* does not pay costs, though he is entitled to receive them if successful. (2) In actions in which the plaintiff recovers damages under 10s., he is, in certain cases, not entitled to costs, unless the presiding judge certifies that he ought to have them; and in all other cases, he is not entitled to them, if the presiding judge certifies that he ought not to have them. (3) A plaintiff who might have brought his action in the county court is not entitled to costs

if he sues in the higher courts, and recovers not more than £10 in certain actions, or £20 in others, unless the judge who tries the case certifies that it was proper the action should have been brought in the higher court. (4) A party who is successful in the main, and therefore entitled to the 'general costs,' may be unsuccessful upon some minor point, and therefore bound to pay the costs which belong properly to it. (5) A party who has tendered the amount recovered, and who pays the sum into court, and pleads the tender, is not bound to pay costs. (6) The payment of money into court in the course of an action relieves the party paying from costs of subsequent proceedings, if no greater amount be ultimately recovered.

In suits by and against the crown, the same rules concerning costs apply as in the case of private suits. In administrative proceedings, such as actions for the execution of trusts, or proceedings to ascertain the construction of a will, executors, trustees and others, who have properly or necessarily taken part in the proceedings, are allowed their costs out of the fund or estate involved. When any step in an action is put off at the request of one of the parties, that party is usually required to pay to the other the costs of the particular step. These are called 'costs of the day.' By the Judicature Act, 1875, it was enacted that the costs of all proceedings in the High Court shall be in the discretion of the court; and that where any action is tried by a jury the costs shall follow the event unless for cause shown the judge shall otherwise order.

Costs are taxed (i.e. the items allowed or disallowed) by the officer of the court appointed for the purpose under the name of the taxing-master; and any party may have, if he choose, his own attorney's or solicitor's bill taxed by the same officer.

In criminal cases, the prosecutor's costs may be allowed by the judge, and in that case are paid out of the county rates, the county being reimbursed by the Treasury; and on acquittal of a person indicted who has not been committed or held to bail, the court may order the prosecutor to pay costs to the accused if it think the prosecution unreasonable.

The English doctrine of allowing costs to the successful party generally prevails in the United States. The right to costs, and the rate of costs, is dependent upon statutes which must be strictly construed. The Federal Courts allow costs according to the rates allowed by state law, unless contrary to some act of congress, in which case the latter will prevail as against the state law. By Act of Congress in 1853 a Fee Bill was established regulating the costs in the Federal Courts. This act, by implication, denies costs to the losing party, which in some cases are allowed by the state laws. The rule of one state as to costs cannot be applied to cases involving contracts of that state litigated in another forum. If the cause is removed from the state to the Federal Courts, the parties are entitled to costs according to the state law before removal, and after under the Act of Congress.

**Costume**. See BENEDICTINES, BREECHES, BOOTS AND SHOES, FASHION, HAIR-DRESSING, HAT, MASQUERADE, SUMPTUARY LAWS, THEATRE, VESTMENTS, WIG.

**Costus**, a widely distributed genus of Zingiberaceæ (q.v.), has two sterile stamens united to form a very large and brilliantly coloured lip, and one fertile stamen, also petaloid. The sepals and petals are relatively small. The flowers are aggregated in spikes. The aromatic *Costus*, or *Costus Arabicus*, is not got from this genus, but from the composite *Sausurea hypoleuca* (*Aplotaxis auriculata*), a native of

the moist, open slopes surrounding the valley of Kashmir. The roots are there burned as incense, and used in medicine. They are also employed in protecting bales of shawls from moths.

**Cosway, RICHARD, R.A.**, miniature-painter, was born in 1740, son of the master of Tiverton school in Devonshire. He studied at the Royal Academy, of which he became a member in 1771. He painted oil-subjects, aiming at the sweetness and softness of Correggio; but it was in portraiture that he made his mark, and soon his miniatures were 'not only fashionable, but the fashion itself.' Having gained the personal friendship of the Prince of Wales, he was appointed his painter-in-ordinary, and Mrs Fitzherbert and all the beauties of the coterie sat to him. His small female full-lengths with the faces finished in water-colour, though slight in execution, are full of exquisite grace; and his ivory miniatures are also delicate and valuable. Personally Cosway was vain and eccentric. He died 4th July 1821. In 1781 he married MARIA HADFIELD, a skilful musician, also known as an artist; she executed subjects for Boydell's *Shakespeare*, and Macklin's *Poets*. She founded a girls' school at Lodi, and died there in 1838. See G. C. Williamson's *Cosway* (1906).

**Côte-d'Or**, a department in the east of France, formed of part of the old province of Burgundy, with an area of 3391 sq. m., and a pop. (1921) of 321,088 (declining). The surface is elevated, and is traversed by a chain of hills forming the connecting link between the Cevennes and the Vosges. A portion of that range, called the Côte-d'Or ('golden slope'), receives its name, which it gives to the department, from the excellence of the Burgundy wines produced on its slopes. Much of the surface is covered with forests. The valleys and plains are fertile, and there is good pasture-land. Côte-d'Or is watered by the Seine, which rises in the north-west, and by several of its affluents; by the Saône, and by the Arroux, a tributary of the Loire. By means of canals it has water-communication with the German Ocean, Mediterranean, English Channel, and Bay of Biscay. Iron, coal, marble, and gypsum are found.

**Cotelerius** is the Latin name of Jean Baptiste Cotelier (1629-86), a French patristic scholar, who edited the Apostolic Fathers, the *Monumenta Ecclesiae Græcæ*, and some of Chrysostom's works.

**Cotentin**, THE, the peninsula projecting from the north-west of Normandy into the English Channel, between the Bay of St Michel and the Gulf of Carentan, now forms the northern part of the department of La Manche. It is about 55 miles long and 25 broad. Under the dukes of Normandy, the Cotentin became the seat of numerous powerful barons and rich abbeys. Many of the former followed William the Conqueror to England in 1066, and the names of several of the aristocratic families of England may be traced to humble towns and villages on this peninsula (e.g. Beaumont, Bruce, Carteret, Neville). The Cotentin is highly fertile, and is famous for its herds of fine cattle. The chief town in the peninsula is Cherbourg, though the old capital is Coutances.

**Cotes, ROGER**, a mathematician, whose remarkable promise was cut short by untimely death, was born at Burbage, near Leicester, July 10, 1682. He had his education at St Paul's School, London, and Trinity College, Cambridge, where he was elected fellow in 1705, and next year, through the influence of Newton, Whiston, and Bentley, Plumian professor of Astronomy and Natural Philosophy. He was elected F.R.S. in 1711, and took orders in 1713. His principal work is the admirable preface explaining the Newtonian philosophy, and answering objections to gravitation, prefixed to the second

edition (1713) of Newton's *Principia*. Various original mathematical papers, tending greatly to the development of logarithms, were edited after his death, which took place 5th June 1716. 'Had Cotes lived,' said Sir Isaac Newton, 'we might have known something.'

**Côtes-du-Nord** ('northern coasts'), a French department forming part of Brittany, and bounded N. by the English Channel, in which are several small islands belonging to Côtes-du-Nord. Area, 2786 sq. m.; pop. (1872) 622,295; (1921) 537,824. The Menez Mountains, 16 miles broad and 1115 feet high, cross the department from east to west, and chiefly consist of granite and clay-slate. There are several short but navigable rivers. Though a great portion of the south and the higher plains is occupied by heath and woods, there are also fertile tracts. The cultivation of flax and hemp, with pasturage and iron-mining, supply employment in the hill-districts; while in the sheltered valleys and on the coast-levels grain, pears, apples, &c. are produced. The department is divided into the five arrondissements of St Brieuc, Dinan, Loudéac, Lannion, and Guingamp. The chief town is St Brieuc.

**Coteswold**, or COTSWOLD HILLS, a range of oolitic limestone hills, running through the middle of Gloucestershire, from Chipping Campden in the NE., by Cheltenham and Stroud, to Bath in the SW. The range is over 50 miles long, with an average height of 500 or 600 feet, and separates the Lower Severn from the sources of the Thames. The highest point is Cleve Hill, 1134 feet. For the Coteswold Games, see ATHLETIC SPORTS.

**Cotgrave, RANDLE**, author of our earliest French dictionary, but of whose life little is known save that he was a native of Cheshire; was admitted scholar of St John's College, Cambridge, in 1587; became secretary to William Cecil, Lord Burghley; and was alive as late as 1632, in which year he carried the second edition of his dictionary through the press. The first edition had appeared in 1611, and editions revised by James Howell were issued in 1650, 1660, and 1673. Cotgrave's dictionary was a really remarkable book for its time, and is still invaluable to the philologist, not only as a storehouse of older English words, but because it fixes the actual forms of French words—though it is inevitably crowded with mistakes.

**Cöthen**. See KOTHEN.

**Coturnus**. See BUSKIN.

**Cotillon**, the name of a brisk dance, of French origin, performed by eight persons. The quadrille may be regarded as a modification of it.

**Cotinga**, a genus of Passerine birds, represented by six species in Central and in tropical South America. The family (Cotingidae) to which they belong is often called the Chatterers of South America, though the name Chatterers (q.v.) is by others confined to the Ampelidæ. They are fruit-eating birds, and the males are very beautifully adorned in blue or violet at the breeding season. See COCK OF THE ROCK.

**Cotman, JOHN SELL**, an artist of the 'Norwich School,' was born 16th May 1782, and educated at Norwich grammar-school, till, about 1798, he went up to London to study art, and there made Turner's acquaintance. He exhibited at the Royal Academy in 1800. In 1807 he returned to his native city, where he taught drawing and published etchings and engravings of local architecture, brasses, &c. He joined the Norwich Society of Artists, of which he became president in 1811. In 1834 he obtained, through Turner, the post of drawing-master in King's College, London, but his later years were clouded by much suffering. He died 24th July 1842.

Cotman's fame as a water-colour landscapist has grown steadily; indeed Mr Cosmo Monkhouse opines that 'taken altogether he was the most gifted of the Norwich School, wider in range, a finer draughtsman, and of more refined individuality than "Old Crome."' His sons, Miles Edmund (1810-58) and Joseph John (1814-78), were also landscape-painters. See W. F. Dickes, *Norwich School of Painting* (1905); Oppé, *The Water-colour Drawings of Cotman* (1923).

**Cotoneaster**, a genus of Rosaceæ, sub-family Pomoidæ, closely allied to the hawthorn and medlar. The species are shrubs or small trees, some evergreen, with simple entire leaves, more or less woolly beneath; small flowers in lateral cymes; and small, unpalatable, but bright-coloured fruit, persistent in winter. *C. vulgaris* (now extinct in its only British station, Great Orme's Head) and other species are common mountain plants of central Europe and Asia, but have been largely introduced as ornamental shrubs, the evergreen species (*C. rotundifolia*, &c.) being especially used for covering walls and rockwork.

**Cotopaxi**, the loftiest active volcano in the world, is in Ecuador, in the eastern chain of the Andes, and about 50 miles S. of the equator. Humboldt gave the height at 18,880 feet; Reiss, the first to ascend it (in 1872), at 19,500 feet; Whymper, who ascended in 1880 to the edge of the crater, at 19,550 feet above the sea. The valley at its foot, however, is itself 9000 feet high. The upper part of Cotopaxi, a perfect cone of 4400 feet, is entirely covered with snow, save that the verge of the crater is a bare parapet of rock. Below the snow is a well-marked barren belt covered with lichens and shrubs, below which again is forest. Smoke issues from the summit; sounds as of explosions are occasionally heard; and above, a fiery glow is often visible by night. Lava rarely flows even during eruptions, but flame, smoke, and immense volumes of ashes are then ejected; and when the heat melts large masses of the snow lying on the sides, destructive floods are occasioned in the valleys beneath. The first eruption recorded was in 1533. Others followed in 1698, 1743, 1744, and 1768, the most terrible of all, when ashes were carried 130 miles' distance, thickly covering an extensive area. Cotopaxi was quiet till 1851. In 1854, 1855, 1856, 1877, 1880, there were again eruptions of more or less violence.

**Cotrone**, a fortified town of Italy, 35 miles NE. of Catanzaro by rail, built on a point of land projecting into the sea; pop. 10,000. See CROTONA.

**Cotswold Hills**. See COTESWOLD.

**Cotta**, a publishing-house established at Tübingen in 1640, and still one of the most flourishing in Germany. The family came originally from Italy. Its most prominent members have been (1) Johann Friedrich (1701-79), a learned writer and theological professor at Tübingen, Göttingen, and Jena; (2) his grandson, Johann Friedrich, Freiherr Cotta von Cottendorf, born at Stuttgart in 1764, educated at Tübingen, and for some time an advocate. In 1787 he undertook the family business; and in 1795 established the famous *Horen*, a literary journal, under the editorship of Schiller, with the friendly co-operation of Goethe and Herder. Already in 1793 he had sketched out the plan for the *Allgemeine Zeitung*, which has appeared since 1798. The *Almanach für Damen* (1798) and other periodicals were no less successful. Cotta now began likewise to publish the works of Schiller, Goethe, Herder, Fichte, Schelling, Jean Paul, Tieck, Voss, the Humboldts, &c., establishing thereby a claim to the gratitude of the wide literary world. In the seventy years ending in 1864, the house had paid to Schiller and his heirs no less a sum than 528,966 marks, to Goethe and his heirs

in the same period, 865,554 marks. In 1810 he changed his residence to Stuttgart, and in 1824 introduced the first steam printing-press into Bavaria. He died 29th December 1832. In the diet of Württemberg, and afterwards as president of the Second Chamber, he was ever the fearless defender of constitutional rights; he was, too, the first Württemberg proprietor who abolished servitude on his estates. He was succeeded by his son, Georg (1796-1863); and he by his son Georg Astolf (1833-76).

**Cottage**, a small dwelling-house, especially of labourers, varying greatly in size, appearance, and comfort. Since 1860 especially, public attention has been called to the deplorable state of the cottages in many parts of Great Britain, and the desire to secure their improvement has led to the publication of many works on Cottage Architecture, including those of Birch (1872), Young (1872), and those connected with the Cheap Cottages Exhibition at Letchworth in 1905.

**Cottbus**, or KOTTBUS, a town of Prussia, in the province of Brandenburg, situated on the Spree, 71 miles SE. of Berlin by rail. It is an important railway junction and a busy mercantile town, with manufactures of woollen cloth, carpets, hats, linen, jute, leather, and tobacco. Pop. (1875) 22,642; (1900) 39,327; (1910) 48,643; (1919) 48,046.

**Cotters**. See CROFTERS.

**Cottin**, SOPHIE (née Risteau), French authoress, born at Paris in 1770, married at seventeen a Parisian banker, who left her a childless widow at twenty. For comfort she turned to letters, wrote verses and a lengthy history, and in fiction won unfading laurels. She had already written *Claire d'Albe* (1797), *Malvina* (1800), *Amélie Mansfield* (1803), and *Mathilde* (1805), when in 1806 she wrote *Elisabeth, ou les Exilés de Sévère*, a story stamped with such real unsought pathos that it has been translated into most European languages. Madame Cottin died 25th August 1807.

**Cottle**, JOSEPH, bookseller and author, born in 1770, was well read in English literature when he started business in Bristol in 1791. He took kindly to Coleridge and Southey, to whom he was introduced by Robert Lovell, and offered them each 30 guineas for their poems; and in addition 50 guineas for Southey's *Joan of Arc*, with 1½ guineas to Coleridge for every additional 100 lines of poetry he might write. The poems thus arranged for appeared in 1796. Cottle also became responsible in a business, and partly in a pecuniary, sense for Coleridge's *Watchman*; and an introduction to Wordsworth led to his publication of the afterwards famous *Lyrical Ballads* (1798). Cottle was entrusted with the delicate duty of handing over De Quincey's generous donation of £300 to Coleridge, to whom he also addressed some serious expostulations as to his indulgence in opium, which drew replies from the poet. Cottle's injudicious and unmerciful exposure of Coleridge's failings in his interesting but frequently inaccurate *Early Recollections* (1837) has served largely to gibbet himself as a somewhat obtuse and self-righteous Philistine. He wrote several volumes of verse, including an epic on Alfred the Great and a poem on John the Baptist. The fourth edition of his *Malvern Hills* (1829) contains several prose essays, one of them on the authenticity of Chatterton's Rowley poems. He retired from business in 1799, and died 7th June 1853.—His elder brother, AMOS SIMON COTTLE (1768-1800), educated at Bristol and Cambridge, wrote various works, including *Icelandic Poetry* (1797), a verse translation of the Elder Edda neither faithful nor poetical (probably from a Latin version); it contains a poetical address to him from Southey.

**Cotton** is one of the most important natural products in the world. It furnishes a large part of the clothing of the human race in almost all climes. It is also employed extensively in the manufacture of other articles. Flax, the origin of linen, has been of the utmost service to man, but beside cotton it occupies a very subordinate position. Of the crops of the world, cotton, wheat, and wool meet most extensively the pressing needs of man. And from the cotton-plant it is not only cotton-wool that is obtained. From its seed we derive cotton-seed oil and cotton-seed cake, or meal, which is so fattening a food for live-stock; and from the rugged stalk of the plant the genius of man mysteriously elicits superfine milk-white writing-paper. The Middle English word *coton* or *cotoun* comes through the French and Provencal from the Portuguese *côto*, and that from the Arabic *qutn*, *qutun*. The generic *Gossypium* of the botanists is Pliny's word.

**Varieties of Cotton.**—Everybody knows that cotton is a vegetable wool which is found in tropical and sub-tropical areas. More exactly, the latitudinal range of its cultivation lies between 43° north and 33° south of the equator. Of its species four are primary—viz.: (1) *Gossypium Barbádense*, (2) *G. herbaceum* or *indicum*, (3) *G. peruvianum*, and (4) *G. arboreum*. The yield of the first species

Cotton (*Gossypium Barbádense*):

a, ripe capsule after dehiscence; b, a seed; c, the same deprived of its hairs.

is the most valuable. The beautiful long-stapled ( $1\frac{1}{2}$  to  $2\frac{1}{2}$  inches) silky down known as 'Sea Island' is a variety. It is grown exclusively upon the islands and a portion of the mainland of Georgia, South Carolina, and Florida. The saline ingredients of the soil and atmosphere in these places are supposed to be indispensable to its satisfactory production. The plant is 6 to 12 feet in height. A large percentage of the crops raised in Alabama, Louisiana, Mississippi, Texas, &c. are also varieties of the first species; though, probably owing to climatic influences, the plant of these districts, which is 4 to 6 feet in height, is smaller than the Sea Island plant, and the wool of the former is less easily separated from the seeds than the wool of the latter. The better descriptions of Egyptian cotton, the staple of which varies from 1 to  $1\frac{1}{2}$  inch, belong also to *G. Barbádense*. Its colour is not white or gray like that of other cottons, but a light brown. *G. herbaceum* is found in India, China, Africa, and some other parts. The principal com-

mercial varieties of its wool are those known as Surat, Madras, Bengal, &c. It is a small, shrubby plant from 2 to 4 feet high. The staple of its wool, though not long ( $\frac{1}{2}$  to 1 inch), is very fine. To this species the cotton known as nankeen is thought to belong. *G. herbaceum* can be profitably cultivated in colder countries than any other kind of cotton-plant. The third species, *G. peruvianum*, is a native of South America; the 'green seed' cotton of the United States appears to be of its family. Its stem reaches to as much as 10 to 15 feet; the fibre of its wool is in length 1 to  $1\frac{1}{2}$  inch, and is strong-stapled. Pernambuco, Maranhão, Bahia, Maceio, and Peruvian are examples. *G. arboreum*, raised in India and China in bulk, as its name imports, is a large, tree-like plant. Varieties have been long cultivated in the United States. The finer kinds of yarn are spun from Sea Island and long-stapled Egyptian.

**Supplies of Cotton.**—At the close of the 18th century 70 per cent. of the cotton used by Great Britain came from the West Indies, and 20 per cent. from the Levant. To-day over 80 per cent. is derived from the United States, and about 15 per cent. from Egypt. Little Indian cotton finds a market in the British Isles; but it is used to far larger extent in Continental Europe. Roughly speaking, half of the Indian crop feeds Indian spindles; of the remainder one-quarter goes to China and Japan, and three-quarters come to Europe; and of that which penetrates to Europe no more than 10 per cent. ordinarily finds its way into England.

The history of cotton-growing in Egypt reads like a romance, and eloquently testifies that attempts to plant new agricultural industries in countries may be productive of truly marvellous consequences. From time immemorial cotton has existed in Egypt, but the Egyptian cotton known to commerce was introduced some time prior to 1820 by Maho Bey from the Isle de Bourbon, where also it was not indigenous, but an immigrant from Barbados. Its cultivation in Egypt was fostered by Mehemet Ali, Jumel, that most enterprising of Frenchmen, who had noticed the cotton in Maho Bey's garden in 1820, and had created a plantation of his own, was placed in control of the viceroy's cotton-fields. Under his wise direction the new husbandry prospered beyond the dreams of its originators. To-day the Egyptian crop is enormous, and is highly prized. At present its cultivation is confined to the delta and parts which admit of irrigation from the Nile. In Egypt, owing to the dryness of the atmosphere, the cotton-fields can be flooded periodically without damage to the plants. Can the Egyptian supply be still further increased? one naturally inquires. This question has for long excited the speculation of experts. But unfortunately, apart from improvements in methods of cultivation, particularly in the use of water (which, according to the allegations of competent investigators, is at present injudicious, so that the land becomes water-logged, and the cotton-plant suffers in both the quantity and quality of its yield), the best-reasoned answer would seem to be in the negative. The area under cotton is strictly dependent upon the amount of water that can be supplied by irrigation, and in the irrigated area cotton has to compete with other crops. It is possible, of course, to extend the perennially irrigated area; to do this water-supplies are adequate. To the north of the cultivated portions of the delta is a large district of waste-land, once the most fertile in all Egypt; and in Upper Egypt and the Sudan large tracts exist which would yield cotton. Vast projects for watering these lands have been conceived, such as the Wady Rayan reservoir and the barrage at Lake

Albert; and the dreams of one generation may become the actualities of the next.

That India should be a poor third in the production of cotton is in some respects surprising. The conditions of climate and soil in that country are by no means unfavourable to cotton universally. Nevertheless, in India the total supply is comparatively small, the yield per acre is meagre, and the cotton is, as a rule, coarse, short-stapled, and dirty. Probably all native varieties of cotton have deteriorated through exhaustion of the soil and careless cultivation. But success has been met with in attempts to improve indigenous plants and educate the Indians, both of late and in the earlier days of endeavour to extend the sources of cotton, to which reference will be made next. Since 1860 the cotton production of British India has increased threefold.

Attempts to encourage the cultivation of cotton in districts where it is unknown or neglected have not been confined to the last few years. In 1857 an association known as the Cotton Supply Association was set on foot in England. Its objects were stated thus: 'To afford information to every country capable of producing cotton, both by the diffusion of printed directions for its cultivation and sending competent teachers of cotton planting and cleaning, and by direct communication with Christian missionaries, whose aid and co-operation it solicits; to supply, gratuitously in the first instance, the best seeds to natives in every part of the world who are willing to receive them; to give prizes for the extended cultivation of cotton; and to lend gins and improved machines for cleaning cotton.' The pioneers who banded themselves together in this association were frightened into their action by the restriction of cotton-supplies which was being experienced at the time. Some believed that American cultivation had reached its ultimate limits, and all were convinced that periodic dearths of raw material for cotton-spinning would be less likely and less severe were supplies obtainable in bulk from more parts of the world. Between 1840 and 1860 the American cotton crop increased 100 per cent., while European, including English, spindles increased about 150 per cent. and improved vastly in productive power. But the association, after some cheery successes, was doomed eventually to comparative failure; as the action of the British government prior to the birth of the association had been also. The elasticity of American sources had been enormously underestimated. Between the middle of the 19th century and its close they were destined actually to be augmented fourfold without such additional pressure on the land as to render production more costly.

But American supplies cannot be inexhaustible, though it may be that they are still far from having reached the end of their tether. And still it is felt as a possible danger by many spinners that the cotton industry is so absolutely dependent on a certain area of the United States for keeping its nimble spindles humming week in and week out. It need excite no surprise, therefore, that more than one association has sought in recent times to spread more widely over the globe the cultivation of cotton. England has had for some years its Cotton Supply Association; a German Colonial Agricultural Committee was started in 1896, and the Association Cotonnière Coloniale in 1902. Russia, too, has given attention to the matter. In 1904 the International Congress of Master Cotton Spinners and Manufacturers formally bestowed their blessing upon what was being done, and urged the need of more strenuous action. So far results have been encouraging. The English association is yearly bringing forward substantial

crops from West Africa (particularly Lagos and northern Nigeria), East Africa, and the West Indies; but as yet the whole of them make up an exceedingly small fraction of the total cotton imports of the United Kingdom. Much time is needed to effect anything appreciable in enterprises of this kind, and naturally immense obstacles have been encountered. Transportation has been a difficulty and labour has been a difficulty. But after the reports which have been made, there seems no sufficient reason to suppose that the parts of Africa where American and Egyptian plants can be acclimatised may not prove eventually, when the industry is firmly established, to be steady sources of a rich supply.

To what extent may an expansion of the American output be looked for? Upon the answer to this question much that is of vital concern to the human race may depend. In the United States, of the cotton area not more than 20 per cent. has at any time been cultivated at all, and as much as 10 per cent. has never been under cotton. It is claimed that the worn-out cotton-lands in the Eastern states might be restored to fertility and so worked that they would not relapse to their present condition, that the black prairie-lands of Texas could produce a great deal, and that superior methods of cultivation on lands now tilled might raise the yield per acre. For our generation, however, these are vague possibilities, with the exception of improvement in cultivation, of which there are already signs.

On the whole, to sum up our findings as regards supplies, there would seem to be no justification which is not remote for the pessimistic conclusion that decreasing returns will soon operate so strongly in the production of cotton that the price of textiles, which have become a necessity of existence, will be sensibly magnified.

This section may be fitly concluded with a quantitative review of existing supplies. The following figures are approximate, and are obtained by roughly averaging the harvests of some recent years when there has been no shortage. As an estimate of the world's cotton crop, they show the relations between different sources of supply.

	1000 Bales of 500 lb. each
United States . . . . .	18,000
India . . . . .	3,000
Egypt . . . . .	1,300
Russia . . . . .	500
China . . . . .	400
Brazil . . . . .	250
Mexico . . . . .	125
Turkey . . . . .	100
Peru . . . . .	50
Other countries . . . . .	100
Total . . . . .	18,775

*Cultivation.*—The most perfect system of cultivation is probably that which prevails in the United States of America, and has been adopted in many other places. Although the plant is not, strictly speaking, an annual, it is found most profitable to destroy the shrub, after the crop is gathered, and sow new seed every year. In the United States sowing usually commences in March, and may extend to May. Picking generally commences in August, occasionally in July, and continues until the occurrence of frost—about the end of October or beginning of November—puts a stop to the further growth of the plant. Picking has extended to December or January, and even into February, but the later cotton, the plant getting exhausted, is inferior in grade and quality. Sowing generally takes place between June and September, according to the district; in India and in Egypt, in March or April.

After picking, the cotton is spread out to dry. When it is dry, the first process of cleaning begins,

the separation of the wool from seed and the worst dirt. This is effected by rollers or by the saw-gin invented by Eli Whitney in 1793. The principle of the saw-gin is to drag the cotton through wires which are set so closely together that seeds cannot pass between them. This machine is employed for cleaning only the short-stapled varieties of cotton, the wool of which adheres so firmly to the seeds as to require a considerable force to separate it. The Sea Island variety is cleaned by the roller system, which consists in two small rollers revolving in opposite directions. Through these the cotton is passed, and they easily throw off the hard, smooth seeds. The Macartny-gin is an improvement on the roller-gin. Of these machines, the saw-gin is the fastest in its action, and therefore, as it happens in view of its cost, much the cheapest to clean with.

Baling is the next process. It is effected by presses. The sizes of bales vary. The approximate weights of the chief bales in the market are as follows: United States, 500 lb.; Indian, 400 lb.; Egyptian, 700 lb.; Peruvian, 200 lb.; Brazilian, 200-300 lb.

*Marketing of Cotton.*—The bulk of American cotton is shipped from Galveston, New Orleans, and Savannah. The first and last have risen considerably in importance of late years. The bulk of the cotton for England is received at Liverpool. Formerly London was the chief port of entry. Since the Manchester Ship Canal was opened some supplies have come direct to Manchester. The percentage so consigned is now substantial. On the Continent the chief cotton-markets are at Bremen and Havre.

The peculiarity of the marketing of cotton is the extent to which 'futures' are used. A 'future' is a contract to deliver a stated quantity of cotton within an agreed period in the future at a price fixed in the present. In order to limit the variety of the contracts entered into on a cotton-market, every 'future' is made to relate directly to one quality, or grade, only. Other grades of the same family, so to speak, are declared to be deliverable, on payment of allowances to or by the purchaser, according to the inferiority or superiority, as the case might be, of the grade delivered to the grade which is the basis of the future contract. Allowances are settled on some agreed principle. Delivery of the commodity is seldom made against 'futures' for reasons which will transpire. They are ultimately bought back, as a rule, when delivery is offered, or any time before.

'Futures,' properly used, enable cotton to be so spread over the year that at no time is it too scarce or too plentiful. Moreover, they are a great aid in affording a means whereby spinners and brokers may evade certain risks. Let us consider the case of the spinner. He is speculating if he quotes prices for future deliveries of yarn without knowing what his raw cotton is going to cost him. He can avoid speculating, of course, by buying at once all the cotton that he needs to execute his orders, but if the price of cotton were generally expected to fall he would be ill-advised to do so. And if he did so the community would lose, because the price of cotton when it was high would be raised still higher, and the range of variation in the price of raw cotton would be stretched out. On the other hand, the spinner might buy 'futures' in cotton in quantities and for periods to suit his orders for yarn. But to do this would not be to protect himself completely, because the price of 'futures' varies with the price of some one grade of cotton, which might not be the grade that he wanted. If the grade that he wants rises in relation to this basis grade, against its special rise in price the spinner would not be insured.

So, broadly speaking, we may say that 'futures' provide him with a hedge against a general rise in the price in cotton, but not against a special rise in the price of the exact kind of cotton that he needs. However, the spinner can escape the whole of the risks which we have been analysing if he contracts with some cotton-broker to deliver to him at stated periods stated quantities of the exact kind of cotton that he needs at a price fixed when the contract is made. The broker in turn can hedge against the bulk of the risks involved in his contract by buying 'futures' on the cotton-market, or entering into some of the numerous future transactions which are there embarked upon. He may even make arrangements with other brokers by which he distributes the whole or a part of the risk associated with the 'points on or off'—that is, the risk that the special kind of cotton that the spinner wants may rise more than basis grade rises. Cotton 'futures' have unhappily been abused and employed as agents for sheer gambling; but the gain derived from their introduction has more than exceeded the disadvantages occasioned in this way, and also occasioned by the fact that they have facilitated cornering transactions designed to rob the public.

*Early Days of the Cotton Industry.*—Where the cotton industry first appeared it is impossible to say. Herodotus said of the Indians: 'They possess likewise a kind of plant which, instead of fruit, produces wool, of a finer and better quality than that of sheep: of this the Indians make their clothes.' From the fact that Herodotus thought it worth while to place this on record, it would seem to be a legitimate inference that cotton goods were not in his time common in Europe, where the cotton industry first attained celebrity in Spain as late as the 13th century. Of its early days Baines, in his *History of the Cotton Manufacture*, says: 'In Spain the manufacture, after flourishing to some degree, became nearly extinct. In Italy, Germany, and Flanders it had a lingering and ignoble existence. It would be altogether a mistake to suppose that the same manufacture which now exists in England ever existed in any other part of Europe. A coarse and heavy article was, indeed, fabricated, probably half of cotton and half of linen, but it was of too little importance to attract the notice of historians; and calicoes, muslins, and the more delicate cotton goods were never made in Europe, except possibly by the Moors in the south of Spain, until the invention of spinning machinery in England.' But China, we know, became very early an important seat of the industry, whither it is said to have been carried from India. Probably the most interesting fact concerning its origin is that the methods of transforming cotton-wool into fabrics must have been invented twice at least. When the New World was discovered, people were found clothed in cotton textiles. It is a truly remarkable fact, and one of no slight sociological import, that the chief steps in economic progress have been made by different races independently.

*The Industry in England.*—It is a task of no small difficulty to fix the exact or even approximate date when a trade appeared in any country if its beginnings were remote. For years its existence might have passed unrecorded. But, curiously enough, we can tell within a few years when the cotton manufacture attained a sensible magnitude in England. There are many scraps of evidence bearing on the point, but far the most important is a petition of merchants praying for relief from a patent granted to the Duke of Lennox. From internal evidence it is certain that the date of the petition must be about 1621. In the petition it is stated as follows: 'About twenty years past, divers

people in this kingdom, but chiefly in the county of Lancaster, have found out the trade of the making of the fustians, made of a kind of bombast or down, being a fruit of the earth growing upon little shrubs or bushes, brought into this kingdom by the Turkey merchants, from Smyrna, Cyprus, Acre, and Sydon, but commonly called cotton-wool. . . . There are at least 40,000 pieces of fustian of this kind yearly made in England.' The industry was probably brought to England by refugees from the Netherlands. The reader of early records must be on his guard against supposing that the English 'cotons' referred to before the 17th century were cotton goods proper. They were really woollens, as a closer search of records will reveal. We may take it that the English cotton industry took root about 1600; and by 1641, according to Lewis Roberts's *Treasure of Traffic*, it was most flourishing; but on Radcliffe's showing in the *Origin of the New System of Manufacturing* (1827), it was not until 1770-83 that the cotton trade assumed such a pre-eminent position in Lancashire, its peculiar seat, that it drove away the woollen and linen industries in bulk. The triumphs of the cotton industry about this time, and for the next few decades, were the outcome of the most sensational series of epoch-making mechanical inventions which has ever been compressed into so short a period in the history of civilisation; and, no doubt, in the industrial exhilaration occasioned by the first discoveries, the later ones took their birth. It is astounding that from the time of the introduction of weaving and spinning, countless ages ago, until the 18th century the methods of manufacture, despite some few improvements, remained fundamentally unchanged. In Homer a reference to weaving will be found which might be a description of the methods pursued in England for ordinary fabrics prior to 1738. It was in this year that John Kay hit on the device of the fly-shuttle. Twenty-two years later his son Robert furnished the loom with a drop-box to aid in weaving with many colours at once. In the closing decades of the 18th century Watt's steam-engine was exciting the wonder of the world that knew of it, and in 1787 Cartwright brought the application of steam-power into relation with cotton machinery by designing a practicable power-loom. In 1794 Bell, and in 1798 Miller, took out their weaving patents; and in 1803 Radcliffe and Johnson contrived to render weaving continuous with the ingenious notion of the dressing-machine, which rendered unnecessary the frequent stoppage of the loom for the dressing of the next piece of warp to be worked upon. And spinning was not left in the lurch. Paul and Wyatt had tried spinning by rollers as early as 1738. In 1769 Arkwright improved on their ideas, and in 1775 he added machinery for carding, drawing, and roving. Spinning by rollers on Arkwright's machine, known as the 'water-frame' because it was soon driven by water instead of the old gin-horse, applied to the production of warps, which up to this time had been made of linen, as a rule, because cotton-threads strong enough for the purpose had not been producible. Other machines were introduced which cheapened weft. About 1764 Hargreaves substituted for the single-spindle wheel the 'jenny,' which carried many spindles; and about 1779 Crompton perfected a scheme for making very fine yarns by combining the principle of dragging out the yarn by rollers revolving at different speeds with the older principle of drawing it out by hand. His appliance, named the 'mule' because of its mixed nature, was a 'jenny' and roller-machine in one. The prodigious growth of the industry under these happenings is amply testified by the following rates of increase of importations of cotton:

1741-51. ....	81	per cent.
1751-61. ....	217	"
1761-71. ....	255	"
1771-81. ....	753	"
1781-91. ....	3194	"
1791-1801. ....	674	"
1801-11. ....	894	"
1811-21. ....	98	"
1821-31. ....	85	"

Observe the stupendous growth between 1781 and 1791.

It is hardly needful to remark that many technical improvements have taken place since the halcyon days when almost every decade brought forth its wonder-working machine or machines. But in the intervening period there is nothing path-breaking to record with the exception of ring-spinning—the idea of which was a stroke of genius for which two persons appear to have been independently responsible—and the automatic loom. Ring-spinning, invented in the 'thirties, was not much resorted to till some years later, though to-day the bulk of American yarns are produced on the ring-frame; and for automatic looms, of which there are many kinds, civilisation had to wait until the closing decades of the 19th century. Automatic looms are extensively used in the United States, but they would seem at present to be less suited to conditions in England, where labour is highly skilled and the fabrics produced in greatest bulk need to be woven with some care. Another idea bearing on the mechanics of industry remains to be noticed in passing—namely, the idea of electric-driving, which is already in operation here and there. It is said to have economies, in that power which is not immediately wanted can be stored in accumulators, as it cannot when driving is obtained direct from the generating engines.

Thanks to the initiation of the industrial revolution in England, particularly in its bearing on textiles, England was the producer of cotton goods for the world by the middle of the 19th century. These figures of average annual imports of raw cotton will show what this result meant for Lancashire:

1816-20. ....	130,000,000 lb.
1831-35. ....	290,000,000 "
1851-55. ....	750,000,000 "
1876-80. ....	1,275,000,000 "
1896-1900. ....	1,575,000,000 "
1917-21. ....	1,496,000,000 "

There was a slackening in the rate of advance, it will be observed, about the 'seventies. The numbers (approximate) of spindles and looms in the United Kingdom in different years bear this out:

Years.	Million Spinning-spindles.	Million Doubling-spindles.	Thousand Power-looms.
1876	38	4.4	468
1878	40	4.7	515
1885	40	4.2	561
1890	41	4.0	616
1908	44	4.0	684
1910	54	—	700 (1906)

We must remember, however, that throughout this period machinery was getting more efficient and being worked increasingly at greater speeds, so that each spindle and loom was annually turning out more. Indeed, advance in the productivity of the machinery in the industry was almost continuous throughout the 19th century. Production per spindle probably doubled between 1820 and 1860, and increased substantially after 1860, while production per loom must have doubled in the last fifty years of the 19th century. In spinning in particular the speeding-up of machinery became a striking feature of the industry from the 'sixties on. But despite the augmented productivity of machinery in the last quarter of the 19th century, it is evident, when all statistics are weighed together, that the cotton industry of

England was for the time approaching its zenith. The industry was developing abroad behind tariff barriers. But the average of English spinning is much the finest. This is evidenced statistically by the comparative consumptions of cotton per spindle.

*The Industry Abroad.*—It is as true as most general statements can be that the industrial revolution, which may be assigned to the beginning of the 19th century in England, was hardly noticeable in most parts of Continental Europe before the middle of the 19th century, though France had an extensive cotton industry earlier. The rapid industrial rise of Germany did not occur until after the Franco-Prussian war. But now there are flourishing cotton industries in France, Germany, and Russia, and even, though in a less degree, in Czechoslovakia, Austria, Spain, Italy, and Switzerland.

For long the United States has been a large and efficient producer of cotton goods. Her industry, even on a substantial scale, reaches back to the later days of discovery and restless energy in England. In 1786 models of an early form of the Arkwright machines were smuggled into the United States. In 1788 the Beverly Association began operations with machinery constructed from these models. The second mill was erected in America in 1790, the third in 1795; and in 1798 Samuel Slater, with some of his wife's relatives, began work in a mill which was the first constructed throughout on the principle of the water-frame mills in England. Power-loom manufacturing appeared in 1814. Progress in the industry was not very rapid until the war of 1812-14, when it was fostered by the check on importations from England. When the war was over duties were raised, after some agitation, to preserve what had been acquired. By 1831 there were in the United States—chiefly in the so-called New England states—800 factories, 1,250,000 spindles, 33,500 looms, and 62,200 operatives, and the annual consumption of cotton-wool was as much as 77,000,000 pounds.

The sudden and colossal expansion of the cotton industry in the southern states of North America is one of the most striking features of recent economic history. In 1880 the south contained about half a million spindles; twenty years later it had 6,000,000, besides 200,000 power-loom. In 1880 it consumed annually, on an average, about a quarter of a million bales of cotton; twenty years later it consumed nearly one and a quarter million. South and North Carolina, Georgia and Alabama, are the states affected, and in what is known as the Piedmont district advance has been most rapid. For this astounding growth of the cotton industry in the southern states proximity to the cotton-fields is partly responsible; but it is a less important consideration than one would at first imagine. Probably the dominant influence consisted in cheap supplies of white labour—not black labour, for negroes are normally indisposed to work in factories. The southern states contain a scattered population of half-occupied whites working in connection with the land. From this the wages paid in the factories attracted large numbers. But since the first steps were taken wages have risen in the south under pressure of a big demand, and as an outcome of the organisation of the operatives. There is no reason to suppose that remarkable cheapness of production must be expected for ever in the southern states.

It is not only on the Continent of Europe and in the New World that the cotton industry has attained an impressive magnitude since the days when Lancashire could truthfully be called the world's cotton-factory. Civilisation, as all know, has revived the sluggish East. India is spinning, in mills fitted with European machinery, yarns of

a high average quality, and is turning them out in bulk. In China the same phenomenon may be witnessed on a much smaller scale; but Japan, in industrial as well as all other activity, has been so pushing of late that she is yearly rendering obsolete any figures which may be put forward to indicate the state of her affairs. There is still, however, a vast distinction between East and West in manufacturing, as weaving is technically termed in England. In the East the hand-loom still holds its own in a degree in which it does not even in the most backward parts of Europe. Its use is deeply rooted in the habits and customs of the people.

*Organisation of the Cotton Industry.*—Although the factory cotton industry is now spread so widely over the face of the habitable globe, it must not be imagined that in organisation it is identical in all places. There are obvious, outstanding differences, and others no less considerable, though less immediately apparent. We shall consider now the important points in the organisation of the cotton industry; afterwards in the light of our analysis we shall comment on national differences.

Let *A* and *B* stand for the processes of spinning and weaving. Let small letters stand for the commercial work of buying and selling. Let brackets mark the boundaries of businesses. Then the following are examples of the types of business organisations that are possible:

- (*a*, *A*, *B*, *b*);
- (*a*), (*A*, *B*), (*b*);
- (*a*), (*A*, *a'*), (*b'* *B*), (*b*);
- (*a*), (*A*), (*a'*, *b'*), (*B*), (*b*).

These are only examples of many possible combinations. Let me now explain. *A* and *B* stand respectively for cotton-spinning and cotton-manufacturing (that is, weaving). The letter *a* means the commercial function of buying raw cotton, *b* means selling cotton fabrics, *a'* means selling yarn, *b'* means buying yarn. The formula (*a*, *A*, *B*, *b*) means that a single business takes responsibility for the purchase of its raw material (through a buyer, perhaps, who is a member or employee of the firm), assuming the risk of fluctuation in price; both spins and weaves; and sells as direct as it can to retailers after it has produced. The formula (*a*), (*A*, *B*), (*b*) means that a wholesale house (*b*), which may engage in the home trade or foreign trade, places orders with the spinning and manufacturing firm (*A*, *B*), and that the latter arranges for its supplies of cotton to meet its orders through an independent cotton-brokering firm (*a*), which takes the risk of fluctuation in the price of the cotton needed. In the next formula (*a*), (*A*, *a'*), (*b'*, *B*), (*b*), spinning and manufacturing are represented as having separated into independent businesses. The spinning firm sells its yarn through its seller, and the manufacturing firm buys its yarn through its own buyer. According to the next formula (*a*), (*A*), (*a'*, *b'*), (*B*), (*b*), an independent yarn agent, (*a'*, *b'*), has appeared, through whom (*A*) disposes of its yarns and (*B*) buys its yarn. There would, of course, be many yarn agents and many spinners, and so forth; and the yarn agents might be simply agents (that is, intermediaries taking no risks), or they might be dealers in yarns taking risks.

When spinning businesses are distinct from weaving businesses, it may be said that specialisation by process rules. With specialisation by process we may contrast specialisation by product, which means that a business confines itself to a very narrow range of output. Both kinds of specialisation may obviously exist together.

England is essentially the home of specialisation by process, both by industrial and commercial process. This kind of specialisation is far less common in America and in Continental Europe

than in the United Kingdom. Of course independent spinning is found to rule where there is much hand-loom work—for instance, in the East and on the Continent of Europe; but there little other specialisation by process can be discovered.

The United States has not infelicitously been dubbed the land of specialisation. And yet her specialisation in the cotton industry has mainly been by product, as it has been expressed above. The chief reason would seem to be that the industry, whether in the New England states in the north or in the southern states, is widely scattered. For specialisation by process it is essential that an industry should be concentrated in a small locality, so that marketing at a common marketing centre may be easy and cost of transport may be low. In Lancashire this concentration of the industry is to be found; and nowhere else is it discoverable in the same degree. To the localisation of the cotton industry and the characteristics of different places we shall now devote some attention.

*The Localisation of the Industry.*—In Lancashire spinning and weaving are carried on in the towns around Manchester, with which they are connected with speedy and frequent services of trains. On the Manchester Exchange, in consequence, all parts of the differentiated Lancashire industry can be brought into contact without difficulty. By the activities on the Manchester Exchange the Lancashire industry is created a unity. Given the chance, an industry gains when it differentiates into specialised parts because of the economies of specialisation. Magnificent opportunities for this differentiation were presented in Lancashire; and in other respects the county was as if designed to meet the industry's needs. All the raw material for the manufacture must be imported, and Liverpool offers magnificent harbourage. Moreover, by the proximity of Liverpool the export trade was encouraged. Lancashire, too, provides cheap coal; and, in addition to coal, she enjoys, or suffers from, a climate peculiarly adapted to the production of cotton goods. For spinning, dampness is a desirability. Without it, threads snap in the processes of drawing and twisting. Dampness causes the fibres to cling together. With its humid atmosphere, its coal and its harbour, its climate rendering an indoor occupation desirable, and its general unsuitability for agriculture, Lancashire is marked out as a spot marvellously well endowed for the prosecution of the cotton industry.

The spinning districts of Lancashire lie on the slopes of hills facing west. Upon these the damp breezes from the Atlantic discharge their moisture as they are driven to higher levels by the slope of the ground. In few places abroad where spinning can be located are such conditions to be found. Artificial humidifiers have been tried under unfavourable climatic conditions both in England and abroad; but no cheap and satisfactory ones have yet been discovered. It is for fine spinning in particular that climatic conditions are so important, and consequently it is in the finest spinning that Lancashire is as yet unrivalled. We may notice here incidentally that the fineness of yarns is technically measured by 'counts.' We speak of 'coarse counts' and 'fine counts.' 'Counts' refers to the number of hanks of yarn to the pound. A hank is 840 yards. This peculiar unit is probably derived from the size of the old winding-wheel. A winding-wheel of  $1\frac{1}{2}$  yards in circumference would yield a 'lea' or 'rap,' as it was called (i.e. 80 threads), of 120 yards, and 7 leas would be 840 yards. In the woollen industry the hank of 7 leas was the usual thing.

In broad outlines, the distribution of the industry in Lancashire may be pictured as follows. In a semicircle round Manchester, on the slopes of the

hills, as we have seen, are most of the spinning-mills, in some degree of course associated with local looms. Up the valleys, forming a crescent farther removed from Manchester, are the leading manufacturing (weaving) towns. For all, the trading centre (apart from cotton buying) is Manchester, and the port and cotton-market is Liverpool, supplemented by the inland port of Manchester. It is a remarkable fact that Lancashire districts have specialised by product as well as by process. This is referred to as follows by the late Elijah Helm (sometime secretary of the Manchester Chamber of Commerce), than whom nobody could be more fully equipped with a knowledge of local conditions in Lancashire: 'Spinning is largely concentrated in south Lancashire and in the adjoining borderland of north Cheshire. But even within this area there is further allocation. The finer and the finest yarns are spun in the neighbourhood of Bolton and in or near Manchester, much of this being used for the manufacture of sewing-thread; whilst other descriptions, used almost entirely for weaving, are produced in Oldham and other towns. The weaving branches of the industry are chiefly conducted in the northern half of Lancashire—most of it in very large boroughs, as Blackburn, Burnley, and Preston. Here, again, there is a differentiation. Preston and Chorley produce the finer or lighter fabrics; Blackburn, Darwen, and Accrington, shirtings, dhoolies, and other goods extensively shipped to India; whilst Nelson and Colne make cloths woven from dyed yarn, and Bolton is distinguished for fine quiltings and fancy cotton dress goods. These demarcations are not absolutely observed, but they are sufficiently clear to give to each town in the area covered by the cotton industry a distinctive place in its general organisation.'

The chief cotton towns in Lancashire and its vicinity, in order of importance, measured by the number of operatives, are Blackburn, Bolton, Oldham, Burnley, Manchester and Salford, and Preston. In number of spindles, Oldham surpasses all other places. Bolton stands next. In number of looms Burnley and Blackburn easily take the lead. Next to them is Preston, and thereafter Nelson and Accrington.

Nowhere else in the world is the industry concentrated as it is in Lancashire. In America, as we have seen, it is scattered over two immense areas. In France it has three districts, and in none is it densely packed and well linked up with railway communication. Normandy, containing the important town of Rouen, the north, and the east are the chief seats of the cotton industry in France. Besides Rouen other noteworthy places in the first-named district are Darnétal, Maromme, Sotteville, Havre, Yvetot, Dieppe, Evreux, Gisors, Falaise, and Flers. The northern district contains Lille, Tourcoing, Roubaix, St Quentin, Amiens, and Hellemmes, which are towns of some mark. The chief towns of the east are Epinal, St-Dié, Remiremont, Senones, Val d'Ajol, Cornimont, and La Bresse, and in Alsace, Mülhausen, Gebweiler, and Logelbach. Other towns known for their cotton industries outside the three chief districts mentioned above are the following: Troyes, Nantes, Cholet, Laval, Tarare, Roanne, Thizy, and Villefranche upon the Saône. Turning to Germany, we notice again an industry distinguished by its wide-spread dispersion. Prussia and Saxony lead with the most spindles, but in both the industry extends over an immense area. Bavaria stands next (now that Alsace is lost), but in neither is there a Lancashire in miniature. Württemberg hardly ranks with the regions already mentioned. Three great districts may be distinguished. The one is the south-west, in the neighbourhood of the

cotton districts of east France, Switzerland, and Vorarlberg. It contains Baden, Württemberg, and Bavarian Swabia. Another district may be called 'the middle district.' It covers the localities north of the mountain-ranges of northern Bohemia. In this territory the oldest industry, that of Saxony, has a history stretching back some four hundred years. Finally there is the north-west district (the Rhine Province and Westphalia). The chief spinning towns of Germany in order of importance are Augsburg, Gronau, Werdau, Rheydt, München Gladbach, Rheine, Hof, Chemnitz, Leipzig, Crimmitschau, Bochlolt, Bamberg, and Bayreuth. In what was Russia, the leading cotton towns and regions are Moscow, Vladimir, Piotrkov, Petrograd, Jaroslavl, Kostroma, Tver, Esthonia, Ryazan.

**Foreign Trade.**—From time to time great changes have taken place in the destination of British exports of cotton goods. Half of our exports of cotton fabrics went to Europe in 1820, about one-tenth to the United States, and one-twentieth to eastern Asia. Sixty years later it was eastern Asia which received the half, while Europe absorbed but a twelfth, and the United States a fiftieth only. The relative importance of the eastern market has never declined since. In yarns our European market has not been affected to nearly the same extent. The causes of the great changes in the location of the foreign demand for our manufactured goods are not far to seek. We have already noticed the development of the American and European cotton industries after the middle of the 19th century. And the opening up of the East is a matter of common knowledge. India now imports annually an enormous bulk of cotton goods. Chinese demand, as a substantial thing, dates from the Convention of 1860. Our colonial markets have steadily grown, and will yearly become of greater value.

The cotton goods received by British self-governing dominions and crown colonies come almost entirely from the United Kingdom. The one notable exception is Canada, where, though English goods preponderate, American cottons are also largely imported, despite the preference accorded to articles proceeding from the home country. Of this exception the proximity of the New England states is a sufficient explanation. India also, as well as other outlying parts of the British Empire, depends almost exclusively upon the United Kingdom for its supplies of cotton goods, apart from the large quantities which it makes for itself.

China is the chief market outside the New World for American exports of cotton goods. American manufacturers have achieved wonders in the way of lowering the cost of cheap goods through the automatic loom, and it is in respect of these cheap goods, for turning out which they have organised specialised businesses on a vast scale, that they have made the weight of their rivalry felt. So far, Lancashire has shown no disposition to follow America's lead in trusting to the automatic loom. Lancashire's staple product is of a higher quality.

It is a commonplace saying that foreign trade results in international division of labour. The statement is broadly correct, but at first one might hesitate to accept it, as regards the cotton industry at any rate, seeing that this industry is found all over the world, though nowhere on so great a scale as in the United Kingdom. How can its dispersion throughout the world be explained, and at the same time how account for the fact that countries which export cotton goods import them also? As regards the last point, the reason is twofold. In the nice balance of trade, as a result of its slight fluctuations, a few goods of a kind that a country exports on balance may flow into it. But this is not the chief reason. That is not revealed till we

look into details. When we do so it will be found that the character of the imports differs in bulk from that of the exports. A country may have a famous speciality; thus America has its cheap cloths woven on automatic looms, and France its tasteful prints. And as regards the resisting power of a small industry against the competition of an enormous and long-established rival, it must be remembered that cost of carriage protects the former, that this protection is frequently supplemented by tariffs, and that the small industry can enjoy most of the economies of specialism created by its giant rival. It can specialise in manufacturing certain things and import what it decides not to make, and for its specialised industry it can import, if it likes, the specialised machinery which its competitor has designed and perfected.

**COTTON-SEED OIL**, an oil obtained by pressure from the cotton-seed, of which it constitutes about a quarter. It consists chiefly of palmitin and olein, stands midway between the drying and non-drying oils, is yellowish in colour, almost odourless, and has a slight nutty flavour. The value of this by-product of the cotton plant was not fully appreciated till late in the 19th century, but its uses since then have been continually extending. The refined oil is employed in cooking, in pharmacy, in the preparation of lard and margarine, and as a substitute for olive-oil. The coarser grades are used in the manufacture of soap, paint, candles, and as a lubricator and illuminant.

**Cotton**, CHARLES, the friend of Izaak Walton and translator of Montaigne, was born at his father's estate of Beresford in Staffordshire, 28th April 1630. His father, himself a man of great ability, was a warm friend of Ben Jonson, Selden, Donne, and other illustrious men. The boy travelled on the Continent, devoted himself from youth to a life of letters, and early wrote verses which were handed about among his friends. In 1656 he married his cousin Isabella, half-sister of the famous Colonel Hutchinson. Though a sincere loyalist, he seems to have lived securely enough under the Commonwealth, and the decay of his father's estate was due mainly to unprosperous lawsuits. In 1664 Cotton issued anonymously his burlesque poem, *Scarronides, or the First Book of Virgil Travestie*, added to in later editions in grossness as well as in bulk. Later books, somewhat of the same character, are his *Voyage to Ireland in Burlesque* (1670), and his *Burlesque upon Burlesque, or the Scoffer Scoft, being some of Lucian's Dialogues* (1675). His *Planter's Manual* (1675: from the French) testifies to his zeal for horticulture. Next year he contributed a treatise on fly-fishing to the fifth edition of Walton's *Compleat Angler*, and here he commends his old friend and master, its author, as 'the best and the truest friend ever man had.' Further marks of affection were his commendatory verses in the 1675 edition of Walton's *Lives*; his poem *The Contentation*, as well as an earlier one of invitation to Walton to visit him; and the twisted cipher of his own and his master's names above the door of his fishing-house on the Dove. In 1685 Cotton published his translation of Montaigne's *Essays*—a masterpiece on which his fame still rests securely. He died in 1687. Cotton's verses have not a few felicities of thought and phrase, but have been overpraised by Coleridge, Lamb, Trench, and Lowell; at their worst they are obscene, dull, or fustian. His prose is simple and clear, direct and vigorous. See his *Life and Poetry* by C. G. Sambower (1911); his *Poems*, ed. J. Beresford (1923).

**Cotton**, GEORGE EDWARD LYNCH, D.D., bishop, born in 1813, was educated at Westminster and Cambridge, and from 1836 to 1852 was a master at Rugby under Arnold and Tait. In *Tom*

*Brown's School Days* he appears as 'the young master.' For six years he was at the head of Marlborough College, which he raised to a position among the first schools of England. In 1858 he was consecrated Bishop of Calcutta, where he successfully administered his immense diocese, and where his schools for the children of the poorer Anglo-Indians and Eurasians are monuments of the services he rendered to education. He was drowned in the Ganges, 6th October 1866.

**Cotton, JOHN**, clergyman, born at Derby in 1585, was a tutor at Cambridge, and from about 1612 held a charge at Boston, in Lincolnshire. Cited to appear, for his Puritan views, before Laud at the high commission court, he in 1633 fled to Boston, in New England, where he preached until his death in 1652. Cotton was reputed a profound scholar, and was the author of nearly fifty works, including a catechism, forms of prayer, and a defence of the interference of the civil authority in religious matters, in a famous controversy with Roger Williams.

**Cotton, SIR ROBERT BRUCE**, an English antiquary, was born at Denton, Huntingdonshire, 22d January 1571. From Westminster School, where he had the famous Camden for master, he passed to Jesus College, Cambridge, where he graduated B.A. in 1585. He soon settled in a house in Westminster on the site of the present House of Lords, and here he commenced to accumulate books, manuscripts, coins, and other articles, and to practise that large hospitality that made Cotton House the meeting-place of all the scholars of the kingdom. His papers read before the Antiquarian Society spread wide the reputation of his learning; King James knighted him in 1603, created him a baronet in 1611, and frequently consulted him on political matters. But he kept the scholar in prison for eight months in connection with the Overbury case. He had been returned to parliament in 1604, and soon identified himself completely with the policy of constitutional opposition to the crown. His protest against the proposed debasement of the coinage (1626), his frank criticism of kingcraft in his *History of Henry III.* (1626-27), his outspoken review of the present political situation in his tract, *The Dangers wherein the Kingdom now Standeth, and the Remedy* (1628), and the frequent meeting in his house for deliberations of Eliot, Pym, Selden, and Sir E. Coke, marked him out to the court as an enemy to be crushed. The occasion was soon found. An ironical tract, entitled *A Proposition for His Majesty's Service to Bridle the Impertinency of Parliaments*, having fallen into the hands of Wentworth, it was found on inquiry that the original was in Cotton's library, from which a copy had been made, though without his knowledge, for the press. Cotton and others were flung into prison, but proceedings were stayed and the prisoners released on the occasion of the birth of an heir to the throne (29th May 1630). But Cotton's library was not restored to him in spite of his pathetic petitions, and as his heart was bound up in his books, he pined and died less than a year after (6th May 1631). Fourteen of his tracts were collected and published as *Cotton's Posthuma* in 1651. His son, Sir Thomas Cotton (1594-1662), had the books restored to him; and his great-grandson, Sir John Cotton (1679-1731), bestowed the library on the nation.

THE COTTONIAN LIBRARY was accordingly removed to Ashburnham House, Westminster, in 1730. In the following year a fire occurred in the house, in which about 114 out of the 958 volumes of MSS. which the library contained were reported as 'lost, burned, or entirely spoiled: and 98 damaged so as to be defective.' The library was

transferred to the British Museum (q.v.) in 1753.

**Cotton-grass** (*Eriophorum*), a genus of Cyperaceæ, in which the *perianth* or covering of united bracts, which in this order enclose the ripening ovary, is developed into long silky or cottony hairs, once employed for candlewicks, stuffing pillows, &c. Attempts to use them as a substitute for cotton have failed; nor is the herbage willingly eaten by sheep or cattle. Two species, common in Britain, give a characteristic appearance to bogs and wet moors.

**Cotton-seed.** See BUTTER, COTTON, OILS.

**Cotton-tree, Cotton-wood.** See POPLAR, SILK-CORRON.

**Cotton-worm** is a common name for the caterpillar of an owl moth (*Aletia xyliana*), which is in some years very destructive to the cotton crop of the United States. The caterpillar is green, with yellow stripes and black dots, and grows to a length of an inch and a half. The boll-worm, the caterpillar of an allied form (*Heliothis armigera*), is also very destructive to cotton-buds and other crops.

**Cottus**, a genus of acanthopterygious fishes, comprising the Bullhead (*C. gobio*) of British rivers, the marine Father Lasher (*C. scorpius*), and the closely akin *C. bubalis*, found on the coasts of California and Georgia. See BULLHEAD.

**Cotyle'don** (Gr., 'a cup or cup-shaped hollow') is the technical term applied by botanists to the seed-leaves of the embryo. Their morphological importance was formerly somewhat exaggerated, as they were supposed to be quite unrepresented even in the higher cryptogams (see FERNS, &c.), to which the term *acotyledonous*, now disused, was therefore applied. The number of cotyledons is, however, usually of high systematic importance; for although in Gymnosperms it varies from a whorl of eight, ten, or even more in conifers, to usually two in cycads, it is almost constant among the higher Angiosperms, the old division of monocotyledons and dicotyledons having few exceptions to its literal accuracy. Every one is familiar with the two cotyledons of so many seedlings of the latter group; but a more extended study shows that many never emerge above ground, or even leave the seed. The form and structure of the cotyledons depends largely on whether they have precociously absorbed and stored the nutritive contents of the endosperm; in this case, of which the leguminous seeds of pea, bean, &c. afford the most familiar example, they become more or less fleshy, and frequently do not appear above ground in germination. The mode of packing the cotyledons in the bud also presents many differences in detail of high systematic constancy, and therefore importance. See OVULE, SEED, EMBRYO, and GERMINATION.

**Coucal** (*Centropus*), or LARK-HEELLED CUCKOO, a genus of common bush-birds in Africa, India, and through the Malayan Archipelago to Australia. The hind-toe is prolonged into a very long spur.

Common Cotton-grass (*Eriophorum angustifolium*).

Their call is loud and in some cases apparently ventriloquistic. They build their own nests. See CUCKOO.

**Couchant.** In Heraldry, a beast lying down, with his head up, is couchant. If the head is down, he is dormant.

**Couch-grass** (*Triticum repens*), also called *Wheat-grass*, *Dog-grass*, *Quickens*, and *Squitch* or *Quitch*, a grass which, although of the same genus with wheat, is a widespread and troublesome weed. Its perennial creeping root-stocks render it extremely difficult of extirpation; they are carefully gathered out of land under cultivation; but in times of scarcity have been employed as human food, as a source of beer, as a domestic medicine, and more frequently as fodder. They are sometimes useful in binding sand into pasture of inferior quality. Cut early, couch-grass makes very good hay.

**Couching.** See CATARACT.

**Coucy**, RAOUL, CASTELLAN DE, was a French court poet or Trouvère (q.v.) of the 12th century, to whom twenty-three poems are ascribed. He was named after the Château de Coucy, near Laon. His heart was unwittingly eaten by his mistress through the device of her jealous husband.

**Coué**, EMILE, exponent of applied psychology, was born at Troyes, France, in 1862. He was educated at Nogent-sur-Seine and at Troyes, and having studied pharmacy at Paris, practised for thirty years in his native town. Devoting himself meanwhile to the practical applications of psychology, he formulated certain theories as to the cure of various physical and mental ills, Autosuggestion (q.v.) being the cope-stone of his system. His views he expounded in the *Transactions* of the Society of Applied Psychology of Lorraine, of which he is president, in *Self-mastery by Conscious Autosuggestion* (trans. 1922), and in *My System* (1923).

**Coughing**, considered physiologically, consists (1) in a long inspiration which fills the lungs to a greater extent than usual; (2) in the closure of the glottis, or narrow opening in the organ of voice (see LARYNX), at the commencement of the act of expiration; and (3) in the sudden forcing open of the glottis by the violence of the expiratory movement. In this way a blast of air is driven upwards from the lungs through the mouth, and carries with it any sources of irritation that may have been present in the air-passages. Coughing may occur from irritation in the back of the throat, in the larynx, trachea, or bronchial tubes, and may be excited by acrid vapours, by irritant gases, or by articles of food or drink making their way into the air-passages instead of into the pharynx, or by excessive or morbid secretion from the walls of the air-tubes, or even by the entrance of cold air. More rarely it results from irritation of other parts, as the ear, and possibly the stomach. It is an accompaniment also of teething.

The object of coughing in the animal economy is unquestionably to guard against the danger of the entrance of mechanical and chemical irritants into the air-passages; and accordingly the mucous membrane, especially of their upper part, is endowed with a most exquisite sensibility which, when aroused by irritation or by a state of disease, provokes incessant coughing until the irritation be allayed or removed. Cough is an exceedingly common symptom of all diseases of the respiratory organs. The treatment of coughing must first be directed to the removal, if possible, of the cause which excites it. But besides, when once begun, coughing frequently becomes excessive, and so irritating or exhausting to the patient, from too great sensitiveness of the nervous mechanism which produces it; and this tendency, when injurious,

must also be combated. The remedies suitable to most cases of cough are therefore Expectorants (q.v.) and nervine sedatives, especially opium, morphia, and hydrocyanic acid; 'cough mixtures' generally contain both. Liquorice, jujubes, black-currant jelly, or linseed tea are often of service.

Cough occurs in the lower animals under similar conditions. In horses it is best treated by repeated doses of belladonna and camphor, but often requires for its entire removal a run at grass. See names of diseases containing cough, also PNEUMONIA, TUBERCULOSIS, BRONCHITIS, CATARRH, &c.

**Couguar.** See PUMA.

**Coulmiers**, a French village, some 12 miles WNW. of Orleans, where Von der Tann and his Bavarians were defeated by an overwhelming force under D'Aurelle de Paladines, 9th November 1870.

**Coulomb**, CHARLES AUGUSTIN DE, famous for his experiments on friction, and the invention of the *Torsion Balance* for measuring the force of magnetic and electrical attraction, was born at Angoulême in 1736. In early life he entered the engineers, and served some time at Martinique. In 1777 he gained an Academy prize by a work on magnetic needles, and again two years later by his *Théorie des Machines simples*. For speaking the truth about a projected canal in Brittany, he was for some time imprisoned, but earned the hearty approval of the honest Bietons, as well as his own conscience. Coulomb lived in retirement during the Revolution, became a member of the Institute in 1804, and died August 23, 1806.

**Coulter.** See PLOUGH.

**Coumarin** (C<sub>9</sub>H<sub>6</sub>O<sub>2</sub>) is a fragrant crystalline substance, analogous to volatile oils and camphor, which is present in the well-known Tonka bean. It is identical with the odorous principle of many other plants, including the Woodruff, Melilot, and Vernal grass.

**Council**, or SYNOD, an assembly of ecclesiastics met to regulate doctrine or discipline. We first hear of such assemblies during the Montanist controversy, about 150 A.D. Œcumenical councils are convoked from all parts of Christendom, and claim to regulate the affairs of the whole church. Other synods have represented the East and West respectively. Patriarchal, national, and primate councils represent a whole patriarchate, a nation, or the several provinces subject to a primate, while the bishops and other dignitaries of a province constitute a provincial; the clergy of a diocese under the presidency of the bishop, a diocesan council. Mixed councils during the middle ages dealt with civil as well as ecclesiastical affairs, and were composed of secular persons as well as churchmen. Sometimes, but not always, the lay and ecclesiastical members voted in separate chambers.

The first eight general councils were convoked by the emperor, all the later ones by the popes, and the fifth Lateran Council asserts (*Sess. xi.*) the modern principle that the right of convoking, removing, and dissolving general councils belongs to the pope. The right of voting was reserved in early times to bishops and priests, or deacons who acted as representatives of absent bishops. From the 7th century onwards this right was sometimes extended to abbots, and from the end of the mediæval period to cardinals who were not also bishops. At the Vatican Council the members entitled to vote were cardinals, bishops (even if only titular bishops), mitred abbots, and generals of religious orders. Priests acting as proxies of bishops were not admitted. The presidency at the early Œcumenical councils followed no fixed rule. In a certain sense it belonged to the emperor, who

had convoked the bishops, and was responsible for peace and order. 'It was not,' says Harnack (*Dogmengeschichte*, ii. p. 101), 'till the fourth general council that the papal legates gained a unique position, and learned Catholics have admitted that the presidency of the papal legates at Nicæa does not admit of positive proof.' This is true even of Catholic theologians writing after the Vatican decrees. Thus Kiaus (*Kirchengeschichte*, p. 147) contents himself with maintaining 'the probability' that the papal legates presided at Nicæa, and Hefele (*Concil.* i. p. 38, 2d ed.) admits that the question is 'not without difficulty.' The modern theory that a council is then, and then only, to be counted general when its acts have been ratified by the pope, is of still later origin. Even medieval theologians, such as Thomas of Walden, maintained that the decisions of general councils did not acquire binding force till they had been accepted by the whole church. And although it was an established principle in the 6th and the following centuries that the definitions of councils, indisputably œcumenical, could not be called in question, it is certain that St Augustine had been of another mind. He asserts (*De Bapt. contra Donat.* ii. p. 3-4) that Scripture alone has final and irrefragable authority, but that even 'plenary councils, assembled from the whole Christian world,' may be 'corrected' (*emendari*) by the accession of knowledge and experience. Moreover, the fact that the decisions even of provincial councils are sometimes attributed, in the 4th century, to the 'suggestion' of the Holy Spirit, shows that caution is needed in interpreting the rhetorical language of early writers.

The Greek Church recognises seven general councils—viz.: (1) The first of Nicæa, 325 A.D.; (2) the first of Constantinople, 381; (3) Ephesus, 431; (4) Chalcedon, 451; (5) second of Constantinople, 553; (6) third of Constantinople, 680; (7) second of Nicæa, 787. To these Roman Catholics add: (8) fourth of Constantinople, 869; (9) first Lateran, 1123; (10) second Lateran, 1139; (11) third Lateran, 1179; (12) fourth Lateran, 1215; (13) first of Lyons, 1245; (14) second of Lyons, 1274; (15) Vienne, 1311; (16) Constance, 1414-18, of which Ultramontanes accept only the decrees passed in sessions 42d to 45th inclusive, and such decrees of earlier sessions as were approved by Martin V.; (17) Basel, 1431 and the following years, œcumenical according to Ultramontanes only till the end of the twenty-fifth session, and even then only in respect of such decrees as were approved by Eugenius IV.; (18) Ferrara-Florence, 1438-42, really a continuation of Basel; (19) fifth Lateran, 1512-17; (20) Trent, 1545-63; (21) Vatican, December 8, 1869, to July 18, 1870, and still unfinished.

The best collections of councils are by Hardouin (12 vols. folio, Paris, 1715), and that of Mansi (31 vols. folio, Florence, 1759), which is by far more complete than Hardouin's, but inferior to it in correctness of typography. An excellent account of the councils, with the text of the most important decrees, will be found in Bishop Hefele's *Konziliengeschichte* (7 vols. 1855-74; continued by Hergenröther and then Knöpfer, vols. viii.-ix., 1887-90; Eng. trans., vols i.-v., 1871-96). For the more important councils, see NICEA, BASEL, &c.

**Council Bluffs**, a city of Iowa, capital of Pottawattamie county, 141 miles WSW. of Des Moines, on a plain backed by high 'bluffs.' The Missouri River, 3 miles to the west, is crossed by a grand railway bridge to Omaha, and six railways meet at the town, which is an important distributing centre, and has manufactures of carriages, agricultural machines, rubber goods, baskets, &c., and an extensive trade in grain and cattle. Pop. 36,000.

**Council of War.** In the 16th century, in England, a council of war was instituted, which was practically a standing Court-martial (q.v.). In more modern times the phrase denotes a conference of military or naval officers or of statesmen, or of a combination of these, to consider a plan of campaign or to assist a commander to make up his mind. It is convened by the commander, or by the secretary of state who is his civil superior, who may cause opinions to be placed on record. A commander of a fortress will usually fortify himself in this way before capitulating. There is no regulation in British military law in relation to councils of war, but a Committee of Imperial Defence under the prime-minister exists permanently, and confers with statesmen and experts from all parts of the empire.

**Counsel.** See ADVOCATE, BARRISTER, KING'S OR QUEEN'S COUNSEL.

**Counsellor** in the United States nearly corresponds to Barrister (q.v.), and Advocate (q.v.); but there is no such well-marked distinction between counsellor and solicitor as between barrister or advocate and solicitor. See LAWYER.

**Count** (Lat. *comes*, in Fr. *comte*, Span. *conde*, Ital. *conte*), the name of a dignity in mediæval and modern Europe, to which Earl (q.v.) is in one view supposed to be analogous, the Latin equivalent of each being the same, and the wife of an earl being a countess. On the various significations of the *comes* of classical times it is unnecessary to enter. Under Constantine the term became an honorary title; and the *comites* became a sort of council of state both in the eastern and western empire, each having his separate office in the household. The counts under the first two races of Frankish kings were (like those of the lower empire) of various degrees. The count of the palace (*comes palatii nostri*) was the highest dignitary in the state after the *maire* of the palace; and in the 11th century he had already acquired a rank apart from that of the other counts. He presided in the court of the sovereign in his absence, and possessed sovereign jurisdiction. The habit of instituting counts-palatine (*comites palatii*) was adopted by Spain and England. Those counts, again, who, at a later period, as rulers of provinces, had attained to something approaching to sovereign power, exercised also the right of appointing counts-palatine under them—e.g. the Counts of Chartres, of Champagne, of Blois, Toulouse, &c.; and the ancient houses of Chartres and of Blois continued to claim in perpetuity the title of count-palatine as that of their eldest sons. Counts of this sovereign class owed their origin to the feebleness of the later Carlovingian kings, under whom they contrived gradually to convert the provinces and towns which they had governed as royal officers into principalities hereditary in their families. It was then that the counts came to be known by the names of their counties. Down to the middle of the 14th century they wielded a most formidable power, somewhat broken by the eventually successful struggle of the towns of Northern France to throw off their yoke. In later times there were numerous mere titular counts, and even before the first revolution many titles of count, believed to be pure assumptions, were recognised by the courtesy of society.

The German word *Graf*, akin (like *reeve*, *grieve*, and *sheriff*) to the Old English *gerefa*, 'governor,' in time came to be identified with the *comes* or count, the *Pfalzgraf* being the German equivalent of the *comes palatii*. In Germany there have been in modern times two classes of counts, one belonging to the *Dynastien-Adel*, or higher nobility—i.e. those families whose head had a seat in the diet or estates of the realm; the other

forming the highest class of the lower nobility. Of the former class the larger number, as the price of their acquiescence in the abolition of the old German empire, received the title of prince. The merely titular counts belonging to the lower nobility were very numerous.

**Counterfeit.** See COINING.

**Counterforts**, the buttresses or arches behind the revetments or retaining walls of the ditches of permanent fortifications. They help to support the earth above them and make it more difficult to form a Breach (q.v.).

**Counter-guard** is a low outwork designed to cover the revetment of a bastion or ravelin from the fire of the enemy's breaching batteries. It is separated from them by a narrow ditch, and lest the enemy should establish a battery on it when captured, the terre-plein, or flat space behind its parapet, is made very narrow. See FORTIFICATION.

**Counter-irritants**, agents applied to the skin so as to redden (rube-faci-ents), to vesicate (vesicatories or Blisters, q.v.), or to produce pustules, purulent issues, or even sloughs of skin and of the subcutaneous textures. The milder counter-irritants are mustard (see CATAPLASM), turpentine applied on warm cloths, and spirit or acetic acid in lotion. The stronger are blisters of cantharides (see CANTHARIS) or of ammonia; Croton-oil (q.v.) or Tartar Emetic (q.v.), in ointment; setons; caustic; and, above all, the actual Cautey (q.v.) or hot iron at various temperatures. None of the stronger counter-irritants should be used without careful consideration and medical advice; great mischief is often done by their careless or improper use. Counter-irritants relieve internal pain, check inflammations, and tend to promote the absorption of morbid effusions. Their effect is, probably due mainly to reflex action, produced by the impression they cause upon the nerves of the skin to which they are applied.

Amongst horses, counter-irritants are much used for strains and diseases of the joints, but should never be applied, as they too often are, in recent cases, or whilst the part is hot or inflamed. Cantharidine preparations, or ointment of biniodide of mercury, are the most convenient. For cows, use fomentations, followed by the smart infriiction of mustard-paste; for dogs, soap-liniment, strengthened, if required, by ammonia or turpentine.

**Countermine**, a subterranean way to counter-act besiegers' mines. See MINES (MILITARY), SIEGE.

**Counterpoint**, in Music, has been defined as

'the art of combining melodies.' The name arose from the early system of notation by points. When another part or melody was added to one already represented by a row of points, this was called *punctum contrapunctum*. A single melody is usually taken as the 'subject,' and the part or parts added are called the 'counterpoint.' When this is done according to the numerous and stringent rules of the old authorities, it is called strict counterpoint; but in modern music these rules are much relaxed. The devices of counterpoint are, however, still largely relied on; Wagner, the greatest innovator of our time, being also one of the greatest practical contrapuntists. The aim of Beethoven in his later works to make every part *sing*, and not be a mere filling up of the harmony, may be referred to as illustrating the object of these devices; and there is no doubt that as used by the classical writers, they are the source of some of the grandest effects in music.

In simple counterpoint the parts are written above or below the subject without regard to their capability of being transposed. It is divided into different species, according as the added parts contain one, two, or four notes against each note of the subject, or are written in syncopated notes, or have a combination of all or any of these, when it is called 'florid.' The so-called 'rules' are in effect limitations of the degrees in which the parts may progress—e.g. the prohibition of consecutive octaves and fifths. The general principle of them is to secure complete *independence* of melodic motion in the parts, while at the same time the laws of harmony are observed. When the parts reach the number of eight or more in vocal music, they are sometimes divided into different choirs, which sing alternately together and in antiphony. A famous example of this class is Tallis's motet 'Spem in alium non habui,' for forty voices, in eight choirs, each of five voices. In double counterpoint the subject and counterpoint are so written that each may form the bass to the other. When in this transposition the upper part is taken to the octave below, or *vice versa*, it is called double counterpoint at the octave; but it may also be at any other interval, the fourth, fifth, &c., or even at two different ones. In treble counterpoint each of three melodies can be put as the bass to the others; and similarly in quadruple and quintuple counterpoint; but counterpoint beyond double can only be at the octave, as the other intervals are impracticable. One or more free parts may be added to fill in the harmony. The following instance of quintuple counterpoint is taken from the finale of Mozart's 'Jupiter' Symphony:

Among the other devices of counterpoint may be mentioned those of contrary motion, augmentation, and diminution, the latter two referring to the time-values of the notes. See IMITATION.

The history of the art of counterpoint can be traced step by step from its beginnings in the rude efforts at part-writing, called *organum*, barbarous to modern ears, in medieval church music, of which

the earliest known account we have is by Hucbald, a Flemish monk, who died in 930. The earliest existing specimen of part-music is an English one—a *rotu* or round, written by a monk of Reading in 1226 to words beginning 'Sumer is icumen in,' the MS. of which is in the British Museum. The Polyphonic schools of composition in Flanders, England, Germany, and Italy, of the four succeeding centuries, reaching their culmination in Palestrina, were based pre-eminently on counterpoint. Bach is usually considered its greatest master.

See Onseley's treatise, based on Cherubini (2d ed. 1880), and manuals by Prout (1890-91) and Pearce (1899).

**Counterscarp.** See FORTIFICATION.

**Countersign.** See SENTINEL.

**Counter-tenor.** See ALTO.

**Counting-out Rhymes.** See FOLKLORE.

**Country-dance,** an English dance in which as many couples can take part as there is space to accommodate them; the gentlemen being ranged at the commencement on one side, and the ladies on the other. The dancers are constantly changing places, leading one another back and forward, up and down, parting and uniting again. 'Sir Roger de Coverley' is the best-known example. The dance and the name—a dance of country-people—passed from England into France, where the name was altered into *contre-danse*, often erroneously assumed to be the original form. See DANCING.

**County,** a territorial division whose name finds its origin in the ancient *scr* or shire, literally 'care,' 'official charge,' not connected (as is often said) with *shear* (O.E. *sceran*). The diocese was the bishop's *scr*. The ancient English counties or shires owe their existence to varying causes. Some—e.g. Kent and Sussex—were originally kingdoms; some were divisions of a kingdom (Norfolk and Suffolk); some, chiefly the midland counties, represent convenient administrative districts created around the centres out of which a heptarchic kingdom (Mercia) grew. The western counties—e.g. Hants, Wilts, Somerset, Devon—are very ancient divisions of the kingdom of Wessex, in which the shire system was existent as early as the reign of Ina. All southern counties date back at least to the time of Edgar; but the northern counties were either formed or much modified after the Conquest—e.g. Northumberland, Cumberland, and Westmorland were not formed until the time of Rufus and Henry I., and Lancashire was created in the 12th century.

The shire was governed by an ealdorman and *geréfa* (or sheriff), and by the *scr-gemót* (shire-moot), which subsequently developed into the county court. The ealdorman was elected in Anglo-Saxon times by the national Witan, with the consent of the king. There was no election of the ealdorman in the shire-moot, though he was probably formally accepted by that body. The office tended to become hereditary. One ealdorman usually ruled over several counties, and some ealdormanships—e.g. that of Mercia—included the greater part of one of the ancient heptarchic kingdoms. The ealdorman sat in the shire-moot (which was also a folk-moot or assembly of free inhabitants) with the sheriff and the bishop, and received one-third of the profits of the jurisdiction. He also commanded the military forces of the shire. The sheriff, whose jurisdiction was confined to a single shire, though anciently he may have been elected, was the representative of the crown, and, within historic times, was nominated by the crown. He was the judicial president of the shire and the executor of the law, as well as the king's steward and the administrator of the royal demesne. The office never became hereditary, and, under the name of *vice comes*, the sheriff was used by the

crown after the Norman Conquest to oust, or to prevent the creation of, any extensive feudal jurisdictions of the Continental type.

The sheriff held the shire-moot twice a year, and he gradually became the chief civil officer of the county, leaving to the ealdorman military duties only. The 'suitors' or constituent members of the court consisted of all lords of lands, all public officers, with the reeve and four men from each township. The shire-moot had jurisdiction in every suit; but it was not, strictly speaking, a court of appeal from the hundred-moot. A suitor could not apply to the shire-moot before he had thrice demanded his right in the hundred-moot; but the right he had there failed to obtain could be asserted in the shire-moot. Thus the shire-moot was not a court of first instance or a court of appeal, but a means of providing for lapses and omissions in the inferior court. The suitors of the court were the judges, and the function of the sheriff was that of chairman or moderator. The court also witnessed private acts (e.g. wills and transfers of land), and though its legislative power was shadowy, national laws appear sometimes to have been accepted in it.

The principal divisions of the county are of great antiquity; indeed, they are probably older than the shire itself. Nominally, at least, they still exist. These are the hundred, the ward, the wapentake, the rape, the lathe. Yorkshire is divided into three ridings (*trithings*), Lincolnshire into three parts. Northumberland, Durham, Westmorland, and Cumberland have wards. The wapentake is found in the ancient Anglian districts only (Yorkshire, Lincolnshire, Nottinghamshire, Derbyshire, Northamptonshire, Rutland, and Leicestershire), though some of these contain hundreds as well. Durham has one wapentake in addition to its wards. Sussex has six rapes, and Kent five lathes, but these are subdivided into hundreds, which seem to correspond to the ancient townships or tithings of other counties. In all other English counties the subdivision is into hundreds, which were, and in some cases still are, in turn divided into townships, or, in the Wessex counties, into tithings. In the hundred or wapentake a hundred-court or hundred-moot was held monthly. It had jurisdiction in every suit both civil and criminal, and gradually became the administrative unit of the county—e.g. the division for purposes of taxation. Franchises or private jurisdictions were granted both in Anglo-Saxon and later times. Such franchises were separated out of the hundred, but not usually out of the county jurisdiction. The rapes and lathes of Sussex and Kent, and the ridings and parts of Yorkshire and Lincolnshire, possibly represent divisions intermediate between the hundred and the shire; indeed, the ridings of Yorkshire and the parts of Lincolnshire have developed into what are, for most administrative purposes, separate counties.

The itinerant justices sent forth by Henry II. sat in the county court, and in this way the ancient popular administration of the law was linked to the new system. But from about this time onwards the county court declined in judicial importance, its sphere being gradually occupied by the king's judges sitting in the assizes on the one hand, and, later, by the justices of the peace on the other. The sheriff became more and more subordinated to the royal judges. Though the court assembled twice a year to meet the judges, it met also every three weeks, presumably to try the more numerous petty causes. And from the settlement of the office of justice of the peace by Edward III., the justices, either in quarter sessions, petty sessions, or as individual justices, became the real county rulers whether in small affairs or great. The *custos*

*rotulorum* (one of the justices designated in the commission of the peace for each county as 'keeper of the rolls of the peace') dates from the beginning of the 16th century. The military office of lord-lieutenant originated in the middle of the 16th century, and was at first a temporary office often held by one person for several counties. But from about 1689 onwards these two offices, though always by separate appointment, were held by the same dignitary. The administrative powers of the justices, especially in general or quarter sessions, grew with especial rapidity in Tudor times, and by the time of the Revolution county government was almost completely in their hands. The county court (become practically the sheriff's court) survived only as a court for the recovery of small debts. Proceedings in outlawry also took place, when at all, in that court. Otherwise its sole function was the election of the county members of parliament (the knights of the shire) and the election of coroners. And it was no longer a folk-moot which theoretically at least could be attended by all freemen since, in 1293, the qualification for jurors had been made the ownership of a forty-shilling freehold.

The administrative functions of quarter sessions were fulfilled by the justices sitting as a court, and their administrative acts in most cases were, in form, judicial decisions. The sessions had to be held at least four times a year. In some counties they were held at a single county centre; in others the session was held at a different centre in turn—e.g. in Wiltshire at Marlborough, Salisbury, Devizes, and Trowbridge; and in some cases—e.g. Lancashire—the same sessions would be adjourned to several county centres, so that a sitting of each session took place at each centre. The *custos rotulorum* was assumed to preside, but in practice a chairman who was not the *custos* was usually elected, though it was not until late in the 18th century that the practice of appointing a permanent chairman became settled. This practice has developed in some cases in the appointment of a paid chairman for the criminal business of the court.

The fact that the administrative functions of the county were performed under the guise of decisions of a court of law is explained when we remember that at any rate from the 16th to the 18th century, when this administrative system was built up, the county was considered by the central government not as an organ of local self-government, but as a unit of obligation, an entity responsible for the performance of obligations imposed upon it. It was the duty of quarter sessions to see that the county, and all the minor units into which the county was divided, fulfilled these obligations. The county as a whole had, either in the form of the sheriff's *posse comitatus* or the militia, to furnish an armed force. It was the duty of the county to furnish the king's taxation. County bridges had to be maintained. The county was to furnish the king's jail, and the lodgings of his judges on circuit. For any failure in these duties the county as a whole could be indicted and fined in the court of assize, and the fine could be levied against the goods of any inhabitant of the county. But the county as a whole could only perform such obligations if the units into which it was divided performed theirs; and the justices in quarter sessions were responsible for seeing that all officers and citizens within their jurisdiction fulfilled their (often obligatory) parochial or manorial offices, or did their duty as private citizens. Thus the grand jury, the hundred jury, the high constables, and other officers made their presentments at quarter sessions, not only of ordinary breaches of the law, but of the wrongful acts and neglects of parishes, officers, or private individuals, such as negligence

to maintain pounds, stocks, highways, or parish bridges, the neglects of hundreds to keep the peace within their limits, and even the omissions of the county itself. Moreover, cases are not wanting in which individual justices made presentments (e.g. of the bad state of roads) on their own knowledge and responsibility. Thus if a parish neglected to maintain a highway, or the high constable of a hundred neglected to pay over punctually the proper quotum of an assessment, the presentment might be taken up by the grand jury; that is, the individual or locality was indicted, and might either submit or 'traverse' the indictment. In the latter case the indictment was tried, and if found guilty the accused, whether a private person, an officer, a hundred, a parish, or manor, might be fined. If the indictment was not traversed the same result ensued without trial. The administrative work of securing the repair of highways was thus performed by the judicial process of fining the parish a sufficient sum to pay for the repair of the road, or more commonly by fining the parish and respiting the fine for three months. During the period of respite the parish could secure the repair of the highway either by the direct enforcement of labour upon the inhabitants or by raising the money by a more or less formal rate.

Presentments of these and many other kinds were made by the grand jury as representatives of the respectable inhabitants of the county, by the now obsolete hundred jury, by the high constables of hundreds or the petty constables of the township or parish, or, apparently, in some cases by juries of constables. But the activity of such juries of presentment tended to diminish as time went on. The hundred jury was almost obsolete by the beginning of the 18th century, and the presentments on which the quarter sessions founded its administrative activity were made by individuals; either by the justices themselves, or by the high constables of hundreds or the constables of parishes or tithings.

The 18th century witnessed the slow transition of the court of quarter sessions into a regular administrative body having a paid staff and acting through committees, and the separation of administrative from judicial functions. The change was marked by the separation of administrative from the judicial work in the records of the sessions, which generally, though not invariably, took place during the late 18th century. This separation in the records resulted from the fact that the administrative business began to be considered by the justices either before or after the sitting of the court. The sessions were thus consciously recognising their administrative functions. The clerk of the peace, originally almost the only paid county official, was supplemented by a paid county treasurer and by a county surveyor. We may mention that Telford was appointed county surveyor by the Shropshire justices in 1787. The minor officials, such as the crier of the court or the marshal (appointed in imitation of the marshal of the judge of assize), were sometimes employed on police work. Some counties appointed common informers to present to the courts not only defects of weights and measures, but all the matters hitherto cognisable by the court leet, the high constable, the hundred jury, and the grand inquest of the county. But in the main the justices relied during this period not on any salaried executive staff of their own, but on the employment of contractors, who undertook for fixed payments the maintenance and conduct of the jails, the removal of vagrants, the conveyance of prisoners or of militia baggage, the repair of bridges, and the performance of such other administrative functions as from time to time became county duties. Thus at the beginning of the 19th century the justices in

quarter sessions had developed into an administrative body, in some cases with a definite committee organisation and a staff; and, as that century proceeded, their duties became greater and more varied, their conduct of them more efficient. And each new county function as it arose was imposed upon the justices.

It was the necessary outcome of such a history that county government was during the greater part of the 19th century conducted by an unpaid, non-elected body of justices. By 1888, when most of their administrative functions were transferred to the newly created county councils, quarter sessions controlled the making, assessing, and levying of the county rate and the expenditure thereof, and the provision of shire and county halls, assize courts, judges' lodgings, police-stations, and other buildings necessary for the administration of justice and police. The control of the jail and prisons remained in their hands up to 1870, when they were transferred to the central government. But quarter sessions still controlled the licensing of houses for music and dancing. Licensing of houses for the sale of beer, spirits, &c. was performed by the justices, not in quarter sessions, but in special brewster sessions. The provision and administration of lunatic asylums and reformatory and industrial schools was another function of quarter sessions. They provided and maintained the county bridges, and appointed and paid inspectors of weights and measures and public analysts. As a rule they paid the coroners, and they controlled the division of county constituencies into polling districts. Further, they were entrusted with the administration of the Contagious Diseases (Animals) Acts, the acts relating to destructive insects, fish and river conservancy, weights and measures, gas-meters, and the like. They were, further, entrusted with any matters arising out of the Riot Act, 1886, and with the registration of the rules of scientific societies under various acts of parliament. And from 1878 onwards the control of main roads (chiefly those roads which before that date were turnpike-roads managed by trustees and supported by tolls) was vested in the quarter sessions.

This régime of county government through the justices was brought to an end by the Local Government Act, 1888, which may be said to have put county local government upon a democratic basis. By this act the whole of the above-mentioned powers and duties were transferred to an elective body, the county council. Broadly speaking, the areas governed by the county councils, called administrative counties, are much the same as the ancient counties governed by the justices, except that the county council has no jurisdiction in the 'county boroughs' created by the act of 1888. Moreover, there are sixty-three administrative counties as compared with the fifty-two ancient counties. The county of London was a new creation, carved out of Middlesex, Surrey, Kent, and Essex, but almost identical with the areas formerly administered by the Metropolitan Board of Works. Each of the three ridings of Yorkshire and the three parts of Lincolnshire is a separate administrative county. The Isle of Wight has its own county council, and there are two administrative counties in Suffolk and Sussex. Moreover, the Soke of Peterborough and the Isle of Ely are each separate administrative counties. Most of these administrative counties, however, represent the divisions previously observed by quarter sessions. Separate sessions were, for instance, held for East and West Sussex, and for the North, East, and West Ridings of Yorkshire.

County councillors are elected upon a franchise which includes all inhabitant householders, whether men or women, and all occupiers. Any

county elector is qualified to be elected for a county council, and this qualification includes peers, clergymen and ministers of religion, and, by 7 Edward VII. c. 33 (1907), women. The number of councillors to be elected for each county was settled by the Local Government Board under powers contained in the act of 1888; and changes in that number or in the apportionment of councillors to electoral districts may be made by the Board (now the Ministry of Health) on the representation of any council. The membership of the councils varies considerably, Rutland having the smallest council, and Lancashire the largest. One-fourth of the members of the council are, however, aldermen. The councillors are elected for three years, and at the first meeting of the council the aldermen are elected. The aldermen hold office for six years, one-half of their number retiring every three years; so that half the aldermen are elected by the newly chosen council triennially.

Besides the functions already mentioned as having been transferred to the county councils from quarter sessions, the councils are empowered under the Rivers Pollution Act, 1876, to prevent the pollution of rivers. The councils may, without consulting the ratepayers, oppose bills affecting their district or its inhabitants in parliament; but, with the exception of the London County Council, they may not promote bills. They have little direct concern with the administration of the sanitary laws, but they may, and usually do, appoint a medical officer of health, who must report periodically both to his council and to the Ministry of Health; and they may, on the petition of district councils, parish councils, or ratepayers, constitute a hospital district and provide an isolation hospital for that district. As education authority, the county council conducts the medical inspection of school children.

The county councils share in the administration of the county police force. This force was formerly controlled by the justices in quarter sessions. Its local control is now vested in a standing joint-committee composed half of justices and half of county councillors. The council has also power to adjust boundaries of parishes and urban districts within its areas, subject to modification or disallowance by the Ministry of Health, on petition of one-sixth of the electors in the district affected; and under the Local Government Act, 1894, the county council has, in certain cases, power to create and dissolve parish councils, to group, alter, unite, or divide civil parishes, and to fix the number of parish councillors.

Since the creation of the county councils very important functions have been added to the original sphere of the councils. The most important of these is the fact that under the act of 1902 (London, 1903) the county council is now the most important local education authority. Since 1889 it had been the technical education authority; but from 1902 onwards it was entrusted not only with the administration of elementary education, but with the power to create and assist out of the public funds secondary schools and, if it pleased, institutions of university rank. The county council has also important powers under the various acts relating to allotments and small holdings.

Welsh counties, as units of local government, have the same constitution and powers (except for some slight differences as to education) as the English counties; but, like the Scottish and Irish counties, they are the outcome of creation rather than growth. First there are the ancient palatine counties, Pembrokeshire and Glamorganshire, created as a result of the Norman conquests in South Wales. The counties of Anglesey, Carnarvonshire, Merioneth, Cardiganshire, and Car-

marthenshire were the outcome of Edward I.'s conquests. Finally, on the incorporation of Wales with England under Henry VIII. the remaining Welsh counties were created. Some of the Welsh counties represent agglomerations of older divisions known as cantreds (or cantrevs) and commotes. From this point of view they resemble rather the Mercian than the Wessex counties.

*Scottish Counties.*—The origin of the Scottish counties is obscure. The tendency in feudal times to imitate English forms of administration is seen in the appointment of sheriffs by Malcolm and Margaret. Districts were appropriated to these sheriffs, and by such a process the modern Scottish counties came into existence. In the Lowlands, the three ancient provinces of Lothian, Galloway, and Strathclyde seem to have been taken as the areas for subdivision. Most of the new sheriffdoms seem to have been formed around old towns from which the counties took their names. Some Scottish counties are probably coincident in area with older districts—e.g. the county of Peebles is the ancient district known as Tweeddale. Strathclyde was divided into the counties of Ayr, Lanark (Clydesdale in the narrower sense), Renfrew, and Dumbarton. Kirkcudbright is still similarly known as the Stewartry of Kirkcudbright. A sheriff of Ayr was appointed in 1221, but Renfrew does not appear as an independent sheriffdom until 1414. In the Highlands sheriffs were introduced very gradually, the process of creating sheriffdoms, and therefore counties, not being completed until the 16th century. The powers of the sheriff were, as a rule, conferred upon local chieftains. Though the office of sheriff originated in much the same manner as the English shrievalty, it developed in an entirely different manner. The object of its introduction was to secure that there should be in each district a person charged with the representation and maintenance of the king's authority in that district. But the process of constitutional development in early times in Scotland tended to increase the power, not of the king, but of the feudal lords. Hence the sheriffdoms fell into the hands of local magnates, and were used as a means of strengthening local rather than national jurisdictions, and the office became hereditary in certain noble families (see HERITABLE JURISDICTIONS). In 1748 the last of these hereditary jurisdictions was abolished, as an incident in the settlement after the Jacobite rising of 1745. Henceforth the sheriffs were legal officers appointed by the Crown. These officers are now of two classes—sheriffs principal or depute, and sheriffs-substitute. The first class act mainly as appeal judges, and are not debarred from private practice. The sheriff-substitute must not engage in private practice, and must reside within the area of his jurisdiction. His functions very much resemble those of an English county court judge. The boundaries of the Highland counties were in some cases not settled until the early 19th century. The system of appointing justices of the peace was introduced by James VI. Prior to 1889, however, the county administration in Scotland was, mainly, not in the hands of the justices as such, but was entrusted to the commissioners of supply. These commissioners consisted of those who owned landed property to the annual value of £100 a year. A landowner might choose to be represented by his agent, and if his income from land exceeded £800 a year his eldest son was also entitled to be a commissioner of supply. Thus the body which carried on the Scottish county administration was neither elected nor appointed, but was a primary and not a representative body, consisting of those who possessed a prescribed property qualification. There are now thirty-three Scottish counties, and a system of government by county councils, essen-

tially similar to that of England, was extended to Scotland in 1889; though education in Scotland is controlled by separate education authorities. Women became eligible for seats in Scottish county councils in 1907 (7 Edward VII. c. 48).

*Irish Counties.*—The existing Irish counties were created either as a result of the conquest of Ireland in the time of Henry II., or of the reconquest under Henry VIII. and his successors. The division at both periods took place gradually, and, as in Scotland, took the form of the appointment of sheriffs and the consequent creation of sheriffdoms. A sheriff of Dublin is mentioned in 1201. The county of Dublin is first mentioned in 1207, Cork in the same year, Kildare in 1249, and Wexford and Waterford in 1251. The division resulting from Henry II.'s conquest seems to have included the areas of Leinster and Munster only. The process of division was long drawn out, King's County and Queen's County being formed as late as the reign of Philip and Mary; and it was not finally completed until 1607, when, after the rebellion of that year, Armagh, Tyrone, Donegal, and other Ulster counties were constituted. There are thirty-two Irish counties. From 1836 to 1898 the principal county authority was a grand jury of twenty-three persons. In 1898, by the Irish Local Government Act of that year, county councils, elected triennially, took over the administrative functions of the Irish grand jury, together with some of the functions of the presentment sessions and the boards of guardians.

*The County Courts.*—The modern county courts were created by the County Courts Act, 1846, which divided England and Wales into circuits, to each of which a local court was assigned. Originally limited in their jurisdiction by the amount of the sum recoverable and by the character of the action brought, their sphere has been very greatly extended; and, in the words of Sir William Anson, they 'are now not so much a relief to the poor suitor as to the judges of the high court.' They replaced and supplemented old-fashioned local 'courts of request' created for various groups of hundreds by local act, or existing in towns by virtue of charters or local act. Some courts of the latter class, of course (e.g. the Lord Mayor's Court in London, the Court of Passage at Liverpool), still exist.

The county courts are now regulated by the County Courts Consolidation Act, 1888. They have civil jurisdiction only. In cases where more than £5 is claimed, and in all other actions, by leave of the judge, a jury may be demanded, the number of such jury being five. Appeal lies to the high court where more than £20 is claimed, and in all other cases by leave of the judge. The registrar of the court may hear all undefended and admitted cases by leave of the judge. The judge may commit to prison, but only where the debtor has suffered judgment and the judge is satisfied that he has means to pay the debt or the instalment ordered and has not done so. The period of commitment is forty-two days. Commitments are very numerous.

*County Boroughs.*—These are boroughs rather than counties. By the Local Government Act, 1888, towns with a population of more than 50,000 were taken out of the county jurisdiction, and their councils were given most of the administrative powers of a county. Other towns have subsequently been added to the list. The county boroughs of England now number about a hundred, and include all the larger English towns. The county boroughs also comprise those towns which were counties of themselves prior to the act of 1888. These are properly called *counties of towns or of cities*, and are chiefly ancient towns, which were of

such importance in the early middle ages that separate sheriffs were appointed for them. Instances, besides the city of London, are Nottingham, Gloucester, Bristol, Kingston-upon-Hull, &c. Thus Nottingham is not only a county borough but an 'ancient' county.

*Authorities.*—Stubbs, *Constitutional History of England*; Pollock and Maitland, *History of the English Law*; Webb, *The Parish and the County*; Redlich and Hirst, *English Local Government*; Atkinson, *The Local Government of Scotland*; Anson, *The Law and Custom of the Constitution*; Ashley, *Local and Central Government*; Lowell, *The Government of England*.

**Coupar-Angus**, a town of Perthshire (till 1891 partly in Forfarshire), near the left bank of the Isla, a tributary of the Tay, 13 miles NNE. of Perth, and 15 NW. of Dundee. Within remains of a Roman camp is a fragment of a Cistercian abbey, founded by Malcolm IV. in 1164. Linen is manufactured. Pop. 2000.

**Coup d'État.** See NAPOLEON III.

**Couperin**, FRANÇOIS (1668–1733), clavicinist and composer, the most notable of the many musicians of his family, was born in Paris, and, like many of his relatives, was organist of St Gervais there. His suites for the clavicin influenced Bach. See Bouvet, *Une Dynastie de Musiciens* (1919).

**Couperus**, LOUIS (1863–1923), born at The Hague, lived in Java as a boy. In 1882–84 he published volumes of verse, and from 1889 novels notable for their vividness, freshness, sensitiveness, and brilliancy. They include *Ecstasy* and a tetralogy, *Small Souls*, *The Later Life*, *The Twilight of the Souls*, *Dr Adriaan*. *Eastward* (trans. 1924) consists of letters from the East written in 1921–23.

**Couple** is a pair of equal forces acting on the same body in opposite and parallel directions. The effect is to rotate the body about a certain axis, perpendicular to the plane of the couple.

**Couplet.** Any two lines which rhyme together may be called a couplet; but the term is more frequently used to denote two lines which contain the complete expression of an idea, and are therefore to a certain extent independent of what goes before or what follows. The poetic wits of the age of Queen Anne excelled in this kind of aphoristic versification. Pope, as has been said, reasons in couplets. However effectively epigrammatic short aphorisms may be expressed in rhymed couplets, a long poem in this rhythm becomes wearisome to the ear. Not all the alert genius of Pope nor the sonorous strength of Dryden could avert from their favourite rhythm the damning sin of monotony.

**Coupon**, a term signifying any billet, cheque, or other slip of paper cut off from its counterpart, applied chiefly to a dividend or interest warrant, which is presented for payment by holders of debentures. Coupons in Great Britain require to be stamped. The term is also applied to one of a series of tickets which are vouchers that certain payments will be made or services be performed, at various times or places, in consideration of money paid.

**Courbet**, GUSTAVE, painter, was born at Ornans, Franche-Comté, on the 10th of June 1819. In 1839 he was sent by his father, a well-to-do farmer, to study law in Paris, but all the bent of his singularly strong and self-assertive nature was turned towards art. In 1841 he took to landscape work, painting in the forest of Fontainebleau. In 1844 he began to exhibit at the Salon; and his works created a great sensation when shown in the Salon of 1850. Marred by frequent coarseness, and by defects of drawing, Courbet's works possess fine and powerful colour, and are valuable for their firm basis in actual fact, for their truth to an

individual and personal impression of nature. His realism meant the negation of all idealism in nature without the addition of sentiment or the infusion of beauty. Revolutionary in his own time, his work seems sober and classic beside that of the post-impressionists. His hunting scenes and animal subjects, his landscapes and sea-pieces, are almost equally vigorous and spirited. In 1871 he joined the Commune, was elected to the Chamber, and, as responsible for the destruction of the Vendôme Column, was sentenced to six months imprisonment, and to be fined for its restoration. On his release in 1873 he retired to Vevey in Switzerland, where he died, 31st December 1877. See Muther's *Modern Painting* (1907–8), Lives by Ideville (1879) and Estignard (1897), L. Bénédite's *Courbet* (trans. 1913).

**Courbevoie**, a north-west suburb of Paris, on the left bank of the Seine; pop. 46,000.

**Courier**, PAUL LOUIS, one of the most powerful and brilliant of French writers, was born in Paris on January 4, 1772. His boyhood was spent in Touraine, and he afterwards studied at the Collège de France and the School of Artillery at Châlons. He then served for some eighteen years in the army, but his interest lay wholly in study, and especially in the study of the Greek language. His military experiences ended in 1809 on the field of Wagram, from which he was carried insensible to Vienna. Thenceforth he devoted himself to letters. He lived for some time at Florence, where he became embroiled with the librarian of the Laurentian Library, in regard to a manuscript of Longus. The quarrel led to the publication of the *Lettre à M. Renouard*, in which Courier's incomparable ironic faculty was for the first time revealed. He removed to Paris in 1812, and in 1814 settled on his estate in Touraine. In 1816 he issued the first of his famous pamphlets, the *Pétition aux Deux Chambres*, a scathing exposure of the wrongs inflicted on the peasantry by the government of the Restoration. The *Pétition* was read by high and low, and its author was thenceforth recognised as a political power in France. Courier continued the attack in a series of admirably witty letters in the *Censeur*, and in 1821 there appeared the inimitable *Simple Discours de Paul Louis, Vigneron de la Chavonnière*. In this pamphlet the scheme to purchase the estate of Chambord for the Duc de Bordeaux by a 'national offering,' wrung from the peasantry, was mercilessly derided and laid bare. The *Simple Discours* is Courier's masterpiece. It was made the subject of a government prosecution, and its author underwent two months' imprisonment in Sainte Pélagie, where he formed the acquaintance of Béranger. On his release he was again tried, but escaped with a reprimand, for his *Pétition pour les Villageois qu'on empêche de danser*. His subsequent writings were published anonymously at Brussels. They comprised *Réponses aux Lettres Anonymes*, the *Gazette du Village*, the *Libret de Paul Louis*, the *Pièce Diplomatique*—an imaginary letter from Louis XVIII. to the king of Spain—and the *Pamphlet des Pamphlets*, a vindication of pamphleteering, which appeared in 1824, and which Armand Carrel called 'the swan-song of Courier.' On Sunday, 10th May 1825, Courier was found shot dead by an assassin near his house at Varetz.

With the exception of Pascal, Courier is the greatest master of irony in the ranks of French authors. A deadly controversialist, he was at the same time an exquisite artist, whose style is characterised by austere simplicity of diction. See the notice of Courier in the edition of his works edited by Armand Carrel (4 vols. Paris, 1829–30), also R. Gaschet's edition (2 vols. 1925), and an essay

prefixed by Sarcey to his edition (1876-77), besides the several papers by Sainte-Beuve.

**Couriers** are persons hired to accompany travellers abroad, whose special duty is to make all arrangements for the journey, and relieve their employers as far as possible of all anxiety about passports, exchange of money, hotel negotiations, and the like. The speaking of several languages is one of many important qualifications in a good courier.—King's or Queen's Messengers are sometimes called Foreign Office couriers.

**Courlan**, an American wading-bird of the genus *Aramus*, usually placed among the Rails (q.v.). The North American courlan or crying-bird (*A. giganteus*) is 27½ inches long, with long bill and short wings, is a rapid runner, and has a cackling note. It inhabits Florida and the West Indies. The nest is usually attached to reeds. The flesh of the young is good eating. The South American courlan (*A. scolopaceus*) is larger.

**Courland**, or KURLAND, till 1917 a Russian government, and one of the Baltic provinces, now two provinces of the republic of Lettland: Courland or Kurseme (5500 sq. m.; pop. 304,000) to the west, and Semgallen or Zemgale (5000 sq. m.; pop. 207,000) to the east. The whole was formerly an independent duchy—properly, indeed, consisting of two duchies, Courland and Semgallen—and belonged, along with Livonia, to the Teutonic Knights. The difficulty of resisting the Russians led to the acknowledgment in 1561 of the feudal sovereignty of Poland. The country was long distracted by the contentions of two parties, one Russian and the other Polish; and after being for some time very completely under Russian influence, it was united to Russia in 1795. Biron (q.v.) was made Duke of Courland in 1737. The people are mostly Protestants. It is generally a level country, with ranges of low hills, and contains many lakes, bogs, forests, and sand-dunes, but some parts have a very fertile soil. Cattle-breeding is on the increase; game abounds; and bears, boars, elks, and wolves are met with occasionally. The proprietors of land, under Russian rule, were mostly German; the Russians did not amount to 2 per cent. of the population. The peasantry, who constitute the bulk of the population, of Lettish extraction, are chiefly engaged in husbandry.

**Courmayeur**, or CORMAGGIORE, a tourist resort of the NW. corner of Italy, under Mont Blanc, has mineral springs.

**Courses.** See SAILS.

**Coursing** is defined by Dr Johnson as 'the sport of hunting hares, foxes, and sometimes deer with greyhounds.' From the sportsman's point of view foxes and deer must be eliminated from the definition, for coursing is now understood to be the pursuit of hares by a brace of greyhounds. The saying that 'a gentleman was known by his hawk, his horse, and his greyhound' is a very ancient one; and King John is recorded to have accepted greyhounds in lieu of a money fine; but in those times it was generally deer that were coursed. In Elizabeth's reign the sport attained a fashion and celebrity previously unknown, and has since that time been followed up with undiminished zeal.

Late in the 16th century we have a record of some laws of the leash, apparently based on a code used by the Greek historian Arrian, and framed by the then Duke of Norfolk on principles which have been largely adhered to since. To Lord Orford, the lord-lieutenant of Norfolk, the sport of coursing is much indebted. Indeed, by some he is called 'the father of modern coursing;' and he it was who founded the first society, as it was then called, in 1776 at Swaffham in Norfolk. Other clubs were soon organised, Lord Craven founding one at

Ashdown Park in 1780, and this was followed by the Malton Club in Yorkshire and the Bradwell and Tillingham Club in Essex, besides many others starting soon after the opening of the 19th century, including the Altcar Club and the Newmarket Club.

After the passing of the Game Laws in 1831 coursing became much more general, and the sport was taken up by the public, meetings prior to that time being principally supported by members of clubs, of which there were a large number spread over the kingdom. From that date up to 1875 the growth of coursing was very great, and all the chief meetings throughout England, Scotland, and Ireland were attended not only by those who owned greyhounds, but also by many who simply went for the love of the sport. It was feared by many that the Ground Game Act of 1880 would greatly interfere with public coursing, and this fear naturally caused coursers to follow the example of Mr Case, of Plumpton, who originated the enclosed system, the first ground being made over his farm in Sussex. Up to this time old-fashioned coursers had looked rather askance at the new method of carrying on the sport; but the Ground Game Act caused more enclosures to be formed, and then the fact of their being so easy of access added greatly to their popularity.

At a coursing-meeting two Greyhounds (q.v.) are slipped together, and the judge who has been appointed by the committee or by the votes of the nominators decides which is the winner of the trial upon the one uniform principle that the greyhound which does most towards the killing—though he may not actually kill—is to be declared the winner. The judge has a recognised code of points to go by, these points being *speed*, for which one, two, or three points may be allowed; *the go-bye*, two, or three points; *the turn*—that is, bringing the hare round at not less than a right angle—one point; *the wrench*—bringing the hare round at less than a right angle—half a point; *the kill*, one or two points or nothing; and *the trip*—where the hare is thrown off his legs—one point.

Coursing in enclosures, however, never attained a lasting popularity, although much money was freely put down in other districts, notably at Gosforth Park, near Newcastle; Four Oaks Park, near Birmingham; and Haydock Park, between Liverpool and Manchester; whilst the Kempton Park racecourse was, at an early period of the innovation, utilised. One after the other, including Plumpton, was abandoned, mainly on account of the receipts not meeting the expenditure, not omitting a very serious discovery that the apology—for it was little better—for the true pristine character and traditions of the pastime was undermining the quality and essential attributes of the greyhound, as far as breeding is concerned. In a sentence, the fast greyhound was the animal for enclosures, and so people devoted their attention almost entirely to speed, to the neglect of other and equally necessary properties of the breed, especially staying powers. The disappearance of enclosed coursing absolutely preserved the real greyhound; and, although an attempt was made to revive Plumpton, three or four seasons saw the last of the enclosures, in the shape of dog-racing.

Strange to say, no departure from the real thing was ever introduced into Scotland; but in Ireland there is another tale to tell in connection with agrarian economics. The number of open meetings in Ireland left are probably no more than about a dozen; but, on the other hand, enclosures of the primitive kind may be counted by scores; indeed, the National Coursing Club (founded in 1858), which controls the sport, as does the Jockey Club racing,

some years ago was compelled to institute regulations to meet what was fast becoming a travesty on the time-honoured pastime by the appointment of an Irish committee, with full powers to act when occasion required.

The Ground Game Act of 1880, as before mentioned, bid fair to undermine, if not ruin, coursing. Fortunately many landed proprietors, following the sport, and breeding their own greyhounds on orthodox lines and on a large scale, arranged with their tenantry to preserve the hares, often at considerable self-denial, whilst, in not a few instances, the tenants themselves guarantee the game, and practically run some of the most important meetings in England. Thus the historical Waterloo Cup, with its interesting international associations, beginning as far back as 1836, and the Altcar Club (founded in 1825), provided no fewer than fifteen days' coursing every season, thanks to the generosity and love of the greyhound displayed by successive Earls of Sefton, and on ground that is without a compeer in the kingdom. The Border Union, dating from the middle of the 19th century, is second in importance to the Waterloo Cup, and for many years was managed by the tenants of the Netherby estate, on the Cumberland side of the border. Owing to a shortage of hares, due probably to the huge establishment erected by the War Office at Gretna, the Border Union Committee were obliged to give up the district, and the Earl of Lonsdale granted them permission to course over his Lowther estate in 1919, and the sport there is quite up to the Netherby standard. Two meetings, under the title of South Lancashire, have been conducted by a committee of leading sportsmen on the famous Scarisbrick estate, near to Southport, during a long period of years. Newmarket, with its Champion Puppy Stakes, has of late years lost its old importance through changes in the management, and in the season of 1914-15 was allowed to lapse. Time was, however, when the Newmarket type of greyhound was a distinct breed at the headquarters of the British turf. The Wryde Club (a successor to the Farset Fen Club), within easy distance of Peterborough, is the scene of the contest for a valuable stake, entitled the Barbican Cup, not to omit a few subsidiary meetings on the same ground. The Southern Counties Club revived coursing in Essex, over marshland that has always been noted for hares that 'run for ever,' so to speak. The county of Kent provides some good sport, thanks to the energetic Isle of Thanet Club. Sussex has a prosperous club, supported by farmers and sportsmen from all parts of the country, and it reminds one of old coursing lore to know that the Swaffham Club is a worthy successor to its namesake of 1776. Many other meetings are periodically held in different parts of England; but Amesbury in Wiltshire, Ashdown in Berkshire, and Stockbridge in Hampshire, the downs which provided incomparable sport, are now mere matters of history. It is regrettable to observe that coursing has during several years past been gradually going to the wall in Scotland. One can trace the decline with the legislation of 1880, till, in spite of the whole-souled enthusiasm and self-sacrifice of two Anstruther baronets on their Lanarkshire estates, a like co-operation by two Jardine baronets in Dumfriesshire, the game has clearly reached its lowest ebb. Yet it can be vividly recalled to mind by a few old coursers that at least half of the Scottish counties could count on two or more meetings in a season. The only meeting that calls for special mention across St George's Channel is that of the Irish Cup, on Waterloo Cup lines, started in 1905 by the Co. Limerick Club, which for a long period has been permitted the use of Lord Dunraven's lands.

**Court, PRESENTATION AT.** Formal presentation to the sovereign of persons whose status entitles them to that honour, takes place either at St James's Palace, at a levee, intended for gentlemen only, or at Buckingham Palace, a drawing-room, where both ladies and gentlemen appear. The days when levees and drawing-rooms are to be held are always announced some time beforehand. It is difficult in the present day to define exactly who may and who may not be entitled to be presented. Members of families of the nobility and landed gentry, diplomats, members of the House of Commons, persons holding high offices under the crown, judges, magistrates, church dignitaries, officers in the army and navy, persons who have attained distinction by eminence of any kind, and the wives and daughters of the same classes, form the larger number of those presented at levees and drawing-rooms. Persons are often presented on entering on some office, or attaining some dignity. Any one who has been once presented is entitled to appear at any future levee or drawing-room without a new presentation. The whole arrangements connected with presentations are under the supervision of the lord chamberlain, in whose office in St James's Palace information is given to all persons wishing to be presented. The names of ladies and gentlemen desiring presentation, and of the ladies, noblemen, and gentlemen who are to present them, have to be submitted to the sovereign for approval, and there is a strict exclusion of persons of damaged reputation, whatever their rank. Court dress or official uniform must be worn. A British subject who has been presented at St James's may on any after occasion claim to be presented by the British minister at any foreign court. As to court dress both of ladies and gentlemen, court etiquette, court mourning, &c., reference may be made to *Old Court Customs and Modern Court Rule*, by the Hon. Mrs Armytage (1883).

**Courtallum (Kūttālam),** a town of the district of Tinneveli, Madras, stands amongst the Ghats near the southern end of the peninsula; and though only 450 feet above sea-level, serves as the sanatorium of the district, deservedly enjoying a reputation for salubrity of air, richness of vegetation, and beauty of scenery.

**Courtesy, or CURTESY,** in Law, is the life interest which the surviving husband has in the real or heritable estate of the wife. Both in England and in Scotland this customary right has been regarded as a national peculiarity. Littleton speaks of it as tenure 'by the curtesie of England, because this is used in no other realme but in England only.' In Scotland it is called the courtesy or curialty of Scotland. It was probably introduced into both countries from Normandy. The four circumstances requisite to make a tenancy by courtesy in England were—marriage, seizin of the wife, living issue, and the wife's death; but see HUSBAND AND WIFE. The rule that the child must have been heard to cry once held in England, and is still adhered to in Scotland. In neither country, however, need the child survive; it is enough that it was once in existence, although only for a moment. In Scotland courtesy extends only over estate inherited by the wife. In both countries the child must be the mother's heir, and it is consequently said that courtesy is due to the surviving husband rather as the father of an heir than as the widower of an heiress.

**Courtesy Titles** are titles allowed to certain near relations of peers by understood usage and the courtesy of society to which the users have no legal right. The subject of courtesy titles, though tolerably familiar in its general outline to persons resident in Britain, is complicated

enough to be a frequent source of perplexity to Americans and foreigners, and may be thus explained: Dukes, marquises, earls, and even viscounts are often in possession of a number of titles belonging to an inferior grade in the peerage, which have in many cases been gradually accumulated by the ancestors of the peer in the course of his upward progress in the peerage. Some peers have as many as sixteen inferior titles—e.g. the Duke of Atholl, who has one marquise, four earldoms, three viscounties, and eight baronies. While in ordinary parlance a peer is known by his highest title (or titles, if he holds two of the same degree), his eldest son bears by courtesy one of his inferior titles. Thus the eldest son of the Duke of Devonshire is Marquis of Hartington; of the Duke of Buccleuch and Queensberry, Earl of Dalkeith; of the Marquis of Bute, Earl of Dumfries. There is no rule as to which inferior title should be assumed, a lower one being occasionally preferred to a higher; and the courtesy title may be different in one generation from another. The inferior title of a viscount who is also a baron is never borne as a courtesy title by his son; but a usage prevails among viscounts and barons (more properly 'lords') in the peerage of Scotland, of the eldest son designing himself 'master'; thus the eldest sons of Viscount Arbutnot and Lord Lovat are known as the Master of Arbutnot and Master of Lovat. Courtesy titles are allowed to the eldest sons of courtesy marquises and earls. Thus the eldest son of Earl Percy, himself eldest son of the Duke of Northumberland, is Lord Warkworth. There are various instances of titles borne by heirs-apparent or grandsons of peers which have no existence among the family honours, or are derived from them by some modifications. While Earl Nelson's inferior titles are Viscount Merton and Baron Nelson, his eldest son is known as Viscount Trafalgar. There are a few cases where, in consequence of the inferior title being identical with the higher one, the eldest son substitutes the family surname for the title. The Earl of Gosford, whose family surname is Acheson, is also Viscount Gosford and Baron Gosford; and his son adopts the courtesy style of Viscount Acheson. The holders of courtesy titles, not being legally peers, can sit in the House of Commons.

The younger sons of dukes and marquises have the courtesy title of 'Lord' prefixed to their Christian name and surname—e.g. Lord Charles William de la Poer Beresford, second son of the late Marquis of Waterford; and the daughters of dukes, marquises, and earls, have 'Lady' followed by their Christian name and surname, the surname being that of their husband if married, or his courtesy title if he be a courtesy peer. But if a lady enjoying such courtesy title marry a peer (not by courtesy), she only takes her husband's peerage title. Thus the fifth Duke of Buccleuch's second daughter, by her marriage with Donald Cameron of Lochiel, became Lady Margaret Elizabeth Cameron, while the same duke's eldest daughter was Marchioness of Lothian. Lady Emily Somerset, daughter of the Duke of Beaufort, on marrying Viscount Dupplin, eldest son of the Earl of Kinnoull, was known as Lady Emily Dupplin; but on her husband succeeding his father as Earl of Kinnoull, she became simply Countess of Kinnoull, this change of designation involving, curiously enough, a loss of precedence, inasmuch as the rank of a duke's daughter is higher than that of a countess. When, as often happens, a royal warrant is granted to the brothers and sisters of a peer whose father has never been in possession, giving them the precedence of the sons and daughters of a peer, they enjoy the corresponding courtesy titles. The title 'Honourable,' used by sons of earls, viscounts,

and barons, and daughters of barons, belongs, not of courtesy, but of right, to them in common with all sons and daughters of peers.

The widow of a peer or a knight is allowed by courtesy to retain the title she acquired from her husband, notwithstanding a second marriage; the widow of a baronet is legally entitled to do so.

Along with courtesy titles may be ranked the appellations of the judges of the Court of Session in Scotland, who prefix 'Lord' either to their surname or to a territorial designation. These titles, though given in general society as well as on the bench, are not used in subscribing the judge's name, even to official papers. Hence Lord Kingsburgh's signature, 'J. H. A. Macdonald.' Only since 1905 do the wives of Scottish judges participate in their husbands' official titles. See ADDRESS, FORMS OF.

**Court-fools.** See FOOLS.

**Court-hand,** a name given in England to a modification of the Norman handwriting, as distinguished from the modern or Italian handwriting which was in use in the English law-courts from the 16th century till abolished by law in the reign of George II. See WRITING.

**Court-martial,** a court for the trial of all persons subject to military law or to the Naval Discipline Act. For early history, see CHIVALRY (*Court of Chivalry*) and MUTINY ACT. This act was passed by parliament in 1689, and, with the articles of war, made by royal prerogative, constituted the law under which discipline in the army was maintained. This law, which is now embodied in the Army Act of 1881, provides for the assembly of courts-martial for the trial of offences which are of too grave a character to be dealt with summarily by the regimental commanders. They are of four kinds—general, district, regimental, and field-general. The sovereign issues warrants to certain high officers and to governors of colonies to convene general courts-martial, and the power to convene district courts follows as an incident. A regimental commander, as such, has power to convene a regimental court. The field-general court-martial is an emergency court for use beyond the seas or on active service, on any occasion when an ordinary general court-martial cannot be assembled conveniently; it may be convened by any commanding officer.

The Army Act lays down rules for the general conduct of courts-martial. In 1920 improvements in procedure were introduced as the result of the recommendations of a parliamentary committee of 1919.

**Composition.**—(a) General court-martial—in United Kingdom, India, Malta, and Gibraltar, not less than nine members; elsewhere, not less than five; each member must have at least three years' commissioned service; except in emergency, the president must be a field or general officer, and five members must be not below the rank of captain. (b) District court-martial—not less than three members, each of whom has at least two years' commissioned service; except in emergency, the president is a field officer. (c) Regimental court-martial—not less than three members, each having at least one year's commissioned service; except in emergency, the president is not under the rank of captain. (d) Field-general court-martial—not less than three members of any rank; in emergency, two members; president, of any rank.

**Jurisdiction.**—(a) General court-martial—all persons subject to military law, which includes civilians under a royal proclamation. (b) District court-martial—cannot try a person subject to military law as an officer. (c) Regimental court-martial—cannot, as a rule, try any soldier above

the rank of corporal. (d) Field-general court-martial—all persons subject to military law; but where it is not 'active service, the offender must be under the command of the convening officer and be charged with an offence against an inhabitant.

**Powers of Punishment.**—A graduated scale of punishments is laid down in the Army Act. (a) General court-martial—any punishment, but two-thirds of the court must concur in the award of death. (b) District court-martial—cannot award death or penal servitude. (c) Regimental court-martial—cannot award discharge with ignominy, or detention for more than forty-two days, or anything higher in the 'scale.' (d) Field-general court-martial—when three members are unanimous, death may be awarded; when less than three members, imprisonment and forfeiture of pay; the punishment known as 'field punishment,' which was introduced in 1907 as a substitute for flogging, was abolished in 1923.

The scale of punishments in the case of officers is—death, penal servitude, imprisonment (two years), cashiering, dismissal, forfeiture of rank, reprimand; in the case of soldiers—death, penal servitude, imprisonment, detention, discharge with ignominy, forfeiture of rank and of decorations, fines, stoppages. Confirmation of award is made by the sovereign, or by an officer authorised by him, who may commute, mitigate, or remit all or part of a sentence, but may not increase it.

The procedure is similar to that of civil courts—the court is public, and the same rules of evidence are in force; but the members of a court-martial act as both jury and judge—i.e. they find the facts and allot the sentence. All are sworn, and each votes, commencing with the junior, both on the finding and sentence, as well as on any question that may arise, the majority deciding. The witnesses are also sworn. An officer is appointed as judge-advocate in important trials, to assist the court on points of law, see that the proceedings are regular, and, with the president, take care that the prisoner is treated with strict fairness. Counsel may appear on both sides at general courts, and, if barristers or officers subject to military law, may address the court, and examine and cross-examine witnesses; or before any court the prisoner may be assisted in his defence by a 'friend,' who may make suggestions to him, but is not allowed to address the court or the witnesses. The prosecutor must be an officer and not a member of the court; he is sworn, and charged with the duty of eliciting the truth, but not necessarily of obtaining a conviction. The proceedings are all written, usually on an official form. In cases of emergency officers are enjoined to preserve at least such record of the proceedings as is possible.

Contempt of a court-martial by persons subject to military law is punishable by the same or another court-martial, and, in the case of civilians, by a civil court, to which the offence is certified by the president. Witnesses are summoned by the convening officer or the president, and, if civilians, their travelling expenses must be tendered.

On board a man-of-war no military court-martial may sit except a regimental court, with the sanction of the captain of the ship, for the trial of a non-commissioned officer, and it may only sentence him to reduction to the ranks. Marines are liable to trial by military court-martial when not borne on the books of a man-of-war, in which case they come under the Naval Discipline Act. Naval courts-martial consist of admirals, captains, and commanders, who try offences against the Naval Discipline Act. The chief admiral of the fleet or squadron appoints the members; but all captains on the station have a right to sit, if not implicated.

The court-martial is open to all the crew and others as spectators. The sentence is final.

**Courtney, LORD** (LEONARD HENRY COURTNEY; raised to the peerage as Lord Courtney of Penwith in 1906), was born at Penzance, the son of a banker, 6th July 1832. Educated at Penzance and St John's College, Cambridge, he graduated second wrangler and first Smith's prizeman in 1855, and became fellow of his college the year after. In 1858 he was called to the bar, and from 1872 to 1876 he filled the chair of political economy at University College, London. He early began to write for the *Times*, and his pamphlets and articles to monthly magazines placed him among the ablest and most advanced doctrinaire Liberals in England. He early became an eager advocate for proportional representation and a wide extension of local government. He was returned for Liskeard in 1876 and 1885; in 1886, 1892, and 1895 for the Bodmin division; in 1900 he was rejected as a pro-Boer. He was Under-secretary of State first in the Home and next in the Colonial Office, and in May 1882 became Financial Secretary to the Treasury. He was chairman of committees in the parliaments of 1885 and 1886-92. He died 11th May 1918. See *Life by Gooch* (1920).

**Court of Session**, the supreme court of civil jurisdiction in Scotland. After various experiments, from James I.'s time, cases in which the Auditors appointed by parliament failed to agree were referred to the Privy-council; and James IV. created Lords of Session who 'approximate to the character of privy-councillors and depart from the older model found in the parliamentary committee of Auditors.' In its present form, however, it was constituted in 1532. Its origin is generally ascribed to the Duke of Albany, who when regent had submitted a scheme for such a court to Pope Clement VII. The details of the scheme were carried out by Archbishop Dunbar of Glasgow, who was then Lord Chancellor. The judges of the Court of Session originally consisted of the Lord Chancellor, Lord President, and fourteen ordinary judges or 'senators of the College of Justice,' together with an indefinite number of extraordinary lords, who represented the peerage. At first, half the number of the judges were laymen appointed by the king, and half ecclesiastics appointed by the church. In 1584 all clergymen were declared disqualified from holding judicial office, but so late as 1664 the Archbishop of Glasgow was made an extraordinary lord. The extraordinary lords themselves were abolished in 1723, and the Court of Session then consisted of the Lord President and fourteen ordinary judges, the office of Lord Chancellor having been abolished at the Union. The Court of Session first sat in the Tolbooth or prison of Edinburgh, but in 1639 was accommodated in the buildings of the Parliament House, which was then erected. It sat as one chamber, one of the ordinary lords going by rotation weekly to sit in what was called the Outer House. Here all cases, with certain exceptions, were in the first place heard and decided by the Lord Ordinary, but an appeal lay from his judgment to the whole court. Fresh changes were made in 1808 and 1810; and in 1830 the total number of judges was reduced to thirteen, the two divisions each consisting of four, including the Lord President and Lord Justice-clerk, whilst the number of the Outer House judges remained as before: this is the present constitution of the court. In 1830, moreover, the office of president was united with that of Lord Justice-general or president of the High Court of Justiciary (q.v.), the supreme criminal court in Scotland. Prior to 1887 five of the judges were appointed Lords Com-

missioners of Justiciary, but by the Criminal Procedure (Scotland) Act of that year all the judges are now members of that court. Since the Union in 1707, several courts which had a separate existence, and in some cases an exclusive jurisdiction, have been merged in the Court of Session. These are the Court or Commission of Teinds (though this still sits nominally as a separate court), in which questions relating to the law of teinds or church tithes were decided; the High Court of Admiralty, dealing with maritime cases; the Court of Exchequer, having jurisdiction in all matters relating to crown rents, customs, &c.; and the Commissary Court of Edinburgh, which had to do with wills. The judges of the Court of Session are appointed by the crown from the bar, and hold their offices *ad vitam aut culpam*. See APPEAL, JUSTICIARY (COURT OF), ACTS OF SEDERUNT; and Professor Hannay in *Book of the Old Edinburgh Club*, vol. xi. (1922).

**Courtrai** (Flem. *Kortrijk*), a town of Belgium, in the province of West Flanders, 48 miles W. of Brussels, and 6 miles from the French frontier. Built on both sides of the Lys, it has ancient walls, a fine old bridge flanked with Flemish towers, a noble town-hall (1526), a belfry, and a beautiful Gothic church, founded in 1238 by Baldwin, Count of Flanders. Table damask, linen, and lace are the principal articles of manufacture. There are extensive bleaching-grounds in the vicinity, and the neighbouring plains supply fine flax in large quantities to many European markets. Pop. 37,000. In 1302 the Flemings, citizens of Ghent and Bruges chiefly, won a splendid victory over the chivalry of France beneath the walls of Courtrai, called 'Battle of the Spurs,' from the number of gilt spurs afterwards gathered from the dead by the victors. Henry VIII.'s 'Battle of the Spurs' was fought at Guinegate (q.v.) in 1513. Courtrai was in German hands almost from beginning to end of the Great War.

**Courts of Law.** See COMMON LAW, CHANCERY, EQUITY, APPEAL, ASSIZE, COURT OF SESSION, COUNTY, ADMIRALTY COURTS, DIVORCE, PROBATE COURT, JUSTICIARY, POLICE.

**Cousin** (Fr., from Low Lat. *cosinus*; for Lat. *consobrinus*), a kinsman; more specifically the son or daughter of an uncle or aunt. The children of brothers or sisters are *cousins-german* (german being the Lat. *germanus*, 'brother'). The children of cousins-german are *second cousins*; and if A and B are cousins, A is a *first cousin once removed* to the children of B, as B is to the children of A. See CONSANGUINITY.

**Cousin, VICTOR**, the founder of systematic eclecticism in modern philosophy, was born in Paris, November 28, 1792. He studied with brilliant success at the Lycée Charlemagne and the École Normale. He was attracted to the study of philosophy by Laromiguière, a disciple of Locke and Condillac; but appointed in 1815 assistant-professor to Royer-Collard at the Faculty of Letters, he threw himself heartily into the reaction against the sensualistic philosophy and literature of the 18th century. Following the path of his senior, he became an exponent of the doctrines of the Scottish metaphysicians, but exhibited far more brilliancy than the original authors of these doctrines. In 1817 Cousin visited Germany, and already introduced to its bolder speculative systems, he now zealously studied Kant, Jacobi, Fichte, Schelling, and Hegel. For his liberalism he was in 1821 deprived of his offices; and in a second visit to Germany in 1824-1825, suspected of carbonarism, he was arrested at Dresden, presumably at the instigation of the French police, and sent to Berlin, where he was detained for six months.

He took advantage of his compulsory residence in the capital of Prussia further to study the philosophy of Hegel. On his return to France he took a decided stand against the reactionary policy of Charles X., and in 1827 was reinstated in his chair at the Sorbonne. Meanwhile he had appeared as an author. During 1820-27 he published his editions of Proclus and Descartes and part of his celebrated translation of Plato. It has been said that to find an audience as numerous and as passionately interested as were those of Cousin, it would be necessary to go back to the days of Abelard. Cousin threw great moral earnestness into his work; his doctrines were for the most part new to his hearers, bold, and in harmony with the spirit of the time. The finest qualities of the national genius appeared in his lectures, a wonderful lucidity of exposition, a beauty of style such as few philosophers have equalled, and a power of co-ordinating the facts of history and philosophy in such a manner as to make each illustrate the other. At this period Cousin was one of the most influential leaders of opinion in Paris; and consequently, after the revolution of 1830, when his friend Guizot became prime-minister, Cousin was made a member of the Council of Public Instruction; in 1832 a peer of France; and later, Director of the École Normale. The great success of his efforts for the organisation of primary instruction was largely a consequence of those valuable reports which he drew up, from personal observation, on the state of public education in Germany and Holland. In 1840 he was elected a member of the *Académie des Sciences Morales et Politiques*, and in the same year became Minister of Public Instruction in the cabinet of Thiers. The revolution of 1848 found in Cousin a friend rather than an enemy, and he aided the government of Cavaignac. After 1849 he disappeared from public life. In his last years he lived in a suite of rooms in the Sorbonne, and he died at Cannes, 13th January 1867.

His philosophy is eclecticism, but not mere syncretism. He has a definite criterion of truth, and a definite method of observation, analysis, and induction; his system comprises psychology, ontology, and an eclectic history of philosophy. Psychological observation gives three great factors—sensibility, activity or liberty, and reason, the latter being impersonal. Cousin repudiates pantheism, with which he has often been charged; and criticising the opposing systems of sensationalism, idealism, scepticism, and mysticism as incomplete rather than false, he holds that each expresses a real order of phenomena and ideas. Cousin's influence revived the study of philosophy in France, and especially renewed interest in the history of philosophy. Amongst his pupils more or less influenced by his teaching are Jouffroy, Rémusat, Barthélemy St Hilaire, Jules Simon, and Janet.

Cousin's chief works (besides those already mentioned) are *Fragmens Philosophiques* (1826), *Cours de l'Histoire de la Philosophie* (1827), *Cours d'Histoire de la Philosophie Moderne* (1841), *Cours d'Histoire de la Philosophie Morale au XVIII<sup>e</sup> Siècle* (1840-41), *Leçons de Philosophie sur Kant* (1842), *Études sur les Femmes et la Société du XVII<sup>e</sup> Siècle* (1853), his famous *Du Vrai, du Beau, et du Bien* (1854), works on Aristotle, Locke, Kant, and Pascal, and his editions of Abelard and of Pascal's *Pensées*. See Sir W. Hamilton's critique in the *Discussions*; Janet, *Victor Cousin et son Œuvre* (1885); Jules Simon's Monograph (1887; trans. by Masson, 1888); Barthélemy St Hilaire, *Victor Cousin, sa Vie et Correspondance* (3 vols. 1895); and Dumas, *Victor Cousin et le Mysticisme* (1902).

**Cousins, SAMUEL**, engraver, was born 9th May 1801 at Exeter, and was apprenticed to S. W. Reynolds, the excellent mezzotinter, in many of

whose plates he had a chief hand, while some fifty-five of the small mezzotints after Sir Joshua, which bear his master's name, were his work. About this period he also executed portraits in pencil. In 1826 he started on his own account as an engraver, and produced the 'Master Lambton' after Lawrence, a mezzotint which at once established his reputation. It was followed by a long series of admirable plates after Reynolds, Lawrence, Landseer, Leslie, Millais, Leighton, and other eminent painters. His 'Marie Antoinette in the Temple,' after E. M. Ward, he was accustomed to rank as one of his finest works. He was elected an Associate-engraver of the Royal Academy in 1835, and a Royal Academician Engraver in 1855, and he retired in 1880. To the Academy he presented a sum of £15,000 to found annuities for poor and deserving artists. He died 7th May 1887. His works were catalogued by Algernon Graves in 1880.

**Coutances**, a town in the French department of La Manche, 5 miles from the English Channel, and 57 S. of Cherbourg by rail. It stands on a hill crowned by the cathedral (dating from the 13th century), one of the finest specimens of ecclesiastical architecture in the Early Pointed style in Normandy. Pop. 6000.

**Couthon**, GEORGES, a fanatic of the French Revolution, was born in 1756 at Orcet, near Clermont, in Auvergne. An advocate at the outbreak of the Revolution, he was sent by Puy de Dôme to the National Convention, where, spite of his crippled limbs, he made himself conspicuous by his shrieking hatred of the priesthood and the monarchy. He voted for the death of the king without delay, became a devoted and bloodthirsty partisan of Robespierre, and was appointed in July 1793 a member of the *Comité de Salut Public*. At Lyons he crushed the insurrection with merciless severity, and outdid himself after his return to the Convention, with his frothy ravings against Pitt and the English nation. The fall of Robespierre brought down Couthon also. Accused by Fréron, he was thrown into prison, delivered by the mob with whom he was popular, recaptured by the soldiers of the Convention, and executed 28th July 1794, along with St Just and Robespierre.

**Coutras**, a town in the French department of Gironde, on the left bank of the Dronne, 32 miles N.E. of Bordeaux by rail, with some trade in flour and wine. Here, in 1587, Henry of Navarre gained a bloody victory over the forces of the League, under the Duc de Joyeuse, who perished. Pop. 5000.

**Coutts**, THOMAS (1735-1822), banker, was born in Edinburgh, the son of a merchant and banker, who was Lord Provost in 1742-44. With his brother James he founded the banking-house of Coutts and Co. in London, and on the latter's death in 1778 became sole manager. Keen and exact in matters of business, although charitable and hospitable in private, he left a fortune of some £900,000. By his first wife, who had been a servant of his brother's, he had three daughters, who married the Earl of Guildford, the Marquis of Bute, and Sir F. Burdett; in 1815 he married Miss Mellon the actress. See BURDETT-COUTTS; Richardson's *Coutts & Co.* (1900); and Life by E. H. Coleridge (1919).

**Couvade**, a singular and widespread custom among savages in many parts of the world, and regulating the conduct of a father in connection with the birth of a child. In Guiana, even before the child is born, the father abstains from some kinds of animal food. The mother works up to a few hours before the birth, and retires alone, or with some women, to the forest for the birth. In a few hours she returns and resumes her ordinary work.

Meanwhile the father has taken to his hammock, and abstains from every kind of work, from meat and all other food except weak gruel of cassava meal, from smoking, from washing himself, and especially from touching weapons of every kind. During this time, which may extend for weeks, he is fed and cared for by the women. The explanation is unattainable; but the custom appears to imply a mysterious magical and sympathetic connection between father and child, such that if the father infringe the rules of couvade the child suffers. If he eat capybara flesh, the child will have protruding teeth like those of that animal; if he eat an animal with spotted skin, the child will be spotted too. In Guiana the child is not weaned till the third or fourth year. Indians often allege in explanation that the child descends more directly from father than from mother. Some recent anthropologists find the origin of the custom in the transition from the original matriarchal system (see *TRIBE*), in which descent and inheritance were reckoned through the mother alone, to the patriarchal system. In some places still the father has to buy the child from the mother; among the ancient Romans, the father had to lift the child from the ground. The couvade may therefore be a ceremony by which the father secures and proclaims his property in the new-born child. Diodorus records the custom as in use among the ancient Corsicans; and it has been found by ancient and modern travellers in parts of China, Borneo, Africa, North and South America. The name, now commonly used by anthropologists, is French, being from *couver*, 'to hatch eggs.'

**Couza**, ALEXANDER JOHN (1820-73), Prince of Rumania (q.v.) from 1859 to 1866.

**Covenant** (Lat. *convenire*, 'to come together'), a contract or agreement; a term much used by theologians, and in its ordinary signification, as well as in its theological use, nearly if not always exactly equivalent to the Hebrew *berith* of the Old Testament and the Greek *diathēkē* of the New. Applied to relations established between God and men, the term covenant must be understood with a certain modification of the meaning it bears when employed concerning the relations of men to one another, where two independent parties enter into a covenant, which they have equal right to make or to refuse to make; so it is sometimes employed as equivalent to *dispensation*, and the Jewish dispensation is called the *Old Covenant* (or *testament*, by another translation of *diathēkē*), in contradistinction to the Christian, which is called the *New* (see *BIBLE*). The 'Covenant' or 'Federal' system of theology was developed by Cocceius (q.v.). God, in his supremacy, is regarded as appointing certain conditions for his creatures, which they cannot but accept, yet their willing consent to these conditions gives to the relation established the nature of a covenant; and thus God is commonly said to have made two covenants with man—the *first covenant*, or *covenant of works*, with Adam, as the representative of the whole human race, promising life (with perfect happiness), upon condition of perfect obedience, whilst death was threatened as the penalty of transgression; the *second covenant*, or *covenant of grace*, being that on which depends the whole hope and salvation of man since the first covenant was broken, and in which life is freely offered to sinners, and they are simply required to believe in Jesus Christ that they may be saved. This covenant God is regarded as having made with Christ, as the representative of his people, and with them in him. The older theologians often speak of the *covenant of redemption* between God and Christ, employing the term *covenant of grace* rather to designate the whole dealings of God with men in

giving effect to the covenant of redemption; but the term *covenant of grace* has long been almost universally employed to include all that was comprehended under both terms. The *Abrahamic covenant* is the covenant of grace as declared to Abraham, in its particular relation to him and his seed. God is represented in Scripture as sustaining a *covenant relation* to his *own people*, to the Jews under the Old Covenant, to believers in Christ under the New; and doctrinal theology consists not a little in tracing out the nature of this relation, and the consequences which flow from it. As the people of God collectively sustain a covenant relation to him, so do believers individually; and it has not been an uncommon thing for pious persons to endeavour to reduce to writing their sense of this *covenant obligation*, under the notion of a *personal covenanting* with God; and of binding themselves by a stronger obligation to what they believed to be good and their duty. It has also been common for men, from the earliest ages, to enter into covenants with one another with more or less of religious solemnity; and this has in particular been done among those who have suffered persecution, or have been engaged in contests concerning matters of religion, for which the authority of certain passages of the Old Testament is strongly pleaded. Instances occur in the history of the Waldenses, and of some of the Reformed churches, particularly in Scotland.

THE COVENANTS, known in Scottish history and tradition, originated in the Reformation movement of the 16th and 17th centuries. The first Reformation, in 1560, was preceded by several religious bonds among the Reformers themselves; but the work of reformation was crowned in both first and second periods by the whole nation engaging in public religious covenanting. These public national covenants are two in number—the National Covenant, and the Solemn League and Covenant.

The *National Covenant*, which is sometimes called the 'Scots Confession' and the 'Short Confession,' to distinguish it from the more elaborate Confession of Faith enacted and placed on the statute-book by parliament in 1560, was drawn up in 1580, at the command of James VI., by one of his chaplains, John Craig (q.v.), to counteract attempts which were made by the Roman Catholics to regain their lost hold of Scotland. It contains a profession of adherence to the 'true Christian faith and religion' more particularly expressed in the Confession of 1560, an explicit renunciation of the tenets of popery, which are detailed at length, and a pledge of obedience to the Presbyterian discipline of the church as then established, and of allegiance to the king in the defence of the gospel, all being ratified by solemn oath. By the ordinance of the king, the Privy-council, and the General Assembly, this Covenant was sworn and subscribed by all ranks and classes in 1581; renewed in 1590 in a bond specially directed against the machinations of the Holy League, which had in 1588 despatched the Armada against the British Isles; again renewed in 1596, and still again in 1638. In the last-mentioned year it was renewed in a bond directed against the attempts of Charles I. to enforce the Laudian service-book and Episcopacy upon Scotland. The swearing and subscribing of the Covenant throughout the country was inaugurated in the Greyfriars' Churchyard at Edinburgh, on 28th February; numerous copies were then sent out over the country, and of these many are still extant both in private and public custody. In the library of the Faculty of Advocates at Edinburgh alone, no fewer than five parchment copies are preserved with the original signatures of Rothes, Montrose, Loudoun, and many others of the nobility, gentry,

commissioners of counties and burghs, and ministers. Only one of these, however, is connected with the year 1638. At the meeting of the General Assembly in Glasgow, on 21st November of that year, the Covenant was ratified and appointed to be again sworn, while in pursuance of the object of the Covenant, the assembly deposed the whole of the Episcopal hierarchy which had been established by James VI. The other four copies of the Covenant above referred to were subscribed in 1639. The Covenant was further ratified by the parliament of Charles I., held at Edinburgh, June 11, 1640; and it was subscribed by Charles II. on his landing in Scotland, at Speymouth, on June 23, 1650, and again at his coronation at Scone, on January 1, 1651.

The *Solemn League and Covenant* was in effect an international treaty between Scotland and England, for the object of securing the civil and religious liberties of these kingdoms. In 1643 commissioners were sent by the parliament to Edinburgh to solicit the assistance of the Scots on the basis of a treaty between the two kingdoms. To this the Scots Convention of Estates and also the General Assembly cordially assented, on condition that the treaty was drawn up in the interests of their religious as well as their civil liberties. Committees of both were appointed to meet with the English commissioners, and the result of their deliberations was the Solemn League and Covenant. It is believed to have been largely the work of Alexander Henderson. It was hailed by both the representative bodies of the Scots with joyful unanimity, and sent to England for approbation, with their warmest recommendations and assurances that it would prove 'the most powerful means, by the blessing of God, for settling and preserving the true Protestant religion with perfect peace in all his majesty's dominions, and propagating the same to other nations, and for establishing his majesty's throne to all ages.' It was received with almost perfect unanimity by the English parliament and the Westminster Assembly of Divines, both of which forthwith swore and subscribed it, and sent copies over the kingdom, with their ordinance that it should be subscribed and sworn by all. Zachary Crofton gives a list of 793 ministers in twelve only of the counties of England, the West Riding of Yorkshire, and the city of London who subscribed their adherence to the Covenant. As soon as intimation of its acceptance by England was received in Scotland, the Solemn League and Covenant was enjoined to be sworn there by all ranks and classes; and being sent to Ireland was embraced by the Protestants there with like eagerness and satisfaction.

The prime object of the Solemn League and Covenant, as stated in the preamble thereof, was 'the preservation of ourselves and our religion from utter ruin and destruction,' and the Covenanters pledged themselves, in their places and callings, to endeavour the preservation of the reformed religion in the Church of Scotland, and the reformation of religion in England and Ireland, in the way of securing a uniformity of religion in the three kingdoms, in doctrine, worship, discipline, and government. There can be little doubt that Presbyterianism was intended, as prelacy, which had just been abolished by both English and Scottish parliaments, was specially marked for extirpation along with popery. The Covenanters also pledged themselves to 'preserve the rights and privileges of the parliaments,' to 'defend the king's majesty's person and authority in the preservation and defence of the true religion and liberties of the kingdoms,' to endeavour that the three kingdoms might 'remain conjoined in a firm peace and union to all posterity,' and finally, to evince a thorough and real reformation of life both in public and in private. The

Solemn League and Covenant was renewed in Scotland in December 1648, and along with the National Covenant was sworn to and subscribed by Charles II. at Speymouth and Scone. In fighting for his succession against Cromwell, the Scots in 1650 enacted that the motto on all their colours and standards should be 'For Covenant, religion, king and kingdom,' and their watchword at the battle of Dunbar was 'The Covenant.' After the Restoration, parliament decreed that the Covenants were not obligatory on the lieges; in 1662 they were declared unlawful oaths, and all acts ratifying and approving them were annulled; in 1682 an oath was imposed specially renouncing the obligations of the Covenants, and in 1685 it was declared to be treason to take them.

Between the Restoration and the Revolution, however, the Covenants were adhered to by many who, upon this account, were called COVENANTERS. They maintained that these Covenants, notwithstanding all acts of parliament to the contrary, were binding upon the nation, and great numbers of them suffered and died in this testimony. Their heroic resistance was justified by the Revolution of 1688, when the nation united in one final effort for the restoration of civil and religious freedom. The Covenanters, however, found no place in the polity of the reconstructed Church of Scotland. They are nevertheless printed along with the authorised standards of the church—viz. the *Westminster Confession of Faith*, and Catechisms, &c. Their continued obligation upon the entire nation remained a prominent principle of the Original Secession and Reformed Presbyterian churches, both of which frequently renewed them. See SCOTLAND (ECCLESIASTICAL HISTORY); CAMERONIANS; and Hewison, *The Covenanters* (1908). For Covenant of League of Nations, see LEAGUE OF NATIONS; and for Ulster Covenant, see IRELAND (History).

**Covenant**, in English Law, an agreement by *Deed* (q.v.) in writing, signed, sealed and delivered. A special *action of covenant* lay where a party claimed damages for breach of a covenant; but since the passing of the Judicature Act, 1875, this is no longer a technical expression. A covenant may also be *implied*. 'Covenant running with the land,' is a covenant affecting the land into whose-soever hands it comes. In the United States, the term covenant is used with the same sense as it has in England. The action of covenant is not there in use, a covenant being enforced by an ordinary civil action. The covenant running with the land is almost universally replaced in the United States by a covenant of warranty, by which the grantor of the deed, and not the land itself, is bound.

**Covent Garden**, corrupted from *Convent Garden*, from having been originally the garden of the Abbot of Westminster, is a spacious square in London, celebrated for a great market held within it of fruit, vegetables, and flowers. The square was formed about 1631 from the designs of Inigo Jones, and has the arcade or piazza on the north and north-east side, Tavistock Row on the south, and the church of St Paul's on the west. In the 17th century Covent Garden was a very fashionable quarter of the town. The scene of one of Dryden's plays is laid here, and frequent allusions are made to the place in plays of Charles II.'s time. The market, now so famous, appears to have originated about 1656 in a few wooden sheds and stalls. Covent Garden is for a stranger one of the sights of London, and is seen to greatest advantage about three o'clock on a summer morning. Covent Garden Theatre (1858) is the home of grand opera in London. The building is the third on the present site; the first, opened in 1732, was destroyed by fire in 1808, as was also the second in 1856. See

Reginald Jacobs, *Covent Garden* (1913), and Wyndham, *Annals of Covent Garden Theatre* (1906).

**Coventry** (A.S. *Cofantrêo*, the tree of Cofa, or Cufa), a city, parliamentary, municipal, and county borough and manufacturing town in north Warwickshire, 18 miles ESE. of Birmingham, and 91 NW. of London. A small stream, the Sherbourne, an affluent of the Avon, flows through the city, which stands on a gentle eminence in a valley, with a ridge of hill on the south, on the edge of the coalfields. The city is ancient, and has associated with it the famous legend of Lady Godiva (q.v.). There are many interesting architectural remains, of which Ford's Hospital for old women, and Bablake Hospital for men, are both perfect specimens of the domestic architecture of the 16th century. The city is famous for its three spires (see Tennyson's 'Godiva') of the three churches of St Michael's (now the cathedral), Holy Trinity, and Christ Church. Coventry's bishopric existed separately from 1102-83, and, bearing the joint title of Coventry and Lichfield, from 1183-1661, when the title was reversed to Lichfield and Coventry. It continued thus until 1836, when the archdeaconry of Coventry was attached to the bishopric of Worcester. Created a separate diocese under the Bishoprics of Bradford and Coventry Act, 1918, it now consists of two archdeaconries—Coventry and Warwick. The cathedral (1373-94), one of the noblest examples of the Perpendicular style of architecture in England, possesses the largest of the three spires (295 feet). The fragmentary remains of the ancient cathedral of Coventry (part of a Benedictine foundation demolished by Henry VIII.) are still to be seen near the Holy Trinity Church. The latter is a cruciform building. The most interesting secular building is St Mary's Hall, which dates from about the 14th century. Originally the home of the craft guilds, it developed later into the centre of civic life. Here are an ancient piece of tapestry and a stained-glass window, both world famed. The muniment-room contains the historical documents of the city, including the Leet Book. The city stocks are preserved just outside the building. The hall served as a council chamber until 1920, when the present council house—a vigorous example of modern architecture—was opened. The city walls, three miles in circuit, and built in 1356, were demolished by order of Charles II. in 1662, probably to avenge the repulse of his father in 1642. Some ruins still remain, of which the Cook Street Gate is a notable example. The public libraries, consisting of the Gulson (Central) Library and three branch libraries, are considered to form a model library system. Other modern public buildings include King Henry VIII., Bablake Secondary, and many other schools; baths; fire station; whilst many large industrial firms are established in the city, specialising in motor-cars, motor-cycles, cycles, aeroplanes and engines, wireless and other telegraphic and telephonic instruments and accessories, machine tools and drop forging, while the ancient trades of silk-dyeing, ribbons, and watches are still fairly well represented. In addition the development of the artificial silk industry has been very rapid. Coventry played a conspicuous part in the provision of munitions during the Great War. A Memorial Park (1921) of about 120 acres, at Stivichall, just outside the city, preserves the beautiful avenue of trees on the road to Kenilworth. Coventry has in addition several small parks, and is rich in charities and common lands. The Martyrs' Memorial in Cheylesmore is to the memory of those who were burnt at Coventry during the reigns of Henry VIII. and Mary. Coventry is nearly in the centre of England, being equidistant from the four great ports of London, Bristol,

Liverpool, and Hull, and has extensive canal and railway communications, being served by the London, Midland, and Scottish Railway. It has an excellent system of sanitation, and owns gas, electricity, tramway, omnibus, and water undertakings. The Coventry Fair (first granted as an eight day fair by Henry VIII.) is held annually during Whit week. During the 15th century mystery plays, sacred plays, and pageants were often acted by the various crafts. Here, on Gosford Green, occurred the famous meeting for the intended trial by battle between the Dukes of Norfolk and Hereford, immortalised in Shakespeare's *Richard II.* Two memorable parliaments were also held in the monastery of Coventry in the 15th century. The one contained no lawyers, and the other passed attainders against the Duke of York and others. In the 14th, 15th, and 16th centuries Coventry was famous for woollens, broad-cloths, caps, and blue thread. Constituted a civic corporation in 1344, a separate county in 1451, and incorporated with the county of Warwick in 1842, it became a county borough under the Local Government Act of 1888. The parliamentary borough returns one member. Population (1801) 16,049; (1831) 27,670; (1861) 40,936; (1891) 52,742; (1901) 69,978; (1911) 106,349; (1921) 130,300.

Coventry has few literary associations. George Eliot was at school in Coventry, and lived there when she translated Strauss's *Life of Jesus*. A. E. W. Mason describes Coventry (as 'Ludsey') in *The Turnstile*. The city is also the birthplace of Ellen Terry. See local histories of Poole and Taunton (1870) and M. D. Harris (1911), and the latter's edition of the *Leet Book* (1907-13).

**Coventry**, SIR JOHN, a staunch cavalier who had sat in the Long Parliament (1640), and who at the coronation of Charles II. was made a Knight of the Bath. Elected for Weymouth in 1667, he asked, during a debate on playhouses (October 1670), a question which reflected on the king's amours. Charles and his minions were furious, and one December night Coventry was pulled from his coach by Sir T. Sandys and other ruffians, and his nose slit to the bone. Parliament took notice of this atrocious outrage, and by its 'Coventry Act' made cutting and maiming a capital offence; but they had not the courage to bring the king's bravoes to trial. Coventry died in 1682.

**Coverdale**, MILES, translator of the Bible, was born in Yorkshire in 1488. He made his studies at Cambridge, was admitted priest at Norwich in 1514, when he joined the Austin Friars at Cambridge, and probably imbibed his liking for the new doctrines from Robert Barnes, who became prior about 1523, and whose Protestantism led to his being tried and ultimately burned in 1540. Before long Coverdale went abroad. According to Foxe he was at Hamburg with Tyndale in 1529. His own translation of the Bible appeared in 1535, with a dedication by himself to Henry VIII., and secured the royal license in the quarto and folio editions of 1537. The Psalms of this translation still form the psalter in the Book of Common Prayer, and many of the finest phrases in our authorised version of 1611 are directly due to Coverdale. The original issue of the book is a folio volume, 'faithfully and truly translated out of Douche and Latyn into Englishe,' printed in German black letter, in double columns, with woodcuts and initials, and containing the Apocrypha. Its place of publication is very uncertain, and attempts have even been made to degrade Coverdale from its translator to a mere proof-reader. In the prologue to his own second edition (1550) he states that the translation was his own work, although not at his own cost, and that it

was made 'out of five sundry interpreters,' most likely the Vulgate, Pagninus, Luther, the Zürich or German-Swiss Bible of 1531, and Tyndale's Pentateuch and New Testament. In 1538 Coverdale was sent by Cromwell to Paris to superintend in Regnault's press another English edition of the Scriptures. Francis I. had granted a license, but in spite of this, before the printing was finished, an edict was issued prohibiting the work. Many of the sheets were burned, but the presses and types were saved and hastily carried over to London, whither also some of the workmen soon came. Grafton and Whitchurch, the noted printers of that day, were thus enabled to bring out in 1539, under Coverdale's superintendence, the 'Great Bible,' which was presented to Henry VIII. by Cromwell. The second 'Great Bible,' known also as 'Cranmer's Bible' (1540), was also edited by Coverdale, who found it expedient to leave England on the fall of his patron Cromwell. While abroad he married, received the degree of D.D. from Tübingen, and acted as Lutheran pastor for some years at Bergzabern, in Rhenish Bavaria. In March 1548 he returned to England, was well received through Cranmer's influence, and in 1551 was made Bishop of Exeter. On the accession of Mary he was deprived of his see, but was suffered to leave the country. From Denmark he passed to Wesel in Westphalia and to Geneva, where he may have assisted in the preparation of the famous Geneva version (1560), the favourite Bible of the Puritans. Returning to England in 1559, he did not resume his bishopric, but was made D.D. by Cambridge in 1563, and the following year was collated by Grindal to the living of St Magnus, near London Bridge, which he resigned from growing Puritan scruples about the liturgy in 1566. He continued, however, to preach, but died early in 1568, and was buried in St Bartholomew's Church, and, on its demolition in 1840 to make room for the New Exchange, was reburied in the south aisle of the church of St Magnus. The tercentenary of his Bible—the first complete English translation of the Scriptures—was celebrated 4th October 1835, when medals were struck in honour of the venerable translator. Most of Coverdale's works, including his letters, were edited for the Parker Society by Rev. George Pearson (2 vols. 1844-46). See *Memorials of Miles Coverdale* (1838), H. R. Tedder's article in the *Dictionary of National Biography*, F. Fry's *The Bible by Coverdale* (1867), and Conant, *History of English Bible Translation* (1910).

**Covered-way**. See FORTIFICATION.

**Covilhão**, a town in the Portuguese province of Beira, on an eastern spur of the Estrella Mountains, with some manufactures of brown cloth, and a pop. of 14,000.—Pedro de Covilham (or Covilhão), sent by the king of Portugal in 1486 to visit Prester John's country, reached Calicut overland in 1487, and Abyssinia in 1490.

**Covington**, a city of Kentucky, U.S., on the Ohio River, opposite Cincinnati, with which it is connected by a fine suspension bridge. Many of the inhabitants transact their business in Cincinnati, but Covington is itself a thriving place, with manufactures of glass-ware, nails, tobacco, &c. Pop. (1830) 715; (1880) 29,720; (1920) 57,121.

**Cow**. See CATTLE, DAIRY.

**Cowbane**. See HEMLOCK.

**Cowberry**. See WHORTLEBERRY.

**Cow-bird** (*Molothrus pecoris*), also called Cowpen Bird, Cow Blackbird, &c., a native of North America, nearly allied to the Troupials, remarkable for its cuckoo-like habit of utilising the nests of other birds for its own eggs. The latter are

hatched sooner than those of the rightful owners, which fall victim to this lofty form of parasitism. The cow-bird is about 7 inches in length, predominantly brownish-black in colour, and has a short but sharply pointed beak. 'It utters a peculiarly liquid April sound.' The females are far more numerous than the males, and polygamy is therefore in vogue. The males have deeper, glossier coats than the females. It is said to damage the fields of sown maize, but feeds largely on insects. The name refers to its habit of frequenting cowpens for the sake of the attracted insects. Seven other species of *Molothrus* are known, occurring from La Plata to the United States.

**Cow-boy.** See RANCHING.

**Cowbridge,** a municipal borough of Glamorganshire, on the Ddow, 12 miles W. of Cardiff (17 by rail), with which and Llantrissant it returned one member to parliament till 1918. It has an old gateway and a grammar-school (1678). Pop. 1200.

**Cow-catcher,** a kind of barred iron cone or beak-shaped arrangement, about 6 feet long, projecting from the front of locomotives, close over the railway track, and attached to the buffer-beam by strong bolts. It is generally used upon American lines where unfenced, for the purpose of throwing aside animals or other obstructions.

**Cowdenbeath,** a police and parliamentary burgh of Fife, 5 miles NE. from Dunfermline, almost entirely inhabited by miners; pop. 14,000.

**Cowdenknoves.** See EARLSTON.

**Cowell, EDWARD BYLES,** a learned Sanskrit scholar, was born at Ipswich, January 23, 1826. He was educated at Ipswich grammar-school and Magdalen Hall, Oxford, and in 1856 sailed for Calcutta, to fill the chair of History in the newly-established Presidency College, becoming also soon after principal of the Sanskrit College. He returned home in 1864, and was elected in 1867 professor of Sanskrit at Cambridge, and in 1874 to a fellowship in Corpus Christi College. He published a long series of Sanskrit texts and translations, alone or in collaboration with other scholars, and edited Colebrooke's *Essays* (1873). A contributor to this work, he died 9th February 1903; and his *Life and Letters* appeared in 1904.

**Cowen, SIR FREDERIC HYMEN,** composer, born at Kingston, Jamaica, 29th January 1852, was brought as a child to England. He early showed decided musical talent, which was cultivated by a course of study under Benedict and Goss, as also at Leipzig and Berlin. Among his works are the operas *Pauline* (1876), *Thorgrim* (1890), *Signa* (1893), and *Harold* (1895); the cantatas *The Rose Maiden*, *Sleeping Beauty*, *The Water Lily*, and others; oratorios (including *Ruth*, 1887); half-a-dozen symphonies (No. 3 being the 'Scandinavian'); a number of overtures, pianoforte pieces, and minor works; and over 250 songs. He has been conductor to the Philharmonic Society, at Manchester, Liverpool, and Bradford, and of the Scottish Orchestra. He was knighted in 1911.

**Cowes,** a seaport and watering-place in the north corner of the Isle of Wight, 1½ miles SSE. of Southampton by water, and 4 N. of Newport by rail. It consists of West and East Cowes, lying on opposite sides of the mouth of the estuary of the Medina, and connected by steam-ferry. Standing on a hill-slope, West Cowes has a striking aspect from the sea, and is the seat of much trade, being the chief port of the island, and the headquarters of the Royal Yacht Club (1815), whose regattas are held here. Their club-house was originally a fort, built by Henry VIII. in 1540. Yacht-building is the great speciality of Cowes, which has a fine promenade (1864), excellent hotels, baths, villas,

lodging-houses, &c. Slatwoods at East Cowes was the birthplace of Dr Arnold. East Cowes Castle (1798) and Norris Castle (1799) are near. Osborne House, a favourite residence of Queen Victoria, for whom it was built in 1845, was converted by Edward VII. in 1902 into a convalescent hospital for naval and military officers, and contained the Royal Naval College till 1921. Pop. of West Cowes, 10,000; of East Cowes, 4600.

**Cowhage.** COWAGE, or COWITCH, consists of short, slender, brittle hairs, which cover the pods of species of *Mucuna*, a papilionaceous climber, particularly *M. pruriens* of the West Indies and *M. urens* of the East. These hairs readily stick in the skin and cause intolerable itching, and were hence formerly used (as still in their native country) as a vermifuge. They are administered in syrup, and of course act mechanically. The unripe pods are eaten like kidney-beans.

**Cowl.** See BENEDICTINES.

**Cowley, ABRAHAM,** in his own day considered the greatest of English poets, was born in London, 1618. His father was a stationer in that city, and died before his son's birth. By the exertions of his mother, Cowley received a learned education. At an early age he was sent to Westminster School, where he displayed an almost unparalleled precocity. It was by the reading of the *Faery Queen*, a copy of which lay in his mother's window, that his mind was turned to poetry. He wrote excellent verses at the age of ten, and published a volume of poems at fifteen. In 1637 he proceeded to Cambridge, and while there wrote, among many other pieces, a large portion of his epic, the  *Davideis*, on the subject of the life of King David. On the outbreak of the Civil War, he was ejected (1644) from Cambridge for refusing to take the oath tendered to all the members of the university. At Oxford, however, the headquarters of the king's party, he continued his studies for other two years. On the queen's flight to Paris, Cowley followed her, and did effectual service to the royalist cause by various missions, and by carrying on the secret correspondence in cipher between the queen and Charles. In 1656 he returned to England, but was arrested and only allowed at large on a bail of £1000. To conciliate the party in power, he qualified himself as a doctor of medicine, by way of proving that he had abandoned all political connections. On Cromwell's death, Cowley again went to Paris, but returned to England at the Restoration. He was disappointed in the hope of preferment, especially of the mastership of the Savoy, which both Charles and his father had led him to expect. By the generosity of the Duke of Buckingham and Cowley's lifelong friend the Earl of St Albans, he at length received a comfortable provision. Cowley died at Chertsey, London, 28th July 1667.

Cowley's most ambitious works are the *Davideis*, the *Pindarique Odes*, written in supposed imitation of Pindar, and the *Mistress*, a series of love poems. His fate as a poet is one of the most singular in literature. Deemed unapproachable in his own day, he has ever since sunk steadily in popular estimation. Dr Johnson's explanation is still accepted as the best that can be suggested. Cowley wrote for the court and the reigning taste, and not for the general heart of men. What he is still admired for is his astonishing ingenuity and agility of mind. Moreover, though the bulk of his verse can never again have any living interest, he has not a few passages characterised by delicacy and power. By his small collection of essays, Cowley takes rank with Goldsmith and Addison as one of the masters of simple and graceful prose style. It is by these essays that Cowley is now best known. See Grosart's (1881) and Waller's (1905-6) editions;

Sprat's *Life of Cowley* (1668), Johnson's *Lives of the Poets*, R. Schafer's *English Ode to 1660* (1918).

**Cowley**, HANNAH (1743-1809), wrote thirteen lively dramatic works, including *The Belle's Stratagem* (1782), and several volumes of feeble verse. She was attacked along with the other Della Cruscans by Gifford in the *Buvald and Mæviad*.

**Cowley**, HENRY RICHARD CHARLES WELLESLEY, EARL (1804-84), diplomatist, was born in London. His father, the first Baron Cowley, was a younger brother of the great Duke of Wellington. He was educated at Eton, and at twenty began a long career as a diplomatist by becoming an attaché at Vienna. He was in succession secretary and ambassador at Constantinople, minister-pleni-potentiary to Switzerland (1848), to the Germanic Confederation (1851), and in 1852 succeeded the Marquis of Normanby as ambassador at Paris, a position he held with rare tact and temper till his resignation in 1867. With Clarendon he represented Great Britain at the Paris Congress of 1856, and in 1860, with Cobden, he arranged the commercial treaty between France and England. He succeeded to his father's title in 1847, and was created Viscount Dangan and Earl Cowley in 1857.

**Cowley Fathers.** See BENSON (RICHARD MEUX).

**Cow-parsnip** (*Heracleum*), a genus of Umbelliferae, of which one species (*H. Sphondylium*) is a common and rank wayside weed, which, however, when cut early in the season, affords a wholesome fodder to pigs and cattle. *H. sibiricum*, a much larger species, has been recommended for cultivation on account of the great quantity of herbage it yields very early in the season, and with other species (*H. villosum*, &c.) it is also used with much effect as a decorative plant. *H. lanatum* is very common in North America.

**Cowper**, WILLIAM, surgeon and anatomist, was born at Petersfield, in Sussex, in 1666, settled as a surgeon in London, and died 8th March 1709. He made some new anatomical observations, notably discovering the glands beneath the male urethra called 'Cowper's glands,' and published *The Anatomy of Humane Bodies* (1698) and other works.

**Cowper**, WILLIAM, was born in 1731 at the rectory of Great Berkhamstead, in the county of Hertford. He was sent to Westminster School at so early an age that all his impressions were painful, and he thus conceived a hatred of public schools which was never modified. He complains that there he became an adept 'in the infernal art of lying,' an art which we could hardly assert either to be extinct in our public schools at the present time, or to be or ever to have been entirely confined to them. Among his schoolfellows were Churchill the poet, and Warren Hastings; and for these two at least he seems to have maintained a lasting affection. On leaving school he was articled to an attorney named Chapman, with whom he idled away his time for several years. One of his fellow-pupils there was Thurlow, who in a jesting mood promised to give Cowper an appointment when he should be Lord Chancellor. The boyish ambition was verified, as every one knows, but not the promise. Cowper was called to the bar in 1754, and lived for some time the ordinary life of a young man, not uncheerful, though with occasional fits of depression. He belonged to the 'Nonsense Club,' founded by Bonnell Thornton and George Colman, and is supposed to have contributed some short articles to the *Connoisseur*, a paper started by them. He also fell in love, during this period, with Theodora, the daughter of his uncle Ashley Cowper, a lady who seems to have had for him a far deeper feeling

than his essentially recipient nature could return. Certainly he appears to have made no particular effort to overcome his uncle's opposition to his suit. In those days a well-connected young man was more easily provided for than now, and a sinecure appointment, as 'Commissioner of Bankrupts,' gave Cowper a certain independence, which he enjoyed tranquilly, relying on the influence of his relations to promote him further, an expectation which they on their side did all they could to fulfil. His cousin, Major Cowper, had the right (extraordinary to hear of nowadays) of appointing to the office of Clerk to the Journals of the House of Lords, and also to the joint offices of 'reading clerk and clerk of the committees' to the same august assembly. All these appointments happened to fall vacant at the same time (1763). Major Cowper wished his cousin to take the latter and more valuable office, but Cowper in one of his fits of self-depreciation, preferred the other, which was found eventually to involve a so-called examination as to his fitness for the office, meaning in fact only an appearance before the bar of the House. The idea of this appearance unmanned him altogether. A fixed idea, the well-known forerunner of madness, that every one was hostile to him, gradually took possession of his mind; and the horror grew by continual brooding, until suicide seemed the only way of escape. He several times attempted to make away with himself, and on one occasion at least was only saved by a fortunate accident. When his friends were finally made aware of his condition, they gave up at once a project so evidently impracticable; but Cowper's mind was permanently unhealed. He fell into a state of religious despair as to the consequences of the crime he had almost committed, in the height of which his misery found vent in the composition of a copy of Sapphics, in which he describes himself as 'damned below Judas, more abhorred than he was,' and again, 'man disavows and Deity disowns me.'

It was found necessary to remove him to a private asylum at St Albans, where he was gradually restored to health by judicious treatment. After this, in June 1765, he drifted to the quiet town of Huntingdon, where he made acquaintance with an amiable and religious family to which he was at once attracted, and in which he was soon accepted as an inmate. The head of the family, Mr Morley Unwin, was a clergyman, but retired from active work, and with his wife and two children lived a life of almost perpetual devotion, into which Cowper plunged, spending most of his time in religious exercises of various kinds, and correspondence on religious subjects. Cowper continued to reside with Mrs Unwin after her husband's death (July 1767), but they soon removed to Olney in Buckinghamshire, where the famous John Newton was curate. This remarkable man soon acquired the most complete influence over the gentle invalid; and, under Newton, Cowper worked among the poor of his friend's parish, devoting his whole time to pious exercises and good works. Owing, perhaps, to these exertions, and to the unbroken monotony of the atmosphere, signs of his former madness began to reappear, and in 1773 it burst out. He was at the time in Newton's vicarage, and here he remained for more than a year, refusing to return to his own house though it was but next door. After his recovery (which was never complete) he lost—we might almost say, though it seems cruel, he was delivered from—the companionship of Newton, who was presented in 1779 to the rectory of St Mary Woolnoth. The effect of his departure on Cowper was miraculous; whether Newton, in his intense enthusiasm miscalculated his friend's powers, or whether he was only ignorant

of the delicate nature of the mind on which he was working, it is evident that the constant intercourse with him, aided perhaps by the wearying sameness of the life, had an oppressive and crushing effect upon Cowper. Even after Newton's departure, the old gloom appears in letters addressed to him, while in correspondence with Hill or Unwin, Cowper is always cheerful, full of graceful playfulness, entering into a pleasant record of his amusements and occupations, his hares and garden and greenhouse. To the quiet of this period of his life we probably owe the tranquillised condition of mind which makes the tone of Cowper's poetry contrast so strangely with the sentiments of his early experiences. An astonishment almost amounting to incredulity fills our mind when we find the madman, the religious fanatic, who despaired of salvation, and on several occasions attempted suicide, luxuriating in the quiet of nature, which he fully appreciated and enjoyed, and changing his abject fears of God's wrath for a tender delight in and love of the ordinary works of His hands.

He was, however, as yet no poet at all. Mrs Unwin was the first who had the wisdom to perceive that a variety of occupation was necessary to Cowper, and that something to occupy his mind during the gloomy months of winter was of the highest importance to his well-being. No power of initiation seems to have existed in his mind, but he followed with docility his friend's suggestions, and when she bade him write poetry, did so. His first volume (1782) was in the fashion of the time, and consisted of several poems on abstract subjects, a poetical dialogue called 'Table Talk' being added to lighten and enliven the book. Probably Cowper himself was not conscious at the time how much higher he was capable of flying and was destined to fly; but once more a happy suggestion came to his aid. In 1781 he accidentally made the acquaintance of Lady Austen, a woman full of intelligence, and of a gay and happy disposition, bringing sunshine with her. The acquaintance rapidly grew into a warm friendship, and Lady Austen settled in Newton's deserted vicarage, next door, it will be remembered, to Cowper's house. The inhabitants of the two houses soon, of course, grew intimate, with the happiest results to the poet. It is to Lady Austen's playful commands to write a poem for her on any subject, 'this sofa for instance,' that we owe Cowper's greatest work, *The Task*. She has also the credit of having told him the story of John Gilpin, reproduced in the immortal ballad the next morning: and there can be no doubt that this lady was his better angel, and made the happiest revolution in the too-serious house. His position between his old friend and his new one, both being women, has been the subject of many, and we think somewhat vulgar comments. That Cowper was engaged to marry Mrs Unwin, that this project was defeated by a dawning love between the poet and Lady Austen, and that jealousy and passion came in to disturb their relations is an off-repeated tale. It surely, however, requires but little reflection to see how unnecessary such a theory is. Cowper was in every way calculated to arouse a more than passing interest in the heart of an intellectual woman, but neither in his past nor his present was there anything that could inspire such a woman with the desire of marrying him. He had the gift of making friends and calling forth sympathy in an unusual degree, and the influence of this tender sympathy not only saved but made him what he grew to be. If Lady Austen had never said to Cowper, 'Why not try blank verse?' that grand revolt against the smoothness and artificial perfection which Pope had established as essentials of poetry might have been indefinitely postponed. Against a style which repelled him,

Cowper was the first to protest by the effectual reproduction of a more excellent way. He took that polished and splendid instrument from the hand of Milton, without his grandeur of tone, yet with a sweetness and serious power not unworthy of it. His schoolfellow, Churchill, had struck a rougher and more vigorous note, yet had not been bold enough to return to the old ways. But the timid poet in his seclusion, under the influence of his domestic muses, with unexpected boldness, seized on his inheritance. Wordsworth carried on both style and subjects, but he, like Gray, put of his own into the theme, and described less Nature herself than the thoughts which she inspired. In Cowper, on the contrary, we have Nature's very face, the calm description of a quiet scene painted by one who loved her for herself, not peopled with fancies by a poetical observer.

How his friendship with Lady Austen came to an end has never been clearly known, but at the end of 1783 she retired to Bristol, and Cowper writing to Unwin declared the connection at an end. It is a commonplace to talk, of course, of jealousy between Lady Austen and Mrs Unwin, and it is easily comprehensible that the latter lady may have objected to see her place as Cowper's friend and adviser taken from her by a stranger. However, as regards our poet, Lady Austen had done her work; *The Task* was published in 1785, and its power and the greatness of the old-new method very soon made themselves apparent. Whether Cowper has retained the high place which was accorded to him in the surprise and delight of the new movement, is a question which will be answered according to individual tastes and opinions, but there can be no doubt that the publication of *The Task* had a most powerful effect upon the literary tastes of the time.

It is characteristic of Cowper that on the departure of Lady Austen, he fell for some time into a little of his old melancholy, until in 1786 Lady Hesketh appeared upon the scene, and the poet accepted the new comforter in lieu of her who was gone. His translation of Homer was carried on under the influence of this new adviser, who was a relation of his own, and consequently escaped the imputation of wishing to marry him. She procured the removal of the sad poet and his ailing companion to Weston-Underwood, where they made acquaintance with the Throckmorton family, and received much comfort and consolation in their waning days. This move, as well as the translation of Homer, Newton, with whom Cowper still kept up a correspondence, condemned with almost brutal violence of language, and it is an evidence of his temporary recovery of strength, that Cowper defended himself without, however, losing his temper. Against Newton's advice he continued his translation, which brought him in at least a little money if not much fame: and the money was by this time much needed. In 1787 he had another attack of his old ailment, and again attempted suicide. From this attack he never seems to have completely recovered, and when he was almost at his worst, Mrs Unwin had a stroke of paralysis which cast a gloom over this devoted pair from which they never emerged. In 1794 a pension of £300 a year was assigned to him, but too late to confer much comfort or relief. When Mrs Unwin died in 1796 he heard the news 'not without emotion,' and growing gradually weaker, died peacefully at East Dereham, Norfolk, on the 25th of April 1800. Curiously enough, out of the gloom of his last waning years came two of his most beautiful and touching poems, the lines 'Addressed to My Mother's Picture,' and those entitled 'My Mary.'

Hayley's Life first appeared in two volumes in 1803. The later editions (1806, 1809, 1812) were in four volumes.

See Life by T. Wright (1892; revised 1921), and his edition of the Correspondence (4 vols. 1904), also his *Unpublished and Uncollected Letters of Wm. Cowper* (1925). Southey's edition of the works, with memoir (15 vols. 1834-37), was reprinted by Bohn (1853-54). Others are those of Grimshawe (8 vols. 1835); the Aldine edition (1865); the Globe edition (1870). Editions of the poems are by Mrs Meynell (1904), Milford (1905), and Bailey (1905); there is a concordance by Neve (1887). See Goldwin Smith's monograph (1880); Sir Leslie Stephen's *Hours in a Library* (1882); and Sainte-Beuve's essay.

**Cowper's Glands.** See COWPER (WILLIAM).

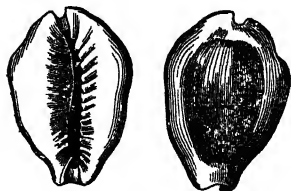

**Cowper-Temple,** WILLIAM FRANCIS (1811-88), son of the fifth Earl Temple, entering parliament in 1835, attained various offices (in Admiralty, Home Office, Board of Trade, &c.), and became vice-president of committee of council on education. Best known as author of the 'Cowper-Temple clause' in the Education Act of 1870 (see EDUCATION), he was in 1880 created Baron Cowper-Temple.

**Cow-plant.** See ASCLEPIADACEÆ, COW-TREE.

**Cowpox.** See VACCINATION, SMALLPOX.

**Cowry** (*Cypræa*), a large genus of Gasteropods in the Prosobranchiate section, including over a hundred species, some of which are very familiar as decorative objects and as furnishing a medium of exchange with uncivilised peoples. The shell has more or less of an oval form, and is usually thick, polished, and beautifully coloured. The young shells are delicate and more typically snail-like, but in the adults the large last whorl more or less conceals the others, and has its outer lip bent in towards the inner. The internal axis may be wholly absorbed. The animal has a broad head, a protrusible proboscis, eyes associated with the long horns, and a broad foot protruded through the elongated aperture. The mantle or skin fold, which forms the shell as in other molluscs, extends over the whole or most of the surface, and thus conceals during life what gives the dead shells half their charm. In habit the cowries are predominantly sluggish animals, creeping slowly on rocks and coral reefs. They are mainly carnivorous in diet. Though widely distributed, they thrive best in the tropical seas. Fossil forms occur abundantly (about 80 species) from the chalk onwards. The nearest relations of the cowries are the two genera *Ovulum* and *Trivia*. The former includes the *Poached Eggs* and the *Weaver's Shuttle* (*Ovulum volva*); two species are found on British shores. The genus *Trivia* includes the little cowry (*Trivia europæa*), not uncommonly found on British coasts—e.g. near John o' Groats's House.

The cowries proper are well known in several practical connections. The money cowry (*C. moneta*), found especially in the Maldivé Islands, was long used as currency, and is still so used in Africa from Guinea to the Central Sudan. In Siam over 6000 cowries were required to make a tical worth 1s. 8d.

Money Cowry.

Cowries are familiar in England as counters in games of chance. From prehistoric times they have been used to form necklaces and other ornaments of the person. In some cases they are worn as charms, and their bright colours, so attractive to human eyes, have also been utilised in catching cuttle-fishes. Cowries have had their share in later days in the conchological craze, and 'small fortunes' have been spent in gathering that wealth of varied

colour which a good cabinet displays. A shell of *C. princeps* has sold for £40. See IMAGES, MAGIC.

**Cowslip** (*Primula veris*; see PRIMROSE), a common native of pastures in England and many other parts of Europe, but rare in the west of Scotland, a delicate and modest little flower, a universal favourite, both for its beauty and its fragrance. It differs from the common primrose conspicuously in having umbels of flowers on a scape; it is supposed to be the original of the garden polyanthus. Darwin holds the common *oxlip* to be a cross between the cowslip and the common primrose. Its bells were long supposed to be the haunt of fairies, and the name of Fairy Cups is still given to them in some parts of England. The flowers are sometimes fermented with sugar to make *cowslip wine*, which is not unpalatable. It was once a favourite domestic soporific. The leaves are by some used as a salad and pot-herb, and also as food for the silkworm before those of the mulberry have expanded. The American cowslip (sometimes also called Shooting-star) is *Dodecatheon Meadia*, a very handsome spring flower. This and other species are also well known in cultivation.

**Cow-tree**, a name given to a number of trees of different natural orders, the bland milky juice (Latex, q.v.) of which is used instead of milk. The most famous of these is the Palo de Vaca of the Cordilleras and Venezuela (*Galactodendron* (*Brosimum*) *utile*), an artocarpaceous tree, with large lamel-like leaves and very small flowers. The milk is obtained by piercing the bark of the trunk or branches, and flows so freely that an ordinary bottle may be filled in half an hour. The milk has an agreeable creamy odour and taste recalling that of cow's milk, but is slightly viscid and soon becomes yellow, gradually thickening into a somewhat cheesy consistency. Its chemical composition, of course, widely differs from that of milk, but its nutritive value is considerable. It is much used by the negroes and Indians.

The cow-tree or Hya-hya of Demerara is *Tabernaemontana utilis*, a tree belonging to the Apocynaceæ. In this order the milky juice is usually acrid and poisonous, and even that of other species of the same genus is of sharp and burning taste. In this case, however, the latex is agreeable and wholesome, although somewhat sticky, owing to the large proportion of caoutchouc.

**Cow-wheat** (*Melampyrum*), a genus of Scrophulariaceæ, of which the deep-furrowed two-celled capsule somewhat resembles a grain of wheat. They are annual weeds, growing in woods, corn-fields, and pastures, and are eaten by cattle. Being root-parasites, they grow on the roots of other plants. *M. pratense* is common in Europe and North America.

**Cox,** DAVID, landscape-painter, was born at Deritend, a suburb of Birmingham, 29th April 1783. His father was a blacksmith, and he worked at the forge for a time; and after trying various employments and studying drawing under Joseph Barber, he was scene-painter in the Birmingham, Swansea, and Wolverhampton theatres, and occasionally appeared upon the boards in minor parts. He next took lessons in London from John Varley; in 1805 and 1806 visited North Wales, which to the end of his life was his favourite sketching-ground; and taught as a drawing-master, mainly in Hereford, publishing *A Treatise on Landscape Painting and Effect in Water-colours* (1814), and other educational works, illustrated by soft-ground etchings by his own hand. In 1813 he joined the Society of Painters in Water-colours, to whose exhibitions he was a regular contributor. From 1827 till 1841 his headquarters were in London, but he was constantly sketching in the country,

and occasionally he made brief visits to the Continent, executing water-colours of noble quality which slowly but steadily made their way with the public, and are now recognised as entitling their painter to a place among the very first of English landscapists. In 1839 he turned his attention seriously to oil-painting, a medium which he had hitherto used only for sketching, and soon he had mastered the process. He executed in all about a hundred works in oil. These are less widely known than his water-colours, but they are of at least equal quality. In 1841 he settled at Harborne, near Birmingham, where he resided for the rest of his life. It was during this period that he produced his greatest works, those most rapidly synthetic in execution, and most deeply poetic in feeling. They owe their inspiration mainly to the scenery of North Wales, and especially of Bettws-y-Coed (q.v.), which he visited every autumn. He died at Harborne, 7th June 1859. The manliness and simplicity of the painter's own character is reflected in his direct, faithful, and forcible art. His works are distinguished by great breadth, purity of tint, truth of tone, and brilliancy of effect, and they are admirable in their rendering of atmosphere, and in their suggestion of the sparkle and breezy motion of nature. Among the more celebrated of his oil pictures are 'Lancaster Castle' (1846); 'Peace and War' (1846), a small picture 18½ by 24 in., for which Cox received £20, but which fetched £3602 in 1872 (his lifelong ambition had been 'some day, D.V., to get £100 for a picture); 'The Vale of Clwyd' (1846 and 1848); 'The Skylark' (1849); 'Boys Fishing' (1849); and 'The Church of Bettws-y-Coed.' Among his very numerous water-colours are 'Lancaster Sands' (1835); 'Ulverston Sands' (1835); 'Bolton Abbey' (1847); 'Welsh Funeral' (1850); and 'Broom Gatherers on Chat Moss' (1854). His water-colour titled 'The Hayfield,' fetched £2950 in 1875. His works have been frequently brought together in exhibitions, and he was admirably represented by forty-six examples in the Manchester Exhibition, 1887. See the Memoir by N. N. Solly (1875), and the Biography by William Hall (1881).—His son, David Cox the younger (1809–85), was also known as a water-colour painter.

**Cox, Sir George**, an eminent mythologist, was born in 1827, and educated at Rugby and Trinity College, Oxford. He took orders in 1850, and after holding curacies in Devonshire, and an assistant-mastership at Cheltenham, became vicar of Bokesbourne in Kent, and afterwards rector of Scrayingham, York. In 1877 he succeeded to his uncle's baronetcy. An industrious man of letters, he wrote much on ancient history and on mythology. His *Tales of Ancient Greece* (1868) was a collected edition of several admirable earlier volumes of Greek history. His most important work, *The Mythology of the Aryan Nations* (2 vols. 1870), was an uncompromising development of the solar and nebular hypothesis as the key to all mythologies. It is learned, lucid, and courageous; but the extreme to which a serviceable enough theory has been pushed in an attempt to account for the unaccountable, and to reconcile the irreconcilable, has exposed its real weakness. His *History of Greece* (2 vols. 1874) was a work of great learning, and his *Introduction to the Science of Comparative Mythology and Folklore* (1881) showed its author's old ingenuity and erudition, but none the less the singular limitation of his knowledge. Other works are *Latin and Teutonic Christianity* (1870), *The Crusades* (1874), *History of British Rule in India* (1881), *Lives of Greek Statesmen* (2 vols. 1886), and concise *History of England* (1887). With W. T. Brande he edited the useful *Dictionary of Science, Literature, and*

*Art* (3 vols. 1865–67). His *Life of Bishop Colenso* appeared in 1888. He died 9th February 1902.

**Coxe, Henry Octavius**, librarian, was born at Bucklebury vicarage in Berkshire, September 20, 1811. He was educated at Westminster and Worcester College, Oxford, and entered the manuscript department of the British Museum in 1833, soon afterwards taking orders. In 1838 he became attached to the Bodleian Library, in 1860 its head, and here his marvellous knowledge and patient kindness made him the very ideal of the librarian. Already in 1857 he had been sent by Sir G. C. Lewis to the East on a tour of discovery, which resulted indeed in his finding many codices, though the grasping greed of the ignorant monks, at last awakened to their value, made it impossible to buy them. Coxe held in succession several curacies near Oxford, and in 1868 became rector of Wytham. He was Select preacher in 1842, Whitehall preacher in 1868, and in 1878 presided at the first annual meeting of the Library Association at Oxford. Coxe died July 8, 1881. Although himself an excellent palæographer and ripe scholar, Coxe did much more for others' reputations than his own. The most important of his own works were an edition of Roger of Wendover's *Chronicle* (5 vols. 1841–44), and of Gower's *Vox Clamantis* for the Roxburghe Club (1850), and his Catalogues of MSS. in the colleges and halls of Oxford (1852), and of the Bodleian MSS. (1853–54). See Dean Burgon's *Lives of Twelve Good Men* (1888).

**Coxe, William**, historical writer, was born in London, 7th March 1747, and from Eton passed to King's College, Cambridge, of which he became a fellow in 1768. As tutor to the sons of four persons of quality, he spent much of twenty years on the Continent, where he neglected no opportunity of collecting information about the countries which he visited. The result appeared in fourteen works of travel and history, careful but dull, the best known being his *History of the House of Austria* (1807). He died, a prebendary of Salisbury and Archdeacon of Wilts, at Bemerton rectory, 16th June 1828.

**Coxswain**, or COCKSWAIN (pronounced *cozn*, and often abbreviated to *cox*), on board ship, is the steersman of a boat, and commander of the boat's crew. In boat-racing, the coxswain should always by preference be a very light weight. See ROWING.

**Coxwell, Henry Tracey**, aéronaut, born in 1819, at Wouldham, near Rochester, was educated for the army, but settled as a surgeon-dentist in London. From boyhood he had taken a keen interest in ballooning; in 1844 he became a professional aéronaut, and in 1845 established the *Aerostatic Magazine*. Thereafter he made some 700 ascents, the most remarkable being that of 1862, when he reached, with Mr Glaisher, a height of seven miles. He published *My Life and Ballooning Adventures* (2 vols. 1887–88), and died 5th January 1900. See BALLOONS AND AEROPLANES.

**Coyote**. See WOLF.

**Coypu** (*Myopotamus coypu*), a large rodent in the porcupine section of the order. It is the only known species of its genus, is common in South America on both sides of the Andes, lives (in pairs) in burrows near water, and feeds on aquatic plants. The animal measures from one to two feet in length, not including the long scaly tail; the general colour is brown varying towards yellow; the hind-feet are webbed and enable the coypus to swim well. The mother-animal swims with her young on her back, and this habit may have something to do, it is suggested, with the peculiar position of the teats, which are high up on the

flanks. The coypu is much hunted for its flesh and fur. The latter is best known under the

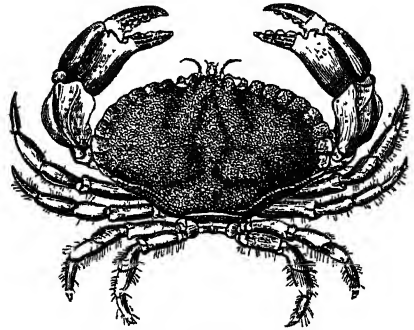

Coypu (*Myopotamus coypu*).

Spanish name of Nutria, and forms an important article of commerce.

**Cozens**, JOHN ROBERT, water-colour painter, was born in England in 1752. He was instructed by his father, Alexander Cozens, also known as an artist in water-colours, who was one of the two natural sons of Peter the Great, by a woman from Deptford who accompanied the Czar to Russia. In 1776 he visited Switzerland, with R. Payne Knight, and in 1783 returned from an extended tour in Italy with William Beckford, who commissioned many of the washed drawings which he then executed. Among his English subjects are some fine studies of trees made in Windsor Forest. In 1794 the artist's mind gave way, and in his later days he was befriended by Sir George Beaumont and Dr Munro. The date of his death has been usually stated as 1799, but there is reason to believe that he was alive after 1801. The great qualities of his art have commanded the enthusiasm of brother-painters. Turner and Girtin copied his drawings, and Constable pronounced that 'his works were all poetry,' that he was 'the greatest genius that ever touched landscape.' He to some extent extended the very limited colour-scheme of previous painters in the medium, introducing greater force and variety of tinting; and he substituted for their topographical treatment of landscape a rendering more imaginative and more perceptive of the delicacies of atmospheric effect. In composition, his works are singularly large and harmonious, and they evince an especial sympathy for nature in her moods of placid sublimity. There is a fine series of his works in the British Museum Print Room.

**Crab**, a popular name legitimately applied to any of the short-tailed (*Brachyura*) division of decapod Crustaceans (q.v.). The body is usually short and compressed; the abdomen is short and is tucked up beneath the relatively large cephalothorax; there are 1 to 4 reduced abdominal appendages, but seldom any tail-paddles; the antennæ are short. In the common Shore-crab (*Carcinus maenas*) the carapace is a wide shield, broader than long, and bent inwards at the sides; the eyes are stalked, and lie as usual above and in front of the antennules, though apparently rather external to them; the antennules have the ear-sac lodged in their dilated base; the bases of the antennæ are immovable, and the opening of the excretory organ at their base has a curious movable plate. The hindmost of the foot-jaws or maxillipedes is in part expanded into a broad plate which covers the neighbouring appendages. The great claws are generally larger in the male than in the female, and thus the market value of the male Edible Crab (*Cancer pagurus*) is said to be five times as great as that of the female. The reduced

abdominal appendages of crabs are solely used for reproductive purposes. The two anterior pairs are copulatory in the males; those that persist in the females have the eggs attached to them. The abdomen is always larger and broader in the females. The nervous system is peculiar in the centralisation of the thoracic ganglia into a single mass. The alimentary, circulatory, and excretory systems do not present any important peculiarities. The gills are always fewer than in the crayfish, never exceeding nine on each side. The gill-cavity is large, especially in the land-crabs. In the common shore-crab, the larva leaves the egg as a zoea, after repeated moults becomes a sort of hermit-crab-like form known as a Megalopa, and gradually with broadening shield, loss of abdominal

Great Crab (*Cancer pagurus*).

appendages, bending up of the abdomen, and modification of the anterior limbs becomes a miniature adult.

**General Life.**—Crabs feed chiefly on other animals both alive and dead. The Swimming Crabs (*Portunus*)—e.g. *P. pelagicus*, attack fishes. *Cardisoma carnifex*, found in the mangrove swamps of the West Indies, is fond of the fruit of a species of Anona, but is also notorious for burrowing in the cemeteries. The well-known Land-crab (*Gecarcinus ruricola*) damages sugar-canes. Many crabs are very rapid runners, especially the sand and land forms; others are powerful burrowers—e.g. the Calling Crab (*Gelasimus*), which has one of its great claws much exaggerated, and carried during locomotion over its head in such a way that it looks as if it were beckoning; others again are expert swimmers—e.g. our British pelagic *Polydora henslowii*, which has a light shell, and four of its thoracic appendages flattened for swimming. In regard to respiration it is worth noticing that the land-crabs are so far terrestrial that they are liable to be drowned in water. The male crabs are usually larger, and sometimes fight with one another as well as with other species. In some cases (*Gelasimus*) the bright colour is only acquired at the period of reproductive maturity. The sexes of the common Shore-crab (*Carcinus maenas*) are said to unite just after the female has moulted her hard shell. In all but the land-crabs the female carries about the eggs till they are hatched.

**Habitat.**—Almost all crabs are strictly marine forms, and the majority frequent shallow water. Among the terrestrial forms the best known are the species of *Gecarcinus*, swiftly moving nocturnal crabs in tropical regions of both hemispheres, chiefly vegetarian in their diet, migrating in companies to the sea for egg-laying purposes. The genus *Ocypoda* includes some land forms, and some which produce a shrill noise by rubbing the ridged surface of the second-last joint of

the right great claw against a sharp edge of the second joint. The Calling Crab (*Gelasimus*) makes large burrows, and the male closes the mouth of the hole with its exaggerated great claw. The Pea-crabs (*Pinnotheres*) live inside bivalves (*Pinna*, *Mytilus*, *Mactra*, &c.). One species (*P. veterum*) was said by the ancients to nip the mollusc when danger threatened, and to receive its share of food in return. There is no doubt as to the share of food, but no evidence that the crab rewards its host. In the genus *Telphusa* all the species live in fresh water in the warm parts of the globe. The European species (*T. fluviatilis*) is tolerably common in southern Europe, was known to the ancients both in its habit and edibility, and is often figured on Sicilian coins. As regards geological distribution, the *Brachyura* do not certainly appear before the upper Jurassic, and become gradually more numerous in Cretaceous and Tertiary strata.

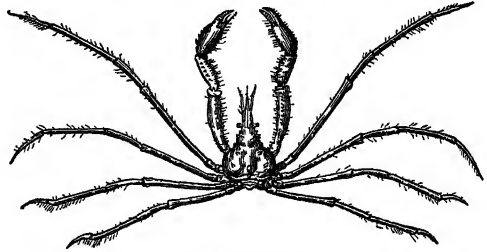

**Moulting and Amputation.**—Like other crustaceans, crabs periodically cast their chitinous and limy shells. The moults are most frequent in youth, when the rapid growth of the body conflicts with the rigidity of the armature. Extra feeding may accelerate the process. Before moulting the old shell becomes virtually dead, reserve stores are used in fresh growth, a new shell begins to form within the old, and finally with considerable, and sometimes fatal effort, the shell is cast. It is left in apparent intactness, a very image of its lost tenant. The new suit, which is at first soft, requires several hours or days to acquire firmness. The loss of internal linings, of stomach mill, of the outer covering of the eyes, &c., as well as of the entire outer armature, leaves the crab very much *hors de combat*. The period is one of great disadvantage to the crabs, not only from the fatigue and often fatality of the process, but from the state of defenceless helplessness in which they are temporarily left. In many cases crabs lose their limbs in fighting, and they may voluntarily resign them (as in *Porcellana platycheles*) to save their bodies. Sudden panic or injury is said to lead to similar self-inflicted amputation or 'autotomy.' Like many animals lower in the scale, crabs are able to make good their injuries, though several moults are required to regenerate a limb.

**Masking.**—A common habit among crabs is that of masking themselves with foreign objects. Thus both the European species of *Maia* (*M. squinado* and *M. verrucosa*) are usually overgrown by *Algæ*, *Hydroids*, and *Polyzoa*; the same is true of *Pisa*; in *Inachus* the long feet are especially well concealed by seaweeds; our common *Stenorhynchus* is often covered by a sponge growth; the Mediterranean *Dorippe lanata* uses its hind-legs to carry some living or dead object upon its back, and thus very emphatically asserts its innocence; the common *Dromia* (*D. vulgaris*) holds sponges on its back in similar fashion. See COMMENSALISM.

**Intelligence.**—As in several features of their structure, so in their intelligence, crabs appear to hold the highest place among crustaceans. Moseley observed how a sand-crab (*Ocypodaippeus*), which dreads the sea, dug itself into the sand and held on against the undertide of each great wave. Romanes refers to the alleged habit of the common crab in stationing a hard-shelled individual as sentinel during the moulting season. There seems to be not a little of the intelligent in some cases of crab-commensalism. Darwin has, however, given a crowning instance of intelligence which is worth many less emphatic. Some shells were thrown towards the hole of a burrowing shore-crab (*Gelasimus*). One rolled in, three remained a few inches from the mouth. In a few minutes the crab came

out, bearing the shell which had fallen in, and removed it to the distance of a foot. 'It then saw the three other shells lying near, and evidently thinking that they might likewise roll in, carried them to the spot where it had laid the first.'

**Common British Forms.**—The Common Shore-crab (*Carcinus maenas*); the Great Crab (*Cancer pagurus*), so much eaten; the Slender Spider-crab or Slender-beaked Crab (*Stenorhynchus tenuirostris*), with very long spider-like legs and bright

Slender Spider-crab (*Stenorhynchus tenuirostris*).

pink triangular body; the large Thorny Spider-crab (*Maia squinado*); the Common Swimming Crab (*Portunus variegatus*), common on Scotch coasts, with the last pair of legs flattened like oar-blades; the Velvet Fiddler-crab or Devil-crab (*Portunus puber*), with a brown hairy shell; the Masked Crab (*Corystes cassivelaunus*), with a carapace marked so as to suggest a mask, often found buried in the sand of English and Welsh coasts; the small Four-horned Spider-crab (*Pisa tetraodon*); the little Pea-crab (*Pinnotheres pisum*, &c.), inside bivalves, are familiar British species.

See CRUSTACEA, CRAYFISH, HERMIT-CRAB, LOBSTER; Smith and Weldon, *Cambridge Natural History*, vol. iv. (1909); Sedgwick, *Student's Text-book of Zoology*, vol. iii. (1909); Calman, *Life of Crustacea* (1911); and 'Crustacea' in Lankester's *Treatise of Zoology*.

**Crab**, ROGER, hermit, was born about 1621 in Buckinghamshire, and served for seven years (1642-49) in the Parliamentary army. He then set up in business as 'a haberdasher of hats' at Chessham, in his native county. He became possessed of the idea that it was sinful to eat any kind of animal food, or to drink anything stronger than water; and in 1651, determined to follow literally the injunction given to the young man in the gospel, he sold off his stock-in-trade, distributing the proceeds among the poor, and took up his residence in a hut. His food consisted of bran, turnip-tops, dock-leaves, and grass. The persecutions the poor man inflicted on himself caused him to be persecuted by others, cudgelled, and put in the stocks. He was four times imprisoned for Sabbath-breaking and other offences, yet still he persisted in his course of life. He published *The English Hermit*, *Dagon's Downfall*, and a tract against Quakerism; and he died at Bethnal Green, 11th September 1680.

**Crab-apple** is a term applied somewhat vaguely to any sour and uncultivated variety or species of apple. Thus *Pyrus spectabilis* of shrubberies is known as the Chinese Crab, *P. prunifolia* as the Siberian Crab, *P. coronaria* as the American Crab, and *P. baccata* of North Asia (including *cerasifera*) as the Cherry Crab. More strictly, however, the term is applied to the wild varieties of the true apple (*P. Malus*, var. *sylvestris*). Of this, again, two main varieties are distinguished, one smooth-leaved and sour (var. *austera*), the other more or less woolly-leaved and sweeter (var. *mitis*). The former

of these may therefore be considered as the crab-apple proper.

**Crabbe**, GEORGE, poet, was born on Christmas Eve of 1754, at Aldeburgh, on the Suffolk seaboard. His father, 'salt-master' and warehouse-keeper, was a clever, strong, violent man; the mother, a meek, religious woman; and of three brothers, one perished captain of a slaver, another was lost sight of in Honduras. George, the eldest, got some schooling at Bungay and Stowmarket, then from 1768 to 1774 was surgeon's apprentice at Wickham-Brook and at Woodbridge. In his first place he had to help the ploughboy; in his second he fell in love with Sarah Elmy ('Mira'), who lived with her uncle, a wealthy yeoman, at the old moated hall of Parham. A spell of drudgery in his father's warehouse—nine months in London, picking up surgery cheaply—some three years' struggling practice at Aldeburgh—at last in April 1780, with £3 in his pocket, he sailed again for London, resolved to try his fortune in literature. Eight years before he had written verses for *Wheble's Magazine*; he had published *Inebriety, a Poem* (Ipswich, 1775); and now his *Candidate* soon found a publisher, unluckily a bankrupt one. A season of penury, dire as Chatterton's, was borne by Crabbe with pious bravery; he had to pawn clothes and instruments; appeals to Lords Thurlow, North, Shelburne, found no response; and early in 1781 he saw himself threatened with arrest for debt, when he made his case known to Burke. Forty-one years later he told Lockhart at Edinburgh how, having delivered the letter at Burke's door, he paced Westminster Bridge all night long until daybreak. Burke proved a generous patron; from the hour of their meeting Crabbe was a 'made man.' He stayed at Beaconsfield; he met Fox, Johnson, and Reynolds; Thurlow gave him a bank-note for £100; Dodsley brought out his *Library*; and the very next winter he was ordained to the curacy of his native town. He resided as domestic chaplain to the Duke of Rutland at Belvoir Castle (1782-85); married Miss Elmy (1783); held four livings in Dorset, Leicester, and Lincoln shires, and spent thirteen happy years in Suffolk, at Parham, Great Glemham, and Rendham (1792-1805); returned to Muston, his Leicestershire rectory; and his wife having died there in 1813, exchanged it the next year for Trowbridge in Wiltshire. His gentle, kindly life, in which botanising had given place to fossil-hunting, was broken now and again by visits to London and its best society; he witnessed the Bristol riots (1831), as fifty-one years before he had witnessed those of Lord George Gordon. He died at Trowbridge, 3d February 1832.

Three novels, a treatise on botany, and poems untold all perished in grand yearly 'incremations'; but still, Crabbe published *The Village* (1783), *The Newspaper* (1785), *The Parish Register* (1807), *The Borough* (1810), *Tales* (1812), and *Tales of the Hall* (1819), for which last and the earlier copyrights Murray paid him £3000. Of these poems Wordsworth wrote in 1832, 'They will last full as long as anything expressed in verse since first they made their appearance;' and Jane Austen said Crabbe was the only man whom she would care to marry. Byron, too, Scott, Jeffrey, Wilson, Tennyson, Swinburne, Cardinal Newman, and above all Edward FitzGerald, must be reckoned among his few votaries. 'Though nature's sternest painter, yet the best,' Byron's verdict upon him, is truer than Horace Smith's, 'a Pope in worsted stockings,' for this refers but to the accident of metre—the rhyming heroics, which, thirty per diem, Crabbe ground out anywhere. Their subject-matter, though, is all Crabbe's own. He is as much the poet of East Anglia as Scott of the Borderland or Wordsworth of the Lake Country. Its scenery and the life

of its fisher-folk and peasantry he described with a realism greater than Zola's, if sometimes almost as tedious. Zola! nay, Crabbe has closer kinship to Balzac; and his strong, sombre pictures of sin and suffering are ever and again lit up with homely pathos and shrewd, Dutch-like humour. 'The tragic power of Crabbe,' says Swinburne, 'is as much above the reach of Byron, as his singularly vivid, though curiously limited, insight into certain shades of character.' And in old John Murray's words, 'Crabbe said uncommon things in so common a way as to escape notice;' surely he claims notice from such as rank thought higher than expression.

An admirable Life by his son, the Rev. George Crabbe (1785-1857), for twenty-three years vicar of Bredfield, Suffolk, is prefixed to *Crabbe's Works* (8 vols. 1834). See also Canon Ainger's *Crabbe* (in 'English Men of Letters' series, 1903); Keble's *Crabbe* (1888); Holland's *Selections* (1899); Courthope's essay in Ward's *English Poets* (vol. iii.); the edition of Crabbe's works by A. W. Ward (3 vols. 1905-7); René Huchon's *George Crabbe and his Times* (trans. 1907); Broadley and Jerrold, *The Romance of an Elderly Poet* (1913).

**Crab-stones**, or CRAB'S EYES, are concretions, mainly calcareous, formed in the stomachs of crayfish and some other crustaceans. Finely powdered, they were used medicinally as an absorbent and antacid; and the name is given to similar powder, whencesoever derived.

**Cracked Heels** are due to washing horses' legs and imperfectly drying them; to permitting horses to stand in accumulated filth and exposed to draughts, so that the skin becomes inflamed, tender, itchy, thickened, and by-and-by cracked; and to clipping horses' legs, especially in spring, when the roads are wet and dirty, and frost sets in before the horses are in from work. An ichorous and fetid discharge exudes, and lameness often results. In animals with round *gummy* legs it is sometimes constitutional; underbred horses with rough hairy fetlocks present the majority of cases; white heels, being more delicate, are especially affected; whilst the hind-limbs, exposed as they are to filth and cold, suffer most frequently. Cleanse carefully with tepid water, wash with a mild astringent, or dress white heels occasionally with oxide of zinc ointment, and, when black, mix a little powdered charcoal with the ointment. When the skin is dry and irritable, poultice and apply glycerine before proceeding with astringents. In cold weather, and especially when the horse is heated, interdict washing the legs; but allow them to dry, and then brush off the dirt.

**Cracovienne** (*krakowiak*), the national dance of the Polish peasantry around Cracow. It has a very marked rhythm in 2 time, and is often accompanied by singing. The Poles have a multitude of little ditties of two lines each adapted to it.

**Cracow** (Pol. *Krakow*, Ger. *Krakau*), a city of Polish (formerly Austrian) Galicia, 259 miles NE. of Vienna by rail. It stands 672 feet above sea-level, in a wide, hill-girt plain on the left bank of the Vistula, which here becomes navigable, and is spanned by a bridge (1850) leading to Podgorze. The old walls have been converted into promenades, and a line of detached forts now defends the city. Its older portion is a labyrinth of narrow, dark, and deserted streets, but contains many fine specimens of Gothic architecture in its churches and other edifices; and some handsome buildings are also to be seen in the more modern suburbs. On the Wawel rock, in the midst of the houses, rises the old castle of the Polish kings, which was degraded to a barracks, but has been restored. The neighbouring cathedral (1320-59) is a splendid pile, containing the graves of John Sobieski, Poniatowski, Kosciusko, Mickiewicz, and many more, with Thor-

waldsen's statue of Christ. The university was founded in 1364 by Casimir the Great, and reconstituted under the Jagellons in 1400. New buildings were erected in 1881-87. The second oldest university in central Europe, it was for long the centre of light for Poland. It has a library of 500,000 volumes, and many MSS. of great value for Polish history. Cracow has important fairs, and its trade and manufactures (chemicals, tobacco, beer, agricultural implements, &c.) have of late years greatly revived. Salt-mining has been in operation since 1054. Three miles west is a grassy mound, 150 feet high, reared in 1820-23 to the memory of Kosciusko. It is composed of earth taken from all the patriotic battlefields of Poland. The population has varied much, from 80,000 in the 16th century to 10,000 at the end of the 18th, 49,835 in 1869, 66,095 in 1880, 74,593 (nearly half Jews) in 1890, and 181,700 in 1921.

Cracow was founded by Krak, Prince of Poland (see the history by Lepszy, translated 1912), about the year 700, became the capital of Poland in 1320, and continued so till 1609. It was taken by the Bohemians in 1039, by the Tatars in 1241, by the Swedes in 1655 and 1702, and by the Russians in 1768. On the third partition of Poland, in 1795, it was assigned to Austria. From 1809 to 1815 it formed part of the duchy of Warsaw. The congress of Vienna established it as a republic, with a territory of 425 sq. m., under the protectorate of Russia, Prussia, and Austria. Polish sympathies there led to its annexation by Austria in 1846, but with the emergence of the republic it was restored in 1919 to Poland.

**Craddock**, CHARLES EGBERT, is the pen-name of Mary Noailles Murfree, born near Murfreesborough in Tennessee in 1850, and known as author of *In the Tennessee Mountains* (1884), *Down the Ravine* (1885), *The Prophet of the Great Smoky Mountains* (1885), *The Bushwhackers* (1899), *A Spectre of Power* (1903), and many other stories.

**Cradley** (separated by the river Stour from the village of Cradley Heath) is a Worcestershire township and an ecclesiastical parish formed in 1799 from the civil parish of Halesowen, on the borders of Staffordshire, with extensive iron trade (nail-making included).

\* **Crag and Tail**, a term used to designate a peculiar hill conformation, in which a bold and precipitous front exists on one aspect of a hill, while the opposite is formed of a sloping declivity.

Castle Rock, Edinburgh.

Fine examples of this structure occur in and around Edinburgh, where the bold 'crag' faces the west and the 'tail' slopes towards the east; as, for example, the Castle rock, precipitous and unapproachable on every side except to the east. The structure owes its origin to the juxtaposition of rocks of variable degrees of durability—the harder and more durable rocks have resisted denudation, and so protected the more readily eroded rocks that occur on the lee side of the former. The crag and tail phenomena of central Scotland and other regions which have been subjected to extreme glaciation (see GLACIAL PERIOD) is due to glacial erosion and accumulation. The crag faces the direction from which the ice came, and thus by opposing its advance induced excessive erosion

upon the ground immediately in front. A hollow has thus usually been scooped out in this place, and continued along either side of the obstruction for some little distance. This somewhat crescent-shaped hollow is well seen on the west side of Edinburgh Castle rock, sweeping round on the north by Princes Street Gardens (the old Nor' Loch), and on the south by the valley of the Cowgate. The morainic material dragged along underneath the ice accumulated in the rear of the crag, so that the strata in that position are usually covered to a greater or less depth with boulder-clay, &c. The High Street of Edinburgh is thus built upon morainic materials.

**Craig**, EDWARD GORDON, son of Miss Ellen Terry, born 1872, began to act in 1889 under Sir Henry Irving, and since 1897 has devoted himself to studying the Art of the Theatre. He maintains that it has been enslaved by acting, and music, and literature, and painting, and costume-designing; whereas the stage director should work not for statement but suggestion, and should appeal primarily to the eye by colour and mass and movement, the words and other things being allowed to help out the meaning. He has written several works on the Art of the Theatre, and influenced the stage in England, Germany, France, and Russia.

**Craig**, JOHN, Scottish Reformer, was born in 1512, and educated at St Andrews. He joined the Dominicans there, but fell under suspicion of heresy, and after a brief imprisonment (1536) went to Rome, and later to the Dominican convent of Bologna. A copy of Calvin's *Institutes* converted him to Protestantism, and on 18th August 1559 he was lying in the dungeon of the Inquisition, condemned to suffer next morning at the stake, when Pope Paul IV. died, and the mob broke open the prisons, and set the prisoners at liberty. A bandit befriended him; a dog brought him a purse of gold as he was wandering helpless through a forest; he escaped to Vienna, and there preached in his friar's habit, one of his hearers being the Archduke Maximilian. Presently the new pope, learning his whereabouts, demanded his surrender; but Maximilian gave him a safe-conduct, and in 1560 he returned to Scotland. In 1563 he was appointed coadjutor to Knox, and with him was accused by the Earl of Bedford of having been privy to Rizzio's murder; in 1567 he incurred some censure for proclaiming, under strong protest, the banns between Queen Mary and Bothwell; and in 1572 he was sent to 'illuminate the dark places' in Angus and Aberdeenshire. He came back to Edinburgh in 1579 as a chaplain to James VI., took a leading part in the church's affairs, and had a share with Melville in the Second Book of Discipline. He was the author of the 'Confession of Faith' or first National Covenant, 'subscribed by the king's majesty and his household and sundry others' at Edinburgh, 28th January 1580. He withstood the restoration of prelacy; but his comparative moderation was not seldom displeasing to the 'popes of Edinburgh.' He died 12th December 1600. His *Short Summe of the whole Catechisme* (1581) has been reprinted in fac-simile, with a valuable introductory Memoir by T. G. Law (Edin. 1883).

**Craig**, THOMAS, writer on feudal law, was born in 1538, either at Craigfintray (Aberdeenshire) or in Edinburgh. From St Andrews he passed in 1555 to the university of Paris, and in 1563 was admitted an advocate at the Scottish bar, being next year appointed justice-depute of Scotland, and in 1573 sheriff-depute of Edinburgh. Whilst head of the criminal judicature, he did not neglect the muses, as was evidenced by an epithalamium on Queen Mary's marriage with Damley and a poem on the

birth of James VI. Besides several more Latin poems, and the masterly *Jus Feudale* (1608; 3d ed. 1732), and *De Unionis Regnorum* (ed. Terry, Scottish History Society, 1910), he wrote two other Latin treatises—on James VI.'s right to succeed to the English throne, and on the homage controversy between Scotland and England. He died 26th February 1608. See *Life* by Tytler (1823).

**Craigie**, MRS PEARL MARY TERESA (*née* Richards), novelist, was born in Boston, U.S., on the 3d Nov. 1867, and educated in Boston, London, and Paris. She contributed to numerous magazines and newspapers, wrote several plays, but is best known from her novels published under her pen-name, John Oliver Hobbes—*Some Emotions and a Moral* (1891); *A Bundle of Life* (1894); *The Gods, some Mortals, and Lord Wickenham* (1895); *The Herb-moon* (1896); *The School for Saints* (1897); *Robert Orange* (1900); *Love and the Soul Hunters* (1902); *The Flute of Pan* (1905); and, almost immediately after her death on 13th August 1906, *The Dream and the Business*.

**Craigleith Stone**, a siliceous sandstone belonging to the Lower Carboniferous series, quarried at Craigleith, in the W. of Edinburgh.

**Craik**, GEORGE LILLIE, born at Kennoway, Fife, in 1798, was educated for the church at St Andrews University, but, settling in London, wrote *The Pursuit of Knowledge under Difficulties* (1831), contributed largely to the *Penny Magazine* and *Cyclopaedia*, and in 1839 became editor of the *Pictorial History of England*, supplying some of the most valuable chapters. From these his *Sketches of the History of Literature and Learning in England* (6 vols. 1844) and his *History of British Commerce* (3 vols. 1844) were reprinted. He filled the chair of English Literature in Queen's College, Belfast, from 1849 till his death on 25th June 1866. His other works include *Spenser* (1845), *Bacon* (1846-47), *Romance of the Peerage* (1848-50), *The English of Shakespeare* (1856), *A History of English Language and Literature* (1861; 9th abridged ed. 1883).—His youngest daughter, Georgina Marion (Mrs May), born in 1831, began to write at nineteen, and had at her death in 1895 published some thirty novels and stories.

**Craik**, MRS. Dinah Maria Mulock, well known as the author of *John Halifax, Gentleman*, was born at Stoke-upon-Trent in 1826. She early took the burden of supporting an ailing mother and two younger brothers, and wrote stories for fashion-books, as well as for graver publications. Her first serious appearance as a novelist was in 1849, with her story *The Ogilvies*, which was followed by *Olive*, *The Head of the Family*, and *Agatha's Husband*. But she never surpassed or even equalled her domestic novel *John Halifax* (1857), which has had, and still continues to have an extraordinary popularity, and has been translated into French, German, Italian, Greek, and Russian. The scene is laid at Tewkesbury, where a marble medallion has been placed to her memory in the abbey. A pension of £60 a year, awarded to her in 1864, she set aside for authors less fortunate than herself. In 1865 she married Mr George Lillie Craik, a partner in the publishing house of Macmillan & Co. (nephew of the subject of the preceding article), and spent a period of quiet happiness and successful literary industry at her home, Corner House, Shortlands, Kent, where she died 12th October 1887. Much of Mrs Craik's verse is collected in *Thirty Years' Poems* (1881). She wrote a good deal for the magazines, and produced in all forty-six works, viz.—fourteen more novels, and several volumes of prose essays, including *A Woman's Thoughts about Women* (1858), and *Concerning Men, and other Papers* (1888). See

Mrs Oliphant's sketch in *Macmillan's Magazine* (1887).

**Crail**, an antique little coast-town in the 'East Neuk' of Fife, 2½ miles WSW. of Fife Ness, 10 SE. of St Andrews, and 43 NE. of Edinburgh by rail. There is a fragment of a castle of David I.; and the church, which was made collegiate in 1517, is an interesting Second Pointed structure. John Knox here preached his 'idolatrous sermon,' 9th June 1559; and in 1648, James Sharp was appointed minister. The fishing is not what it once was, and the harbour has little trade; but Crail is a pleasant summer-resort. A royal burgh since 1306, it was till 1918 one of the seven parliamentary 'St Andrews burghs.' Pop. 1500.

**Craiova**. See KRAJOVA.

**Crake**. See CORN-CRAKE.

**Crambe**, a genus of Cruciferae, having a pod (*silicula*) of two unequal joints, of which the upper is globose and one-seeded, the lower abortive. *C. maritima* is well known as Sea-kale (q.v.). *C. tatarica*, of Eastern Europe, with much divided leaves and a great fleshy root, is cultivated in Rumania as caniflower, and its root is eaten either boiled or in salads.

**Cramer**, JOHANN BAPTIST, pianist, was born at Mannheim in 1771, the son of Wilhelm Cramer (1745-99), a musician of repute, who settled in London in 1772. From 1788 the son undertook concert tours on the Continent, and gained a high reputation as a facile and expressive performer. He founded the musical publishing firm which bears his name in 1828, and after some years' residence in Paris, died in London, 16th April 1858. Most of his compositions are now forgotten, but his series of *Studies* is a work of importance.

**Cramp** is a word applied to muscular contractions of an irregular kind, in a somewhat variable way.

(1) In its common use, it denotes an involuntary and painful contraction of a voluntary muscle or group of muscles. It is most apt to occur when a muscle has been fatigued; though any muscle may be affected, those of the calves most often suffer. It is especially common in pregnant women and persons of a gouty diathesis, and is a prominent feature in some diseases, especially cholera. There is no specific for preventing it; each case must be treated on its merits. The contraction and accompanying pain is usually cut short if the affected muscle be stretched—e.g. in the case of the calf-muscles, the knee must be straightened and the foot bent up as far as possible towards the front of the leg, to lengthen the affected muscles to the utmost, and similarly with other cases.

(2) *Writer's Cramp* is the commonest and best known of a group of diseases called *trade spasms*. The person affected can use his fingers for any purpose, even the most delicate manipulations, so long as he does not attempt to write; but whenever he does so, the muscles refuse to obey his will, and the pen either drops from his hand or executes spasmodic purposeless movements. Similar conditions may occur in telegraphists and pianists—in fact, in any case where frequent and continued use of particular muscular actions is necessary. These distressing and troublesome affections are often cured by means of Massage (q.v.), electrical applications, and systematic gymnastic exercises of the affected parts.

(3) *Bather's Cramp*.—A good swimmer, while bathing, is seen to throw up his arms, perhaps is heard to cry out once, and then sinks to rise no more. It is said that 'bather's cramp' has been the cause of his death. This phrase, however, is merely an apology for ignorance: what has happened, and whether it is the same in all

apparently similar cases is as yet quite uncertain. Cramp, in the ordinary sense, of one or more limbs, though very embarrassing and alarming, would not be so disastrous to a practised swimmer as to make him sink without a struggle; and, though common in bathers, cannot be accepted as the cause of all the fatal accidents like that described above. Of other theories advanced, the most probable is that sudden failure of the heart's action, a partial or total faint, is the cause of the calamity, at least in very many cases. A sudden plunge into cold water by itself causes some strain upon the heart; and swimming, about the most severe of all forms of exercise, increases its work very greatly—sometimes, it is easy to believe, beyond safe limits. The recorded experience of some who have narrowly escaped death from this cause makes it appear extremely probable that it is the real explanation of at least some of these sad accidents. No one when out of practice should attempt a long swim in cold water; and persons with weak hearts should be especially careful to avoid fatiguing themselves when bathing.

**Cramp Rings** were rings which were supposed to cure cramp and the 'falling-sickness.' They are said to have originated as far back as the middle of the 11th century, in a ring presented by a pilgrim to Edward the Confessor, which, after that ruler's death, was preserved as a relic in Westminster Abbey, and was applied for the cure of epilepsy and cramp. Hence appears to have arisen the belief that rings blessed by English sovereigns were efficacious in such cases; and the custom of blessing for distribution large numbers of cramp rings on Good Friday continued to exist down to the time of Queen Mary. The accomplished Lord Berners, ambassador to Spain in Henry VIII.'s time, writes from Saragossa to Cardinal Wolsey: 'If your grace remember me with some crampe ryngs ye shall doo a thing muche looked for; and I trust to bestow thaym well with Goddes grace.' The metal the rings were composed of was what formed the king's offering to the cross on Good Friday, usually either gold or silver. The superstitious belief in the curative property of cramp rings made out of certain pieces of silver obtained in particular ways still lingers in some districts of England.

**Cran** (Gaelic), a measure of capacity in Scotland for herrings when just taken out of the net. It amounts to  $3\frac{3}{4}$  imperial gallons, and comprises about 750 herrings on an average.

**Cranach**, LUCAS, a celebrated German painter, so named from Kronach in the bishopric of Bamberg, Upper Franconia, where he was born, 4th October 1472. Little is known of his early life, but he seems to have been instructed by his father, and, possibly, by Matthew Grundewald; to have resided in Gotha, where he married Barbara Brengbier; and to have accompanied Frederick the Wise, Elector of Saxony, to the Holy Land in 1493. Certainly he was befriended by that prince, and was his court-painter at Wittenberg, an appointment made in or before 1504. He received in 1508 a patent of nobility, and the 'motto,' or *kleinod*, of a crowned and winged serpent, with which he marked his subsequent works, instead of (sometimes in combination with) the initials which he had previously used. Monopolies for printing and the sale of medicine were also bestowed upon him. The house in which he carried on his manifold occupations was standing at Wittenberg till 1871, and his importance in the town may be gathered from the fact that in 1537, and again in 1540, he was elected burgomaster. In 1509 he accompanied an embassy to the Emperor Maximilian, and while in the Netherlands he portrayed the

prince, afterwards Charles V., then a boy of nine. After the death of the Elector Frederick in 1525, he was continued in his official position by his brother, and also by his successor, John Frederick the Magnanimous, whose captivity at Augsburg the artist shared, and whose release he is believed to have procured from the emperor in 1552. He returned with his master to Weimar, and died there on 16th October of the following year. The superiority of his earlier works, both in painting and engraving, is doubtless to be accounted for by the fact that in later life the pressure of numerous commissions necessitated the assistance of his sons, and of many other pupils. His paintings, executed in oils on panel, include sacred and a few classical subjects, hunting-scenes, and portraits.

His drawing is commonly hard and defective, but his colouring is rich, warm, and effective, and a certain homely earnestness, sometimes mingled with humour, characterises his productions. A quaint portrait of a girl in an elaborate costume from his hand is in the National Gallery, London. He was closely associated with the German Reformers, many of whom were portrayed by himself and his pupils. Figures of Luther and Melancthon, and the painter himself, are introduced in his 'Crucifixion' in the Stadtkirche, Weimar, a work engraved in Waagen's *Handbook of Painting* (ed. of 1874), and usually regarded as the artist's most important composition. Three of his copper engravings, dated 1519, 1520, and 1521, represent Luther; and among his other principal works with the burin are 'The Penitence of St John Chrysostom' (1509), and a portrait of the Elector Frederick. His wood-engravings are more numerous, including 'The Passion,' 15 cuts; 'The Martyrdom of the Apostles,' 12 cuts; and 'The Wittenberg Hagiology,' 119 cuts. He had three sons, all of whom were painters.—The second of them, LUCAS, the younger, born 1515, was a burgomaster of Wittenberg. He painted in the manner of his father, and their works are difficult to distinguish, especially as both artists used a similar mark. According to Schuchardt, however, in the productions of the son the crowned serpent appears with the wings folded, instead of erect as in those of the father. His 'Crucifixion,' or 'Nativity,' and a picture of 'The Lord's Vineyard,' symbolical of the progress of the Reformation, are in the Stadtkirche at Wittenberg, and his works may also be studied in Berlin, Munich, and at Dresden, where are his portraits of the Electors Maurice and Augustus, and a 'Crucifixion.' He died at Wittenberg in 1586.

**Cranberry** (*Oxycoccus*), a north temperate and arctic genus of small evergreen shrubs of the order Ericaceæ (sub-order Vaccinioideæ). The only British species (*O. palustris*, or *Vaccinium Oxycoccus*) grows in peaty bogs and marshy grounds, and is a small wiry shrub with creeping thread-like branches, and small oval leaves rolled back at the edges. Large quantities of the fruit, which is chiefly used for making tarts, are collected in some parts of Britain and elsewhere, although the draining of bogs has now made it scarce where it was once plentiful. The berries are an excellent antiscorbutic, and hence furnish an excellent addition to sea stores. Wine is made from them in Siberia, and a beverage made from them is sold in the streets of St Petersburg.—The American Cranberry (*O. macrocarpus*) is of similar distribution, but is a larger and more upright plant, with bigger leaves and berries. The berries are not now collected by means of a rake, but by hand, as the former method bruises them. Large quantities are exported to Europe, and the berries are also imported into Britain from Russia and other parts of northern Europe. Both kinds may be cultivated in gardens, in a peat-soil kept very moist

or round the margin of a pond.—The berries of the Red Whortleberry or Cowberry, the Preiselbeere of the Germans (*Vaccinium Vitis-Idæa*) are sold under the name of cranberries in Aberdeen and

Cranberry (*Oxycoccus palustris*):  
a, flower; b, fruit.

other places, and are used in the same way.—The Tasmanian Cranberry is the fruit of *Astroloma humifusum*, a pretty little trailing Epacridaceous shrub; while in Australia the same name is given to other plants of the same order, notably to *Lissanthe sapida*.

**Cranborne**, VISCOUNT, the courtesy title of the eldest son of the Marquis of Salisbury.

**Cranbrook**, a pleasant little market-town in the Weald of Kent, 46 miles S.E. of London. It has a fine Perpendicular church, and a large trade in hops. From the 14th to the 17th century it was the centre of the broadcloth manufacture introduced by the Flemings.

**Cranbrook**, GATHORNE GATHORNE-HARDY, EARL (1814–1906; created 1892), was born at Biadford, the son of John Hardy of Dunstall Hall, Staffordshire. Educated at Shrewsbury and at Oriel College, Oxford, where he took his B.A. in 1837, he was called to the bar in 1840, and in 1856, after unsuccessfully contesting Bradford nine years earlier, was returned as a Conservative by Leominster. In 1865 he defeated Gladstone in the celebrated Oxford University election; in 1878 he was raised to the peerage as Viscount Cranbrook. He was Under-secretary of State for the Home Department (1858–59), President of the Poor-law Board (1866–67), Home Secretary (1867–68), War Secretary (1874–78), Secretary of State for India (1878–80), and Lord President of the Council (1885–92). See *Life* by his son (1910).

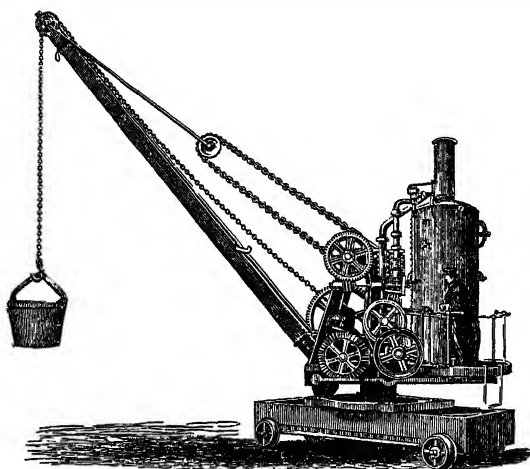

**Crane** (*Grus*), a genus of birds in the family Gruidæ, within the order Gruiformes, which also includes the Rails. They are not nearly related to storks or to herons. They frequent marshes and fens, and also the plains, and eat all sorts of vegetable food, varied occasionally with small animals of many kinds. They seem to be averse to wading. The cranes are all large birds, long-legged, long-necked, and long-billed. They seem to find it a little difficult to get going, but once started they fly steadily and swiftly. In migrating they often cover great distances, and at a great height. They have an elaborate courtship, with dances and trumpetings,\* and are said to be monogamous, pairing for life. The nest is on the ground, and there are usually two eggs. The young birds can run almost from the shell.—The Common Crane (*Grus communis*) bred in East Anglia till the end of the 16th century; nowadays it is not more than a very rare visitor. It is a stately, slate-gray bird, stand-

ing nearly four feet high, with a red, warty patch on its crown, and with remarkable inner secondary feathers which exceed the primaries in length and have free barbs. These bluish-black plumes form a graceful covering of the posterior parts of the body, and used to be much prized for decorative purposes. After the breeding season cranes become gregarious, feeding, playing, and flying together in large numbers. Both during flight and on the ground they utter characteristic trumpet-like notes, which may in part depend on the remarkable coiling of the windpipe within the breast-bone.—In the American Whooping Crane (*G. americana*) the windpipe is said to be four feet long. The flesh of the crane is palatable, especially after a diet of corn. Cranes use their bill as a dagger, and when wounded are dangerous to the eyes of a rash assailant. They may be readily tamed, and exhibit great sagacity; indeed they rank, with parrots and crows, as the wisest of birds.—The Demoiselle Crane, *Grus (Anthropoides) virgo*, with long white ear-tufts, and the Balearic Crane (*Balearica pavonina*) are both reported as having once occurred as stragglers in Britain. There are at least two North American representatives. See Blyth's *Natural History of the Cranes* (London, 1881).

**Crane**, a machine for lifting weights, worked either by hand, or by steam, or by hydraulic, or by electric power. It may be either revolving, the ordinary jib crane being of this form, or non-revolving—the overhead traveller of the workshop belongs to this class. The jib crane may be fixed, in which case the central post is securely fixed in one position, or portable, when the whole crane is mounted on a truck carried by wheels so that the crane may be moved from place to place as required. The simplest form of the first class is the hand crane, which consists of an upright revolving central post, a projecting arm, the jib, which carries a fixed pulley at its extremity, ties, which are attached to the extremity of the jib and to the framework of the crane, the winding drum with its attached gearing, and the lifting chain. The lifting chain or rope is secured to the load by an eye or hook; it then passes over the fixed pulley, and, finally, round the drum or cylinder; suitable toothed wheel gearing, worked by a handle, revolves this drum, and thus winds up, or unwinds, the rope or chain, and so raises or lowers the load. The effort applied by the men is magnified—if we neglect friction losses—in the same proportion that the peripheral speed of the handles is reduced by the gearing interposed between handle axis and drum axis. The revolving motion of the crane post enables the load to be deposited at any point within the sweep of the jib. In some forms the jib is hollow, the lifting chain then passes down inside it, diminishing the risk of fouling; in other forms the jib is of a curved form which enables the full benefit of the lift to be obtained. Hand cranes can only be used for comparatively light loads, and the speed of lift is slow; for heavy lifts and quick work power cranes are essential. The steam crane is still largely employed, and has certain advantages; it is self-contained, can, when portable, be moved by its own power to any required position; it is quick in action, economical in operation, and can be utilised for a wide range of work. Where, however, as in docks, railway yards, &c., a large number of cranes of similar type have to be installed, then it is cheaper to build a central power station and to distribute the power to each crane either hydraulically or electrically; the latter is the latest method, and has in certain cases a considerable advantage over the hydraulic system; it is now almost entirely employed for workshop travellers.

Hydraulic cranes, largely used for dock work and in steel-works, are simpler in construction

than steam cranes, much gearing being done away with; the water in the operating cylinder is under

great pressure, 700 to 1100 lb. per sq. inch. The power given out by the hydraulic cylinder is reduced and the speed of the lift made greater than that of the cylinder ram by using systems of pulleys in the inverse order; the lifting chain is attached to the cylinder and then passes round pulleys fixed to the ram head, and round other pulleys fixed to the cylinder frame on its way to the jib pulley. In the steam crane there are generally two direct-acting steam cylinders, which replace the two handles worked by hand. The illustration shows a portable steam crane. The truck carries a central post, the rest of the crane being carried on a base plate capable of rotating around the post; the steam boiler is placed in such a position on the base plate that it acts as a counterbalance to the load which has to be lifted. By means of gearing and clutches, operated by the engineman by hand or foot levers, the engine can perform the following operations: (1) lower or raise the outer end of the jib and thus increase the radius of the circle within which the load can be lifted or deposited; (2) slew the crane; (3) propel the truck along the rails; (4) hoist the loads. For the last three operations the gearing is arranged to give two speeds, slow or quick, either of which can be used, depending on the nature of the work. This crane can handle loads of 5 to 7 tons as a maximum.

Electric cranes are in most essentials similar to steam cranes, the electric motor taking the place of the boiler and steam cylinder, the series wound continuous current motor being most commonly used, as it has certain advantages, but other types are also used.

In all cranes powerful brakes are essential: barrel cranes are usually fitted with hand brakes; in steam cranes the driver puts the brakes on by use of a handle or foot treadle, so the brake is not automatic; in electric cranes it is more usual to arrange for the brakes to be on when there is no current passing through the motor—hence, as soon as the motor is shut off, or should a failure of current occur, the brake is at once put on. When in an ordinary crane the jib is raised or lowered in order to alter its radius, the load is also raised or lowered; several devices have been designed to get over this difficulty, and thus enable the load to remain at the same level while the jib is pivoted up or down. The mechanical efficiency of the lifting gear in modern cranes is about 85 per cent., and in a first-class electric crane about 70 per

cent of the electrical energy supplied to its motor is utilised in lifting the load.

Stationary power cranes are often of great size and consequent complexity; the 'hammer-headed' type has a lofty steel-braced tower on which is carried a horizontal double cantilever, the jib, which can rotate; this carries at one end the lifting crab, and at the other end the necessary lifting machinery and counter-weights. In this type, as in the Titan, the load can be moved inwards or outwards along the jib without altering its level. Such cranes are made up to a capacity of 200 tons. In the Titan form, much used in harbour and breakwater construction, the crane is portable.

The overhead traveller in a workshop or factory is a non-revolving crane; its essential parts are the main cross girders, the crab which moves to and fro along the cross girders on rails supported by them, two end carriages, on which the cross girders are supported, carrying wheels; these wheels run on rails carried by the longitudinal gantry girders; the crab can, therefore, lift and shift the load from one part to any other part of the shop by the following two motions—the crab moving to and fro along the cross girder, and the cross girder carrying the crab moving to and fro along the longitudinal girder by means of the end carriage wheels.

See *Cranes, their Construction, Mechanical Equipment, and Working*, by A. Bottcher, translated by A. Tolhausen.

**Crane, STEPHEN** (1871–1900), novelist, born at Newark, New Jersey, received a university education, was a war-correspondent in Turkey in 1897, and from 1891 became known as an eccentric poet and novelist of promise—his *Red Badge of Courage* (1896), a story of the Civil War, being his most notable work. Others were *George's Mother*, *The Little Regiment*, *The Open Boat*, *Whilomville Stories*, *The Monster*; besides *On Active Service*, *Wounds in the Rain*, and *Great Battles of the World*. In his later years he lived in England.

**Crane, THOMAS FRIDERIC**, folklorist, was born in New York city, 12th July 1844, graduated at Princeton in 1864, and from 1868 taught modern languages in Cornell University, in 1881–1909 as professor of Romance Languages. He wrote much on the literary history and philology of the Romance languages, and on the origin and diffusion of popular tales, and was one of the founders of the American Folklore Society (1888). Among his books are *Italian Popular Tales* (1885); *Le Romantisme Français* (1887); *Les Chansons Populaires de la France* (1891); and an edition (1890), for the English Folklore Society, of the *Exempla* or illustrative stories contained in the *sermões vulgares* of Jacques de Vitry, Bishop of Acre (died 1240).

**Crane, WALTER** (1845–1915), painter and socialist, was born at Liverpool, the son of an artist, Thomas Crane (1808–59). He himself was trained as an artist, and his earlier as well as much of his later work consists of book-illustrations. Among these may be named his series of 'Toy-books' (1869–75), 'The Baby's Opera' (1877), and 'The Sirens Three,' in which last the poem as well as the designs was his work. In 1862 he began to exhibit paintings at the Royal Academy, showing in that year 'The Lady of Shalott'; and he was a constant contributor to the Grosvenor Gallery from its foundation in 1877 till 1888. His pictures nearly always deal, in a somewhat decorative and archaic fashion, with subjects of an imaginative nature, such as 'The Riddle of the Sphinx' (1887). He also produced many very delicate landscape subjects in

water-colours; and published poems, illustrated by himself, *The Claims of Decorative Art* (1892), and *An Artist's Reminiscences* (1907). Associate (1889) and member (1902) of the Painters in Water colours, he was in 1893-96 art director to Manchester, and in 1898-99 principal of the Royal College of Art, South Kensington.

**Crane**, WILLIAM HENRY, comedian, born in 1845 at Leicester, Massachusetts, made his debut in opera at Utica, N.Y., but from 1870 became conspicuous as an exponent on the stage of eccentric American character, as in *David Harum*.

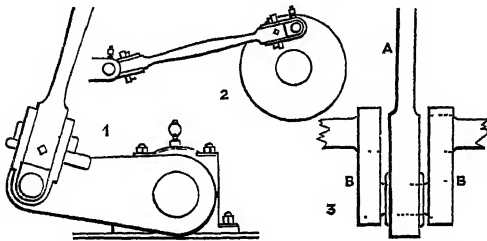

**Crane-fly**. See DADDY LONG-LEGS.

**Crane's-bill**. See GERANIOUM.

**Crananore** (properly *Kodungalūr*), a taluk in Cochin state, on one of the openings of the great Cochin backwater, 18 miles N. of Cochin town; pop. about 33,000. It is the traditional scene of St Thomas's labours. The Syrian Christians were established here before the 9th century, and the Jews' settlement was probably still earlier. It was taken from the Portuguese by the Dutch in 1661; was seized by Tippoo in 1776, retaken, sold, and destroyed and abandoned by Tippoo in 1789.

**Craniology**. See SKULL, ETHNOLOGY.

**Crank**, in Machinery, is a lever or arm on a shaft, driven by hand (e.g. a winch-handle), or by a connecting-rod, its object being to convert reciprocating motion into rotary motion. Engine-cranks which convert the to and fro motion of the piston into continuous rotation of crank-shaft are connected to the piston-rod end by the connecting-rod. They are, when single, of steel, wrought-iron, or cast-iron, the crank in this case being either a simple arm, enlarged at one end to fit over the shaft, and with a pin at the other end embraced by the rod end (fig. 1); or else a disc centred on the shaft, with crank-pin as before (fig. 2). This last form is well balanced. When double, as is usual in large engines (fig. 3), they are now often built up

of steel, the two arms being shrunk on to the shaft, and pin on to them. In two positions during each turn, a connecting-rod exerts no power of rotation. These are when rod A and crank-arms B are parallel (as in fig. 3 and opposite position), and are the *dead centres*; all the push or pull of the rod only causes pressure on shaft-bearings. To carry the crank over these points either a heavy wheel (fly-wheel) is attached to the shaft, which stores up energy during other parts of the revolution, and gives it out at these points, or else two or more cranks are so placed on the shaft that when one is on its dead centre, the others are exerting nearly their maximum effort, which is when rod and crank are at right angles. See TREAD-WHEEL.

**Cranmer**, THOMAS, Archbishop of Canterbury, was born of a good old family at Aslacton, Nottinghamshire, 2d July 1489. He learned his grammar of 'a rude parish clerk,' a 'marvellous severe and cruel schoolmaster,' who seems to have permanently cowed his spirit; still, his father trained him in all manly exercises, so that even

as primate he feared not to ride the roughest horse, and was ever a keen hunter. By his widowed mother he was sent in 1503 to Jesus College, Cambridge, where in 1510 he obtained a fellowship. He forfeited it by his marriage with 'black Joan' of the Dolphin tavern, but regained it on her death in childhood before the year's grace was up; and taking orders in 1523, proceeded D.D., and became a divinity tutor. During the quarter of a century that he resided at Cambridge he did not greatly distinguish himself; Erasmus never so much as mentions him; he was just a clever, hard-reading college don.

But in the summer of 1529 the plague was raging in Cambridge, and Cranmer removed with two pupils to Waltham. Here he met Fox and Gardiner, the king's almoner and secretary; and their talk turning on the divorce, Cranmer suggested that Henry might satisfy his conscience of the nullity of his first marriage by an appeal to the universities of Christendom. The suggestion pleased Henry; he exclaimed, 'Who is this Dr Cranmer? I will speak to him. Marry! I trow he has got the right sow by the ear.' So Cranmer became a counsel in the suit. He was appointed a royal chaplain and archdeacon of Taunton; was attached to the household of Anne Boleyn's father (Anne at the time being Henry's paramour); penned a treatise to promulgate his view; and was sent on two embassies, to Italy in 1530, and to Germany in the middle of 1532. At Rome the pope made him grand penitentiary of England; at Nuremberg he had married a niece of the Reformer Osiander—a marriage uncanonical but not then illegal—when a royal summons reached him to return as Warham's successor in the see of Canterbury. He sent his wife secretly over, and himself following slowly, was consecrated on 30th March 1533, four days after the arrival of the eleven customary bulls from Rome. He took the oath of allegiance to the pope, with a protest that he took it 'for form sake,' and with, as was usual, a contradictory oath of allegiance to the king.

That Henry looked for a pliable judge in Cranmer no man could doubt, least of all Cranmer himself, who in May pronounced Catharine's marriage null and void *ab initio*, and Anne's, four months earlier, valid; and who in September stood godfather to Anne's daughter Elizabeth. It was the samethroughout the entire reign. Cranmer annulled Henry's marriage with Anne Boleyn (1536), divorced him from Anne of Cleves (1540), informed him of Catharine Howard's prenuptial frailty, and strove to coax her into confessing it (1541). Sometimes he raised a voice of timid entreaty, on Anne Boleyn's behalf, on Cromwell's; still, if Henry said they were guilty, guilty they needs must be. He did what he dared to oppose the Six Articles (1539), naturally, since by one of them the marriage of priests was rendered felony, punishable with death; but he failed to stick to his opposition, and sent away his own wife to Germany, whence he did not recall her till 1548.

A kindly, humane soul, yet he was not ahead of his compeers—More, for instance, or Calvin—in the matter of religious toleration. We cannot acquit him of complicity in the burning of Frith and Lambert for denying the doctrine of Transubstantiation (1533-38), of Friar Forest for upholding the papal supremacy (1538), of two Anabaptists, a man and a woman (1538), of Joan Bocher for denying Christ's humanity (1550), and of a Dutch Arian (1551). In the death, however, of Anne Askew (q.v.) he seems to have borne no part; nor is there one word of truth in Foxe's legend that he coerced Edward VI. into signing the warrant for Joan Bocher's execution. With the dissolution of the monasteries he had little to do; but he

bestirred himself in promoting the translation of the Bible (q.v.) and a service-book, in curtailing the number of holy days, in the suppression of the cult of St Thomas of Canterbury, and in negotiating an eirenicon with foreign Reformers. On the path, indeed, towards Protestantism, he was ever in advance of Henry VIII., though to Henry he surrendered his right of private judgment as completely as ever Ultramontane to Pope. Thus, writing in 1540 on the sacraments, he could wind up a thesis with 'This is mine opinion and sentence at this present, which nevertheless I do not temerariouly define, but remit the judgment thereof wholly unto your majesty.' Henry repaid him with implicit confidence, and twice saved him from the plots of his enemies (1543-45).

On 28th January 1547 Henry died, and Cranmer sang mass of requiem for his soul. He had been slowly drifting into Protestantism; but now the inrushing tide swept him onward through all those religious changes by which the mass was converted into a communion—changes stereotyped in the Second Prayer-book of 1552. See ENGLAND (CHURCH OF), PRAYER-BOOK, ARTICLES, HOMILIES, CATECHISM. During this as during the preceding reign he meddled little with affairs of state, though he was one of the council of regency. What he did do was not too creditable. In gross violation of the canon law he signed Seymour's death-warrant; he had a chief hand in the deposition and imprisonment of Bishops Bonner, Gardiner, and Day; and won over by the dying boy-king's pleading, he reluctantly subscribed the instrument diverting the succession from Mary to Lady Jane Grey (1553). Herein he was guilty of conscious perjury, yet, the twelve days' reign over, he made no attempt to flee. On the contrary, he was roused to an outburst of indignation, rare with him, by a report that he had offered to restore the mass, had indeed restored it at Canterbury. In the heat of the moment he dashed off a letter, denouncing that report as a lie of the devil, which letter, unrevised, being prematurely circulated, on 14th September Cranmer was sent to the Tower, on 13th November was arraigned for treason, and, pleading guilty, was condemned to die. If he had been executed on that sentence, little could have been urged against his executioners, but he was reserved to be tried as a heretic, and, perchance, to recant his heresy. In March 1554 he was removed with Ridley and Latimer, to Bocardo, the common gaol at Oxford. He bore himself bravely and discreetly in a scholastic disputation, as also upon his trial before the papal commissioner, whose jurisdiction he refused to recognise. In October from the gaol he witnessed Latimer's and Ridley's martyrdom; in December judgment was pronounced against him; and on 14th February 1556 he was formally degraded, stripped of the mock vestments in which they had arrayed him. And now in rapid succession he signed form after form of recantation, seven in all, each more submissive than its predecessor. The last he transcribed on the morning of 21st March, and forthwith they brought him to St Mary's Church. If not before, he learned at least now from the sermon that he must burn; anyhow, when they looked for him to read his recantation, instead he retracted all that 'for fear of death' his hand had written 'contrary to the truth.' With a cheerful countenance he then hastened to the stake, and, fire being put to him, thrust his right hand into the flame, and kept it there, crying: 'This hath offended! Oh this unworthy hand! Very soon he was dead.

Among Cranmer's forty-two writings, the chief of which have been edited by the Rev. H. Jenkyns (4 vols. 1833) and the Rev. J. E. Cox (2 vols. Parker Society, 1844-46), may be noticed his

prefaces to the Bible (1540) and the First Prayer-book (1549); the *Reformatio Legum Ecclesiasticarum*—his revision, happily abortive, of the Canon Law (q.v.)—first published in 1571; and *A Defence of the True and Catholic Doctrine of the Sacrament* (1550).

See *Narratives of the Reformation*, edited by J. G. Nichols (Camden Society, 1859), with a sketch of Cranmer by Ralph Morice, his secretary; Foxe's *Acts and Monuments*; Cooper's *Athenæ Cantabrigienses* (1858); Mr Gairdner's article in the *Dictionary of National Biography* (vol. xii. 1888); Strype's *Ecclesiastical Memorials* (1721); Shakespeare's *Henry VIII.* and Tennyson's *Queen Mary*; Lives of Cranmer by Strype (1694), Gilpin (1784), Todd (2 vols. 1831, with fine portrait), Le Bas (2 vols. 1833), Dean Hook, *Lives of the Archbishops* (vols. vi.-vii. 1868), Collette (1887), Canon Mason (1898), A. D. Innes (1900), and A. F. Pollard (1905); also C. H. Smyth, *'Cranmer and the Reformation under Edward VI.* (1926).

**Crannog** (Gaelic *crann*, 'a tree,') a species of lake-dwelling common in Scotland and Ireland, which consisted of an islet wholly or partially built up from the bottom of the loch by masses of brush-wood, steadied by piling, and consolidated by stones and gravel, the whole being surmounted above the level of the water by a platform of timber, earth and stones, on which were wooden huts, often surrounded by palisades for better security. The word first occurs in historical documents in the Register of the Privy-council of Scotland in 1608, when the 'Crannokis of the Ylis' are classed with 'houssis of defence and strongholds' to be given up to the king. See LAKE-DWELLINGS.

**Crape**, a thin fabric made of silk, which has been tightly twisted, without removing the natural gum with which it is covered when spun by the worm. It is woven as a thin gauze, then boiled to extract the gum, which causes the threads partially to untwist, and thus gives a waved and rough appearance to the fabric. It is usually dyed black, and used for mourning apparel. The nature of the finishing processes in the making of crape is kept secret by European manufacturers. In Japan, crape is manufactured by using alternately weft threads twisted in opposite directions, and these are of a much closer twist than ordinary threads. When the piece is woven it is dipped in cold, then in hot, and again in cold water in rapid succession, and afterwards rolled and dried. The effect of these operations on the weft threads produces the crisp surface. Chinese and Japanese crapes are often white, with coloured designs, or in single colours, and used for shawls, scarfs, &c.

**Crashaw, RICHARD** (circa 1613-49), an English religious poet, was the son of a clergyman in the English Church, and was born in London about 1613. He was educated at the Charterhouse, and at Cambridge, where he obtained a fellowship at Peterhouse in 1637. His leanings towards Roman Catholicism prevented him from receiving Anglican orders, and in 1644 he was ejected from his fellowship by the parliament for refusing to take the Covenant. He went to Paris, adopted the Roman Catholic faith, and suffered great pecuniary distress, until about 1648, through Cowley's influence, he was introduced to Queen Henrietta Maria, who recommended him to certain dignitaries of the church in Italy. He obtained a humble office in the household of Cardinal Palotta, but in April 1649, a few months before his death, he became sub-canon of the church of Our Lady of Loretto. In 1634 Crashaw published a volume of Latin poems, *Epigrammatum Sacrorum Liber* (2d ed. 1670), in which appeared the famous line on the miracle at Cana:

*'Nympha pudica Deum vidit et erubuit'*

(The modest water saw its God and blushed).

In 1646 appeared his *Steps to the Temple; Sacred Poems, with other Delights of the Muses*—in which

there is much fervid poetry. The title of this collection, which is due to the editor, not the author, refers to its affinity with George Herbert's *Temple*. An edition (the third) was published at Paris in 1652, under the title *Carmen Deo Nostro*, with 12 vignette engravings designed by Crashaw. Crashaw has much in common with George Herbert and with Henry Vaughan, 'the Silurist'; though his conceits are more strained, his imagination is too copious, his subtlety too intricate. For him religion is 'all raptures and ecstasies, burning halos, quiring voices, soaring and shimmering wings'; St Teresa and Juan de Dios were his models. He is a great master of musical English versification, the first to succeed in irregular rhyming verse. Coleridge admitted his direct influence in *Christabel*; parallels have been found in Shelley and Swinburne; and many poets and critics in the second half of the 19th century recognised Crashaw's fascination.

There are editions of Crashaw by Turnbull (1858) and Grosart (1872-88), and of his poems by J. E. Tutin (1887 and 1900) and A. R. Waller (1904). See Mario Praz, *Secentismo e Marinismo in Inghilterra: John Donne-Richard Crashaw* (Flor. 1925).

**Crassulaceæ**, a family of succulent herbaceous or shrubby plants allied to the Saxifragæ. They grow chiefly in warm and temperate countries, especially South Africa and Mexico, and in dry, sunny situations. *Sedum* (stone-crop) and *Sempervivum* (house-leek) are the most familiar genera, largely used for bedding out and on rockwork.

**Crassus**, the surname of several old Roman families, among which that of the Licinii was most remarkable.—(1) LUCIUS LICINIUS, born in 140 B.C., was the best orator of his age, and was as distinguished for his wit as for his rectitude in the capacity of proconsul of Gaul. In 95 he was elected consul, along with Quintus Scævola, who had been his colleague in all his previous offices. During their consulship was enacted a rigorous law banishing from Rome all who had not the full rights of citizens, which imbibed the feelings of foreigners toward Rome, and was one of the chief causes of the Social War. As censor in 92 Crassus closed all the schools of the rhetoricians, believing that they exercised a bad influence on the minds of young men. He died in 91 B.C., a few days after vigorously opposing in the senate the democratic consul L. Philippus. Crassus is one of the speakers in Cicero's *De Oratore*, and indeed is the representative of the writer's own opinions.—(2) MARCUS LICINIUS, surnamed *Dives*, the triumvir, was born sometime before 115 B.C. His father was a partisan of Sulla, and on the return of Marius and Cinna to Rome in 87 made away with himself. Cinna spared the boy's life, but subjected him to a jealous and dangerous surveillance, to escape which he went to Spain. He afterwards joined Sulla (83), and distinguished himself in the battle against the Samnites at the gates of Rome. As prætor he crushed the Servile revolt by the conquest of Spartacus at the battle of Lucania (71), and in the following year was made consul with Pompey, a colleague whom he hated. On the other hand, Cæsar valued the friendship of Crassus, the most wealthy of Roman citizens. He was a keen and far-seeing speculator, and devoted his entire energies to the accumulation of money. We are told that he even bought clever slaves, and had them taught lucrative arts that he might enjoy the profits. During his consulate, Crassus gave a feast to the people, which was spread on 10,000 tables, and distributed to every citizen a provision of corn for three months. Plutarch estimates his wealth at more than 7000 talents, and Pliny states that his lands were worth 8000 talents (say £2,000,000). About 60, Cæsar, Pompey, and Crassus entered into

a private arrangement for their common benefit, which pactio is known as the first *triumvirate*. In 55, as consul with Pompey, Crassus had Syria assigned him for his province, and began to make preparations of war against the Parthians, hoping both for glory and for gain. The latter end he effected in the meantime by plundering the towns and temples in Syria. At length, however, he set out, but was misled by a treacherous guide, and utterly defeated in the plains of Mesopotamia by the Parthians. Crassus now retreated to the town of Carrhæ, intending to pass into Armenia; but was beguiled into a conference with the Parthian general, Surenas, and was slain at the appointed place of meeting. His head was cut off and sent to Orodes, who is said to have poured melted gold into the dead lips, saying: 'Sate thyself now with that of which in life thou wert so greedy.' His questor, Cassius, with 500 cavalry, escaped into Syria; but the remaining Romans were scattered and made prisoners, or put to death.

**Cratægus**, a genus of Rosaceæ, sub-order Pomeæ, very nearly allied to *Mespilus* (Medlar) and *Pyrus* (Pear, Apple, &c.), but distinguished by the acute calycine segments, and by the round or oval fruit, closed at the apex, and concealing the upper end of the bony cells. The species are pretty numerous, natives of the temperate parts of the northern hemisphere, and in general have flowers in beautiful terminal corymbs. They are all large shrubs or small trees, more or less spiny, whence the name Thorn has been very generally applied to them. The only native of Britain is the common Hawthorn (q.v.), (*Cratægus Oxyacantha*). Most of the species resemble it considerably in habit, size, form of leaf, &c. A number of them are now frequent in plantations and shrubberies in Britain, of which perhaps the most common is the Cock's-spur Thorn (*C. Crus-galli*), a native of North America from Canada to Carolina. Its leaves are not lobed; its fruit rather larger than that of the hawthorn. The Azarole (*C. Azarolus*), a native of the south of Europe, and the Aronia (*C. sinica*), a native of the Levant, are occasionally cultivated for their fruit. *C. orientalis* (or *odoratissima*) and *C. tanacetifolia* have also fruit of a considerable size. *C. Pyracantha* differs much in appearance from most of the genus; being a pretty evergreen shrub, with rich clusters of red berries.

**Cratinus**, a Greek comic poet born about 519 B.C., did not begin to exhibit till sixty-five, and died in 424. Next to his younger contemporaries, Eupolis and Aristophanes, he best represents the Old Attic comedy; but only fragments of his works have come down to us.—A younger CRATINUS belonged to the Middle School.

**Cratippus**, a peripatetic philosopher, a native of Mitylene and a contemporary of Cicero, whose son Marcus he instructed at Athens in 44 B.C.—Of the works of another CRATIPPUS, a continuator of Thucydides, only fragments have survived—one of them found at Oxyrhynchus in the 20th century.

**Craufurd**, ROBERT (1764-1812), major-general, born at Newark in Ayrshire, served against Tippoo Saib and in Ireland in 1798, gained credit even under Whitelocke at Buenos Aires, commanded a brigade in Sir John Moore's retreat, distinguished himself in important commands in the Peninsular campaigns, and fell at Ciudad Rodrigo. Probably the most brilliant leader of light troops in the Peninsula, he was headstrong, rash, and liable to outbursts of passion. Wellington was irritated by his risky operations on the Coa, but fully recognised his merit. See Innes Shand's *Wellington's Lieutenants* (1903).

**Craven** is a hill district in the north of the West Riding of Yorkshire, at the sources of the Aire and Wharfe.

**Craven, ELIZABETH, COUNTESS OF (1750-1828)**, a daughter of Lord Berkeley, married Lord Craven, but separated from him, and after his death in 1791 became Margravine of Anspach. She wrote books of travel, plays, and interesting *Memoirs*.—**LOUISA, COUNTESS OF CRAVEN (1785-1860)**, daughter of a Norwich soap-dealer called Brunton, retired from the stage in 1807 to marry another Earl of Craven.

**Craven, MRS (1808-91)**, was born in London, the daughter of a French *émigré*, who after the Restoration was ambassador at St Petersburg. Pauline de la Feronays married in 1834 Augustus Craven (died 1884), an English diplomatist, a grandson of the Margravine of Anspach. She wrote *Anne Sévérin* and other novels, a (French) Life of Lady Georgiana Fullerton, and the famous *Récit d'une Sœur*, a record of tender affection, bereavement, and mystical Catholic piety.

**Craven, WILLIAM, EARL OF (1606-97)**, served under the Prince of Orange and Gustavus Adolphus, and was so devoted to the cause of the Princess Palatine of the Rhine that it was said he was married to her. He suffered for his loyalty to Charles I., and was made Earl of Craven in 1664.

**Crawford, THOMAS (1814-57)**, sculptor, born in New York city, settled in Rome, where he worked under Thorwaldsen. His later works include the Washington monument at Richmond, and the bronze Liberty on the capitol at Washington. Mrs Hugh Fraser, author of *A Diplomatist's Wife in Japan* and many novels, is a daughter.

**FRANCIS MARION CRAWFORD**, his son (1854-1909), was born in Tuscany, and was educated at Concord (N.H.), Cambridge University, Heidelberg, and Rome. In India he studied Sanskrit, and during 1879-80 was engaged in press work at Allahabad, where he was admitted to the Catholic Church. His first novel, *Mr Isaacs* (1882), was a book of unusual merit, seizing on a new romantic element in modern Oriental life. Among its successors were *Dr Claudius* and *To Leeward* (1883); *A Roman Singer*, and *An American Politician* (1884); *Zoroaster* (1885); *The Story of a Lonely Parish*, and *Saracinesca* (1886); *Marzio's Crucifix*, and *Paul Patoff* (1887); *With the Immortals* (1888); *Sant'Iario* (1889); *A Cigarette Maker's Romance*, *Khaled*, and *The Witch of Prague* (1891); *Don Orsino* (1892); *Pietro Ghisleri*, *Marion Darche*, and *The Children of the King* (1893); *Katherine Lauderdale*, *Love in Idleness* (1894); *The Ralstons* (1895); *Taquasara* (1896); and *Corleone* (1897). *Constantinople* (1898) was a description of the city. *Ave Roma Immortalis*, *The Rulers of the South* (reprinted in 1904 as *Sicily, Calabria, and Malta*), and *Venetian Gleanings* (1898-1905) were historical works. *Marietta*, *Cecilia*, *Whosoever Shall Offend*, *Soprano*, *A Lady of Rome*, *Arethusa* appeared between 1901 and 1907.

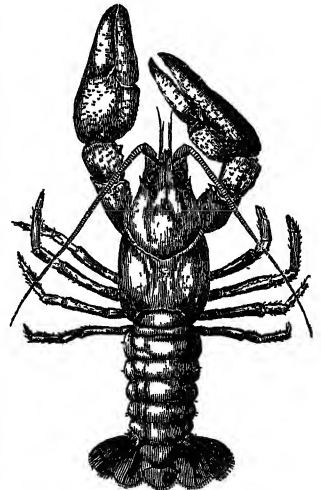

**Crawford, WILLIAM HARRIS (1772-1834)**, born in Virginia, was U.S. senator, minister to France, secretary of the treasury in 1816, and Democratic candidate for the presidency in 1824.

**Crawford and Balcarres, ALEXANDER WILLIAM CRAWFORD LINDSAY, EARL OF**, born in 1812, was educated at Eton and Cambridge, and succeeded his father in 1869. He gained a high reputation for his works on religion, philosophy, and art; and his researches into the annals of his own house enabled him in 1848 to prepare the case for his father's (Lord Balcarres's) claims to the premier earldom of Scotland, as 24th Earl of Crawford (cre. 1398). Besides *Lives of the Lindsays* (1835), and the *Earldom of Mar* (1882), he wrote *Letters on the Holy Land* (1838), *Progression by Antagonism* (1846), and *Sketches of the History of Christian Art* (1847), by which he is best remembered. His dominant idea, however, was, the formation of a

perfect library, to which for nearly half a century he devoted great industry and learning; and the library at Haigh Hall, near Wigan, was probably unrivalled among private collections. He died in Florence, 13th December 1880; his body, which for over seven months had been missing from the mausoleum at Dunecht, near Aberdeen, was found in a wood close by in July 1882.—His son and successor, **JAMES LUDOVIC LINDSAY (1847-1913)**, was elected president of the Royal Astronomical Society in 1878-80, and F.R.S. in 1878, and received the degree of LL.D from Edinburgh University in 1882. In 1888 he presented to the nation the admirably equipped observatory at his seat of Dunecht, 12 miles W. of Aberdeen; and the apparatus, with the magnificent astronomical library, were transferred to the Royal Observatory on Blackford Hill, Edinburgh. See **LINDSAY**.

**Crayer, CASPAR DE**, a Flemish historical and portrait painter, was born at Antwerp in 1584. He lived first at Brussels, and afterwards at Ghent, where he died in 1669. The churches at Ghent contain many of his paintings, which are also common all over Flanders.

**Crayfish** (*Astacus*, Fr. *écrevisse*), a large freshwater crustacean, in the long-tailed (*Macrura*) division of the order Decapoda. The body consists of two great divisions, the head and thorax protected by a rigid shield, and the abdomen or tail of six separate rings. The integument exhibits the characteristic Arthropod combination of lime and Chitin (q.v.). There are altogether twenty segments and nineteen pairs of appendages, not including the eyes. The sensitive antennules and antennae, the six appendages crowded round the mouth, the great claws, the four walking legs, the little swimmerets under the tail, and the pair of large terminal paddles make up the series. These appendages, so different in form and function, are all homologous.

Crayfish (*Astacus fluviatilis*).

The muscles are well developed for working the tail, the appendages, and the stomach mill. The nervous system consists of brain and ventral chain of ganglia. The eyes are stalked and compound; the ear-sacs with their fringes of auditory hairs and inclosed foreign particles floating in a gelatinous fluid lie at the bases of the antennules, which also bear olfactory bristles. The most remarkable feature in the alimentary system is the gastric mill, a complex masticating apparatus in the fore-gut, the essential mechanism of which consists in the rapid clashing of three teeth—one dorsal and two lateral. On the walls of the stomach there are two limy concretions (gastroliths) which store lime preliminary to moulting. There is a large digestive gland opening into the small mid-gut; the hind-gut is long and straight. The circulatory system consists of a dorsal heart, whence the blood passes by arteries and capillaries to the body, thence

by venous channels to the gills, and thence back again to the heart. The *respiratory system* includes twenty pairs of feathery gills lying under the shelter of the sides of the great shield. The ceaseless baling movement of one of the mouth appendages secures a current of water. The *excretory system* is represented by a 'green-gland' or kidney, lying behind the base of the antennæ, on which its opening, shielded by a prominent knob, may be readily seen. The *reproductive system* consists of three-lobed essential organs with paired ducts opening on the thoracic legs.

The eggs are laid in November or December, and are glued by a secretion to the abdominal legs of the mother. The young are hatched in May to July. They do not differ in any important features from the adults, and the crayfish has thus very much abbreviated the typical life-history. The young escape from the inclosing egg-cases, to which they, however, adhere for a while by means of the strongly incurved claw-tips. The female with its crowd of attached young presents a curious and interesting appearance. The young crayfish moults eight times during its first year of life, five times in the second, twice in the third. The male is adult in its third year, and continues for some time at any rate to moult twice a year. The female is mature in the fourth year, and has only one annual moult. The moulting is in part the result of the fact that the inclosing armature does not grow with the growth of the body. Reserve products of lime and glycogen accumulate before moulting; the old shell virtually dies; a new armature (at first soft) begins to be formed; the animal grows; the old husk, including the hard structures of the stomach, is cast; and the crayfish is left perfectly limp and helpless. The fatigue of the process is shown in the great mortality.

The crayfish is exclusively a fresh-water form, barring the fact that some related genera (*Engæus*, *Cambarus*, *Parastacus*) appear to be for the most part terrestrial. They usually make burrows by the sides of streams, and often lie at the mouths of their holes in wait for passing prey. They are chiefly nocturnal. In their diet they are strikingly omnivorous, eating most things available, from worms to water-voles. Dead animals, molluscs, worms, and insect larvæ form their chief sources of supply. In captivity they may be kept for a while on bread crumbs. In certain cases they do not refrain from eating one another. Their chief enemies are said to be eels and otters.

Crayfishes, though fresh-water forms, have a peculiarly wide distribution. The English and Irish crayfish is a variety of *A. fluviatilis*, and is by authorities designated *A. torrentium*. It occurs all over Europe, except in Scandinavia and Scotland, but is locally limited by the presence of sufficient lime in the water for shell-forming purposes. Another variety of *A. fluviatilis*, *A. nobilis*, is also widely distributed on the Continent. This variety is much cultivated in France and elsewhere for the sake of its dainty though not abundant flesh. They are in best condition from May to August. In ponds for artificial breeding, the animals often fall victims to disease, probably of a fungoid character. In rivers they are sometimes netted, sometimes lured by a light in the darkness. Numerous other species occur both in the Old and New World, and along with the southern forms (*Parastacidae*) may be fairly called cosmopolitan. In the United States, where they are very common, their burrows sometimes cause *crevasses* or ruptures in the artificial dykes of rivers. The largest species measures over a foot in length. Crayfish-like forms appear in the Middle Mesozoic times, and a somewhat doubtful *Astacus* (*A. philippi*) has been found in the Carboniferous Limestone of Ireland. It is

probable that they were originally marine. The term crayfish is often extended to the nearly related marine form, the Norway Lobster or *Nephrops norvegicus* (see LOBSTER); and fishmongers often reserve the form 'crawfish' for the 'spiny lobster.' See Huxley's *Crayfish* and the article CRUSTACEA.

**Crayon** (Fr., 'a pencil'). Though used in French, and occasionally in English, to designate pencils generally, including those made of lead, the word crayon is more frequently applied in England to those small cylinders of charcoal, or of pipe-clay or chalk coloured with various pigments, which are used for drawing. Cohesiveness is given to the paste of which the cylinders are formed by means of gum, wax, soap, &c. Crayon drawings are often remarkable for the delicacy and softness with which objects are represented, but they are deficient in power. See PENCIL, CHALK.

**Cream** is the fat of Milk (q.v.). It exists in minute globules throughout the bulk of milk as it comes from the cow. In virtue of being lighter than the watery portion of milk, cream gradually rises and forms a thin yellowish greasy layer on the surface. *Deconshure cream*, or *clouted* (i.e. clotted) *cream*, is obtained by heating milk in a shallow wide pan on a hot plate or over a slow charcoal-fire. The milk should stand in the pan for twenty-four hours before heating. It usually takes from half an hour to three-quarters of an hour to heat the milk completely; but it must not boil. It then stands for twenty-four hours, when the cream is skimmed off, and a little sugar thrown on the top. *Whipped cream* is cream or milk beat up with white of egg by means of a whisk. *Lemon cream*, *Vanilla cream*, &c. are made with milk, white of egg, and sugar, and flavoured. *Cream cheese* may be made of rich cream, or cream, milk, and rennet, tied up in a clean wet cloth, and kept for some days in a cool place, then put in a finer cloth, and placed for a day or two in a mould, with a weight upon it (see CHEESE). The term cream is used frequently for anything superior in quality; thus the French, in referring to persons in the height of fashion, speak of *la crème de la crème*, 'the cream of cream.'

**CREAM SEPARATORS** (Centrifugal).—The best-known forms are the 'Alfa Laval' and 'Melotte.' Though they differ considerably in form and in detail, the principle involved in the work of separating the cream is common to all. Advantage is taken of the difference existing between the specific gravity of cream and the watery part of milk. While yet warm the milk coming from the cow is run into a strong, spherical, steel vessel revolving at high speed. As the milk is carried round within the vessel (whether revolving horizontally or vertically) it rises up the sides and stands as a wall, thus forming a lining of milk while the speed is maintained. The heavier part inclines outwards, and the light cream is forced inwards and forms an inner layer. From the positions indicated the separated cream and milk are conducted into different channels, and finally into different vessel receptacles. The advantages, as compared with the old method of flat setting (see MILK), are that the cream is got off immediately; no time is allowed for the development of acidity in either the skim milk or cream, and more of the cream present can be removed—the proportion being as 13 is to 11. Small machines driven by hand, separating 16 gallons of milk an hour, do not give quite so good results as those driven by steam. A steam turbine has been adopted as the means by which power is communicated. See BUTTER, DAIRY.

**Cream of Tartar** exists naturally in grape-juice, but being insoluble in alcohol, it is gradually

deposited, in the form of argol, as the sugar of the juice becomes converted into alcohol by fermentation. In the preparation of cream of tartar the argol is dissolved in hot water, to which charcoal or fine clay is added, to take up the colouring matter; by boiling and filtering a clear colourless solution is obtained, from which, on cooling, the cream of tartar separates as crystals. These crystals, after being exposed on linen for several days, become whiter and constitute the *crystals of tartar*, or, when ground to powder, the *cream of tartar*. Although cream of tartar is, practically speaking, the bitartrate of potash,  $\text{KHC}_4\text{H}_4\text{O}_6$  (see TARTARIC ACID), yet it usually contains from 5 to 10 per cent. of tartrate of lime, while adulterants, properly speaking, may also be present. The tartrate of lime is derived from the clay added to purify it, and is more or less present in all commercial samples. Cream of tartar is used for making tartaric acid and baking-powder, and as a mordant for dyeing wool. Cream of tartar is readily soluble in hot water, though it takes 60 parts of cold water to dissolve one part of it. *Soluble cream of tartar* is prepared by dissolving together 2 parts of Borax (q.v.) and 5 parts of cream of tartar, evaporating to dryness and powdering. Cream of tartar has an acid taste and gritty feel. When taken repeatedly in small doses of a scruple to a drachm, it acts as a refrigerant and diuretic; in doses of one to two drachms, it is useful as an aperient; and in larger doses of from two to three drachms it acts as a purging agent, accompanied by flatulence and griping. *Imperial liquid* is prepared by dissolving about a drachm of cream of tartar in a pint of boiling water, and adding a little lemon-peel and sugar to flavour it, when an agreeable refrigerant drink is obtained, which is highly serviceable in allaying thirst in feverish cases. Cream of tartar whey is obtained by adding two drachms of the salt to a pint of milk.

**Cream of Tartar Tree**, the remarkable gouty-stemmed tree *Adansonia Gregorii* of north-western Australia. It is of the natural order Malvaceae, and is closely related to the Baobab (q.v.) of tropical Africa, to which the name Cream of Tartar Tree is also applied.

**Crease**, a Malay weapon. See KRIS.

**Creasote** (Gr. *kreas*, 'flesh'; *sōzō*, 'I preserve') is an oily substance obtained from the tar produced by the destructive distillation of wood. When Coal-tar (q.v.) is distilled, a certain portion called creasote oils passes over, and from this much of the creasote of commerce is obtained. This, although similar in some respects to wood creasote, is quite distinct chemically. The coal product consists largely of carbolic acid, along with creasol and xyleneol, while the wood product, to which alone the name creasote rightly belongs, consists of guaiacol, creasol, and phlorol. As it contains several substances, so its boiling-point ranges from  $392^\circ$  to  $428^\circ$  ( $200^\circ$ – $220^\circ$  C.). The leading character of wood creasote is that it instantly coagulates albumen, but does not coagulate Collodion (q.v.), in this respect differing from carbolic acid. It has a very remarkable power of arresting the decay of meat or wood, and when meat is treated with so small a proportion as one-hundredth of its weight of creasote, and exposed to the air, it does not putrefy, but becomes hard and dry, assuming the taste and odour of smoked meat. Indeed, there can be no doubt that hams cured by means of wood smoke owe their preservation and flavour to some extent to the volatile creasote in the smoke. Railway sleepers and wood liable to be frequently wet are often saturated with the coal-tar creasote; or, where economy is not so essential, with the

wood creasote, and are thereby preserved indefinitely. In toothache, where the cause of pain is a carious tooth with an exposed, inflamed nerve, a drop of creasote, carefully inserted, after previously cleansing the cavity, will often give relief. In this case it acts by coagulating the albumen and destroying the nerves. Creasote acts powerfully on the skin, producing a white stain when applied to it. A few drops added to a pint of ink preserve it from mouldiness. Medicinally, it is given in bacterial lung diseases such as phthisis and bronchitis, as it is of value owing to its antiseptic qualities. It may be inhaled by means of an atomiser. Only beechwood creasote should be used.

**Creasote Plant** (*Larrea mexicana*), of the order Zygophyllaceae, growing abundantly on the borders of the Colorado Desert, emits a strong odour of creasote. The plant forms a dense scrub, and binds the loose sand. It is xerophytic in character. Its smell protects it against animals.

**Creasy**, SIR EDWARD SHEPHERD (1812–78), born at Bexley in Kent, from Eton passed to King's College, Cambridge, in 1832, and in 1834 was elected a fellow. Called to the bar in 1837, he went on the home circuit for upwards of twenty years, and presided for three or four years as assistant-judge at the Westminster Sessions Court. In 1840 he became professor of History in University College, London; in 1860 chief-justice of Ceylon. Invalided home in 1870, he went out again in 1871, but had to return finally to England in 1873. He was the author of *The Fifteen Decisive Battles of the World* (1851), *Invasions of England*, *History of the Ottoman Turks*, *Imperial and Colonial Constitutions* (1872).

**Creationism**, or CREATIONISM. See PRE-EXISTENCE.

**Creatin**, or KREATIN (Gr. *kreas*, 'flesh'), a constant and characteristic constituent of the striped muscle of vertebrates. It was discovered by Chevreul in 1835, but little was known about it till Liebig published his researches on the *Chemistry of Food* in 1847. Its chemical formula is  $\text{C}_4\text{H}_7\text{N}_3\text{O}_2$ . Except in one doubtful case, it has always been found as above indicated; it is very uncertain if it ever occurs in unstriped muscles, and it has never been demonstrated in invertebrates. A dehydrated form, known as *Creatinin*,  $\text{C}_4\text{H}_5\text{N}_3\text{O}$ , occurs as a constant constituent of urine, and has also been demonstrated in fish muscles. Under the influence of acids, creatin becomes creatinin, and by hydration the transformation may be reversed. As these changes may readily occur during extraction, there is often doubt whether creatin or creatinin is present.

**Creation**. According to the accredited results of modern scholarship, there are two accounts of the creation in the book of Genesis. The first (Genesis i. 1–ii. 4a) is derived from the document known as P—the Priestly Code—which was composed in the period 538 B.C.–444 B.C. The second (Genesis ii. 4b–25) belongs to the document known as J—the Jahwistic document—which is of much earlier date, 900–750 B.C. (see BIBLICAL CRITICISM). Both these narratives agree in respect to the exalted position which they assign to man in the universe, but they differ upon almost every other point. The first describes the process of creation as lasting for six days—each day being marked by a special fiat of God. On the first day light is created, on the second the firmament dividing the upper and lower waters, on the third dry land, the seas, and vegetation, on the fourth the heavenly bodies, on the fifth water animals and birds, on the sixth land animals, and man as the crown and climax of all. The second narrative, which is probably incomplete, omits any reference to the seven days and the making of the world, and

places the creation of man anterior to that of the beasts. It describes how the earth was fertilised by a mist, how man was formed out of the dust and animated by the breath of life, how trees were made to grow and animals to live for the sake of man, and how finally woman was created as his companion and helpmeet. The second account is the more ancient and primitive of the two. The first is more interested in ecclesiastical institutions, and derives from the story a basis and justification for the observance of the Sabbath.

Modern investigation seems to have proved conclusively that the Genesis narratives of the creation are connected—remotely perhaps, but still connected—with Babylonian and other Semitic myths. According to the Babylonian tablets, the story of creation was as follows: In the beginning, before heaven and earth existed, when the primal father Apsu (ocean) and the primal mother Tiāmat mingled their waters the gods were created. The lower deities, headed by Tiāmat, revolted against the higher gods. Marduk, however, suppressed the rebellion and destroyed Tiāmat. Out of part of her body he made the heaven, with bars to keep back the upper waters. After this he created the heavenly bodies, the beasts and creeping things. The story is incomplete, as some of the tablets are missing and parts of others undecipherable, but the coincidences with the Genesis narrative are too striking to be altogether accidental. In both stories the world is made out of water and darkness. There is a noticeable resemblance between the words Tiāmat and Tehom, the latter of which is the Hebrew term used to describe the watery abyss that existed prior to the act of creation. The primal waters are, in each case, divided by a firmament. The creation of the heavenly bodies on the fourth day is very similar to the parallel account on the fifth Babylonian tablet. In both cases the work of creation redounds to the glory of the Creator. The Babylonian tablets end with a hymn of praise to Marduk. In the Genesis story Yahweh himself expresses approval of the result. But though the coincidences are remarkable, the differences between the two accounts are equally striking. In summing up Gunkel's account of 'the glaring contrasts' between the Babylonian and Old Testament records, Dr Whitehouse in his illuminating article on Cosmogony in *Hastings's Dictionary of the Bible* says: 'In the Babylonian epic we have wild, grotesque, tumultuous mythology expressed in poetic form. In the Biblical account we have serene, majestic, calm and sober prose. In the one the gods rise into being in the course of the drama. In the other, God pre-exists and remains from the first the creative source whose command summons each new order of created beings into existence.' It is this difference that constitutes the contribution which the Old Testament makes to the subject. There can be no doubt that the statement in Genesis is based upon the common Semitic mythology—but that mythology is purified and brought into agreement with the Jewish conception of God. The Babylonian epic is frankly polytheistic, and anthropomorphic. It bears all the marks of a 'myth,' and is akin to the myths which we find in Hindu and Greek poetry. The writer of the Genesis narrative has transformed the myth into a theodicy, excised the pagan elements, and used the old material to exalt the glory and majesty of Yahweh.

Such being the origin of the story in Genesis, it is impossible for us to regard it in the light of a revealed record of the process of creation. Similar stories are found in most nations. There are few mythologies which do not attempt to solve the riddle of the universe. Genesis gives us the noblest theory known to ancient thought—but still

it is only a theory, and to regard it as a scientific statement, which must be maintained at all costs, is absolutely out of the question in view of the discoveries of modern science, theology, and Biblical criticism. (1) The Bible is not a manual of science. It was not intended to reveal the facts and processes of the working of natural laws. Its purpose is to reveal the will of God to man. (2) The methods by which the revelation is made, according to the modern conception of inspiration, preclude the possibility of a Divine communication giving the details of the order of creation. The assumption that God revealed to a seer of the 5th century B.C. a scientific account of the origin of the world would raise many difficult problems. Why did he not reveal our modern medical knowledge to the physicians of the time and so enable them to remedy human suffering? Why should the secret of the origin of the universe have been made known, while other secrets, which would have been of much greater value to the race and have made the lot of men easier and happier, were denied to mankind? (3) It is impossible to square the statement in Genesis, *as it stands*, with the findings of modern science. Many attempts have been made, but it is only in so far as they have done violence either to Genesis or modern science that they have met with any success. The most glaring differences are (a) Genesis represents the world as having been created in six days. Modern science has proved that the process must have taken millions of years. (b) Genesis assumes the fixity of species from the very first. Each species, as it exists to-day, was created 'after its kind.' The modern theory of evolution strongly maintains that species have been developed out of each other. (c) Light existed, according to Genesis, before the sun and moon were created. The writer fails altogether to recognise the fact that the existence of day and night depends upon the existence of the sun and moon. (d) The conception of the world as a flat disc covered by a canopy and bounded below and above by waters is absolutely impossible in view of the discovery of Copernicus. (e) The narrative conflicts with modern geology alike in the order which it assigns to the different stages in the process of creation, in the time which it allots for its completion, and in the manner in which it groups together different living forms. There is an excellent discussion of this point in Driver's commentary on Genesis.

The value of the creation story lies not in the details, but in its general conception. The solution of the riddle of the universe is to be found in God alone. No materialistic explanation is satisfactory. Science and religion alike require us to trace back the first cause of everything to God.

See article on Cosmogony by Whitehouse in *Hastings's Bible Dictionary*; article on Creation by Zimmern and Cheyne in *Encyclopædia Biblica*; Gunkel, *Schöpfung und Chaos*; Zoeller, *Theologie und Naturwissenschaft*; Driver, 'The Cosmogony of Genesis' in *Expositor*, 1886; Ryle, *Early Narratives of Genesis*; Commentaries by Dillman, Skinner, Bennett.

**Creationism, or CREATIANISM.** See PRE-EXISTENCE.

**Crébillon**, PROSPER JOLYOT DE, born at Dijon on 13th January 1674, studied law. His tragedy of *Idoménée* (1703) was followed by *Atrée et Thyeste* (1707), *Electre* (1709), and *Rhadamiste et Zénobie* (1711)—the last his best play. But he soon fell into neglect, and produced nothing for more than twenty years. He was then pushed forward as a dramatic rival to Voltaire by Madame de Pompadour and other enemies of the great writer, elected to the Academy, awarded a pension of 1000 francs, and appointed royal censor, and one of the royal

librarians. His tragedy of *Catiline*, for which the king furnished the properties, was brought out with great success in 1748. Among his other works were *Xerxès*, *Sémiramis*, *Pyrrhus*, and *Le Triumvirat*, the last of which was written when he was eighty-one years old. He died on June 17, 1762. He was a very unequal writer. An oppressive gloom pervades the tragedies which he founded on Greek legend; but occasionally he writes naturally and powerfully. 'Not a few of his verses have a grandeur which has been said to be hardly discoverable elsewhere in French tragedy between Corneille and Hugo' (Saintsbury). Next to Voltaire, he was the best tragic dramatist of his age in France. There are editions of his works by Perelle (2 vols. 1828) and Vitu (1885).—CLAUDE PROSPER JOLYOT DE CRÉBILLON, the younger son of the dramatist, was born in Paris on February 14, 1707. He was educated at the Jesuit College of Louis le Grand, and after writing a number of slight pieces for the stage, acquired great popularity as an author of prose fiction. In 1740 he married an Englishwoman, Lady Stafford. One of his books, *Le Sopha, conte moral*, having given offence to Madame de Pompadour by its indecency, he was banished from Paris for five years, but on his return in 1755 was appointed to the censorship. He was believed by his friends to be dead long before he died on April 12, 1777.

**Crèche** (Fr., 'manger'), a sort of public nursery where, for a small payment, the children of women who have to go out to work are fed, nursed, and taken care of during the work hours of the day.

**Crécy-en-Ponthieu**, or CRESSY, a village in the French department of Somme, on the Maye, 12 miles N. of Abbeville. Crécy is celebrated on account of the brilliant victory obtained here, 26th August 1346, by Edward III., with 40,000 English soldiers, over a French army amounting, according to Froissart, to 100,000 men under the command of the Count of Alençon. In this great battle, one of the most honourable to English prowess recorded in history, perished the flower of the French chivalry, as well as the blind king of Bohemia, who was fighting on the side of France. Altogether about 30,000 of the French soldiers bit the dust. In this battle the Black Prince distinguished himself greatly. See the article ICH DIEN, and a work by H. Bellac (1913).

**Credence**, a small table placed near the altar or communion-table, at its south side, on which the bread and wine intended for consecration are placed in readiness. In the Greek Church this is called the *trapeza prothessōs*, or simply *prothesis*, but is always placed north of the altar, usually in a structural side-chapel. Archbishop Laud was a great stickler for the credence, and pleaded the authority of Bishop Andrewes and other bishops for its use. There are ancient credences in not a few Anglican churches. The introduction or restoration of credences was one of the marks of the Oxford movement; and they were judicially pronounced legal.

**Credi, Lorenzo di** (1459–1537), painter, was the fellow-pupil, lifelong friend, and executor of Leonardo da Vinci.

**Credit**. See BANKING, BILL OF EXCHANGE.—A Letter of Credit is a letter addressed to a correspondent at a distance requesting him to pay a sum therein specified to the person named, or to hold the money at his disposal, and authorising the correspondent to reimburse himself for such payment, either by debiting it in account between the parties or by drawing on the first party for the amount. For Cash Credit, see CASH ACCOUNT. See also CIRCULAR NOTES, MARGINAL CREDIT.

**Crédit Foncier**, a system of lending money on the security of landed property, established by the French government in 1852. Its peculiarity is that the loan is repayable by a terminable annuity, the amount and currency of the annuity being so calculated that when the last payment is made the loan and the interest on it will be extinguished. Or it may be described as a loan repayable by instalments. The borrower, however, has the right of anticipating repayment. The three original companies were in the same year incorporated into one.

**Crédit Mobilier**, a company founded in Paris in 1852 to make advances on movable property, in contrast to the Crédit Foncier (q.v.). Its declared object is especially to promote industrial enterprises of all kinds, such as railways and mines.

**Crediton**, or KIRKTON, an urban district in the middle of Devonshire, in a narrow vale on the Creedy, a tributary of the Exe, 7 miles NW. of Exeter. Its church is a fine old cruciform structure. The traditional birthplace of St Boniface (q.v.), the apostle of Germany, Crediton was the seat of a bishopric from 910 to 1050, and from 1897 has a bishop suffragan under Exeter. Pop. 3500.

**Cree**, a tribe of North American Indians of Algonquian stock, found especially around Lake Winnipeg and the Saskatchewan River. Old enemies of the Blackfoot Indians, they are now peaceful fur-traders, numbering some 10,000.

**Creech**, THOMAS (1650–1700), translator of Lucretius, was headmaster of Sherborne and rector of Welwyn, Herts. He died a suicide.

**Creech**, WILLIAM (1745–1815), an Edinburgh bookseller, Lord Provost in 1811–13, who published the first Edinburgh edition of Burns, the works of Blair, Beattie, Dugald Stewart, and Mackenzie.

**Creeds**, the authorised expressions of the doctrine of the church at large, or of its several main sections. The creeds of Christendom grow in complexity, in elaborate analysis and inventiveness of doctrinal statement, as they succeed one another. The so-called *Apostles' Creed* is probably the earliest form of Christian creed that exists, unless we give the precedence to the baptismal formula at the close of St Matthew's Gospel; but it is not to be attributed to the apostles or any of them. It is doubtless apostolic in substance; but in its present form it cannot pretend to be so ancient by four hundred years, though Irenæus repeats a creed not much unlike it. It is doubtless the Roman or Latin form of the creed which prevailed in all the early churches. The *Nicene Creed* sprang out of the Christological conflict in which early in the 4th century Arius (q.v.) maintained the view of Christ's person which Athanasius (q.v.) denounced; see also CHRIST, CHRISTIANITY. The Council of Nicea was summoned in 325 by Constantine to settle this controversy, and the Nicene Creed was the result. Christ was declared not merely to be of like substance (*homoiousios*) but of the same substance (*homoousios*) with the Father. At the Council of Constantinople (381) the additional tenet of the divinity of the Holy Spirit was added, and the creed completed in the form in which it is familiar, except the memorable phrase 'and from the Son' (*filioque*). This phrase, teaching the procession of the Holy Spirit from the Son, which was destined to be the subject of controversy between the Eastern and Western Churches (see GREEK CHURCH), seems to have been added by the Western Church during the 5th and 6th centuries. The so-called *Athanasian Creed* is probably a product of the 5th or 6th century, much later than Athanasius, but represents his doctrine of the Trinity, as apprehended and elaborated by the Western Church, first in Gaul; see the article ATHANASIAN CREED. The Oriental

churches never formally accepted any creed except the Nicene (without the *filioque*). The *Professio Fidei Tridentina*, called the 'Creed of Pope Pius' (1564), arose out of the *Decrees of Trent*, and is practically the Confession of Faith of the Roman Catholic Church (q.v., and see TRENT). For Post-Reformation creeds, see CONFESSIONS, ARTICLES. The non-Episcopal churches of Britain, the Dominions, and the United States do not as a rule recite any of the creeds in public worship or formally include them in their standards, though Presbyterians and other orthodox dissenters adhere to their doctrines.

See the relevant articles in Hastings's *Encyclopædia of Religion and Ethics* (1908 et seq.); the *Catholic Encyclopedia* (1907-15), or the revised Wetzler and Welte (1893-1903); the Protestant Hauck-Herzog, *Realencyklopädie* (1896-1909); Schaff's *Creeds of Christendom* (1877); *A History of Creeds and Confessions of Faith*, by Curtis (1912); Warnack's *History of Dogma*; also ARTICLES, ATHANASIAN CREED, CONFESSIONS, DOGMA, THEOLOGY.

**Creeks**, or MUSCOGEES, a once powerful tribe of American Indians, of Appalachian stock, who, reduced by war to some 25,000, were in 1832 removed from Georgia and Alabama to Indian Territory (Oklahoma). They numbered 18,700 in 1909. See *Bull. 73 of the Bureau of American Ethnology* (1922).

**Creepers** (*Certhia*), a genus of Passerine birds, the type of the family Certhiidae. The bill is long, much curved, laterally compressed, and pointed; the tongue is long, narrow, sharp-pointed, and jagged near its tip; the tail is rather long. The feet, which are somewhat slender, are well adapted for tree-climbing, and the stiff feathers of the tail are also employed for support. The Common Creeper (*C. familiaris*) is found in all temperate parts of the

Common Creeper (*Certhia familiaris*).

northern hemisphere, wherever woods abound. It is a permanent resident, but is never numerous or gregarious. It is not so well known as many other birds, in consequence of its restless habits, its rapid movements, and prompt retirement to the farther side of the tree from the spectator. The Scots name, *Bark-speeler* ('climber'), describes its almost constant habit, as it searches for insects and their larvae in the crevices of the bark. The nest is usually in a hole of a decayed tree. The creeper, larger than the wren, is dark gray above, with spots of yellow and white; the under parts are white. The Nuthatch (q.v.) is closely allied.—Creeper is also a name for Climbing Plants (q.v.).

**Crefeld.** See KREFELD.

**Creighton, MANDELL** (1843-1901), born at Carlisle, from Durham School gained a postmastership at Merton College, Oxford, in 1862, and was elected a fellow in 1866. He became vicar of

Embleton, Northumberland, in 1875, first professor of Ecclesiastical History at Cambridge (1884), Bishop of Peterborough (1891), and of London (1896). His chief works were *Simon de Montfort* (1876), *History of the Papacy during the Reformation Period* (5 vols. 1882-94), and *Queen Elizabeth* (1897; cheaper edition 1899). His wife published in 1902 a volume of his *Historical Essays and Reviews*, and in 1904 his *Life and Letters*.

**Creil**, an iron-manufacturing town of the French dept. of Oise, 25 miles SE. of Beauvais; pop. 11,000.

**Crema**, a town of Lombardy, 27 miles NW. of Cremona, with a cathedral (1341); pop. 10,000.

**Cremation** seems to have been the almost universal custom of the Aryan peoples—of the Aryan settlers in India, of Greeks, Romans, Slavs, Kelts, and Teutons—in disposing of their dead. The graves of north Europe throughout the 'bronze age' contain only jars with ashes. It was Christianity that gradually suppressed the practice of cremation. In India it is still a usual method for disposing of corpses, and is also practised by numerous uncivilised peoples of Asia and America (see BURIAL). Beginning in Italy about 1870, a return to the practice has been strongly insisted on by many in modern Europe. This is opposed mainly on grounds of kindly feeling for the dead, and for religious reasons connected with the belief in the resurrection of the dead. Advocates of cremation assert that the question is solely a sanitary one—the prevention of the pollution of water, or the contamination of air. By burning, the body is reduced more swiftly to its constituent elements, without disrespect to the dead or hurt to the living. In reply to the juridico-criminal difficulty that cremation might be made to destroy the evidence of murder (as by poisoning), advocates of cremation answer that the properly organised system of medical inspection, provided for by the act of 1902, under which all cremations take place, has obviated this objection. In Italy cremation has been legal since 1877. In Germany the first crematorium was erected at Gotha in 1878, and by the end of the year 1921 it and the other German institutes had cremated over 171,900 bodies. Crematories have been built in most of the great provincial centres of France. Throughout Europe there are strong societies for the promotion of the method. In England the Cremation Society, established in 1874, purchased ground at Woking, and there erected a crematory in 1885; others have since then been built in London. In 1900 an act gave local authorities power to expend money in building crematories, and Hull was the first important town to build a municipal crematorium. There are crematories at Manchester, Glasgow, Birmingham, Liverpool, Leicester, Darlington, Leeds, Bradford, and Sheffield. In Great Britain 341 persons were cremated in 1898; 1134 in 1911; 2009 in 1922. In the United States cremations have increased rapidly. A special form of Siemens's regenerative furnace is used in Germany; elsewhere at the present day various systems are employed, and incineration is effected by the agency of coke, gas, oil, and electricity, the former being used in this country, and the latter in the United States. The time occupied in the reduction of an adult varies from 1 to 1½ hours, and the ashes weigh from 5 to 7 lb. Crematories for the garbage of towns are called Destructors (q.v.).

See Sir Henry Thompson, *Modern Cremation* (4th ed. 1900); books by A. C. Freeman (1906, 1910); *Cremation in Great Britain* (1909); Lord R. S. Gower, *Cleanliness v. Corruption* (1912); *Transactions of the Cremation Society of England*. The John Crerar Library, Chicago, publishes a list of books and pamphlets on cremation, including the Cremation Association of America collection.

**Crémieux, ISAAC ADOLPHE** (1796-1880), born of Jewish parents at Nîmes, became an advocate

in Paris, entered the Chamber, and in 1848 was a member of the provisional government. Imprisoned at the *coup d'état*, he took up professional work till 1870, when he was a member of the government of national defence; and he died a senator. He founded the *Alliance Israélite Universelle*.

**Cremona**, capital of a province in northern Italy, on the north bank of the Po, 60 miles SE. of Milan. Famous are its cathedral (1107-1606), octagonal Baptistery, Palazzo Pubblico, Campo Santo, and belfry with the loftiest campanile in Italy (396 ft.). In the 16th, 17th, and 18th centuries it was greatly celebrated for its violins, the most famous makers being the Amati, Stradivarius, and the Guarneri. Pop. 60,000.

**Cremonne Gardens**, near Battersea Bridge, on the north side of the Thames, a very popular place of amusement for Londoners down to 1877.

**Creole** (Span. *criollo*), in general an individual born in the country but not of indigenous blood, a term applied, especially in the former Spanish, French, and Portuguese colonies of America, Africa, and the East Indies, to natives of pure European blood (*sangre azul*), in opposition to immigrants themselves born in Europe, or to the offspring of mixed blood, as mulattoes, quadroons, Eurasians, and the like. Creole dialects are corruptions of French, Spanish, Portuguese, English, or Dutch, arising in various colonies, and may be studied in such formal treatises as Thomas's *Creole Grammar* (1869) and Quentin's (Paris, 1872). Cable's stories revealed the charm of the Creole phraseology of Louisiana.

**Creosote**. See CREASOTE.

**Cres.** See CHERSO.

**Crescendo**, in Music, means a gradual change from piano to forte and fortissimo, marked thus —, or *cresc.* The converse is *decrescendo*. The swell of a good organ produces a perfect crescendo.

**Crescent**, a figure resembling the waxing moon with the horns turned upwards, was Hittite and a Greek before it became a Turkish emblem (see CONSTANTINOPLE); but it was not adopted by the Turks from the Greeks—it had been used by them hundreds of years before in central Asia. Genghiz Khan's Tatars had the crescent on their banners, and so had the Janissaries of Sultan Orchan. The Turkish Order of the Crescent (see ORDERS) was founded in 1799.

**Cress**, a name given to a number of widely distributed plants belonging to the family Cruciferae, which have a mustard-like taste and antiscorbutic and diaphoretic qualities. Of the Common Cress (*Lepidium sativum*) there are several varieties (e.g. Curled Cress). The Poor Man's Pepper is the Broad-leaved Cress (*L. latifolium*). The Virginian Cress (*L. virginicum*) is cultivated for salads. The allied genus *Barbarea* supplies the Winter Cress or Yellow Rocket of gardens (*B. vulgaris*). The Bitter Cress (*Cardamine amara*), the Lady's Smock or Cuckoo-flower (*C. pratensis*), and the Hairy Cress (*C. hirsuta*) are natives of temperate and northern countries. Water Cress (*Nasturtium officinale*) is an aquatic perennial of the same family, largely cultivated in England. For the so-called Indian Cress, see TROPÆOLUM.

**Cressida**. See TROILUS.

**Cressy**. See CRÉCY-EN-PONTHIEU.

**Crest**. See HERALDRY.

**Cresswell**, SIR CRESSWELL, judge, born in Newcastle in 1794, was educated at Charterhouse and Cambridge, and called to the bar in 1819; in 1830 he was appointed recorder of Hull, and in 1834 K.C. He was returned to parliament by Liverpool, and in 1842 Peel made him a puisne

judge. He sat in the Court of Common Pleas till 1858, when he was appointed first judge of the newly created Probate and Divorce Court. He died 29th July 1863.

**Crestien de Troyes**. See CHRÉTIEU.

**Creston**, a city of Union county, Iowa, with large machine-shops and railway-carriage works; pop. 8000.—There is a smaller town of Creston in Wyoming, and a third in Illinois.

**Creswick**, THOMAS, R.A. (1811-69), was born at Sheffield. In 1828 two of his pictures found a place in the Royal Academy's exhibition. He loved to paint the beautiful streams and glens and wooded dells of his native land; and these, which, along with some coast scenes, form the subject of his best paintings, are represented on his canvas with great delicacy of finished detail and truth of aerial perspective, the figures introduced being frequently from the brush of Andsell, Cooper, Friih, and other artists. He was well known as a book-illustrator, and he contributed to the publications of the English Etching Club.

**Cretaceous System**, the highest division of the Mesozoic or Secondary strata, rests conformably upon the Jurassic System (q.v.), and is overlaid unconformably by the oldest deposits of the Eocene System (q.v.). The Cretaceous strata of Britain are confined chiefly to the east and south-east of England. They form the Yorkshire Wolds, extend over large parts of Norfolk, Suffolk, and Hertford, and compose the Chiltern Hills, Salisbury Plain, the Downs, and the south part of the Isle of Wight. They form a broad basin in the north of France, and stretch eastward from Belgium, Holland, Denmark, and the south of Sweden, through the great plains of northern Europe to the south end of the Ural Mountains—often concealed under younger formations. They enter largely into the composition of many of the Mediterranean coast-lands. The chief petrological feature of the Cretaceous strata of western and northern Europe is the great development of white chalk in the Anglo-French area, and its gradual replacement, when followed eastwards in Germany, &c., by earthy limestones, shales, sandstones, &c. The most marked characteristic of the Cretaceous system in southern Europe is the great development in that region of massive marine limestone (hippurite limestone).

In North America Cretaceous strata are prominent in the western states and territories, and in the Gulf states, whence they extend up the Mississippi valley to the Ohio; they appear at intervals between South Carolina and New Jersey, as also on the Pacific border and in the coast-range, at the mouth of the Mackenzie River, and in Greenland. In India the system is marked in the Deccan by a massive series of basalt-rocks, 4000 to 6000 feet thick, and covering an area of 200,000 sq. m. In Australia and New Zealand there is a considerable development of Cretaceous rocks, sometimes coal-bearing. The following is the succession of cretaceous strata in England:

Upper Cretaceous—	
Upper Chalk.....	600 feet.
Middle Chalk.....	200 "
Lower Chalk and Chalk Marl.....	450 "
Chloritic Marl and Upper Greensand.....	250 "
Gault.....	200 "
Lower Cretaceous—	
Lower Greensand .....	550 "
Wealden Series.....	1850 "

The Wealden Beds consist largely of clay and sand, and are almost entirely of fresh-water origin. In Yorkshire the strata which occur on the same horizon as the Wealden beds of the south are of marine origin. The Lower Greensand, consisting of sand, clay, &c., are marine. The Gault (q.v.), a tough blue clay, is likewise marine, and so also are

the shallow-water sands of the Upper Greensand and the Chloritic Marl (q.v.). The most characteristic rocks of the system are the chalk-beds. The basement of these beds is the argillaceous chalk known as Chalk Marl. The Lower Chalk is a grayish-white chalk, while the Middle Chalk is a pure-white chalk, containing in its upper portions layers of flint nodules. A hard layer of yellowish limestone called Chalk-rock lies at the top of this division. The Upper White Chalk is a thick massive white chalk, containing numerous layers of nodules and occasional sheets of flint. All these chalks are of marine origin.

Continental Cretaceous.	Equivalent English Strata.
Danian . . . . .	(wanting).
Senonian . . . . .	Upper Chalk.
Turonian . . . . .	Middle Chalk.
Cenomanian . . . . .	Lower Chalk and Chalk Marl.
	Chloritic Marl.
Albian . . . . .	Upper Greensand.
	Gault.
Neocomian . . . . .	Lower Greensand.
	Wealden.

The Cretaceous strata of Britain being almost exclusively of marine origin, it is not surprising that land-plants seldom occur, and that they are met with chiefly in the fresh-water beds near the base of the system. They consist chiefly of ferns, cycads, and conifers—a flora resembling that of the preceding Jurassic period—though dicotyledons occur in the Lower Greensand. The Upper Cretaceous rocks of Germany, however, have furnished many remains of dicotyledons, such as extinct species of maple, oak, walnut, beech, laurel, magnolia, &c. A similar admixture of forms occurs in Cretaceous strata of North America.

Amongst animals the Protozoa played a very important part—the white chalks and earthy limestones being very largely composed of the minute shells of foraminifera, such as Globigerina, Rotalia, and Textularia, which still swarm in the ooze of the Atlantic. Sponges, such as Ventriculites, Siphonia, &c., were very abundant, and sea-urchins also occurred in great numbers. Star-fishes and brvozoans were fairly common, as were also, amongst brachiopods, Terebratula and Rhynchonella. Ordinary bivalves were very numerous. In the Danian beds carnivorous gasteropods begin to abound, and they include a number of existing genera. Cephalopods are not only the most abundant, but also the most characteristic fossils of the cretaceous rocks. Amongst them are a great variety of Ammonites and many forms of Belemnitide. Amongst the fishes were ganoids and various kinds of the shark tribe, together with the earliest representatives of the Teleostei—which include most living genera of fishes. The waters of the period seem also to have swarmed with reptiles, such as Ichthyosaurus and Plesiosaurus. Winged reptiles were also present, such as Pterodactylus. Amongst dinosaurs were Cetiosaurus, Megalosaurus, and Iguanodon. Another remarkable reptile was the serpent-like Mosasaurus. Besides these, there were lizards, chelonians, and crocodiles. The American cretaceous system is likewise characterised by the presence of huge dinosaurs and other reptiles—some of them being European types, while others are peculiar. One of the most remarkable features of the American rocks is the occurrence in them of the toothed birds—Ichthyornis and Hesperornis.

No break separates the Jurassic from the Cretaceous system. At the beginning of cretaceous times most of the British and Irish area existed as dry land. Over the south-east of England lay the estuary of a large river, flowing probably from the north. The Wealden beds are the delta-deposits of that river, the English and French beds of this division covering an area of 20,000 sq. m. The sea into which

that river flowed occupied a considerable area in the north of France, spread over the Low Countries into Hanover, filled the basin of the North Sea, and overflowed a portion of eastern England. Wealden beds occur in north-west Germany, and indicate the delta of a river, like that of the British area, flowing from the north. While land-conditions predominated in northern and middle Europe, an open sea covered vast areas in southern Europe. Gradual subsidence of the sea-bottom took place during the deposition of the Wealden series, and eventually the great deltas became submerged, and a wide sea covered most of what are now the low grounds of the British area, and passing eastwards, submerged vast regions of middle Europe up to the slopes of the Ural Mountains. The depression was greatest in the western areas, where in the deep clear waters there gradually accumulated the calcareous matter which subsequently formed our white chalk. There is no deposit forming at present which is quite analogous to white chalk. The extreme purity of the chalk, consisting as that rock does of 95 per cent. and more of carbonate of lime, is difficult to account for on the supposition that the sea in which it formed was comparatively shallow. The sea of western Europe may have been dotted with small islands. In the Mediterranean basin, a deep open sea would seem to have persisted all through the cretaceous period. Open water appears at this time to have extended through the Mediterranean area into Asia, covering there also vast tracts of what is now dry land, and communicating with the Indian Ocean. The conditions of climate seem to have been remarkably uniform over vast regions of the earth's surface. Ferns, cycads, and conifers flourished in the lands within the Arctic Circle, and the waters of the same region were tenanted by cuttle-fish, ammonites, and huge reptiles.

**Crete** (Gr. *Krētē*; Venetian, *Candia*; Turk. *Kirid*), the largest island in the Greek Archipelago, forming the central and major part of the semi-circular bar which, beginning with the islands of Cerigo and Cerigotto off Cape Malea, and continued by Casos, Carpathos, and Rhodes to Cape Krio, shuts the Aegean Sea from the main Mediterranean. Crete is about 140 miles long, with an average width of less than 30 miles, and consists of a chain of mountains, mainly composed of hippuritic limestone with older volcanic intrusions, which rise at short intervals into five main *massifs*: (1) at the west end, the White Mountains of *Splákiá* (*Aspra Vouná*), the most extensive group, with several summits over 7000 feet, and *Hágios Theódoros*, 7882 feet; (2) *Psiloríti* (anc. *Ida*), a hogback rising to 8193 feet; (3) *Kophíno*, 3888 feet, a southern offshoot of the main spine; (4) *Lasíthi* (anc. *Diète*), with *Aphenti Christos*, 7165 feet; and (5) at the east end, the *Sítia Mountains*, with *Aphenti Kavousi*, 4850 feet. The low intervening lands are widest between *Psiloríti* and *Lasíthi*, and this advantage has always caused the most populous urban settlements (successively *Phæstus*, *Cnossus*, *Gortyna*, and *Candia*) to be situated in that gap. The lowest interval, however, is between *Lasíthi* and *Aphenti Kavousi*, the so-called *Isthmus of Hierapetra*. There are also low but narrow coastal tracts. On the north-west, below the face of the White Mountains, is the small lowland of *Canea*; on the north centre, under *Psiloríti*, the more rugged lowland of *Mylopotamo*; and under *Lasíthi* that of *Mirabello*. There is only one true lowland plain of considerable extent, the *Messará* in the gap between *Psiloríti* and *Lasíthi*; but isolated upland plains, generally lacustrine, and sometimes drained by subterranean outlets (*katoióthra*), are characteristic of Crete, and have largely determined its social character by supporting the moun-

tain population in independence of the coast towns.

The coasts offer only one perfectly protected roadstead for large craft, the Bay of Suda on the north coast, west of the centre. Its depth and great extent (8½ sq. m.), which render it much less suitable for small ships than for large, deprived it of importance in antiquity; but with the growth of modern steam shipping its superiority has asserted itself, and since 1840 has determined the position of the political capital, Canéa. The other harbours of the island are either open bays or very small and unsafe coves. The largest islets, Dia, off Candia, and Gavdo (anc. *Clauda*), off Sphákia, are distant from the main coast, and the first is uninhabited. There are no rivers of importance.

Lying in the track of the wet westerly winds, and possessing much high land which retains precipitation in a frozen form until late spring, Crete has abundance of springs and a sufficiently saturated soil. At the same time, its southern latitude and neighbourhood to Africa make its valley lands the warmest in the Greek area. Consequently it is extremely productive, and can support by its own resources a relatively larger population than other Greek islands. It is famous for the richness of its flora; but, on the other hand, the wild fauna is extraordinarily meagre, owing to the density of population and the resultant disappearance of forests. A wild goat (*Capra aegagrus*) exists, but is seldom seen; and other game is very scarce. Horses, mules, and asses serve the vehicular traffic of the island, but, like all the other domestic animals, are of rather small and mean breeds.

The population is about 300,000, all of Greek race except an insignificant sprinkling of Europeans, Jews, and Bengázi Arabs; but about one-ninth of the Greeks profess the Moslem religion and call themselves Turks. The stature of the Sphákiote mountaineers is much above the average, and the type throughout the island is fine. Short heads and dark coloration prevail; but there is a considerable admixture of blonds, ascribed variously to Venetian and Slavonic strains. The Sphákiotes believe themselves to be original Dorians, but apparently have some Albanian blood. The towns are Candia (Gr. *Heraklion* or *Megalópolis*), about 25,000; Canéa (Gr. *Chánia*), about 23,000; and Rétimo (Gr. *Rethymnos*), under 10,000. No other centre of population is better than a village, large or small; but it is important to observe that in rural, and generally mountainous, districts live and have long lived five-sixths of the population of the island. Hence in many a revolution the will of the Cretans has been carried out by the villages.

*History.*—The importance of Crete has been very various at different epochs, and the apparently unequal treatment of its history which follows is really in due proportion. Before the status of peoples had come to depend on cosmopolitan trade, Crete profited above her neighbours by a singular combination of natural advantages. Protected by insular position, but not too far from the kinder coasts of Egypt, Syria, and Asia Minor to communicate with their societies, of which one, the Egyptian, had already advanced far; blessed with unusually wide and fertile lands for an Ægean island, and a temperate climate; possessing so large a development of coast-line that none of her subsequent 'hundred cities' was more than half a day's journey from the sea, Crete was an ideal nursery of nascent civilisation of the European type; and there, as a fact, such a civilisation first developed. But as it grew to adolescence other civilisations, partly engendered by it, made good their footing in wider continental regions, and Crete, unable to expand her territory, fell behind and apart, and lapsed into an insignificance which has

continued to our own day. Her renewed importance, or rather notoriety, in the 19th century was due to accident. Had she been included in the Greek kingdom after the Liberation, her insignificance would have persisted unchanged. But her relegation then to the condition of an Ottoman province, the most outlying, predominantly Christian, Hellenic, and irreconcilable, made her a constantly active factor in European politics; and she received from the great Powers, who had agreed to preserve the Ottoman empire intact as a primary condition of the maintenance of their mutual balance, a measure of attention never before paid to her.

(1) *The Minoan Period.*—This designation of the whole brilliant prehistoric period in Crete down to the opening of the Age of Iron is convenient, because the most notorious historical feature of the period was the rule of the Minos dynasty in Cnossus. It opens obscurely in a *Neolithic Age*, before 4000 B.C. At Cnossus and Phæstus thick beds of neolithic deposit have been found to contain pottery, stone implements, and idols of stone and clay; and at Mágasá, near Sitia, in the east of the island, are remains of a stone-built house of the period. The neolithic Cretan pottery, which constitutes our main evidence, testifies, almost from the beginning, to a sense for symmetrical form, brilliance of surface, and effective decoration. The idols are of distinctly individual style, and quite different from the types of marble idol which became characteristic of the neighbouring Cycladic islands at a later period. Yet there was some communication with other Ægean islands, for Melian obsidian was in use for implements.

The use of metal, at first for colouring-matter and then for the fabrication of implements, seems to have become known about 3000 B.C. Pure copper, which occurs in Crete itself, especially on the dependent islet of Gavdo, was earliest employed; but this was soon replaced by bronze, the tin in which, since it must have been brought from outside, demonstrates the existence of oversea communication. Since about the same time the Cretans began to make stone vases closely resembling in form those made in Egypt under the Old Empire, it is reasonable to suppose that they derived their knowledge of bronze, their tin alloy, and perhaps the actual composite metal in ingots from Egypt, where bronze was already in general use. Nor is it improbable that they owed to the same region the impulse to decorate their pottery with painted, instead of incised, designs. The new fashion made the body-colour at first light and the design dark; but under the influence of the old black incised ware the reverse—light design on dark ground—gradually became prevalent, and spiraliform patterns were introduced, perhaps from the Cyclades. This *Early Minoan Age* was a period of oversea communication with Egypt, as we have seen, and also with other Ægean islands and coasts, as is proved by the presence of idols of Cycladic types and Cycladic marble. Peaceful parallel development seems to have gone on at several centres in the island, no one having yet established overlordship. Cnossus and Phæstus both show evidence of continuous inhabitation in this period, as in the preceding neolithic age; but far the richest remains of it have come to light in East Crete—e.g. at Mokklos, where were found the finest of the stone vases mentioned, and also much thin gold jewellery of astonishingly good design and workmanship. Vasiliké, on the Isthmus of Hierapetra, is another productive Early Minoan site.

It is not till we reach a date about 2000 B.C. that the cities which were going to be greatest in prehistoric Crete are seen to emerge as overlords. The first to attain wealth seems to have been Phæstus, which dominated the rich Messará plain;

but it was closely followed by Cnossus, which depended less on the rolling uplands and fat valleys behind modern Candia than on the sea, its port at the mouth of the Kaiatos River being safer than any harbourage on the south coast. Both cities erected great palatial and religious buildings during what are called the *First and Second Middle Minoan periods*, roughly contemporary with Dynasties xi.-xiii. in Egypt. These buildings have been explored since 1900, the one by Sir Arthur Evans, the other by the Italian mission under F. Halbherr and L. Pernier. In the ruins of both immense quantities of a very beautiful black glazed ware with white or polychrome decoration, admirable both in fabric and form, have been brought to light; and since fragments of this singular Cretan ware (long called 'Kamares' from the cave on Ida where it was first noticed) have been found in Egypt, Melos, and the Argolid, it is clear that overseas communications were well established. Engraved stones and clay tablets or labels prove that a system of writing, which had already developed linear hieroglyphic characters from earlier pictographs, was in use; and the fragments of painted fresco, the stone vessels, and the obvious imitation of metal forms by potters testify to an abundant and rich apparatus of domestic life. On the East Cretan sites, however, which had flourished in the early Minoan period, there is no such subsequent evidence of culture and prosperity; and their eclipse suggests that the days of free local development had been closed by the imperial aggression of one or both of the great central cities. Whether either of these lorded it over the other we do not know; this only is certain, that, while the Phaestian palace outlived the Second Middle Minoan Age, that at Cnossus was destroyed by fire about 1800 B.C. It may have been sacked by the Phæstians, or by a body of raiders from the sea; on the other hand, it may have perished by accident. In any case it began to be rebuilt almost at once, and ere the Middle Minoan Age closed was furnished with as rich and various an art as before. A century or so after the burning of Cnossus, Phaestus suffered ruin in its turn; and since in the period immediately succeeding (*Late Minoan I.*, contemporary with Dynasty xviii. in Egypt) all the East Cretan towns rose to renewed prosperity after a long eclipse, it looks as if Phaestus, not Cnossus, had been their oppressor. Cnossus, now supreme, advanced to its apogee, rebuilt its palace on an enlarged scale, and equipped it with the amazing wealth of furniture and ornaments, the discovery of whose remains by Sir Arthur Evans from year to year after 1900 made the greatest archaeological sensation of the time. Whoever had oppressed the East Cretan towns before, it was Cnossus now. By about 1500 B.C. (*Late Minoan II.*) they are again in eclipse, with the exception of a settlement on the rocky islet of Psira, whose natural advantages seem to have made it a secure refuge for a while. Art-products bearing the hall-mark of Cnossian Late Minoan style are found not only all over Crete, but in the other Ægean isles, on the southern mainland of Greece, and in Egypt. Phaestus, though rebuilt, was by comparison mean and provincial. On all grounds it looks as if Cnossus now lorded it alone over the island, and reached out far over the Ægean to Tiryns and Mycenæ, and even up to the northern isles and coasts. There can be little doubt that it was this epoch of Cnossian supremacy which left to classic Greece so many memories connected with the name of Minos, and that the *thalassocrætia* or searlordship of Crete, of which tradition told Herodotus and Thucydides, actually existed then.

The remains of this period at Cnossus, Phaestus, Hágia Triáda, and other lesser sites, mostly

situated in East Crete, show us a luxurious, sport-loving people whose princes lived in elaborately decorated structures of stone, with well-developed systems of lighting, ventilation, drainage, and sanitation; while even the commoner folk had good stone houses. The dress of both men and women among the better class was full and rich. The precious metals were abundant; the arts of sculpture, painting, and engraving were far advanced; and a system of writing in linear syllabic or alphabetic characters was perfected. The clay tablets, found in great numbers, prove that book-keeping was understood, and that a decimal system of reckoning was in use. The prevalent religion was of a comparatively high type, the idea of supreme divinity being expressed in feminine form, and the link with humanity supplied by a son-consort. There is evidence of a considerable apparatus of cult, and of the practice of various ritual acts. Since the written documents cannot be read, we do not yet know to which family the language belonged; and this inability, coupled with the insufficiency of our craniological and iconographic evidence, prevents any certainty about the racial affinities of the Minoans. Their social system we should judge to have been monarchical, and it is evident that the dynast of Cnossus had an imperial position, and exacted tribute from other towns in Crete and perhaps abroad. Much knowledge of the sea and its life is evinced, and it is clear that Egypt was visited by Cretans, and Crete by Egyptians. The latter people knew the former, perhaps, as *Keftiu*. The presence of a strong Cretan element in the finer art-products of this period which have been discovered in southern Greece, as well as in the Cyclades, makes it most probable that the Cnossian empire extended over the European Ægean coasts, while its cultural influence went to Sicily and even north Italy on the west, and to Asia Minor and Syria on the east. The story of Dædalus preserved a memory of this splendid age to later times.

On this flourishing society in Cnossus, and at the same time in all other Minoan towns, a great blow fell, probably in the first part of the 14th century B.C. When the storm has passed we see all the cities in relative abasement, but preserving a culture unchanged in type, without alien admixture. Accordingly it has been conjectured that the authors of the cataclysm were themselves men of Minoan culture, perhaps whilom dependants of Cnossus grown strong, but forced out of south Greece by a force yet stronger, that of the first Indo-European wave. The *Third Late Minoan period*, thus begun, is marked by a general distribution of Ægean art-products over the Mediterranean and its coasts, and by conspicuous uniformity in the types of their decadent forms and decoration. It seems as if Ægean and perhaps Minoan populations had been dispersed by some centrifugal force, and had found their way both west and east. Sicily, where later legend placed the death of Minos, becomes full of their influence, and Cyprus, in another direction, even more so. Legend and archaeological evidence combine to indicate that they reached southern Syria and were perhaps identical with the Cherethim or Philistines of the Bible story.

Two or three centuries later another general catastrophe overtook Crete, and thereafter we find northern types of dress, weapons, burial, houses, &c., as well as implements of iron, intruding among remnants of moribund Minoan culture. The Achæans had appeared in south Europe and west Asia, and to them we must ascribe the ending of the Minoan Age. In the Homeric epics, whose original composition falls probably within a century of this epoch, Crete is Achæan.

(2) *The Historic Period.*—It is evident, however, that the influence of the old culture was slow to die. Homer represents the Cretans as bold searovers still, and at a subsequent period, contemporary with the earliest classical renaissance in Greece proper, they had a remarkably prolific and individual, if somewhat formalised, art. The 'Geometric' cemeteries have supplied many products of it in ceramic and metallurgy, while the Idaean cave sanctuary has illustrated it with splendid votive shields; the excavation of Præsus has shown us its terra-cottas and jewellery, and a fine archaic Apollo from Eleutherna has reminded us of the known names of its sculptors, Dipœnus and Skyllis. But the most precious witness to Cretan civilisation in the early part of the first millennium B.C. is the code of laws, relating to inheritance, land-tenuie, and other domestic matters, which has been found inscribed in archaic Greek characters at Gortyna (H. Deka). By this time the Dorian element had become the strongest, and Crete was regarded throughout the Greek period as a typical Dorian region, whose civic institutions had much in common with the Spartan. The best known of these were the *syssitia* or public meals. Like the Spartan *ephoroi*, the Cretan *cosmi* exercised a very intimate and paternal control over both public and private life; but Aristotle, in a famous chapter of his *Politics* (ii.), showed himself doubtful of the utility of such excessive state supervision. Of external history Crete has none during the Greek period; internally she was divided into many small autonomous city states, everlastingly at feud under the leadership of Cnossus, or Gortyna (which had succeeded Phæstus as lord of the Messará), or Cydonia.

So troublesome was mountainous Crete to conquer, and of so little worth, that even Alexander and his successors left her alone; but Rome, which did not long tolerate independent islands in the Mediterranean, finding Crete implicated with the Cilician pirates, subdued her after a three years' war (67 B.C.). First as a separate senatorial province with Gortyna for capital, and then as a joint governorate with Cyrenaica, Crete obeyed the Roman empire, and as part of the prefecture of Illyria, after Constantine, remained Byzantine till the Saracens came in 823 A.D. They held the island for more than a century, till Nicéphorus Phocas drove them out in 960 and restored it to the Eastern Empire. With the rest of the Greek isles and mainland it passed into Latin hands after 1204, and was sold by Boniface of Montserrat to Venice.

The Venetians were destined for about 460 years to keep Candia, as they now named the island and its new capital (from *Khandax*, a fort built by the Saracens near Cnossus); but they never quite pacified it. The mountain spirit of the Cretans and their irreconcilable hatred of the Latin church led to repeated risings, one of which, provoked by misgovernment and supported even by resident Venetians, lasted three years (1361-64). If the republic sent harsh governors, she promoted trade; and remains of fine fortified harbours, docks, and galley-slips still attest the material prosperity of Crete under Venetian rule as eloquently as the huge landward fortifications of Candia and Canéa attest the insecurity of Venetian hold on the interior. Yet the victorious Turks were slow to dispossess Venice, and made no strong effort till 1645. Capturing Canéa and Retimo in that year, they advanced on the capital in 1648. Its tremendous walls kept them out for twenty-one years, and the siege is among the most famous in history. If it had not been for the energy infused into the operations from 1667 onwards by Ahmed Kuprili, the great Albanian vizier of Mohammed IV., Crete might never have been Ottoman. With Candia lost in 1669, Venice held on to three islets,

Suda, Grabúsa, and Spinalonga, for half a century more, but retired from the last in 1718.

The Turks thought it worth while at first to encourage apostasy to Islam by promises of the rich plain lands, and soon brought over about a third of the whole population to their faith and interest. The descendants of these converts, reduced to less than one-half their number, make the 'Moslem Question' in the island to-day. Against their insolence and exactions (many of them joined the Janissary Order), rather than against actual Turks, the Christians revolted more than once (e.g. in 1770), but could make no headway till Mahmud II. himself had undermined Janissary power. With the Greeks of the mainland they rose at last with success in 1821, cleared the Moslems out of all the island except the fortresses, and would have reduced these had not the sultan prevailed on his Egyptian viceroy to save them and reconquer the interior. This Mehemet Ali did, and eventually he retained the island under his effective if despotic rule till 1840, the Powers having refused in 1830 the request of the Cretans for union with the new Greek kingdom. His governor, Mustapha Ali, remained on in the island till 1852; but with the end of his strong and comparatively enlightened administration peace departed from Crete. The Porte, recognising that it could not diagoon the island as of old, tried to secure power by making concessions, the least possible, to the Christians; but continually playing them false, it provoked insurrection after insurrection, until, after a more serious one than usual (1866-68), whose suppression cost the Turks a very heavy price, a measure of constitutional government was conceded by the Organic Statute of 1868. Its cumbrous machinery, however, worked ill, and matters were not much improved by the Pact of Halépa (1878), which followed on the unrest provoked in Greek lands by the Treaty of San Stéfano.

(3) *Recent Period.*—But these palliative measures, for purposes of practical government, were still-born. The elaborate duplicated executive and judiciary (to every Moslem a Christian assessor, or *vice versa*) could only have worked successfully with abundant goodwill to help; and goodwill was conspicuously absent on both sides. The Christians, having obtained something never before conceded to *rayahs*, had still not obtained what they desired—complete autonomy—and were aware that since the Berlin Treaty the Powers could be induced more easily than of old to interfere in internal Ottoman affairs. The Moslems grudged to the Christians their newly conceded privileges, and especially their majority in the Assembly and the administration. But if neither party was minded to make the machine of government work well, both intended to get as much as possible of the spoils of office before it should break down. As a result financial troubles soon appeared, and an abortive rising in 1889 led to the virtual annulling of Christian privileges. Though these were restored in 1894, and a Christian governor-general, Karatheodory Pasha, formerly Prince of Samos, was appointed, the financial situation, going from bad to worse, paralysed government and brought discontent to the point of desperation. Revolt was once more organised in the hills, and broke out in 1896 with the investment of Vámos; and though, after the relief of this town and some punitive operations, the sultan tried conciliation and revived the Halépa Pact, the slow realisation of his promises, and the constant incitement of the Christians by emissaries of an Athenian society, the Ethniké Hetairia, brought about a renewed outbreak of trouble in Canéa on February 4, 1897. The Greek government's hand was forced; an expeditionary force under Colonel Vassos landed ten

days later; and the Powers, having occupied the fortified towns, proclaimed a blockade of the coast. The whole interior was now in open rebellion, and such Moslems as had been able to escape massacre were crowded into the towns. This state of things lasted with little change for more than a year, the warships and occupying forces of Great Britain, France, Russia, and Italy keeping back the insurgents; but Moslem fanatics hastened the end by pillaging Christian property at Candia and incidentally killing some members of the British garrison. The Turkish troops were forcibly deported by Admiral Noel on November 14, 1898, and the Ottoman flag was hauled down except on Suda Island. The four Powers undertook to administer Crete, and appointed Prince George of Greece their first high commissioner. For a short time they conducted the government, but in June 1899 handed it over to the Cretans, themselves occupying the chief towns till 1908.

In spite of the enactment of a constitution, the Cretans complained of arbitrary government; and, under the lead of Venezélos (q.v.), a party raised the standard of revolt in 1905, demanding the recall of Prince George and the consummation of national union with Greece. The Powers refused to countenance these demands, but proposed a revision of the constitution and certain reforms, one of which, the admission of Greek officers to reorganise the police and militia, paved the way for the withdrawal of the international troops. On September 25, 1906, Prince George resigned his high commissioner-ship, and the king of the Hellenes was allowed to nominate Alexandros Zaimis, an ex-premier of Greece, to hold office for five years. The latter's tenure was characterised by the strengthening of ties with Greece through the substitution of Greek gendarmerie officers for Italian, and the raising of a loan from the Greek National Bank; and also, less legitimately, by the Assembly voting union, the executive taking the oath of allegiance to King George, and an election being held of Cretan deputies to sit in the Greek Chamber (1910). This election, however, was declared void by the king of the Hellenes under pressure from Turkey and the Powers. After returning themselves in the census of 1911 as Greek subjects, the Cretan Christians were sharply reminded of their real status by the Powers, who were still anxious that 'reformed' Turkey should not be unduly embarrassed. An attempt by the Porte to enforce its sleeping rights of suzerainty by appointing *cadis* to Crete in May 1911 had, however, to be abandoned. In September the Powers announced that, on the completion of M. Zaimis's term, the office of high commissioner would not be filled again. In June 1912, encouraged by the Tripolitan war, Cretan deputies attempted to take their seats in the Assembly at Athens, but were kept out by the Greek government. Still the whole trend of events for many years had brought the island nearer and nearer to union with the Hellenic kingdom; and the war begun in October 1912 by the allied Bulgarians, Serbians, Montenegrins, and Greeks against the Turks raised the question again in acute form. In the first weeks of the war, after the startling early successes of the allies, the Cretan deputies were welcomed to their places in the Greek Chamber, and a Greek governor of Crete was appointed by the Hellenic government. In the peace negotiations Greece claimed the island, and the Powers agreed by the Treaty of London (December 1913) to confirm that claim. Since this date it has been recognised Greek territory, strongly Venezelist in its sympathies. In the Great War its remoter coves were undoubtedly used by German submarines, which made the straits, west, south, and east of it, the most dangerous part of the Mediterranean; but there

is no reason to suppose that the island population or administration connived generally at such use.

The National Assembly has now vanished with all other provisional features of the autonomous régime, and the Greek system of centralised administration has taken the place. The law is the code in use in Greece, and the Metropolitan of Candia and his seven bishops act under the Metropolitan of Athens. The Moslem population steadily dwindles, no opportunity being lost to promote its impoverishment and emigration.

Olive-oil, wine, carob-beans, oranges, lemons, and soap are the chief products. Home-grown cereals are insufficient for the island's own consumption. External trade is slack, owing to want of good harbours and of the seafaring habit among the population. Internal trade is hampered by the badness of roads and all means of communication. The main attraction to foreigners has been offered in recent years by archaeological excavations at Cnossus, the Dictæan Cave, Zakro, and Palaiakastro (British); Phaestus and H. Triáda (Italian); Gournia, Vasiliké, Mochlos, and Psira (American); and various cemeteries and lesser sites—e.g. Tylissos (Cretan). Their results have been gathered mainly into a new museum built at Candia. The western part of the island has been but little explored archaeologically, and its chief town, Canéa, though the residence of the foreign consuls, has much less to interest a visitor than Candia.

For general history and travel, see K. Hoeck, *Kreta* (3 vols. 1823-29)—a compendium of literary authorities; J. H. Freese, *Short Popular History of Crete* (1897); H. **Crétin**, GUILLAUME (d. circa 1525), typical French poet of his time, enjoyed a considerable reputation in his day, but his obscurity and tricks of rhyming contributed largely to his later neglect.

**Cretinism** (Fr. *crétin*, 'an idiot;') probably from *chrétien*, 'a Christian, an 'innocent'), idiocy or defective mental development, associated with bodily deformity or arrested growth, occurring, along with Goitre (q.v.) or enlargement of the thyroid gland, in the lower mountain valleys of the Swiss and Italian Alps, of the Pyrenees, of Syria, India, and China. In Europe it is rarely found above 3000 feet, and haunts chiefly valleys surrounded by high and steep walls of rock, which exclude the light and limit the free circulation of air. In some such localities it is extremely prevalent. Cretins are always pitiable and frequently repulsive objects; they are generally dirty, shameless, and obscene; their appetite is commonly voracious; the mouth is large and open, the tongue often protruded, the eyes small, the nose flat and broad, the skull flattened above and

expanded at the sides, the forehead retreating, the complexion cadaverous; in addition to which, the whole body is dwarfish, the skin thick and coarse, the hands and feet large, the limbs often rickety, the belly protuberant. Recent investigations have shown that the connection between cretinism and goitre is an extremely close one. The disease called Myxœdema (q.v.) closely resembles cretinism, except that it comes on during adult life; and it has been proved to be always associated with destructive change of the Thyroid (q.v.) gland. A similar condition has been found to follow the removal of the thyroid gland by surgical operation in a large proportion of cases. Loss of function of the thyroid gland seems to be the essential factor in the production of cretinism, while goitre consists in its enlargement. Treatment, as in myxœdema, by the administration of a preparation of thyroid gland, and the implanting of thyroid glands from animals, has been found to improve the condition of adult 'cretins'; and cretin infants treated with thyroid preparations have recovered, but the treatment must be continued for life. See GLANDS.

**Cretonne**, a printed cotton fabric used for curtains or for covering furniture, introduced about 1860. Unlike chintz, it is generally thick and strong for a cotton fabric, and with a twilled, crape, basket, wave, or other figure produced on the loom. A cretonne is rarely calendered or glazed.

**Creuse**, a river in central France, which flows 146 miles north-westward till it falls into the Vienne, a tributary of the Loire, 12 miles N. of Châtellerault.

**Creuse**, a department of France between Haute Vienne and Puy-de-Dôme, has an area of 2150 sq. m.; pop. (1872) 274,663; (1901) 277,831; (1921) 228,344. Low mountains and chains of hills, 2000 to 3000 feet high, occupy the greater part of the land. The climate is moist and variable, and the soil thin and light, interspersed with stretches of heath and pasture in the southern hilly district, but better in the lowlands of the north-east. The rearing of cattle forms the chief industry, and large quantities of chestnuts and fruit are grown.

**Creusot**, or **Creuzot**, LE, a town in the French department of Saône-et-Loire, 14 miles SSE. of Autun, and 236 SSE. of Paris. Situated in the midst of a district rich in coal and iron, it owes its importance to the establishment here in 1837 of great ironworks, amongst the largest in Europe, with collieries, coke furnaces, smelting furnaces, rolling-mills, factories which produce cannon and ordnance, engines, locomotives, &c. There are also glass-works here. Pop. (1846) 4012; (1921) 38,396.

**Creuzer**, FRIEDRICH (1771-1858), classical scholar, born at Marburg, studied there and at Jena, and held chairs at Marburg and, from 1804, at Heidelberg. His first and greatest work was his perversely ingenious and learned *Symbolik und Mythologie der alten Völker, besonders der Griechen* (4 vols. 1810-12), giving a symbolical explanation of ancient mythologies (see MYTHOLOGY). His next was a complete edition of Plotinus (3 vols. Oxford, 1835). He produced and also edited some of Cicero's works, and published 10 vols. of *Deutsche Schriften*, including an autobiography.

**Crèveccœur** (Fr., 'heart-breaker'), a once famous Dutch fort, 4 miles NNW. of Bois-le-Duc.

**Crèveccœur**, JEAN HECTOR SAINT-JOHN DE (1731-1813), was born at Caen, educated in England, and in 1754 settled in the United States, where he bought an estate near New York, and became a notable agriculturist. He suffered much in the Revolutionary war, being imprisoned as a spy in New York and shipped to England as a prisoner. His glowing account of the climate and fertility of America, in *Letters of an American Farmer*, brought

hundreds of French families to the Ohio valley. And his idyllic descriptions of life in the New World seemed to realise Rousseau's state of nature, and helped to mould French thought and aspirations. His influence has been traced in Chateaubriand, in Campbell, Southey, and Coleridge. He was French consul at New York (1783-93), but returned to France. See Life by Julia Post Mitchell (1917).

**Crevillente**, a town of Spain, 20 miles WSW. of Alicante; pop. 11,000.

**Crewe**, a town of Cheshire, 43 miles SE. of Liverpool, with a great railway junction and huge railway works, established in 1843. About 1840 there were only two or three houses where Crewe now stands; in 1851 its population was 4491, in 1921 46,477. It has art and technical schools. Crewe was incorporated in 1887. Lord Crewe's seat, Crewe Hall, by Inigo Jones, was destroyed by fire in 1866, but rebuilt.

**Crewe** (ROBERT OFFLEY ASHBURTON CREWE-MILNES), MARQUESS OF, son of Lord Houghton (q.v.), was born in 1858, and educated at Harrow and Trinity College, Cambridge. He was successively Assistant-secretary for Foreign Affairs (1883-84), Lord-lieutenant of Ireland (1892-95), Lord President of the Council, Lord Privy-seal, Colonial Secretary (1908-10), Secretary for India (1910-15), and Lord President of the Council and President of the Board of Education in Mr Asquith's Coalition Ministry (1916). Heir to his maternal grandfather, Baron Crewe, he was made Earl of Crewe in 1895 and Marquess in 1911. He was Chairman of London County Council (1917), and ambassador to France (1922). He published a volume of verse in 1891.

**Crewel-work**. See EMBROIDERY.

**Crewkerne**, a market-town of Somersetshire, in the fertile valley of the Parret, 15 miles SE. of Taunton, has a cruciform Perpendicular church, with a splendid west front, and a grammar-school (1499) in modern buildings; pop. 3700.

**Cribb**, TOM. See PUGILISM.

**Cribbage**, a game at cards, probably of English origin—according to Aubrey, it was invented by Sir John Suckling, the cavalier poet. It is played with a pack of fifty-two cards; the scores accrue in consequence of certain combinations in play, hand, and crib. The scores are marked on a cribbage-board pierced with holes. Cribbage was formerly called *noddy*, and is mentioned under that name in an epigram by Sir John Harrington (1615). The earliest description of the game is in *The Compleat Gamester* (1674).

**Crib-biting** is a bad habit and an unsoundness met with especially in the lighter breeds of horses, and those spending a considerable amount of leisure in the stable. The animal seizes with his teeth the manger, rack, or any other such object, pulls on it, and makes at the same time a peculiar noise as if swallowing air. Crib-biting springs often from idle play; may be first indulged in during grooming, especially if it is conducted in the stall and the animal be needlessly teased or tickled; is occasionally learned, apparently, by imitation; and in the first instance is frequently a symptom of indigestion. It may be suspected where the outer margins of the front teeth are worn and ragged, and will soon be proved by turning the animal loose where he can find suitable objects to lay hold of. It usually interferes with thriving and condition, and leads to attacks of indigestion. It can be prevented only by the use of a muzzle or throat-strap; but in those newly acquired cases resulting from gastric derangement, means must further be taken to remove the acidity or other such disorder.

**Criccieth** (pron. *Krikkieth*), a Carnarvonshire watering-place, one of the Carnarvon boroughs,

home of Mr Lloyd George, on Cardigan Bay, 4 miles W. by S. of Tremadoc. Across the bay—good land submerged in punishment of one man's drunkenness, according to Welsh legend and Peacock's *Misfortunes of Elphyn*—is Harlech Castle. Criccieth Castle, also a ruin, dates from British times, but was strengthened by Edward I. Pop. 1900.

**Crichton, JAMES**, surnamed the 'Admirable,' son of Robert Crichton of Eliock, Dumfriesshire, Lord Advocate of Scotland, was born 19th August 1560, and educated at St Salvador's College, St Andrews, where George Buchanan was his tutor, and where he graduated M.A. in 1575. In 1577 Crichton left Scotland, and was for two years in France, where he seems to have served in the French army. There is no trustworthy evidence that he distinguished himself as a disputant at the university of Paris. In July 1579 he was at Genoa, and addressed the senate in a Latin oration, which was printed. Next year he reached Venice, and printed a Latin poem addressed to Aldus Manutius, grandson of the founder of the Aldine press. Aldus took the youth under his patronage, and issued a printed handbill announcing a great scholastic disputation in which Crichton was to take part. The young Scotsman was there described as a skilled athlete, scholar, poet, linguist, with unparalleled powers of memory. In 1581 (according to Aldus) Crichton went to Padua, and overcame all the scholars there in public disputations. At the end of 1583 Aldus issued an edition of Cicero's *De Universitate*, dedicated to Crichton's memory, and asserted there that his versatile protégé had died in July. Some confusion has arisen from the fact that another James Crichton was in Italy at the same time or soon after. In 1584 the second Crichton visited Milan. There late in that year he published an elegy on the death of the archbishop, Cardinal Borromeo, and two gratulatory odes—one addressed to the cardinal's successor, Gaspar Visconti, and the other to Charles Emmanuel, Duke of Savoy, on his marriage. Early next year (March 1585) he issued a collection of scattered Latin poems dedicated to the chief-magistrate of Milan. Bernardini Baldini addresses this second James Crichton in Latin verses as a kinsman of the other, whose death by 'a wicked hand' he deplores; and the survivor's reply confirms his evidence. In 1601 one Thomas Wright, in *Passions of the Mind*, related that when in Italy he heard that a young (unnamed) Scotsman, 'of most rare and singular parts,' was attacked and basely killed by an (unspecified) Italian prince. John Johnston, in *Heroes Scoti* (1603), states that Crichton was killed at Mantua by a son of the duke in a nocturnal brawl, and that he was buried at Mantua. The Mantuan state papers, while leaving some points obscure, show that the first-named Crichton was killed by Vincenzo Gonzaga, the duke's son, between the hours of one and two in the night of the 3d July 1582. Crichton had entered the duke's service in February, had drawn up a scheme of fortification, defeated all comers in theological disputation, and by his popularity had gained Vincenzo's enmity. According to the prince's own story, which is not consistent in all points, Crichton met the prince with a disreputable companion, and insisted on taking the wall of them; Crichton, being thrust aside, killed the prince's friend, and was mortally wounded by the prince before either recognised the other. Public opinion in Mantua and elsewhere was strongly against the prince; and the duke, though he hushed the matter up, seems to have taken the less favourable view of his son's conduct and character. Johnston in 1603 first used the epithet 'admirable' in describing Crichton ('*omnibus in studiis admirabilis*'). But Crichton chiefly owes

his repute and surname to Sir Thomas Urquhart (q.v.), who wrote an extravagant account of his scholastic and athletic prowess in his *Discovery of a most exquisite Jewel* (1652). The testimony of Aldus to Crichton's versatility is alone worthy of serious consideration; but Aldus was in the habit of praising extravagantly promising young strangers at the Italian universities. That Crichton's power of memory was extraordinary is, however, independently corroborated by Burchelati in his *Epitaphiorum Dialogi Septem* (1583); and there is no reason to doubt his linguistic facility or his skill as a fencer. Harrison Ainsworth wrote a novel on Crichton's apocryphal career in 1837.

See articles in the *Dictionary of National Biography* and in the *Gentleman's Magazine* for March 1888 (both by Sir Sidney Lee); a genealogical paper by John Stuart in *Proceedings of Society of Antiquaries of Scotland* (1855), ii. 103-118; and for the Mantuan papers and the second James Crichton, see Mr Douglas Crichton in vol. xliii. (1909), 296-308.

**Cricket.** All games which are played with ball and hand may be divided into two classes. The first consists of those games in which the ball, when struck with bat, racket, or some other kind of weapon, is in motion; the second when the ball is at rest. In the first class are the games of cricket, tennis, rackets, fives, and polo; in the second, golf, billiards, and croquet. The greatest of those in the first class, and perhaps the greatest of all, is cricket, the national summer game of the English race throughout the world. The derivation of the word cricket is uncertain, but there is no sound reason why Professor Skeat in his *Etymological Dictionary* is not correct when he says that the word is derived from *crice*, a staff. There are other authorities who contend that the old French word *cricquet*, a stick used in the game of bowls, is the origin; but the great authority of Professor Skeat is on the side of *crice*, and his view is now generally adopted.

Records have been very far from continuous on the subject, but there can be no doubt that in some shape or other a game with bat and ball has been played ever since the middle of the 13th century. There is a drawing in a book called *Chronique d'Angleterre depuis Ethelberd jusqu'à Hen. III.*, in which, apparently, two men are playing with bat and ball. In the Bodleian Library there is a MS. showing monks playing with fieldsmen. In the *History of Guildford*, by Russell, it is stated that cricket was played there in the middle of the 16th century; but if the opinion of Stow in his *Survey of London*, published in 1593, is correct, however old the game was in some shape or other it was thought little of, because it is not mentioned; indeed he speaks of the ball contemptuously as used 'by noblemen and gentlemen in tennis-courts, and by people of the meaner sort in the open fields and streets.'

The history of the game may conveniently be divided into four epochs, and each epoch was created by the style of bowling in vogue at the time. The first began at whatever time in the Middle Ages cricket was first played, and lasted till about 1750, and during this period the bowling was all along the ground. The grounds were naturally rough, and the bat was more like a hockey-stick than a modern bat; but in a sense it was well adapted to play the style of bowling the player had to contend with. That the scores were not bigger was owing to the rough pitches, which often caused the ball to rise an inch or so, and thus to pass over the narrow bit of wood that projected nearly at right angles to the upright stick, and which was the operative part of the bat. The wicket was originally a hole in the ground, and there was no such thing as being bowled out; the striker was

either caught or run out, the latter mode of dismissal being caused by the fieldsmen putting the ball into the hole before the batsman could get in his bat. It may have been that the frequent damage the hand of the fieldsmen sustained was the immediate cause of the development of putting up a stump, but at what date this took place is unknown. From one stump it was only a short step to putting up two, and these were 12 inches high, placed 24 inches apart, and a third was afterwards laid along the top. From about this date, whatever it was, to bowl out a batsman became an important part of the game, and the unfairness of so many of the best balls passing through the broad wickets without hitting a stump brought about a change which brings us to the next epoch.

From 1750 onward rather more attention was paid to the grounds, which became slightly smoother, and as years went on the run-getting increased so much that not only was a third stump added at some date, probably about 1755, but bowlers began to pitch 'length-balls' instead of bowling 'sneaks.' The Hambledon men, led by the famous David Harris, were the pioneers of this new style of bowling; and the game became more scientific, and the bat was made something like the shape of to-day. No doubt the pitches became smoother and smoother till, in 1796, the scoring rose so high that the stumps were raised two inches; but it was not until 1817 that the present dimension of wicket—27 inches high and 8 inches broad—was finally fixed upon; and this has not been altered up to the present date. It is a curious fact that the distance of 22 yards between wickets has been the same in all probability for 200 years.

We have now come to the third epoch, when round-arm bowling was introduced in 1826, but not formally permitted till 1844. No doubt previous to that date the scoring on better pitches grew so large that bowlers gradually raised their arm, but the rule was strict that no jerking was legal. To define a jerk is impossible; but nobody can jerk a ball unless his hand or arm, or both, is touching his body when the ball leaves the hand. To keep the hand clear of the body was very likely the cause of raising it, till finally, in 1826, William Lillywhite and Jem Broadbridge of Sussex brought in the system of round-arm bowling, after very strong opposition; and this system was finally made legal in 1844. From 1826 to 1864 was the duration of the third epoch, and the latter part of this period was no doubt a glorious time in cricket, for though the wickets were rough as compared with those of the present day, they were not so rough as to be dangerous to bowling with the arm never raised above the shoulder. Bowlers on the whole had the best of it, but there were many fine batsmen, and, except owing to bad weather, drawn matches in first-class cricket were unknown. In 1862 the famous Edgar Willsher was no-balled at Kennington Oval by John Lillywhite for bowling with his arm above the shoulder. Willsher left the ground in wrath, and there was almost a riot; but this incident led to the fourth epoch, for in 1864 a new rule was passed which permitted bowlers to bowl with the hand at any height, and this is the position up to the present day, but the ball must not be thrown or jerked.

We have now exhausted to a certain extent the history and development of the game in its broadest sense, but it is curious and instructive to see that the real factor which has been the cause all along of changes and development has been run-getting. Batsmen learn to adapt themselves to different kinds of bowling, and succeed so well that too many runs are got, and this generally leads to changes in the rules; and this will proceed still further. The wickets are now so easy to bat on

that there is a danger that in first-class cricket really fast bowling will die a natural death, as the work is too hard, and generally bowlers and fielders are worked too much. The great success of Messrs Macdonald and Gregory in the tour of Australian cricketers in England in 1921 seems at first sight to prove that there is a future for fast bowling; but the war had a great effect on English cricket, and England had never been so weak in the last sixty years as she was in 1921, and the summer was very dry and suitable to fast bowlers. In Australia the perfect wickets make fast bowling easy, and slow bowlers of Mailey's stamp are the most successful.
